# Aerothionin and Homoaerothionin: Two Tetrabromo Spirocyclohexadienylisoxazoles from Verongia Sponges 

By K. Moody and R. H. Thomson,* Department of Chemistry, University of Aberdeen, Old Aberdeen AB9 2UE, Scotland<br>E. Fattorusso, L. Minale, and G. Sodano, Laboratorio per la Chimica e Fisica di Molecole di Interesse Biologico, C.N.R., Arco Felice, Naples, Italy<br>Aerothionin and homoaerothionin, tetrabromo-compounds from the sponges $V$. thiona and $V$. aerophoba are shown to be the homologous spirocyclohexadienylisoxazoles (XIII) and (XIV), respectively.

Most natural organobromo-compounds are of marine origin, found especially in algae ${ }^{1}$ and sponges. ${ }^{2-6}$ Several relatively simple dibromo-compounds have been isolated from Verongia spp..$^{2-4}$ and we describe here two more complex tetrabromo-metabolites ${ }^{5}$ from $V$. thiona and $V$. aerophoba ( $=$ Aplysina aerophoba).

The major component in both species ( $10 \%$ in $V$. aerophoba), aerothionin, $\mathrm{C}_{24} \mathrm{H}_{28} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{8}$, is optically active, and shows $\lambda_{\text {max }} 284 \mathrm{~nm}$ (cisoid diene) and $\nu_{\text {max }}$ 3335,1660 , and $1550 \mathrm{~cm}^{-1}$ (secondary amide). Doublets $(J 8 \mathrm{~Hz}$ ) at $\delta 4.18$ and 5.37 p.p.m. in the n.m.r. spectrum indicate the presence of an isolated secondary alcohol function and this was confirmed by $\mathrm{D}_{2} \mathrm{O}$ exchange when the hydroxy-signal at $\delta 5.37$ p.p.m. disappeared and the doublet at $\delta 4 \cdot 18$ p.p.m. collapsed to a singlet, and also by the downfield shift of the methine proton signal to $\delta 5.83$ p.p.m. on acetylation (diacetate, $v_{\mathrm{CO}} 1744 \mathrm{~cm}^{-1}$ ). The symmetrical structure of aerothionin is reflected in the simplicity of its n.m.r. spectrum, which shows also singlets for olefinic and methoxy-protons at $\delta 6.50$ and 3.72 p.p.m., respectively, and the amide proton as a broad triplet at $\delta 7.58$ p.p.m. An isolated methylene group in an asymmetric environment is indicated by an AB quartet with line positions at $\delta \mathbf{3 . 8 4}$ and 3.14 p.p.m., while the large geminal coupling constant ( $J 18 \mathrm{~Hz}$ ) suggests that the group is adjacent to a $\pi$-electron system. ${ }^{7}$ A multiplet at $\delta 3.34$ p.p.m., assigned to a methylene group attached to nitrogen, is coupled to another methylene multiplet at $\delta 1.60$ p.p.m. which,

[^0]from its chemical shift, must be linked only to saturated carbon. This suggests that a $C_{4}$ saturated chain is present and hints at the dimeric nature of aerothionin. In confirmation addition of deuterium chloride eliminated the $\mathrm{N}-\mathrm{H}$ signal at $\delta 7.58$ p.p.m. and simplified the $N$-methylene resonance at $\delta 3.34 \mathrm{p} . \mathrm{p} . \mathrm{m}$., while coupling between the signals at $\delta 3.34$ and 1.60 p.p.m. was demonstrated by double irradiation.
The observation from t.l.c. that treatment of aerothionin with an excess of trimethylsilyl chloride or dihydropyran gives initially both mono- and diderivatives suggests that two alcoholic functions are present, and that the number of protons is twice the simplest ratio indicated by the n.m.r. spectrum. This was established by mass spectrometry of a rearrangement product (see below) but the mass spectra of aerothionin and its di-tetrahydropyranyl, di-trimethylsilyl and diacetyl derivatives were not particularly useful as molecular ions were absent. However many of the fragment ions occurred as multiplets, the relative intensity of which was diagnostic for the presence of bromine. Chemical evidence indicated that bromine was attached in either aromatic or vinylic form as the $\mathrm{C}-\mathrm{Br}$ linkage in aerothionin was stable to attempted oxidation by dimethyl sulphoxide at $70^{\circ} \mathrm{C}$, and was unaffected by boiling aqueous methanolic potassium hydroxide.
Thus the combined evidence shows that aerothionin

[^1]has the following functional groups; $2 \mathrm{OMe}, 2>\mathrm{CHOH}$, $2 \mathrm{CH}=\mathrm{C}, 2>\mathrm{CH}_{2}, 4 \mathrm{Br}$, and a $\mathrm{CONH} \cdot\left[\mathrm{CH}_{2}\right]_{4} \cdot \mathrm{NHCO}$ unit. Two CNO groups remain unidentified. Mild basic treatment of aerothionin converts it quantitatively into an isomeric optically inactive, dihydric phenol ( $\lambda_{\max }$ 292 nm ). The n.m.r. spectrum of this product is very similar to that of aerothionin except that the $>\mathrm{CHOH}$ resonances are absent, olefinic proton absorption is

Hydrolysis of the tetramethyl ether of (I) with $25 \%$ aqueous methanolic potassium hydroxide yielded the oximinopyruvic acid (V; $\mathrm{R}=\mathrm{Me}$ ). This structure agrees with the spectroscopic properties of the acid and its methyl ester, and the acid was synthesised from methoxyamine and the arylpyruvic acid (VI; $\mathrm{R}=\mathrm{Me}$ ), derived ${ }^{8}$ from 3,5-dibromo-2,4-dimethoxybenzaldehyde and $N$-acetylglycine by way of the acetamidocinnamic

