Received 14th January 1999, Accepted 9th April 1999

Silver(I) complexes, [Ag(O,S-C₅H₄NOS)(L)] [L = Ph₂PCH₂PPh₂ (dppm) 1, Ph₂P(CH₂)₄PPh₂ (dppb) 2, PPh₃ 3 or $P(C_6H_4Me-m)_3$ 4] were obtained from silver(i) acetate and neutral 1-hydroxypyridine-2-thione(C_5H_5NOS) in water-ethanol medium followed by addition of tertiary phosphines. Direct reaction of mercury(II) halides with 2-benzylsulfanyl)pyridine 1-oxide[$C_5H_4NO(SCH_2C_6H_5)$] in ethanol formed [$HgX_2\{C_5H_4NO(SCH_2C_6H_5\}\}$] [X = Cl 5 or Br 6]. Similarly, organomercury(II) derivatives, Hg(R)L [$R = m-O_2NC_6H_4$, $L = C_5H_4NS^-$ 7 or $C_5H_4NOS^-$ 8; $R = p-ClC_6H_4$, $L = C_5H_4NS^-$ 9 or $C_5H_4NOS^-$ 10; $R = C_6H_5$, $L = C_5H_4NS^-$ 11 or $C_5H_4NOS^-$ 12] were prepared from $Hg(R)(O_2CCH_3)$ and neutral pyridine-2-thiones(C_5H_5NS or C_5H_5NOS). All these have been characterised using analytical data, IR, far-IR, NMR (1H, 13C or 31P) spectroscopy and for 1, 5 and 11 X-ray crystallography. Complex 1 exists as a dimer with dppm bridging the two Ag atoms leading to the formation of an eight membered metallacyclic ring with C_sH₄NOS⁻ moieties chelating to each Ag atom via O.S-donor atoms. The geometry about each Ag is highly distorted tetrahedral with bond angles varying from 72.85(7) to 137.92(4)°. Compounds 5 and 11 acquire formally dimeric structures via weaker interactions. For example, in 5, Hg binds strongly to one O, two Cl and weakly to one Cl and one S atom of a second ligand molecule. The geometry about each Hg is formally highly distorted trigonal bipyramidal with Cl(1)-Hg-Cl(2) and O(1)-Hg-S(1*) bond angles of 172.84(5) and 151.70(9)° respectively. Finally in 11 Hg is bonded strongly to one C and one S atom, relatively weakly to N{Hg-N 2.795(10), 2.879(9) Å} and very weakly to a second S atom of a second ligand molecule {Hg-S 3.312(3), 3.365(3) Å}. If secondary interactions are ignored the geometry about Hg is formally distorted T-shaped.

The co-ordination chemistry of heterocyclic thiones is of immense interest because such compounds mimic (a) cysteine sulfur co-ordination in metalloenzymes, (b) electronic and structural properties of the active sites in copper "blue" proteins involving S,N co-ordination, (c) the environment for molybdenum in nitrogenase where S,N-chelated molybdenum is believed to be relevant to the reduction of nitrogen by nitrogenase, (d) interactions of nucleotides and nucleic acid and bases with metals, 1,2 etc. In addition, the use of sulfur-coordinated gold(I) complexes in the treatment of rheumatoid arthritis, platinum complexes in anticancer activity and a variety of biochemical applications have stimulated interest in heterocyclic thiones and their derivatives.³⁻⁶ Using the simplest molecules, pyridine-2-thione (I, C₅H₅NS) and its N-oxide derivative, namely 1-hydroxypyridine-2-thione (II, C₅H₅NOS), several investigations have been made by others 4-6 and our laboratory.7-16 Compound I and its anion C5H4NS- bind in several ways 4-6 while C₅H₅NOS co-ordinates only in its anionic form via its O,S-donor atoms in a chelating mode.7

