Received 2nd February 1999, Accepted 7th April 1999

Reaction of [Mn(CO)₅X] (X = Cl or Br) with L–L {L–L = dppm (Ph₂PCH₂PPh₂), dppe (Ph₂PCH₂CH₂PPh₂), dppp (Ph₂PCH₂CH₂PPh₂), $C_6H_4(PPh_2)_2$ -o, $C_6H_4(PH_2)_2$ -o, dpae (Ph₂AsCH₂CH₂AsPh₂), diars [$C_6H_4(AsMe_2)_2$ -o], dpsp (Ph₂SbCH₂CH₂CH₂SbPh₂) or dmsp (Me₂SbCH₂CH₂CH₂SbMe₂)} or with two molar equivalents of L (= PPh₂H, PCy₂H or PPhH₂) in refluxing CHCl₃ yielded the neutral manganese(i) complexes [MnX(CO)₃(L–L)] and [MnX(CO)₃L₂] as yellow or orange solids. Infrared spectroscopic studies confirmed the *fac*-tricarbonyl arrangement and ¹H, ¹³C-{¹H}, ³¹P-{¹H} and ⁵⁵Mn NMR spectroscopy have been used to probe the solution behaviour. For a given halide ⁵⁵Mn NMR spectroscopic studies showed some dependence of δ (⁵⁵Mn) on halide, chelate ring size, substituent and donor atom. X-Ray crystallographic analyses on [MnCl(CO)₃{C₆H₄(PPh₂)₂-o}], [MnBr(CO)₃(dppe)] and the diprimary phosphine complex [MnCl(CO)₃{C₆H₄(PH₂)₂-o}]·CH₂Cl₂ confirmed a *fac*-tricarbonyl arrangement, with the ditertiary or diprimary phosphine chelating. The structure of [MnBr(CO)₃-(PPhH₂)₂] also shows a *fac*-tricarbonyl arrangement with the primary phosphine ligands mutually *cis*.

Introduction

Recently we have been investigating manganese(I) carbonyl complexes incorporating Group 15 and 16 donor ligands, with particular interest in establishing trends in the carbonyl stretching frequencies (IR) and the 55 Mn chemical shift ranges which might convey information about the relative binding properties of these soft donor types to MnI. Manganese-55 [100%, I=5/2 ($\Xi=24.84\,$ MHz)], possesses a moderately high quadrupole moment (0.55 \times 10 $^{-28}$ m²), thus for complexes with less than $O_{\rm h}$ or $T_{\rm d}$ symmetry a considerable electric field gradient is expected to result in substantial broadening of the resonances. We have recently shown that 55 Mn NMR spectroscopy is a sensitive probe of the nature of the manganese–ligand bonding for fac-[Mn(CO)3X(E–E)] (E–E = dithio-, diseleno- or ditelluro-ether ligand), with $\delta(^{55}$ Mn) shifting to low frequency from S to Se to Te, indicative of increased σ bonding down the group. In most cases the resonances for the individual invertomers were readily detected

In this paper we are concerned with Group 15 donor ligands involving P, As and Sb donor atoms and we now describe the preparation and spectroscopic characterisation, including IR, ¹H, ¹³C-{¹H}, ⁵⁵Mn and ³¹P-{¹H} NMR spectroscopy, of the manganese(I) complexes [MnX(CO)₃(L-L)] and [MnX- $(CO)_3L_2$ [X = Cl or Br; L-L = dppm, dppe, Ph₂PCH₂CH₂- $CH_2PPh_2(dppp), C_6H_4(PPh_2)_2-o, C_6H_4(PH_2)_2-o, Ph_2AsCH_2CH_2-o, Ph_2AsCH_2-o, Ph_2ASCH_2-o,$ AsPh₂ (dpae), C₆H₄(AsMe₂)₂-o (diars), Ph₂SbCH₂CH₂CH₂- $SbPh_2$ (dpsp) or $Me_2SbCH_2CH_2CH_2SbMe_2$ (dmsp); L =PPh₂H, PCy₂H or PPhH₂]. The crystal structures of [MnCl- $(CO)_3\{C_6H_4(PPh_2)_2-o\}$], [MnBr(CO)₃(dppe)] and the primary phosphine complexes $[MnCl(CO)_3\{C_6H_4(PH_2)_2-o\}]$ and [MnBr(CO)₃(PPhH₂)₂] are also described. The redox properties of selected examples are also reported. Some of the compounds, notably [MnX(CO)₃(dppm)], [MnX(CO)₃(dppe)] and [MnX(CO)₃(dpae)], were reported a number of years ago and have been the focus of considerable interest due to the unusual electrochemical responses which they display.³⁻⁶ However we have resynthesized these compounds to compare their NMR properties with those of the other phosphine, arsine and stibine derivatives. The compounds [MnBr(CO)₄(PPh₂H)], [MnBr(CO)₃(PPh₂H)₂], [MnBr(CO)₄(PPhH₂)], [MnBr(CO)₃-(PPhH₂)₂]⁷ and a series of cationic manganese(I) complexes involving PPh₂H, [Mn(CO)_x(PPh₂H)_{6-x}]⁺ (x = 2–5), have also been described previously,⁸ although multinuclear NMR spectroscopic data for these are very limited. The chemistry of RSbCH₂SbR (R = Ph or Me) with metal carbonyls including Mn^I) has been reported, and the ligand binds either in an η^1 mode or μ -bridging mode.^{9,10}