(X)

replaced by an aromatic proton singlet at lower field ( $\delta 7.59$ p.p.m.), and the isolated methylene group is now benzylic and appears as a singlet at $\delta 3 \cdot 82$ p.p.m. The $\mathrm{CONH} \cdot\left[\mathrm{CH}_{2}\right]_{4} \cdot \mathrm{NHCO}$ unit is still present so that two CHNO moieties are not yet accounted for; as the compound forms a tetra-acetate ( $\nu_{\mathrm{CO}} 1797$ and $1760 \mathrm{~cm}^{-1}$ ) CHNO must contain OH and is therefore an oxime, $>\mathrm{C}=\mathrm{NOH}$. The phenol was also characterised by its tetramethyl and tetrabenzyl ethers. Unlike the other derivatives of aerothionin, the mass spectrum of the tetramethyl derivative showed a molecular ion, a quintet centred at $m / e 874$ with relative intensities, $1: 4: 6: 4: 1$, indicative of a tetrabromo-compound. Accurate mass measurement established the formula $\mathrm{C}_{28} \mathrm{H}_{34} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{8}$, and the structure of the phenol may now be represented by (I). The n.m.r. spectra of these methyl and benzyl ethers were in agreement with those of the model compounds (II; $\mathrm{R}=\mathrm{Me}$ and $\mathrm{PhCH}_{2}$ ).

The relative positions of the aromatic substituents in (I) were established by degradative experiments. Oxidation of the tetramethyl derivative of (I) with potassium permanganate in aqueous acetone gave an acid, which, on the basis of its n.m.r. spectrum and i.r. bands at 1675 and $1705 \mathrm{~cm}^{-1}$ appeared to be the glyoxylic acid (III); synthesis of an authentic sample, however, from ethyl 2,4-dihydroxyphenylglyoxylate showed that this was not the structure. The acid was subsequently found to be the benzoic acid (IV) identical with material prepared by oxidative decarboxylation of (III) with alkaline hydrogen peroxide. The presence of two carbonyl bands in the i.r. spectrum of the acid (IV) in Nujol mull is probably associated with two different orientations of the carboxy-group in the crystal structure.
acid (VII; $\mathrm{R}=\mathrm{Me}$ ). The structure of the tetramethyl ether of (I) can now be defined as (VIII; $\mathrm{R}=\mathrm{Me}$ ). Supporting evidence comes from the mass spectrum which shows prominent ions at $m / e 508,335,320$, and 309 (all triplets) suggesting the fragmentation pattern below [the ions $(b),(c)$, and $(d)$ also give significant peaks in the mass spectrum of $(\mathrm{V} ; \mathrm{R}=\mathrm{Me})]$. The structure (VIII; $\mathrm{R}=\mathrm{Me}$ ) was finally confirmed by synthesis from the acid chloride of ( $\mathrm{V} ; \mathrm{R}=\mathrm{Me}$ ) and 1,4-diaminobutane.

The position of the phenolic groups in (I) was established by hydrolysis with 6m-hydrochloric acid, which gave the arylacetic acid (IX) (characterised as its methyl ester by comparison with a synthetic sample), and also the coumarin ( $\mathrm{X} ; \mathrm{R}=\mathrm{OMe}$ ) (after methylation with diazomethane). These products establish that the structure of (I) is (VIII; $\mathrm{R}=\mathrm{H}$ ) with the phenolic groups ortho to the side-chain. One attempt to synthesise (VIII; $\mathrm{R}=\mathrm{H}$ ) from ( $\mathrm{V} ; \mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}$ ), on a very small scale, was unsuccessful. In another approach, condensation of the appropriate benzaldehyde with the amide (XI) could not be achieved (some experiments on the benzylation of 3,5 -dibromo-2-hydroxy-4-methoxybenzaldehyde are described in the Experimental section), and in the reaction of 2 -acetoxy- 3,5 -dibromo-4-methoxybenzaldehyde with $N$-acetylglycine, the coumarin (X; $\mathrm{R}=\mathrm{NHAc}$ ) was obtained instead of the expected acetamidocinnamic acid (VII; $\mathrm{R}=\mathrm{Ac}$ ).

It will be recalled that the transformation of aerothionin into (VIII; $\mathrm{R}=\mathrm{H}$ ) is accompanied by aromatisation, the formation of benzylic methylene groups, and the conversion of two secondary alcohol functions into

[^2]phenolic groups. Bearing in mind the structure and properties of aeroplysinin-1 (XII), ${ }^{4}$ a co-metabolite in $V$. aerophoba, which has very similar u.v. and (where relevant) n.m.r. spectra, it is clear that aerothionin must have structure (XIII). This is in complete agreement with all the evidence and its rearrangement to the phenol (VIII; $\mathrm{R}=\mathrm{H}$ ) is straightforward (XIII, arrows). The mass spectrum of aerothionin shows an intense peak at $m / e 321$, also present in the spectrum of the phenol
degraded with acid to (IX) and (X; R $=\mathrm{OMe}$ ) (after methylation). The difference between the two compounds can best be seen in the n.m.r. spectra of the crystalline diacetates which are virtually the same except that the high-field multiplet at $\delta \mathrm{I} \cdot 3-1.9 \mathrm{p} . \mathrm{p} . \mathrm{m}$. integrates for six protons. Thus the central part of the homoaerothionin molecule (XIV) is a pentamethylene chain, and this was confirmed by synthesis of the tetramethyl ether ( $\mathrm{XV} ; \mathrm{R}=\mathrm{Me}$ ) of the derived phenol by

(VIII; $\mathrm{R}=\mathrm{H}$ ), which may be attributed to the ion (e). By analogy with aeroplysinin-1 (XII) ${ }^{4}$ and its enantiomer, ${ }^{9}$ the hydroxy-groups are probably trans to the ring oxygens, and as aerothionin is optically active the asymmetric end units must be identical and not in a mirror-image relationship.