Silver(I) is known to form mono-, di-, hexa- and octa-nuclear complexes with neutral C_5H_5NS or its derivatives containing substituents in the pyridyl ring. ¹⁷⁻²⁰ Similarly, there are a few reports on the use of organic substituents on sulfur which can significantly modulate the co-ordination properties of C_5H_5NOS . Further, the co-ordination chemistry of organomercury(II) cations, RHg^+ ($R=CH_3$, Ph, etc.) is important in view of their toxicity to living systems by binding to cysteine thiolate groups and thus there is need for detoxification of mercury similar to metallothioneins. ²² There are limited

reports on the interaction of heterocyclic thiones with organomercury ($\!\Pi\!$) substrates. $^{3\text{-}6,23}$

In this paper we report (a) complexes of silver(I) containing 2-thioxopyridine-1-one and tertiary phosphines as co-ligands, (b) 2-(benzylsulfanyl)pyridine 1-oxide **III** complexes with mercury(II) halides and (c) arylmercury(II) derivatives containing $m\text{-}C_6H_4$, $p\text{-}ClC_6H_4$ and Ph as organic moieties and $C_5H_4NS^-$, $C_5H_4NOS^-$ anions.²⁴

Experimental

General materials

Mercury(II) chloride, bromide (used after recrystallisation from ethyl alcohol), silver acetate, silver carbonate and triphenyl-

[†] The chemistry of pyridinethiols and related ligands. Part 10.24a

phosphine were from M/s Sisco Laboratories, Bombay, tri-mtolylphosphine and Ph₂PCH₂PPh₂ from Pressure Chemicals Co. Ltd., Pittsburg, USA; other materials were prepared as reported.8,9 The compound C₅H₅NS was prepared by heating 2-hydroxypyridine with P₂S₅, C₅H₅NOS by oxidation of 2chloropyridine using H₂O₂ followed by reaction with a mixture of NaSH (prepared by passing H2S gas through NaOEt in EtOH)⁷⁻⁹ and Na₂S. Sodium salts, Na⁺C₅H₄NS⁻ and Na⁺C₅H₄-NOS-, were prepared by treating neutral C5H5NS and C₅H₅NOS with NaOEt prepared in situ.⁷ C₅H₄NO(SCH₂C₆H₅) was prepared by treating the sodium salt of C₅H₅NOS with benzyl chloride in 1:1 mole ratio (mp 158-59 °C).24a Phenylmercury(II) chloride (Fluka chemika, Switzerland) was used after recrystallisation from ethanol; m-nitrophenyl- and pchlorophenyl-mercury(II) chlorides were prepared by literature methods.25-27

Preparations

[Ag(C_5H_4NOS)(dppm)] 1. To a solution of silver(I) acetate (0.100 g, 0.6 mmol) in distilled water (20 ml) was added an ethanolic solution of C₅H₅NOS (0.076 g, 0.6 mmol) dropwise under magnetic stirring. After 0.5 h was added an ethanolic solution of dppm (0.230 g, 0.6 mmol) dropwise and stirred overnight. The white precipitates formed were filtered off, washed with water and dried in vacuo. Crystals were grown from ethanol-benzene-dichloromethane by slow evaporation at room temperature. Yield 60%, mp, 120-123 °C (Found: C, 57.3; N, 2.31. Required for C₃₀H₂₆AgNOP₂S: C, 58.0; N, 2.34%). IR (cm⁻¹): 1215m, 1190m, ν (C=S); 1100m, ν (P-C); 1080m, v(N-O); 830m, $\delta(N-O)$. NMR (see structure **Ia** for numbering scheme): ${}^{1}H$, δ 8.18 [d, $J(H^{5}H^{6})$ 6.4, H^{6}], 6.84 [td, $J(H^4H^{3,5})$ 7.6, $J(H^4H^6)$ 1.4, H^4], 7.57 [d, $J(H^3H^4)$ 8.4, H^3] and 6.65 [td, $J(H^5H^{4,6})$ 6.8, $J(H^3H^5)$ 1.9 Hz, H^5]; ¹³C, δ 162.7(C²), 140.7(C⁶), 133.5(C⁴), 127.2(C⁵), 118.8(C³); phosphine signals, 29.8(CH₂), 135.9(*i*-C), 135.0(*o*-C), 130.6(*m*-C), 131.9(*p*-C). ³¹P, δ 15.43, $\Delta \delta$ = 36.7. Complexes **2–4** were prepared by the same