Results and discussion

Syntheses

Treatment of $[MnX(CO)_5]$ (X = Cl or Br) with one molar equivalent of L-L [= dppm, dppe, dppp, C₆H₄(PPh₂)₂-o, C₆H₄-(PH₂)₂-o, dpae, diars, dpsp or dmsp] or two molar equivalents of L (= PPh₂H, PCy₂H or PPhH₂) in gently refluxing CHCl₃ under an inert atmosphere affords the neutral species $[MnX(CO)_3(L-L)]$ or $[MnX(CO)_3L_2]$ as yellow or orange solids. The reaction progress was monitored by solution IR spectroscopy, and considered to be complete when $\nu(CO)$ associated with [MnX(CO)₅] had disappeared. In all cases the reaction flasks were wrapped with foil to protect the manganese species from bright light. Typically the isolated compounds are very soluble in chlorocarbons, and some are also quite soluble in hydrocarbons. The solids are stable, and solutions of the compounds also appear to be quite stable unless exposed to oxygen. The dmsp derivatives were rather more difficult to isolate than the other compounds.

The FAB or electrospray mass spectra for these compounds generally show peaks with the correct isotopic distributions consistent with $[Mn(CO)_3(L-L)]^+$ or $[Mn(CO)_3L_2]^+$ and $[Mn(L-L)]^+$ or $[MnL_2]^+$, although the parent molecule and/or fragmentation products containing Cl or Br are also seen in some cases.

Three isomeric forms are possible for [MnX(CO)₃L₂], fac, mer-trans and mer-cis, and, since they all have approximate C_s symmetry, group theory predicts three ν (CO) absorptions for

^a Spectra recorded in CH₂Cl₂–CDCl₃ solution at 300 K. ^b Solutions in CHCl₃, all bands were strong. ^c At 145.8 MHz and referenced to external 85% H₃PO₄. ^d At 89.27 MHz and referenced to external aqueous KMnO₄. ^e Second species at δ –2070.

each. Thus, it is not possible to distinguish these on the basis of the number of bands observed. Many of the original assignments of isomers of [MnX(CO)₃L₂] were however made on the basis of IR spectroscopic studies and this has led to some discrepancies in the literature. Owing to the limited solubilities of most of the compounds in non-polar solvents, and to provide a directly comparable set of data, the IR spectra were recorded in CHCl₃ (Table 1). The polarity of this solvent does broaden the bands and thus the data are less sensitive to small changes in v. The values of v(CO) obtained for the compounds reprepared in this work are in good agreement with the literature.^{3,6,7} The solution IR spectroscopic studies show three strong CO stretching vibrations (Table 1), and the frequencies and relative intensities of the three bands do not differ greatly between compounds. In all cases the stretching frequencies are comparable with v(CO) reported for fac-[MnCl(CO)₃(SbPh₃)₂] (2024, 1955, 1912 cm⁻¹) but distinctly different from the values for mer $trans-[MnCl(CO)_3(SbPh_3)_2]$ (1950, 1909 cm⁻¹). Hence we assign all of the compounds in this work as fac isomers. In an early paper Abel and Wilkinson 11 assigned [MnX(CO)₃L₂] $(X = Cl, Br or I; L = PPh_3 or AsPh_3)$ as fac isomers. This assignment was subsequently questioned, 12 however our data for complexes involving PPh2H, PPhH2 and PCy2H are in accord with the conclusions of Abel and Wilkinson and are supported by a single crystal structure determination on [MnBr(CO)₃(PPhH₂)₂] (see below). As expected, the highest frequency v(CO) band (CO trans to X) shifts to low frequency according to the series X = Cl > Br. Since, $\nu(CO)$ for these manganese compounds appears to be dependent on the terminal substituent on the donor atom and the interdonor linkage, and since the shifts are small, there is no obvious trend in v(CO) with donor type.

Similar reactions were undertaken with [MnX(CO)₅] (X = Cl or Br) and diars. For X = Cl the data are consistent with the formation of [MnCl(CO)₃(diars)], however for X = Br there is evidence for a second species in addition to [MnBr(CO)₃(diars)] (electrospray mass spectrometry: found m/z = 711, [Mn(CO)₃-(diars)₂]⁺; δ (⁵⁵Mn) -1702).

The ¹H, ¹³C-{ ¹H}, ³¹P-{ ¹H} and ⁵⁵Mn NMR spectroscopic data were also recorded for the compounds in this study. The combination of observable NMR nuclei provides a very convenient way in which to monitor the species present in solution

and for a series of related compounds variations in chemical shift values may also reflect subtle differences in the bonding.