A very closely-related compound, homoaerothionin, ${ }^{10}$ found in smaller quantity in both $V$. thiona and $V$. aerophoba would not crystallise and was purified as its diacetate. (Aerothionin crystallises fairly easily but retains solvents tenaciously.) Like aerothionin, homoaerothionin could be aromatised in base to give a phenol very similar to (VIII; $\mathrm{R}=\mathrm{H}$ ) which, in turn, could be

[^3]condensing 1,5 -diaminopentane with the acid chloride of (V).

It seems very probable that 3,5 -dibromotyrosine ${ }^{2}$ is a precursor of all the Verongia metabolites (XII), (XIII), (XIV), (XVI), ${ }^{2}$ and (XVII), ${ }^{3}$ and presumably the central $\mathrm{C}_{4} \mathrm{~N}_{2}$ and $\mathrm{C}_{5} \mathrm{~N}_{2}$ chains of aerothionin and homoaerothionin are derived from ornithine and lysine, respectively. (Both dibromotyrosine and lysine have been found in sponge protein. ${ }^{11}$ ) The spirocyclohexadienylisoxazoline systems in (XIII) and (XIV) could arise in various ways including nucleophilic attack by an oxime function in a modified tyrosinyl unit on an arene oxide ${ }^{12}$ (XVIII), or by conversion of the latter into a phenol

[^4]followed by intramolecular phenol-oxime coupling. It has been suggested ${ }^{13}$ that nitriles may be derived in vivo from $\alpha$-amino-acids by way of $\alpha$-keto- and $\alpha$-oximinoacids, and there is experimental support, both in

(XVI)

(XYIII)

vitro ${ }^{13,14}$ and in vivo, ${ }^{15}$ for the last step. Thus (XVIII; $\mathrm{R}=\mathrm{OH}$ ) seems a likely precursor of the nitrile (XII) ${ }^{\mathbf{1 6}}$ as indicated by (XIX).

## EXPERIMENTAL

Extraction of Verongia thiona.-Dried sponge ( 1160 g ), from La Jolla, California, was digested with cold acetone ( 6 l) for 3 days, filtered, and the extract taken to dryness. The oily residue ( $35 \cdot 6 \mathrm{~g}$ ) was redissolved in a small volume of cold acetone, and the solution was filtered and evaporated. Crystallisation of the crude product from chloroform gave aerothionin (XIII) ( $15 \cdot 1 \mathrm{~g}, 1 \cdot 3 \%$ dry wt. of sponge), which was recrystallised from ethyl acetate and then, for analysis, from acetone-benzene to give plates, m.p. 134-137 ${ }^{\circ}$ (decomp.), $[\alpha]_{D}+252^{\circ}$ (acetone) [Found: C, 35.4; H, 2.9; $\mathrm{Br}, 39 \cdot 2 ; \mathrm{N}, 7 \cdot 1 \% ; M$ (osmometric), 844. $\mathrm{C}_{24} \mathrm{H}_{26} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{8}$ requires $\mathrm{C}, 35 \cdot 2 ; \mathrm{H}, 3 \cdot 2 ; \mathrm{Br}, 39 \cdot 1 ; \mathrm{N}, 6.9 \% ; M, 817 \cdot 6]$, $\lambda_{\text {max }}$ (EtOH) 234 and $284 \mathrm{~nm}(\log \varepsilon 4.16$ and 4.13$)$; $\nu_{\text {max }}$. (Nujol) 3335, 3160, 1675, 1660, 1580, and $1550 \mathrm{~cm}^{-1}$; $\delta\left[100 \mathrm{MHz},\left({ }^{2} \mathrm{H}_{6}\right.\right.$-acetone $\left.)\right] 7.58(2 \mathrm{H}, \mathrm{bt}, \mathrm{NHCH} 2), 6.50(2 \mathrm{H}$, $\mathrm{s},>\mathrm{C}=\mathrm{CH}), 5 \cdot 37(2 \mathrm{H}, \mathrm{d}, J 8 \mathrm{~Hz}, \mathrm{OH}), 4 \cdot 18(2 \mathrm{H}, \mathrm{d}, J 8 \mathrm{~Hz}$, $>\mathrm{CHOH}), 3.72\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.84$ and 3.14 (each $2 \mathrm{H}, \mathrm{d}$,

[^5]$\left.J 18 \mathrm{~Hz}, \mathrm{CH}_{2}\right), 3 \cdot 34\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH} \mathrm{H}_{2}\right)$, and $1 \cdot 60$ p.p.m. $(4 \mathrm{H}$, $\mathrm{m}, \mathrm{NHCH}_{2} \mathrm{CH}_{2}$ ). The diacetate, prepared with acetic anhydride in cold pyridine, formed needles, m.p. 206-208 ${ }^{\circ}$ (from acetone), $[\alpha]_{D}+236^{\circ}\left(\mathrm{CHCl}_{3}\right)$ (Found: C, 37.5; H , $3 \cdot 3 ; \mathrm{Br}, 35 \cdot 6 ; \mathrm{N}, 6 \cdot 1 . \quad \mathrm{C}_{28} \mathrm{H}_{30} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{10}$ requires $\mathrm{C}, 37 \cdot 3$; $\mathrm{H}, 3.4$; $\mathrm{Br}, 35 \cdot 4$; N, $6 \cdot 2 \%$ ), $\nu_{\text {max. }}$ (Nujol) 3335, 1744, 1652, and $1540 \mathrm{~cm}^{-1} ; \delta\left(60 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.67\left(2 \mathrm{H}, \mathrm{bt}, \mathrm{NHCH}_{2}\right)$, $6.28(2 \mathrm{H}, \mathrm{s},>\mathrm{C}=\mathrm{CH}), 5.83(2 \mathrm{H}, \mathrm{s},>\mathrm{CHOAc}), 3.75(6 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{3}$ ), 3.41 and 3.06 (each $2 \mathrm{H}, \mathrm{d}, J 18.5 \mathrm{~Hz}, \mathrm{CH}_{2}$ ), 3.35 $\left.(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH})_{2}\right), 2 \cdot 13\left(6 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{CO}\right)$, and 1.63 p.p.m. ( $4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2} \mathrm{CH}_{2}$ ).