[Ag(C₅H₄NOS){Ph₂P(CH₂)₄PPh₂}] 2. Yield 55%, mp 193–195 °C (Found: C, 57.6; H, 4.91; N, 2.34. Required for C₃₃H₃₂AgNOP₂S: C, 57.4; H, 4.64; N, 2.03%). IR (cm⁻¹): 1210m, 1190m, ν (C–S); 1100m, ν (P–C); 1080m, ν (N–O); 833m δ (N–O). NMR: ¹H, δ 8.12 [dd, J(H⁵H⁶) 6.6, J(H⁴H⁶) 1.4, H⁶], 6.85 [td, J(H⁴H^{3,5}) 7.7, J(H⁴H⁶) 1.2, H⁴], 7.67 [dd, J(H³H⁴) 8.3, J(H³H⁵) 1.9, H³] and 6.62 [td, J(H⁵H^{4,6}) 6.9, J(H³H⁵) 1.9 Hz, H⁵]; ¹³C, δ 160.0(C²), 137.8(C⁶), 130.8(C⁴), 124.8(C⁵), 116.0(C³); phosphine signals, 27.0–29.1(CH₂), 133.2(*i*-C), 132.0(*o*-C, J_{CP} 16.6) 129.2 (m-C, J_{CP} 8.5 Hz) and 128.9(p-C); ³¹P, δ –1.95, $\Delta\delta$ = 19.0.

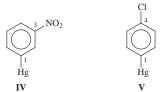

[Ag(C₅H₄NOS)(PPh₃)] 3. Yield 60%, mp, 170 °C (Found: C, 54.6; H, 3.72; N, 2.17. Required for C₂₃H₁₉AgNOPS: C, 55.6; H, 3.83; N, 2.82%). IR (cm⁻¹): 1215s, 1190s, ν (C=S); 1105s, ν (P-C); 1080s, δ (N-O); 833m, ν (N-O); 338m, ν (Ag-O). NMR: ¹H, δ 8.29 [d, J(H⁵H⁶) 6.6, H⁶], 6.99 [t, J(H⁴H^{3,5}) 7.3, H⁴], 7.78 [dd, J(H³H⁴) 8.3, J(H³H⁵) 1.9, H³] and 6.78 [td, J(H⁵H^{4,6}) 6.9, J(H³H⁵) 1.9 Hz, H⁵]; ¹³C, δ 164.9(C²), 137.6(C⁶), 130.7(C⁴), 124.9(C⁵), 116.5(C³); phosphine signals, 130.1(*i*-C), 133.1(*o*-C, J_{CP} 16.5), 128.0(m-C, J_{CP} 10.4 Hz) and 129.6(p-C);^{24 31}P, δ 12.57, $\Delta\delta$ = 19.7.

[Ag(C₅H₄NOS){P(C₆H₄Me-*m*)₃}] 4. Yield 55%, mp 220–225 °C (decomp.) (Found: C, 59.0; H, 4.88; N, 2.10. Required for C₂₆H₂₈AgNOPS: C, 58.0; H, 4.64; N, 2.60%). IR (cm⁻¹): 1209m, 1189m, ν (C=S); 1096s, ν (P-C); 1080s, ν (N-O); 831m, δ (N-O); 321m, ν (Ag-O). NMR: ¹H, δ 8.11 [d, J(H⁵H⁶) 6.6, H⁶], 6.81 [t, J(H⁴H^{3,5}) 7.6, H⁴], 7.60 [d, J(H³H⁴) 7.2, H³] and 6.58 [t, J(H⁵H^{4,6}) 6.4 Hz, H⁵]; ¹³C, δ 160.9(C²), 131.8 (C⁴), 125.8(C⁵), 117.1(C³); phosphine signals, 21.5(CH₃), 131.8(i-C), 131.0(i-C¹, i-C_P 14.4), 134.8(i-C², i-C_P 20.1), 138.8(i-C¹), 128.8(i-C², i-C_P 10.1 Hz) and 131.5(i-C); ³¹P, δ 4.17, $\Delta\delta$ = 13.4.