The ¹H NMR spectra were recorded for the new ditertiary ligand complexes and for all of the primary and secondary phosphine complexes. The spectra show broad resonances associated with the ligand, and for those with Me terminal substituents two distinct Me resonances are observed: one due to the Me groups adjacent to a CO ligand and the other due to the Me groups adjacent to Cl or Br. For the secondary phosphine complexes the PH protons appear as a widely separated multiplet, while for the primary phosphine derivatives the two distinct environments for the P-bonded protons are clearly identified.

¹³C-{¹H} NMR spectroscopy provides evidence for the coordinated L–L or L in each case, and, for the ligands with Me substituents, two Me environments are seen. The CO resonances are broad (spanning a few ppm) due to the effect of the directly bonded ⁵⁵Mn quadrupole, however typically we do observe two resonances in a 1:2 ratio: the one to high frequency attributed to the CO *trans* to X and the lower frequency resonance due to the two CO ligands *trans* to L–L or L.

The ³¹P-{¹H} and ⁵⁵Mn NMR data are presented in Table 1. For all of the monodentate and bidentate phosphine complexes ³¹P-{¹H} NMR studies show a single resonance consistent with only one species (fac) in solution. Again, the directly bonded 55Mn quadrupolar nucleus results in the 31P-{1H} NMR resonances being broadened, although coupling to 55Mn is not resolved. The data are in accord with other phosphine complexes, exhibiting the same trends in co-ordination shift $(\delta_{\text{complex}} - \delta_{\text{free phosphine}})$ and chelate ring-size effects.¹³ Thus, the [MnX(CO)₃(L–L)] complexes involving dppe, $C_6H_4(PPh_2)_2$ -oand C₆H₄(PH₂)₂-o each show a large, high frequency coordination shift consistent with the presence of a 5-membered chelate ring. For those compounds involving primary or secondary phosphines the ³¹P NMR spectra show coupling to the directly bonded proton (ca. 300 Hz) with further splittings due to other nearby protonss, giving a second order pattern. These results clearly indicate that the primary and secondary phosphine ligands act as neutral two-electron donors to Mn^I, without deprotonation or decomposition such as occur for e.g. compounds of Pd^{II}, Pt^{II} and Rh^{III} of these ligands. 14-16 Generally, substituting Cl for Br also results in a small low frequency shift.

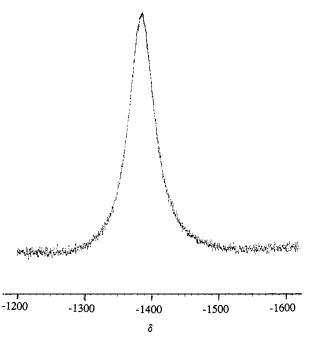

Fig. 1 The 55 Mn (89.27 MHz, CDCl₃) NMR spectrum of [MnBr-(CO)₃{C₆H₄(PH₂)₂-o}].

The ⁵⁵Mn NMR spectra each show a single, broad resonance (Fig. 1). The linewidths vary widely between ca. 3000 and ca. 13300 Hz, and are typically much larger than those observed for fac-[MnX(CO)₃(E–E)] (E–E = dithio-, diseleno- or ditelluroether) which are approximately 3000 Hz or less for each invertomer. Coupling to ³¹P is not resolved. The compounds [MnX(CO)₃L₂] show $w_{1/2}$ increasing from L = PPhH₂ to PPh₂H to PCy₂H, due to the change in steric (increase in Tolman cone angle) and/or electronic effects (increase in σ donation) along the series. Both of these factors are expected to affect the electric field gradient at Mn. Similarly, for the complexes involving diphosphine, diarsine and distibine ligands bearing phenyl substituents there is a decrease in $w_{1/2}$ from P to As to Sb.

For the monodentate phosphine compounds $\delta(^{55}\text{Mn})$ lies in the range -976 to -1173, with δ for the bromo derivatives occurring at lower frequency than for the chloro species. This is consistent with the trend observed for the parent [MnX-(CO)₅].¹⁷ Unfortunately, since the ligands R₂Sb(CH₂)₂SbR₂ are not known it is not possible to study a complete set of directly analogous diphosphine, diarsine and distibine systems, however three trends are apparent: (i) for the compounds involving bidentate phosphines there also appears to be a trend in $\delta(^{55}\text{Mn})$ with chelate ring size, with a shift to low frequency according to the series dppm (4-membered chelate ring) dppp (6-membered chelate ring) \longrightarrow dppe, $C_6H_4(PH_2)_2$ -o, $C_6H_4(PPh_2)_2$ -o (5-membered chelate ring); (ii) for the o-phenylene linked diphosphine complexes we find that δ ⁽⁵⁵Mn) for the diphenyl-substituted species are to high frequency of the diprimary phosphine analogues, and the Ph-substituted stibine compounds are to high frequency of the Me-substituted analogues; (iii) there is a shift to high frequency according to the series $P \longrightarrow As \longrightarrow Sb$. The complex fac-[MnCl(CO)₃- $(SbPh_3)_2$] shows $\delta(^{55}Mn) = -730 \ (w_{1/2} = 1000 \ Hz),^9 \ to high$ frequency of the distibine complexes in this work. The 55Mn shifts for the group 15 complexes in this work are all to low frequency of those of fac-[MnX(CO)₃(E-E)] (E-E = dithio-, diseleno- or ditelluro-ether ligand) consistent with the general perception that the former are generally better σ donors than the Group 16 ligands, and also that π -back bonding is generally more important for the former.