The chloroform mother liquor from the initial crystallisation was diluted with light petroleum which precipitated a mixture of bromo-compounds ( $5 \cdot 47 \mathrm{~g}$ ) leaving sterols and fatty acids in solution. The former were separated (p.l.c.) on silica gel in ethyl acetate-benzene ( $1: 1$ ) to give more aerothionin, and homoaerothionin (XIV) as a gum ( 0.91 g ) (two other products were isolated as gums but were not obtained pure). Homoaerothionin was precipitated from acetone solution with light petroleum as an amorphous solid $(0.77 \mathrm{~g}) ; \delta\left[\mathrm{CDCl}_{3}-\left({ }^{2} \mathrm{H}_{6}-\mathrm{DMSO}\right)\right] 7.60\left(2 \mathrm{H}, \mathrm{b}, \mathrm{NHCH}_{2}\right)$, $6.28(2 \mathrm{H}, \mathrm{s},>\mathrm{C}=\mathrm{CH}), 4.16(2 \mathrm{H}, \mathrm{s},>\mathrm{CHOH}), 3.73(6 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{3}$ ), 3.87 and 3.02 (each 2 H, d, $J 18.5 \mathrm{~Hz}, \mathrm{CH}_{2}$ ), 3.35 $(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH} 2)$, and $\mathrm{l} \cdot 60$ p.p.m. $\left(6 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}-\right.$ $\mathrm{CH}_{2}$ ). The diacetate, purified by p.l.c. on silica gel in ethyl acetate-benzene ( $2: 3$ ), crystallised from ethanol as nodules, m.p. 166-167,$[\alpha]_{D}+191.5^{\circ}\left(\mathrm{CHCl}_{3}\right)$ (Found: C, $38.4 ; \mathrm{H}$, $3.5 ; \mathrm{N}, 5.9 . \quad \mathrm{C}_{29} \mathrm{H}_{32} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{10}$ requires C, $38.0 ; \mathrm{H}, 2 \cdot 5 ; \mathrm{N}$, $6.1 \%$ ), $\lambda_{\text {max. }}(\mathrm{MeOH}) 289 \mathrm{~nm}(\log \varepsilon 4 \cdot 13) ; \nu_{\text {max. }}$ (Nujol) 3310, 1740,1658 , and $1540 \mathrm{~cm}^{-1}$; $\left.\delta\left(\mathrm{CDCl}_{3}\right) 6 \cdot 60(2 \mathrm{H}, \mathrm{b}, \mathrm{NHCH})_{2}\right)$, $6.30(2 \mathrm{H}, \mathrm{s},>\mathrm{C}=\mathrm{CH}), 5.80(2 \mathrm{H}, \mathrm{s},>\mathrm{CHOAc}), 3.75(6 \mathrm{H}, \mathrm{s}$, $\mathrm{OCH}_{3}$ ), 3.41 and 3.07 (each $2 \mathrm{H}, \mathrm{d}, J 18.5 \mathrm{~Hz}, \mathrm{CH}_{2}$ ), 3.30 $\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2}\right), 2.13\left(6 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{CO}\right)$, and 1.63 p.p.m. ( $6 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ).

Extraction of V. aerophoba.-The ether-insoluble fraction ( 20 g ) (see preceding paper) was chromatographed on a silica-gel column in chloroform-methanol, $500-\mathrm{ml}$ fractions being collected. The crude product ( 12.2 g ) from fractions 10-13 was crystallised from acetone-chloroform to give aerothionin, melting range, $130-150^{\circ}$ (gas evolution), containing 1 mol chloroform ( $\delta 7.25 \mathrm{p} . \mathrm{p} . \mathrm{m}$.) (Found: C, $32.0 ; \mathrm{H}, 2.8$; N, 6.15 ; O, 13.75, OMe, 6.3. $\mathrm{C}_{24} \mathrm{H}_{26} \mathrm{Br}_{4}-$ $\mathrm{N}_{4} \mathrm{O}_{6}, \mathrm{CHCl}_{3}$ requires $\mathrm{C}, 32 \cdot 0 ; \mathrm{H}, 2.9 ; \mathrm{N}, 6.0 ; \mathrm{O}, 13.65$, OMe, $6 \cdot 6 \%$ ). The mother liquors were evaporated and the residue $(2 \cdot 1 \mathrm{~g})$ was combined with the homoaerothionin ( 300 mg ) from fractions $6-9$ and converted into the diacetate. Fractions $15-21$ afforded the amide (XVI) ( 3.5 g ), m.p. 192-194 ${ }^{\circ}$ (lit., ${ }^{2} 193-195^{\circ}$ ) (from acetone) spectroscopically identical with literature data. ${ }^{2}$