[HgCl₂{C₅H₄NO(SCH₂C₆H₅)}] **5.** This was prepared by direct reaction of mercury(II) chloride (0.100 g, 0.37 mmol) with 2-(benzylsulfanyl)pyridine 1-oxide (0.080 g, 0.37 mmol) in ethanol at room temperature under magnetic stirring (48 h) and slow evaporation gave fine crystals of the complex. Yield 50%, mp 190–192 °C (decomp) (Found: C, 29.9; H, 2.41; N, 2.89. Required for C₁₂H₁₁Cl₂HgNOS: C, 29.5; H, 2.25; N, 2.86%). IR (cm⁻¹): 1250m, 1220s, ν (C=S); 1090m, ν (N=O); 837s, δ (N=O); 710s, 700s, 333s, ν (Hg=O); 307m, 288m, ν (Hg=Cl). NMR: ¹H, δ 8.40 [d, J(H⁵H⁶) 6.8, H⁶], 7.55 (broad, H⁴), 7.38 (broad, H³) and 7.23 [td, J(H⁵H^{4,6}) 6.8, J(H³H⁵) 2.2 Hz, H⁵]; ¹³C, δ 154.5(C²), 140.8(C⁶), 129.0(C⁴), 125.4(C⁵) and 123.1(C³); benzyl group, 37.1(CH₂), 136.9(*i*-C), 130.0–132.2(*o*-, *m*- and *p*-C).

[HgBr₂{C₅H₄NO(SCH₂C₆H₅)] **6.** This was prepared by the same method. Yield 60%, mp 180–185 °C (Found: C, 25.7; N, 2.40. Required for C₁₂H₁₁Br₂HgNOS: C, 25.4; N, 2.37%). IR (cm⁻¹): 1240m, 1220s, ν (C=S); 1090m, ν (N–O); 830s, δ (N–O); 710s, 690s, ν (C–S). NMR: ¹H, δ 8.19 (broad, H⁶), 7.10–7.47 (broad, H^{3,4,5}); ¹³C, δ 143.0(C⁶), 125.5(C⁴), 121.7(C⁵), 120.5(C³); benzyl group, 36.8(CH₂), 128.4(o-C), 127.3(m-C) and 128.4 (p-C).