X-Ray crystallography

In order to confirm the stereochemistries at the manganese(I)

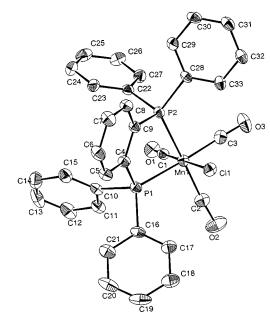

Fig. 2 View of the structure of $[MnCl(CO)_3\{C_6H_4(PPh_2)_2-o\}]$ with the numbering scheme adopted. Hydrogen atoms are omitted for clarity and ellipsoids are drawn at 40% probability.

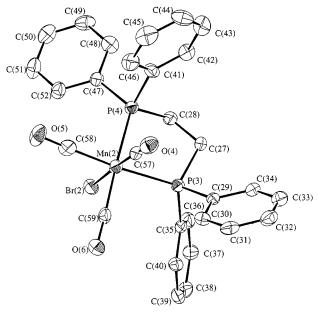

Fig. 3 View of the structure of one of the crystallographically independent [MnBr(CO)₃(dppe)] molecules (the other molecule is essentially indistinguishable). Other details as in Fig. 2.

centre and to establish trends in the bond lengths and angles, single crystal structure analyses were undertaken on [MnCl- $(CO)_3\{C_6H_4(PPh_2)_2-o\}$], [MnBr(CO)₃(dppe)] and the primary phosphine derivatives $[MnCl(CO)_3\{C_6H_4(PH_2)_2-o\}]$ and [MnBr-(CO)₃(PPhH₂)₂]. Crystals of the complexes were obtained from vapour diffusion of light petroleum into a solution of the appropriate complex in CHCl3. The crystal structures of $[MnCl(CO)_3\{C_6H_4(PPh_2)_2-o\}]$ (Fig. 2, Table 2), $[MnBr(CO)_3-o]$ (dppe)] (Fig. 3, Table 3) and [MnCl(CO)₃{ $C_6H_4(PH_2)_2-o$ }] (Fig. 4, Table 2) each show the fac-octahedral arrangement predicted from the spectroscopic studies, with the diphosphine chelating. Noticeably, the Mn-P distances for [MnCl(CO)₃{C₆H₄(PPh₂)₂o}] are significantly longer than those for the diprimary phosphine analogue, [MnCl(CO)₃{C₆H₄(PH₂)₂-o}], probably reflecting the greater steric demands of the former. The P-Mn-P angles involved in the chelate rings are 81.97(6)° for [MnCl- $(CO)_3\{C_6H_4(PPh_2)_2-o\}\}$, 84.14(10) and 84.11(9)° for [MnBr- $(CO)_3(dppe)$] and $83.06(6)^\circ$ for $[Mn(CO)_3\{C_6H_4(PH_2)_2-o\}]$, i.e.

smaller than the 90° expected for a regular octahedron. The crystal structure of [MnBr(CO)₃(PPhH₂)₂] (Fig. 5, Table 2) is similar, once again showing three *fac* CO ligands and the PPhH₂ ligands mutually *cis*. The Mn–C bond length *trans* to Br is significantly shorter than Mn–C *trans* to P and the Mn–P distances are comparable with those for the bidentate ligand

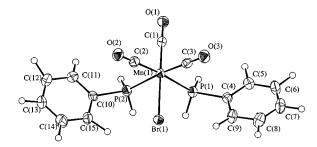

Fig. 5 View of the structure of [MnBr(CO)₃(PPhH₂)₂] with the numbering scheme adopted. Ellipsoids are drawn at 40% probability.

complexes above. The angles around Mn involving mutually cis donor atoms lie in the range 84.63(3)-95.5(2)°. These are the first structurally characterised manganese species involving primary phosphine ligands, and the structural analyses confirm the integrity of the co-ordinated PH2 units and the same stereochemistry in the solution and solid states. The crystal structure of the dinuclear species [Mn₂(CO)₉(PPh₂H)] has been reported.¹⁸ The related manganese(I) species involving monodentate phosphines, $[MnBr(CO)_3L_2]$ $[L = PPh_3, P(C_6H_4Me-o)_3]$ or P(C₆H₄Me-m)₃] have been described previously and assigned as mer on the basis of spectroscopic studies, although structural data were not presented, 12 while Levason and co-workers 9 have described both fac- and mer-trans-[MnBr(CO)₃(SbPh₃)₂], including X-ray crystallographic data. The Mn-P and Mn-CO bond lengths in the compounds reported here are similar to those reported for related species such as fac-[MnCl(CO)₃(Et₂PCH₂-CH₂PEt₂)] [Mn–P 2.309(1), Mn–CO 1.770(5), 1.808(4) Å].¹⁹