Alkaline Treatment of Aerothionin and Homoaerothionin.(a) Aerothionin ( 0.6 g ) was boiled on a steam-bath with $3 \%$ methanolic potassium hydroxide $(15 \mathrm{ml})$ and water $(4.5 \mathrm{ml})$ for 2 h . After evaporation of the methanol, the aqueous solution was diluted to $c a .40 \mathrm{ml}$ and acidified with acetic acid. The precipitated oximinophenol (VIII; $\mathrm{R}=$ H) $(0.6 \mathrm{~g})$ was chromatographically pure, and crystallised from ether-chloroform as prisms, m.p. 188.5-189.5 (Found: $\mathrm{C}, 34 \cdot 9 ; \mathrm{H}, 3 \cdot 1 ; \mathrm{Br}, 39 \cdot 1 ; \mathrm{N}, 7 \cdot 1 . \mathrm{C}_{24} \mathrm{H}_{26} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{8}$ requires $\mathrm{C}, 35 \cdot 2 ; \mathrm{H}, 3 \cdot 2 ; \mathrm{Br}, 39 \cdot 1 ; \mathrm{N}, 6.9 \%$ ). A sample crystallised from acetone-chloroform had m.p. 182-187 ${ }^{\circ}$ and contained 1 mol chloroform (Found: C, 31.5; H, 2.7;

[^6]$\mathrm{N}, 5 \cdot 8 ; \mathrm{O}, 13 \cdot 4 . \quad \mathrm{C}_{24} \mathrm{H}_{26} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{8}, \mathrm{CHCl}_{3}$ requires $\mathrm{C}, 32 \cdot 0$; $\mathrm{H}, 2.9 ; \mathrm{N}, 6.0 ; \mathrm{O}, 13.65 \%$ ), $\lambda_{\text {max }}(\mathrm{EtOH}) 292 \mathrm{~nm}(\log \varepsilon 3.39)$, $\nu_{\max }$ (Nujol) 3340, 3200, 3070, 1647, 1616, and $1551 \mathrm{~cm}^{-1}$; $\delta\left({ }^{2} \mathrm{H}_{6}\right.$-acetone) $10.93(2 \mathrm{H}, \mathrm{b}, \mathrm{OH} *), 7.99\left(2 \mathrm{H}, \mathrm{m}, \mathrm{N} H \mathrm{CH}_{2}\right)$, $7.59(2 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 3.82\left(10 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}\right.$ and $\left.\mathrm{OCH}_{3}\right), 3 \cdot 40(4 \mathrm{H}$, $\mathrm{m}, \mathrm{NHCH}_{2}$ ), and 1.62 p.p.m. ( $4 \mathrm{H}, \mathrm{m}, \mathrm{NHCN}_{2} \mathrm{CH}_{2}$ ). The tetra-acetate crystallised from ether-benzene as prisms, m.p. $140-141^{\circ}$ (Found: C, $39 \cdot 5$; $\mathrm{H}, 3 \cdot 6$; $\mathrm{Br}, 32 \cdot 8$; $\mathrm{N}, 5 \cdot 8$. $\mathrm{C}_{32} \mathrm{H}_{34} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{12}$ requires $\mathrm{C}, 39 \cdot 0 ; \mathrm{H}, 3 \cdot 5$; $\mathrm{Br}, 32 \cdot 4$; N , $5.7 \%$ ), $\nu_{\text {max. }}$ (Nujol) $3365,1797,1760,1675,1623$, and $1530 \mathrm{~cm}^{-1} ; \delta\left(\mathrm{CDCl}_{3}\right) 7.48(2 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 7 \cdot 00(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{NHCH} \mathrm{N}_{2}\right), 3 \cdot 87\left(4 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}\right), 3 \cdot 85\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3 \cdot 37(4 \mathrm{H}$, $\mathrm{m}, \mathrm{NHCH}_{2}$ ), 2.33 and 2.18 (each $6 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{CO}$ ), and 1.59 p.p.m. $\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2} \mathrm{CH}_{2}\right)$. The tetramethyl derivative (prepared with methyl iodide and silver oxide in boiling chloroform) crystallised from benzene-light petroleum (b.p. $60-80^{\circ}$ ) as needles, m.p. $128-129^{\circ}$ [Found: C, $38 \cdot 1$; H, $4.1 ; \mathrm{Br}, 36.7 ; \mathrm{N}, 6.3 \% ; \quad M, 871.9107$ (1:4:6:4:1 quintet). $\mathrm{C}_{28} \mathrm{H}_{34}{ }^{79} \mathrm{Br}_{3}{ }^{81} \mathrm{BrN}_{4} \mathrm{O}_{8}$ requires $\mathrm{C}, 38 \cdot 5 ; \mathrm{H}, 3 \cdot 9$; $\mathrm{Br}, 36.6$; $\mathrm{N}, 6.4 \%$; $M, 871 \cdot 9092$ ], $v_{\text {max. }}$ (Nujol) 3310, 1650, and $1536 \mathrm{~cm}^{-1}$; $\delta\left(\mathrm{CDCl}_{3}\right) 7 \cdot 15(2 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 6.75(2 \mathrm{H}, \mathrm{b}$, $\mathrm{N} H \mathrm{CH}_{2}$ ), $3.88\left(4 