[$Hg(m-O_2NC_6H_4)(C_5H_4NS)$] 7. To a water-acetone solution of [Hg(m-O₂NC₆H₄)(O₂CCH₃)] (25 ml) [prepared by treating $Hg(m-O_2NC_6H_4)Cl$ (0.100 g, 0.28 mmol) with $Ag(O_2CCH_3)$ (0.046 g, 0.28 mmol)] was added C₅H₅NS slowly (0.030 g, 0.27 mmol)mmol) in ethanol (20 ml). The contents were stirred for 5 h when a white fibrous crystalline product separated. It was filtered off washed with EtOH and then dried in vacuo. Yield 55% mp 140 °C (decomp.) (Found: C, 30.0; H, 1.33; N, 6.41. Required for C₁₁H₈HgN₂O₂S: C, 30.5; H, 1.85; N, 6.47%). IR (cm^{-1}) : 1124m, $\nu(C=S)$; 478s, $\nu(Hg-C)$; 389s, $\nu(Hg-S)$. NMR: ¹H, δ 8.13 [d, $J(H^5H^6)$ 4.1, H^6], 7.40 [td, $J(H^4H^{3,5})$ 7.3, $J(H^4H^6)$ 1.8, H^4], 8.08 [d, $J(H^3H^4)$ 7.1, H^3] and 6.9 [td, $J(H^5H^{4,6})$ 6.2, $J(H^3H^5)$ 1.6 Hz, H^5]; 13 C, $168.6(C^2)$, $146.7(C^6)$, $136.1(C^4)$, $122.3(C^{5})$ and $118.5(C^{3})$; ¹H, $(m-O_{2}NC_{6}H_{4})Hg$, 8.29 [d, $J(H^{2}H^{4})$ 2.1 Hz], 7.21 [d, $J(H^5H^6)$ 8.2, H^6], 7.55 [t, $J(H^5H^{4,6})$ 7.8, H^5] and 7.71 [d, $J(H^4H^5)$ 7.3 Hz, H^4]; 13 C, δ 128.3(C²,C⁶), 141.7(C³), 122.3(C⁵) and 130.0(C⁴). Other complexes 8-12 were prepared similarly (see structures IV and V for numbering scheme of RHg⁺ moiety).

[Hg(m-O₂NC₆H₄)(C₅H₄NOS)] 8. Yield 70%, mp 249–250 °C (Found: C, 29.4; H, 1.36; N, 6.12. Required for C₁₁H₈HgN₂O₃S: C, 29.4; H, 1.78; N, 6.23%). Physical measurements

The elemental analyses for C,H and N were obtained with a Carlo-Erba 1108 microanalyser (Santiago, Spain) or from RSIC Chandigarh. The melting points were determined with a Gallenkamp electrically heated apparatus. The infrared spectra were recorded in KBr pellets (4000–400 cm⁻¹) or Nujol mulls in polyethene sheets (500–100 cm⁻¹) on a Bruker 1FS 66V spectrometer. The NMR spectra were recorded in CDCl₃ using (i) a Bruker AMX 300.13 spectrometer and 75.48 MHz probe frequencies (¹H and ¹³C respectively) with TMS as the internal reference and (ii) a Bruker AMX 500 spectrometer at 202.45 MHz probe frequency (¹³P-{¹H} with 85% H₃PO₄ as the external reference (δ 27.5).

X-Ray data collection and reduction

Suitable colourless prismatic crystals of complexes 1, 5 and 11 were mounted on glass fibers and used for data collection. Cell constants and an orientation matrix for data collection were obtained by least squares refinement of the diffraction data from 25 reflections in the ranges (a) $11.491 < \theta < 42.234^{\circ}$ for 1, (b) $9.372 < \theta < 18.159^{\circ}$ for 5 and $9.319 < \theta < 20.811^{\circ}$ in an Enraf-Nonius MACH3 automatic diffractometer. Bata were

collected at 293 K using Mo-K α radiation (λ = 0.71073 Å) and the ω scan technique and corrected for Lorentz-polarisation effects. A semiempirical absorption correction (ψ scan) was made. A summary of the crystal data, experimental details and refinement results is given in Table 1.

Structure solution and refinement. The structures were solved by direct methods 31 which revealed the positions of all non-hydrogen atoms and refined on F^2 by a full matrix least squares procedure using anisotropic displacement parameters. 32 The hydrogen atoms were located from difference maps and refined isotropically. Atomic scattering factors were taken from ref. 33, while molecular graphics were drawn with ZORTEP. 34

CCDC reference number 186/1422.