Electrochemistry

Bond *et al.*⁵ have studied the electrochemistry of [MnX(CO)₃-(dppm)] in some detail and have shown that at room temperature this species undergoes an irreversible one-electron oxidation which is associated with a redox-induced $fac \longrightarrow mer$ isomerisation. Electrochemical studies were subsequently undertaken on the dppe, dppp and dpae compounds. We have conducted cyclic voltammetry experiments (CH₂Cl₂ solution, 0.1 mol dm⁻³ $^{\rm n}$ Bu₄NBF₄, platinum working electrodes) on a selection of the other new compounds. At scan rates of 50, 100 and 200 mV s⁻¹ [MnCl(CO)₃{C₆H₄(PPh₂)₂- $_{\rm e}$ }] and [MnCl-(CO)₃(diars)] both show a chemically reversible oxidation ($E_{1/2} = 0.74$ and 0.82 V $_{\rm VS}$. Fc–Fc⁺ respectively), attributed to a Mn^{I/III} redox couple. These oxidation potentials are comparable

1618

with those reported by Bond *et al.* The compounds [MnX- $(CO)_3\{Ph_2Sb(CH_2)_3SbPh_2\}$] each show an irreversible oxidation at 0.89 (X = Cl) and 0.98 V (X = Br) vs. Fc–Fc⁺ respectively, while [MnX($CO)_3\{C_6H_4(PH_2)_2-o\}$] showed irreversible oxidations at 0.98 (X = Cl) and 1.04 V (X = Br).

Experimental

Infrared spectra were measured in solution using NaCl plates on a Perkin-Elmer 1600 FTIR spectrometer, mass spectra by fast-atom bombardment (FAB) using 3-nitrobenzyl alcohol as matrix on a VG Analytical 70-250-SE Normal Geometry Double Focusing Mass Spectrometer or by positive electrospray in MeCN solution using a VG Biotech platform. The ¹H NMR spectra were recorded in CDCl₃ using a Bruker AM300 spectrometer, ¹³C-{¹H}, ⁵⁵Mn and ³¹P-{¹H} NMR spectra in CH₂Cl₂-CDCl₃ (ca. 7:1) using a Bruker AM360 spectrometer operating at 90.1, 89.27 or 145.8 MHz respectively and referenced to Me₄Si, external saturated, aqueous K[MnO₄] and external 85% H_3PO_4 respectively (δ 0); [Cr(acac)₃] was added to the NMR solutions prior to recording ¹³C-{¹H} NMR spectra and a pulse delay of 2 s was employed to take account of the long relaxation times. Cyclic voltammetry measurements were conducted using an EG&G Princeton Applied Research Model 362 scanning potentiostat using double platinum working and auxiliary electrodes and a SCE reference electrode. All potentials are quoted against the ferrocene-ferrocenium (Fc-Fc+) couple ($E_{1/2} = 0$ V). The compounds [MnX(CO)₅] (X = Cl, Br or I) were prepared according to literature procedures. 20,21

Preparations

All of the compounds were synthesized by the same general procedures, hence only one example is described in detail below.

[MnCl(CO)₃(dppm)]. The compound [MnCl(CO)₅] (0.15 g, 6.5×10^{-4} mol) was dissolved in stirred, degassed CHCl₃ in the absence of light, dppm (0.250 g, 6.5×10^{-4} mol) added and the reaction stirred under a dinitrogen atmosphere for approximately 5 h, until solution IR studies showed the absence of bands associated with the starting material. The solvent volume was reduced to about 5 cm³ and then added to stirred, ice cold, degassed hexane, yielding a yellow-orange powder which was filtered off, washed with hexane and dried *in vacuo*. Yield = 0.258 g, 71% (Required for $C_{28}H_{22}ClMnO_3P_2$: C, 60.2; H, 3.9. Found: C, 65.5; H, 4.1%). Electrospray mass spectrum: found m/z = 523 and 439; calculated for [Mn(CO)₃(dppm)]⁺ m/z = 439. $^{13}C-\{^{1}H\}$ NMR: δ 220.9, 219.1 (br, CO), 133.5 (t, Ph), 133 -129 (Ph) and 39.4 (t, CH₂).

[MnCl(CO)₃(dppe)]. Yield = 68% (Required for $C_{29}H_{24}$ -ClMnO₃P₂: C, 60.8; H, 4.2. Found: C, 60.4; H, 4.3%). Electrospray mass spectrum: found m/z = 537 and 494; calculated for [Mn(CO)₃(dppe)]⁺ m/z = 537, [Mn(dppe)(MeCN)]⁺ m/z = 492. ¹³C-{¹H} NMR: δ 219.6 (br, CO), 134.7 (m, Ph), 135.3–127.9 (Ph) and 26.1 (m, CH₂).

[MnCl(CO)₃(dppp)]. Yield = 80% (Required for C₃₀H₂₈-ClMnO₃P₂: C, 61.4; H, 4.4. Found: C, 61.0; H, 4.6%). Electrospray mass spectrum: found m/z = 552 and 508; calculated for [Mn(CO)₃(dppp)]⁺ m/z = 552, [Mn(dppp)(MeCN)]⁺ m/z = 508. ¹³C-{¹H} NMR: δ 222.2, 217.3 (br, CO), 147.8 (m, Ph), 134.0–128.6 (Ph), 24.1 (PCH₂) and 19.2 (PCH₂CH₂CH₂P).