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}\right), 3.94,3.84$, and 3.82 (each $\left.6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.35\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2}\right)$, and 1.59 p.p.m. ( 4 H , $\mathrm{m}, \mathrm{NHCH}_{2} \mathrm{CH}_{2}$ ). The tetrabenzyl derivative [prepared by stirring the phenol ( 102 mg ), benzyl chloride ( 0.5 g ), sodium iodide ( 0.6 g ), and anhydrous potassium carbonate ( 1 g ) in dimethylformamide ( 2 ml ) for 22 h ] formed micro-crystals, m.p. 124.5-125.5 (from ethanol) (Found: C, 53.3; H, $4 \cdot 5 ; \mathrm{Br}, 27 \cdot 2 ; \mathrm{N}, 4 \cdot 8 . \quad \mathrm{C}_{52} \mathrm{H}_{50} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{8}$ requires $\mathrm{C}, 53 \cdot 0$; $\mathrm{H}, 4.3 ; \mathrm{Br}, 27 \cdot 1 ; \mathrm{N}, 4.8 \%$ ) ; $\nu_{\text {max. }}$ (Nujol) 3410,1682 , and $1500 \mathrm{~cm}^{-1} ; \delta\left(\mathrm{CDCl}_{3}\right) 7 \cdot 00-7.70(22 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 6 \cdot 70(2 \mathrm{H}$, b, $\mathrm{N}_{\mathrm{HCH}}^{2}$ ) $, 5 \cdot 13\left(4 \mathrm{H}, \mathrm{s}, \quad \operatorname{ArCH} \mathrm{ON}_{2}\right), 4.99(4 \mathrm{H}, \mathrm{s}$, $\mathrm{PhCH}_{2} \mathrm{OC}=3.94\left(4 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}-\mathrm{C}=3\right), 3.86\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $\left.3.20(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH})_{2}\right)$, and 1.50 p.p.m. $\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2} \mathrm{CH}_{2}\right)$.
(b) Crude homoaerothionin ( 180 mg ) was treated as for aerothionin for 1 h , and acidified with 4 m -hydrochloric acid. The precipitate ( 144 mg ) was purified by p.l.c. on silica gel in ethyl acetate-benzene ( $1: 1$ ) to give the phenol (XV; $\mathrm{R}=\mathrm{H}$ ) as a gum which formed micro-crystals, m.p. $136.5-138^{\circ}$ (from chloroform) (Found: C, 35.9 ; H, 3.6 ; $\mathrm{N}, 6.55 . \quad \mathrm{C}_{25} \mathrm{H}_{28} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{8}$ requires $\mathrm{C}, 36 \cdot 1 ; \mathrm{H}, 3.5 ; \mathrm{N}$, $6.7 \%$ ), $\lambda_{\text {max. }}(\mathrm{MeOH}) 292 \mathrm{~nm}(\log \varepsilon 3.79)$, $\nu_{\text {max. }}$ (Nujol) 3310, 1647, 1616, and $1551 \mathrm{~cm}^{-1}$; $\delta\left({ }^{2} \mathrm{H}_{6}\right.$-acetone) $11.00(2 \mathrm{H}, \mathrm{b}$, $\mathrm{OH}), 7 \cdot 90\left(2 \mathrm{H}, \mathrm{b}, \mathrm{N} H \mathrm{CH}_{2}\right), 7.59(2 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 3.81(10 \mathrm{H}$, $\mathrm{ArCH}_{2}$ and $\left.\mathrm{OCH}_{3}\right), 3.38\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2}\right)$, and $1 \cdot 60$ p.p.m. $\left(6 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right)$. The tetramethyl derivative was prepared from the crude phenol with methyl iodide and silver oxide in boiling chloroform, and purified by t.l.c. on silica gel in ethyl acetate-benzene (1:4). It separated from methanol as nodules, melting range $32-39^{\circ}$ (Found: $M, 883.9250 . \quad \mathrm{C}_{29} \mathrm{H}_{36} \mathrm{H}_{4}{ }^{79} \mathrm{Br}_{4} \mathrm{O}_{8}$ requires $M, 883.9268$ ), $\nu_{\text {max. }}$ $\left(\mathrm{CHCl}_{3}\right) 3410,1670$, and $1523 \mathrm{~cm}^{-1}$; $\delta\left(\mathrm{CDCl}_{3}\right) 7 \cdot 20(2 \mathrm{H}$, s, $\mathrm{ArH}), 6.77\left(2 \mathrm{H}, \mathrm{bt}, \mathrm{N} H \mathrm{CH}_{2}\right), 3.92\left(4 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}\right), 3.96$, 3.87 , and 3.85 (each $\left.6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3 \cdot 35\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2}\right)$, and 1.63 p.p.m. $\left(6 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right)$.