Results and discussion

General comments

Stoichiometric reactions of Ag(O₂CCH₃) with C₅H₅NOS in the presence of tertiary phosphines formed Ag(C₅H₄NOS)L products $[L = Ph_2P(CH_2)_mPPh_2, m = 1 \text{ or } 4, PPh_3 \text{ or } P(C_6H_4Me-1)_mPPh_2, m = 1 \text{ or } 4, PPh_3 \text{ or } P(C_6H_4Me-1)_mPPh_2, m = 1 \text{ or } 4, PPh_3 \text{ or } P(C_6H_4Me-1)_mPPh_3, m = 1 \text{ or } 4, PPH_3, m = 1 \text{ or } 4, PPH_3$ m₃]. The complexes were generally soluble in organic solvents, though organomercury derivatives have relatively low solubility in C_6H_6 , EtOH and MeOH. Direct reactions of HgX_2 (X = Cl or Br) with C₅H₄NO(SCH₂C₆H₅) in EtOH formed products of stoichiometry $[HgX_2\{C_5H_4NO(SCH_2C_6H_5\}]$ (X = C1 or Br).However, there was no reaction with HgI2 and products with CuX(X = Cl, Br or I) were air sensitive and adducts could not be isolated. Reaction of HgRCl with NaC₅H₄NS (or NaC₅H₄-NOS) in EtOH {or of Hg(R)(O₂CCH₃) with neutral ligands} formed Hg(R)L products $[R = m - O_2NC_6H_4, p - ClC_6H_4]$ or C_6H_5 ; $L = C_5H_4NS^-$ or $C_5H_4NOS^-$]. Reactions of Hg(R)L with tertiary phosphines were complex and no product could be established. This is in line with the chemistry of the RHg+ moiety which prefers two- or three-co-ordinated complexes and extension of the co-ordination number to 4 or higher is not common.35

Crystal and molecular structures

The atomic numbering schemes of [Ag(C₅H₄NOS)(dppm)], 1, $[HgCl_2\{C_5H_4NO(SCH_2C_6H_5)\}]$ 5 and $[Hg(C_6H_5)(C_5H_4NS)]$ 11 are shown in Figs. 1-3 respectively; bond lengths/angles are listed in Table 2. Complex 1 exists as a centrosymmetric dimer with no interaction between the dimers. The two dppm molecules bridge two Ag(C₅H₄NOS) moieties forming a eight membered Ag₂P₄C₂ metallacyclic ring with C₅H₄NOS chelated to each Ag. Each Ag atom acquires distorted tetrahedral geometry by co-ordinating to one O, one S and two P atoms. The angles about each Ag atom vary from 72.85(7) to 137.92(4)° with the bite angle of C₅H₄NOS⁻, O(1)-Ag-S(1) being the shortest and P(1)-Ag-P(2) the largest (Table 2). Two Ag-P distances are different [2.4254(10), 2.4914(11) Å], while two Ag-S and two Ag-O distances are equal [Ag-S 2.5844(12), Ag-O 2.440(3) Å]. This is unlike those in 3 where the Ag-P and Ag-O distances are equal [Ag-P 2.3824(10), Ag-O 2.343(3) Å] while the Ag-S distances are significantly different [Ag-S 2.5072(10), 2.8218(11) Å] obviously due to sulfur bridging the two Ag atoms, VI. There is no Ag \cdots Ag interaction [3.8457(7) Å] ³⁷ unlike that observed in 3 [Ag \cdots Ag 3.2472(11) Å]. ²⁴ This weak interaction is similar to the Cu^I···Cu^I interaction in the sulfur bridged dinuclear complex [{CuI(C5H5NS)[P(C6H4Me p_{3}]₂].¹⁵ The S(1)–C(1)_{py}, N(1)–O(1) and N(1)–C(1) distances suggest double bond character and thus charge density is delocalised in the S-C-N-O moiety. 4-6,24,37

In compound 5 Hg forms normal bonds to two Cl and one O atom; however, an S atom binds to a second $HgCl_2\{C_5H_4NO-(SCH_2C_6H_5)\}$ unit leading to the formation of the dimer