[MnCl(CO)₃{C₆H₄(PPh₂)₂-o}]. Yield = 74% (Required for C₃₃H₂₄ClMnO₃P₂: C, 63.8; H, 3.9. Found C, 64.8; H, 4.2%). Electrospray mass spectrum: found m/z = 585 and 542; calc. for [Mn(CO)₃{C₆H₄(PPh₂)₂-o}]⁺ m/z = 585; [Mn{C₆H₄(PPh₂)₂-o}(MeCN)]⁺ m/z = 542. ¹H NMR: δ 7.0–8.1 (m, aromatic H). ¹³C-{¹H} NMR: δ 220.2, 219.0 (br, CO), 141.8 (m, Ph) and 134.9–128.5 (Ph).

[MnCl(CO)₃(dpae)]. Yield = 72% (Required for $C_{29}H_{24}As_2$ -ClMnO₃: C, 52.7; H, 3.6. Found: C, 52.6; H, 3.7%). FAB mass spectrum: found m/z = 576 and 541; calculated for [Mn³⁵Cl-(CO)₃(dpae)]⁺ m/z = 576, [Mn(CO)₃(dpae)]⁺ m/z = 541. ¹³C-{¹H} NMR: δ 221–218 (br, CO), 140.0, 127.0 (Ph) and 24.4 (CH₂).

[MnCl(CO)₃(diars)]. Yield = 69% (Required for $C_{11}H_{16}As_2$ -ClMnO₃: C, 33.9; H, 3.5. Found C, 33.7; H, 3.5%). FAB mass spectrum: found m/z = 376 and 341; calculated for [Mn³⁵Cl-{ $C_6H_4(AsMe_2)_2$ -o}]⁺ m/z = 376, [Mn{ $C_6H_4(AsMe_2)_2$ -o}]⁺ m/z = 341. ¹H NMR: δ 7.5–7.8 (br m, C_6H_4 , 4H), 1.8 (s, Me, 6H) and 1.6 (s, Me, 6H). ¹³C-{¹H} NMR: δ 217.0–212.0 (br, CO), 140.6–135.7 (Ph), 130.5 (Ph), 13.7, 8.8 (Me).

[MnCl(CO)₃(dpsp)]. Yield = 71% (Required for C₃₀H₂₆-ClMnO₃Sb₂: C, 46.9; H, 3.4. Found: C, 47.2; H, 3.6%). FAB mass spectrum: found m/z = 733, 684 and 649; calculated for [Mn(CO)₃(dpsp)]⁺ m/z = 733, [Mn³⁵Cl(dpsp)]⁺ m/z = 684, [Mn-(dpsp)]⁺ m/z = 649. ¹H NMR: δ 7.1–8.0 (br m, Ph, 20 H), 2.3–2.7 (m, SbCH₂, 4H) and 1.9 (m, CH₂CH₂CH₂, 2H). ¹³C-{¹H} NMR: δ 220.5, 218.7 (br, CO), 135.2, 131.9–128.8 (Ph), 23.8 (SbCH₂) and 17.2 (SbCH₂CH₂CH₂Sb).

[MnCl(CO)₃(dmsp)]. Required for $C_{10}H_{18}ClMnO_3Sb_2$: C, 23.1; H, 3.5. Found C, 23.5; H, 3.6%. ¹H NMR: δ 0.7–2.0 (br, m). ¹³C-{¹H} NMR: δ 224–217 (br, CO), 24.2, 14.8 (CH₂), -3.9, -4.1 (Me).

[MnBr(CO)₃(dppm)]. Yield = 54% (Required for $C_{28}H_{22}$ -BrMnO₃P₂: C, 55.7; H, 3.6. Found: C, 55.2; H, 3.5%). Electrospray mass spectrum: found m/z = 523; calculated for [Mn(CO)₃-(dppm)]⁺ m/z = 523. ¹³C-{¹H} NMR: δ 222.5, 219.4 (br, CO), 134.1 (m, Ph), 132.6–129.3 (Ph) and 40.1 (t, CH₂).

[MnBr(CO)₃(dppe)]. Yield = 66% (Required for $C_{29}H_{24}$ -BrMnO₃P₂: C, 56.4; H, 3.9. Found: C, 56.1; H, 3.8%). Electrospray mass spectrum: found m/z = 537; calculated for [Mn(CO)₃-(dppe)]⁺ m/z = 537. ¹³C-{¹H} NMR: δ 221.0, 219.0 (br, CO), 134.5 (m, Ph), 132.7–127.9 (Ph) and 25.6 (CH₂).

[MnBr(CO)₃(dppp)]. Yield = 84%. Electrospray mass spectrum: found m/z = 551; calculated for [Mn(CO)₃(dppp)]⁺ m/z = 551. ¹³C-{¹H} NMR: δ 222.8, 216.7 (br, CO), 136.9 (m, Ph), 133.3–128.2 (Ph), 24.2 (PCH₂) and 18.5 (CH₂CH₂CH₂).