Hydrolysis of the Phenols (VIII; $\mathrm{R}=\mathrm{H}$ ) and (XV; $\mathrm{R}=\mathrm{H})$.-(a) The phenol (VIII; $\mathrm{R}=\mathrm{H})(0.5 \mathrm{~g})$ was suspended in 6 m -hydrochloric acid ( 30 ml ); the mixture was heated under reflux for 4 h , and then cooled, diluted with water ( 120 ml ), and extracted with ether ( $3 \times 150 \mathrm{ml}$ ). After removal of the solvent the residual oil ( 200 mg ) was divided into two equal portions.

The first portion was methylated with diazomethane in

[^7]methanol in the usual way, followed by t.l.c. on silica gel plates in benzene. The product obtained from the band with $R_{F} 0 \cdot 2$ was eluted with acetone and crystallised from carbon tetrachloride to give the coumarin ( $\mathrm{X} ; \mathrm{R}=\mathrm{OMe}$ ), m.p. $210-211^{\circ}(50 \mathrm{mg})$ (Found: C, $35.9 ; \mathrm{H}, 2 \cdot 05 ; \mathrm{O}, 17.8$. $\mathrm{C}_{11} \mathrm{H}_{8} \mathrm{Br}_{2} \mathrm{O}_{4}$ requires $\mathrm{C}, 36 \cdot 25 ; \mathrm{H}, 2 \cdot 2 ; \mathrm{O}, 17.6 \%$ ), $\lambda_{\text {max }}$. $(\mathrm{MeOH}) 286,298$, and $318 \mathrm{~nm}(\log \varepsilon 4 \cdot 07,4 \cdot 08$, and 4.00$)$; $\nu_{\max }(\mathrm{Nujol}) 1740$ and $1630 \mathrm{~cm}^{-1} ; \delta\left(\mathrm{CDCl}_{3}\right) 7.56(1 \mathrm{H}, \mathrm{s}$, $\mathrm{ArH}), 6.69(1 \mathrm{H}, \mathrm{s}, \mathrm{CH}=\mathrm{C})$, and 3.93 p.p.m. $\left(6 \mathrm{H}, \mathrm{ds}, \mathrm{OCH}_{3}\right.$, split into well separated singlets by addition of $\mathrm{C}_{6} \mathrm{D}_{6}$ ).

The second portion was kept in methanol-hydrogen chloride for 16 h at room temperature. After removal of solvent the residue was run on silica-gel plates in chloroform and the band with $R_{F} 0.6$ was eluted with acetone and crystallised from light petroleum (b.p. $40-70^{\circ}$ ) to give the methyl ester of (IX) ( 5 mg ) identical with authentic material (see preceding paper).

Similar acid hydrolysis of the phenol ( $\mathrm{XV} ; \mathrm{R}=\mathrm{H}$ ) ( 60 mg ) gave ( $\mathrm{X} ; \mathrm{R}=\mathrm{OMe}$ ) (identified by mixed m.p. and u.v. and i.r. spectroscopy) and the methyl ester of (IX) (identified by t.l.c. and g.l.c.).

Degradation of the Tetramethyl Derivative (VIII; R = Me). -(a) Compound (VIII; $\mathrm{R}=\mathrm{Me}$ ) ( 150 mg ) was oxidised with potassium permanganate ( 4 g ) in boiling $50 \%$ aqueous acetone ( 50 ml ) for $3 \frac{1}{2} \mathrm{~h}$. The manganese dioxide was filtered off, and washed with aqueous sodium hydrogen carbonate and acetone. After evaporation of the acetone, the combined filtrates were extracted with chloroform (recovered starting material, 67 mg ), concentrated to $c a .10 \mathrm{ml}$ and acidified with 4 m -hydrochloric acid. The precipitate ( 37 mg ) crystallised from chloroform to give 3,5-dibromo-2,4-dimethoxybenzoic acid as needles, m.p. $193^{\circ}$ (Found: C, 31.9; H, 2.2; $\mathrm{Br}, 47.2 ; M, 337.8786$. $\mathrm{C}_{9} \mathrm{H}_{8}{ }^{99} \mathrm{Br}_{2} \mathrm{O}_{4}$ requires $\mathrm{C}, 31.8 ; \mathrm{H}, 2.35 ; \mathrm{Br}, 47.0 \%$; $M$, 337.8791 ), $\nu_{\text {max }}$ (Nujol) $3240-2060 \mathrm{br}, 1705$, and $1675 \mathrm{~cm}^{-1}$, $\delta\left[\mathrm{CDCl}_{3}-\left({ }^{2} \mathrm{H}_{6}\right.\right.$-acetone $\left.)\right] 8.15(1 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 8.01(1 \mathrm{H}, \mathrm{b}$, $\left.\mathrm{CO}_{2} \mathrm{H}\right)$, and 3.95 p.p.m. $\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$.
(b) Compound (VIII; $\mathrm{R}=\mathrm{Me}$ ) ( 400 mg ) was heated under reflux in methanol ( 7 ml ) and water ( 1 ml ) containing potassium hydroxide ( 2 g ) for 21 h . After evaporation of the methanol, the solution was extracted with chloroform and acidified. The acidic product was taken into chloroform, evaporated, and esterified with excess of ethereal diazomethane. Preparative t.l.c. on silica gel in benzene then yielded methyl 3-(3,5-dibromo-2,4-dimethoxyphenyl)2 -methoximinopropionate ( $134 \mathrm{mg}, 34 \%$ ) which was distilled in vacuo and eventually crystallised, m.p. $64^{\circ}$ (Found: C, 36.7 ; $\mathrm{H}, 3.5$; $\mathrm{Br}, 37.9$; $\mathrm{N}, 2.9 \% ; M, 424.9301$. $\mathrm{C}_{13} \mathrm{H}_{15}{ }^{79} \mathrm{Br}^{81} \mathrm{BrNO}_{5}$ requires $\mathrm{C}, \mathbf{3 6 . 7} ; \mathrm{H}, \mathbf{3 . 6}$; $\mathrm{Br}, 37.6$; $\mathrm{N}, 3 \cdot 3 \% ; M, 424 \cdot 9298), \nu_{\text {max. }}(\mathrm{Nujol}) 1724 \mathrm{~cm}^{-1} ; \delta\left(\mathrm{CDCl}_{3}\right)$ $7.19(1 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 3.92\left(2 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}\right), 4.07\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, and $3.85\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$. Hydrolysis of the ester with m-sodium hydroxide in $50 \%$ aqueous methanol gave the $\operatorname{acid}(\mathrm{V} ; \mathrm{R}=\mathrm{Me})$, as prisms, m.p. 104-104.5 (from benzene-light petroleum) (Found: C, 35.2; $\mathrm{H}, 3 \cdot 2$; Br , $38.8 ; \mathrm{N}, 3.4 \% ; M$, 408.9159. $\mathrm{C}_{12} \mathrm{H}_{13}{ }^{79} \mathrm{Br}_{2} \mathrm{NO}_{5}$ requires C, $35 \cdot 1 ; \mathrm{H}, 3 \cdot 2$; $\mathrm{Br}, 38.9$; $\mathrm{N}, 3.4 \% ; M, 408.9162$ ), $\nu_{\text {max. }}$ (Nujol) $3340-2200 \mathrm{br}$ and $1700 \mathrm{~cm}^{-1}$; $\delta\left(\mathrm{CDCl}_{3}\right) 7.82(\mathrm{lH}$, b, $\left.\mathrm{CO}_{2} \mathrm{H}\right), 7 \cdot 22(1 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 3.94\left(2 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}\right), 4 \cdot 12,3 \cdot 91$, and 3.90 p.p.m. (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}$ ).