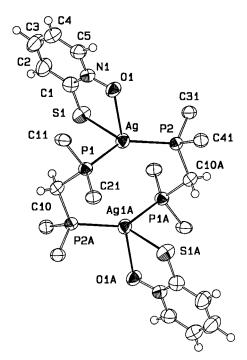

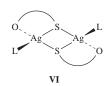

Fig. 1 Perspective view of $[{Ag(C_5H_4NOS)(dppm)}_2]$ **1** with the numbering scheme. The thermal ellipsoids are drawn at the 30% probability level

 $[\{HgCl_{5}[C_{5}H_{4}NO(SCH_{5}C_{6}H_{5})]\}_{2}]$ (Fig. 2). This $Hg\cdots S(1^{*})$ interaction is weak [3.3116(14) Å] and close to the sum of the van der Waals radii.37 Similarly, the Hg···Cl(1*) distance 3.2317(14) Å is slightly longer than sum of the van der Waals radii [3.30 Å]. In the dimer the geometry about each Hg can be described as distorted trigonal bipyramidal with Cl(1)-Hg-Cl(2) (equatorial) and O(1)-Hg-S(1*) (axial) bond angles of 172.84(5) and 151.70(9)° respectively. There is a weak $O(1) \cdots S(1)$ interaction [2.679(4) Å] less than the sum of the van der Waals radii [3.30 Å], but more than a normal single bond [O–S 1.75 Å]. ^{36,37} The S(1)–C(6) distance [1.831(7) Å] is somewhat longer than a single bond [1.81 Å] and lengthening of this bond as well as some other bonds of the CH₂C₆H₅ moiety could be due to the combined effect of Hg-O coordination and O · · · S interaction (Table 2). The phenyl group makes an angle of 79.24° with the plane of the pyridyl group. Similarly the pyridyl group makes an angle of 50.01° with the plane defined by Cl(1)HgCl(2)O(1).

In compound 11 the mercury atom is bonded strongly to one $C\{Hg(1)-C(11) \ 2.062(9) \ A\}$ and one S atom $\{Hg(1)-S(1)\}$ 2.376(3) Å] (Fig. 3, Table 2). The N(1) atom of one pyridyl moiety is at a distance of 2.795(10) Å from the Hg atom and it shows weak interaction {sum of van der Waals radii, 3.05 Å}. However, this $Hg \cdots N(1)$ interaction is stronger than that in $HgCH_3(C_5H_4NS)$ { $Hg\cdots N$ 2.980(5) Å}.²³ Further, the Hg(1)-S(2) distance of 3.365(3) Å is close to the van der Waals distance (3.30 Å) and thus 11 forms a weak centrosymmetric dimer, $[{Hg(C_6H_5)(C_5H_4NS)}_2]$. The angle (C11)– Hg(1)–S(1) [175.2(3)°] deviates from linearity and the S(1)– Hg(1)–N(1) angle is $60.57(18)^{\circ}$. This shows that the geometry about each Hg can be treated as distorted T-shaped. The plane defined by atoms Hg, C(11)-C(16) makes an angle of 89.65 with that defined by S(1), C(17)–C(19), C(40), C(111), N(1), Hg(1).

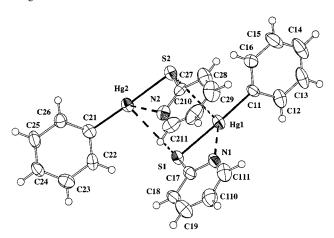

Fig. 3 Perspective view of $[Hg(C_6H_5)(C_5H_4NS)]$ 11. Details as in Fig. 1.