[MnBr(CO)₃{C₆H₄(PPh₂)₂-o}]. Yield = 77% (Required for C₃₃H₂₄BrMnO₃P₂: C, 59.5; H, 3.6. Found: C, 60.0; H, 3.3%). Electrospray mass spectrum: found m/z = 585, calculated for [Mn(CO)₃{C₆H₄(PPh₂)₂-o}]⁺ m/z = 585. ¹H NMR: δ 7.1–8.0 (m, aromatic H). ¹³C-{¹H} NMR: δ 221.2, 218.4 (br, CO), 141.8 (m, Ph) and 134.5–128.1 (Ph).

[MnBr(CO)₃(dpae)]. Yield = 70% (Required for $C_{29}H_{24}As_2$ -BrMnO₃: C, 49.4; H, 3.4. Found: C, 49.1; H, 3.5%). FAB mass spectrum: found m/z = 620 and 541; calculated for [Mn⁷⁹Br-(CO)₃(dpae)]⁺ m/z = 620, [⁵⁵Mn(CO)₃(dpae)]⁺ m/z = 541. ¹³C-{¹H} NMR: δ 220.7 (br, CO), 135.5–128.5 (Ph) and 24.7 (CH₂).

[MnBr(CO)₃(dpsp)]. Yield = 65% (Required for $C_{30}H_{26}^-$ BrMnO₃Sb₂: C, 44.3; H, 3.2. Found: C, 44.4; H, 3.3%). FAB mass spectrum: found m/z = 728 and 649; calculated for [Mn⁷⁹Br(dpsp)]⁺ m/z = 728, [Mn(dpsp)]⁺ m/z = 649. ¹H NMR: δ 7.0–8.1 (br m, Ph, 20H), 2.3–2.7 (br m, SbCH₂, 4H) and 1.9 (br m, CH₂CH₂CH₂, 2H). ¹³C-{¹H} NMR: δ 221.0, 216.0 (br, CO), 135.2, 130.3–129.1 (Ph), 23.0 (SbCH₂) and 16.9 (CH₂CH₂CH₂).

[MnBr(CO)₃(dmsp)]. (Required for $C_{10}H_{18}BrMnO_3Sb_2$: C, 21.3; H, 3.2. Found: C, 21.5; H, 3.0%). FAB mass spectrum:

found m/z 480 and 401; calculated for [MnBr(dmsp)]⁺ m/z 480, [Mn(dmsp)]⁺ m/z 401. ¹H NMR: δ 1.1–2.2 (br). ¹³C-{¹H} NMR: δ 224.0–211.0 (br, CO), 24.2, 14.3 (CH₂), -3.8, -4.1 (Me).

[MnCl(CO)₃(PPh₂H)₂]. Yield = 83% (Required for C₂₇H₂₂-ClMnO₃P₂: C, 59.3; H, 4.0. Found: C, 59.4; H, 4.1%). FAB mass spectrum: found m/z = 511, 462 and 427; calculated for [Mn(CO)₃(PPh₂H)₂]⁺ m/z = 511, [Mn³⁵Cl(PPh₂H)₂] m/z = 462, [Mn(PPh₂H)₂]⁺ m/z = 427. ¹H NMR: δ 7.1–7.8 (br m, Ph, 20 H) and 5.5 (m, PH 2H). ¹³C-{¹H} NMR: δ 221.1, 217.3 (br, CO) and 135.9–126.9 (Ph).

[MnCl(CO)₃(PCy₂H)₂]. Yield = 79% (Required for C₂₇H₄₆-ClMnO₃P₂: C, 56.8; H, 8.1. Found: C, 56.3; H, 7.7%). FAB mass spectrum: found m/z = 486 and 451; calculated for [Mn³⁵Cl(PCy₂H)₂]⁺ m/z = 486, [Mn(PCy₂H)₂]⁺ m/z = 451. ¹H NMR: δ 4.05 (m, PH, 2H), 1.2–2.6 (br m, CH₂, 40H) and 0.9 (m, CH, 2H). ¹³C-{¹H} NMR: δ 222.0, 219.0 (br, CO), 34.8–31.9 (Cy) and 31.5–26.1 (Cy), 23.0 (Cy).

[MnCl(CO)₃(PPhH₂)₂]. Yield = 61% (Required for C₁₅H₁₄-ClMnO₃P₂: C, 45.7; H, 3.6. Found: C, 45.4; H, 3.7%). Electrospray mass spectrum: found m/z = 350; calculated for [Mn³⁵Cl(PPhH₂)₂·MeCN]⁺ m/z = 350. ¹H NMR: δ 7.3–7.7 (m, Ph, 10H), 5.6 (m, PH, 2H) and 5.3 (m, PH, 2H). ¹³C-{¹H} NMR: δ 219.7, 216.7 (br, CO) and 133.0–125.0 (Ph).

[MnCl(CO)₃{C₆H₄(PH₂)₂-o}]. Yield = 64% (Required for C₉H₈ClMnO₃P₂: C, 34.1; H, 2.5. Found: C, 34.6; H, 2.8%). FAB mass spectrum: found m/z = 289; calculated for [Mn³⁵Cl(CO)₂{C₆H₄(PH₂)₂-o}]⁺ m/z = 288. ¹H NMR: δ 7.6–8.0 (m, C₆H₄, 4H), 6.1 (m, PH, 2H) and 5.6 (m, Ph, 2H). ¹³C-{¹H} NMR: δ 219.1, 217.9 (br, CO) and 137.8–128.0 (C₆H₄).

[MnBr(CO)₃(PPh₂H)₂]. Yield = 88% (Required for C₂₇H₂₂-BrMnO₃P₂: C, 54.8; H, 3.7. Found: C, 55.0; H, 3.9%). FAB mass spectrum: found m/z = 592, 508, 427 and 320; calculated for [Mn⁷⁹Br(CO)₃(PPh₂H)₂]⁺ m/z = 591, [Mn⁷⁹Br(PPh₂H)₂]⁺ m/z = 506, [Mn(PPh₂H)₂]⁺ m/z = 427, [Mn⁷⁹Br(PPh₂H)]⁺ m/z = 320. ¹H NMR: δ 7.0–7.8 (m, Ph, 20H) and 5.45 (m, PH, 2 H). ¹³C-{¹H} NMR: δ 222.2, 216.5 (br, CO) and 133.0–128.0 (Ph).

[MnBr(CO)₃(PCy₂H)₂]. Yield = 84% (Required for C₂₇H₄₆-BrMnO₃P₂: C, 52.7; H, 7.5. Found: C, 53.0; H, 7.0%). FAB mass spectrum: found m/z = 530, 451 and 332; calculated for [Mn⁷⁹Br(PCy₂H)₂]⁺ m/z = 530, [Mn(PCy₂H)₂]⁺ m/z = 451, [Mn⁷⁹Br(PCy₂H)]⁺ m/z = 332. ¹H NMR: δ 4.05 (m, PH, 2H), 1.2–2.7 (br, m, CH₂, 40H) and 0.85 (m, CH, 2H). ¹³C-{¹H} NMR: δ 223.3, 219.4 (br, CO) and 34.9–26.0 (Cy).

[MnBr(CO)₃(PPhH₂)₂]. Yield = 66% (Required for C₁₅H₁₄-BrMnO₃P₂: C, 41.0; H, 3.2. Found: C, 41.3; H, 3.3%). ¹H NMR: δ 7.35–7.55 (br m, Ph, 10H), 5.6 (m, PH 2H) and 5.3 (m, PH, 2H). ¹³C-{¹H} NMR: δ 221.0, 216.9 (br, CO) and 132.8–125.5 (Ph).

[MnBr(CO)₃{C₆H₄(PH₂)₂-o}]. Yield = 63% (Required for C₉H₈BrMnO₃P₂·CH₂Cl₂: C, 27.0; H, 2.3. Found: C, 27.5; H, 2.5%). Electrospray mass spectrum: found m/z 322; calculated for [Mn(CO)₃{C₆H₄(PH₂)₂-o}·MeCN]⁺ m/z = 322. ¹H NMR: δ 7.6–8.0 (m, C₆H₄, 4H), 6.2, (m, PH, 2H) and 5.9 (m, PH, 2H). ¹³C-{¹H} NMR: 220.3, 217.3 (br, CO) and 137.6–129.3 (C₆H₄).

Crystal structures of [MnCl(CO) $_3$ {C $_6$ H $_4$ (PPh $_2$) $_2$ -o}], [MnBr-(CO) $_3$ (dppe)]·0.5CHCl $_3$, [MnCl(CO) $_3$ {C $_6$ H $_4$ (PH $_2$) $_2$ -o}]·CH $_2$ Cl $_2$ and [MnBr(CO) $_3$ (PPhH $_2$) $_2$]

Details of the crystallographic data collection and refinement parameters are given in Table 4. The crystals were grown by vapour diffusion of light petroleum into solutions of the complexes in CHCl₃, or CH₂Cl₂ for [MnCl(CO)₃{C₆H₄(PH₂)₂-o}].

Data collection used a Rigaku AFC7S four-circle diffractometer equipped with an Oxford Systems open-flow cryostat operating at 150 K and graphite-monochromated Mo-Ka X-radiation ($\lambda = 0.71073 \text{ Å}$). In the case of [MnBr(CO)₃(dppe)] considerable icing occurred during data collection in the final shell $(2\theta = 45-50^{\circ})$. This resulted in inaccurate intensities and hence the data set was truncated. Correspondingly, the quality of the structure determination was poorer. The structures were solved by heavy atom methods²² and developed by iterative cycles of full-matrix least-squares refinement and Fourierdifference syntheses.²³ For [MnBr(CO)₃(dppe)] two crystallographically independent molecules were identified in the asymmetric unit as well as a CHCl₃ solvent molecule. All non-H atoms were refined anisotropically while H atoms were placed in fixed, calculated positions with d(C-H) = 0.96 Å, except for $[MnCl(CO)_3\{C_6H_4(PH_2)_2-o\}]\cdot CH_2Cl_2$ and $[MnBr(CO)_3-o]\cdot CH_2Cl_2$ (PPhH₂)₂] where the H atoms associated with the phosphine ligand were located from the difference map and included but not refined.

CCDC reference number 186/1415.