Spectroscopy

The infrared and NMR spectral data are listed in the Experimental section. The IR spectrum of complex 1 showed diagnostic v(C=S) peaks at 1215m, 1190m, v(N=O) at 1080m and δ (N–O) at 830m cm⁻¹ [cf. C₅H₅NOS, 1225s, ν (C=S); 1082, ν (N–O); 832m, δ (N–O)] supporting the O,S binding of the C₅H₄NOS moiety in its characteristic modes.⁷ A similar situation pertains for the complexes 2–4, 8, 10 and 12. The ν (M–S), ν (M–O) or ν (Hg–Cl) bands could be located for 3, 5, 6, 8, 10 and 12. For the $C_5H_4NS^-$ complexes 7, 9 and 11 the $\nu(C=S)$ peak shows a low energy shift of 15 cm⁻¹ [cf. C₅H₅NS, ν (C=S) 1139s cm⁻¹]⁷⁻¹⁶ supporting Hg-S interaction. The weak Hg... N interaction revealed from the crystal data could not be identified from IR data. The spectra of 5 and 6 show mainly intensity changes in the characteristic regions for C-S single (710-690 cm⁻¹) and C=S double or partially double bonds $(1250-1180 \text{ cm}^{-1}).^{7-16}$

 1 H and 13 C NMR spectra (see structure Ia for numbering scheme). From the proton NMR of complexes 7, 9 and 11, the absence of a NH signal shows that anionic $C_{5}H_{4}NS^{-}$ is bonded to Hg. The diagnostic H(6) and H(5) signals of the pyridyl moiety provide information about the co-ordination of the

N-donor atom. These proton signals generally move downfield relative to those of the "free" ligand when it is N,S bonded and upfield when S bonded, as for example, for $M(C_5H_4NS)_2$ and $M(C_5H_4NS)_2(PPh_3)_2$ complexes $(M=Pd\ or\ Pt)$ respectively.³⁸ Thus in **7**, **9** and **11**, C_5H_4NS is N, S bonded which is supported by the X-ray study of **11**, though weak $Hg\cdots N$ interaction occurs. The weak $NH\cdots X$ (halogen) interaction in copper(I) complexes, viz. [{ $Cu(C_5H_5NS)(X)(R_3P)$ }₂] $(X=Cl,\ Br\ or\ I)$ having S-bonded C_5H_5NS , also leads to a similar effect on the H(5) and H(6) protons of the pyridyl group.¹⁵ The position of

the 13 C NMR signals of **7**, **9** and **11** support neither essentially S-bonded nor N,S-chelating or bridging $C_5H_4NS^-$ when compared with literature trends because the C(6) carbon remains significantly low field. This points to an intermediate situation where weak $Hg\cdots N$ interaction is suggested in addition to normal Hg-S bonding. 8,15,16,23,38,39 The spectral trends of $C_5H_4NOS^-$ compounds of mercury (**8**, **10**, **12**) and silver (**1–4**) are suggestive of O,S chelation as these show characteristic upfield shifts for C(2) and C(4) carbons, while other carbons show trends similar to that of $C_5H_4NS^-$. In the case of the silver compounds, tertiary phosphines do shift the C(2) signals to low field as compared to those of the mercury compounds. For compounds **5** and **6** all the pyridyl protons except H(3) and carbons undergo low-field shifts.

The ³¹P NMR spectra of the silver(I) complexes show single peaks at positions different from the ligand peaks. The lack of coupling from ¹⁰⁷Ag/¹⁰⁹Ag [¹⁰⁷Ag, abundance 51.35%, I = 1/2; ¹⁰⁹Ag, abundance, 48.65%, I = 1/2} suggests fast equilibrium between co-ordinated and dissociated phosphines. The coordination shifts ($\Delta\delta P = \delta_{\text{complex}} - \delta_{\text{ligand}}$) for 1, 2, 3 and 4 are 36.7, 19.0, 19.7 and 13.4 ppm respectively which shows that the binding of phosphine ligands to the Ag(C₅H₄NOS) moiety varies in the sequence: dppm > PPh₃ \approx dppb > P(C₆H₄Me-p)₃. The binding of tertiary phosphines to Cu^I in analogous dimeric [{CuX(C₅H₅NS)L}₂] complexes [L = P(C₆H₄Me-m)₃ or P(C₆-H₄Me-p)₃; X = Cl, Br or I] was also labile. ¹⁵