## Synthetic Compounds

3,5-Dibromo-2,4-dimethoxybenzoic Acid (IV).-Bromine $(3.5 \mathrm{~g}, 0.022 \mathrm{~mol})$ in acetic acid $(10 \mathrm{ml})$ was added to ethyl 2,4-dihydroxyphenylglyoxylate ${ }^{16}(2 \cdot 1 \mathrm{~g}, 0.01 \mathrm{~mol})$ in the
same solvent ( 10 ml ) and stirred at room temperature for 30 min . Dilution with water ( 200 ml ) precipitated the 3,5 -dibromo-derivative ( $2.83 \mathrm{~g}, 77 \%$ ) which crystallised from aqueous ethanol as yellow needles, m.p. $117.5-118.5^{\circ}$ (Found: C, $32.8 ; \mathrm{H}, 2 \cdot 4 ; \mathrm{Br}, 43 \cdot 6 . \quad \mathrm{C}_{10} \mathrm{H}_{8} \mathrm{Br}_{2} \mathrm{O}_{5}$ requires $\mathrm{C}, 32 \cdot 6 ; \mathrm{H}, 2 \cdot 2 ; \mathrm{Br}, 43.4 \%$ ), $\nu_{\text {max }}$ (Nujol) 3490,1715 , and $1640 \mathrm{~cm}^{-1}$. Treatment with methyl iodide-silver oxidechloroform gave the dimethyl ether ( $\nu_{00} 1740$ and $1680 \mathrm{~cm}^{-1}$ ) as an oil which was hydrolysed in boiling $5 \%$ potassium hydroxide in $50 \%$ aqueous ethanol during 15 min to give 3,5-dibromo-2,4-dimethoxyglyoxylic acid (III), m.p. 143$144^{\circ}$ (from benzene) (Found: C, $33 \cdot 0 ; \mathrm{H}, 2 \cdot 4 ; \mathrm{Br}, 43.4 \%$; $M, 365.8746 . \quad \mathrm{C}_{10} \mathrm{H}_{8}{ }^{79} \mathrm{Br}_{2} \mathrm{O}_{5}$ requires $\mathrm{C}, 32.6 ; \mathrm{H}, 2 \cdot 2 ; \mathrm{Br}$, $43 \cdot 4 \% ; \quad M, 365 \cdot 8740$ ), $\nu_{\max }$ (Nujol) $3240-2060,1731$, 1720 sh , and $1680 \mathrm{~cm}^{-1}$. The acid ( 150 mg ) in $10 \%$ aqueous sodium hydroxide ( 9 ml ) was treated with hydrogen peroxide ( 100 vol .; 1.5 ml ) for 1 h . Acidification with 4 m -hydrochloric acid gave 3,5-dibromo-2,4-dimethoxybenzoic acid $(138 \mathrm{mg})$ which formed needles, m.p. $188-189^{\circ}$ (from benzene) undepressed on admixture with that described above; both samples had identical i.r. spectra.

When ethyl 2,4-dimethoxyphenylglyoxylate ${ }^{17}(2 \cdot 4 \mathrm{~g}$, 0.01 mol ) in carbon tetrachloride ( 10 ml ) was treated with bromine ( $3.8 \mathrm{~g}, 0.024 \mathrm{~mol}$ ) only monobromination occurred even after the mixture had been refluxed 1 h . On cooling ethyl 5-bromo-2,4-dimethoxyphenylglyoxylate separated, and was recrystallised from ethanol as needles, m.p. 116-117 ${ }^{\circ}$ $(2 \cdot 14 \mathrm{~g}, 68 \%)$ (Found: C, $45 \cdot 4 ; \mathrm{H}, 4 \cdot 3$; Br, 24.9 . $\mathrm{C}_{12} \mathrm{H}_{13} \mathrm{BrO}_{5}$ requires $\mathrm{C}, 45 \cdot 5 ; \mathrm{H}, 4 \cdot 1 ; \mathrm{Br}, 25 \cdot 2 \%$ ), $\nu_{\max }$. (Nujol) 1730 and $1645 \mathrm{~cm}^{-1}$. A similar reaction in refluxing pyridine also gave the monobromo-compound (76\%). Alkaline hydrolysis gave the acid, m.p. 182.5-183.5 ${ }^{\circ}$ (from benzene) (Found: C, 41.7; H, 2.9; $\mathrm{Br}, 27.4 . \quad \mathrm{C}_{10} \mathrm{H}_{9} \mathrm{BrO}_{5}$ requires $\mathrm{C}, 41 \cdot 6 ; \mathrm{H}, 3 \cdot 1$; $\mathrm{Br}, 27.6 \%$ ), $\nu_{\text {max }}$ (Nujol) $3220-$ 2140,1715 , and $1650 \mathrm{~cm}^{-1}$; $\delta\left[\mathrm{CDCl}_{3}-\left({ }^{2} \mathrm{H}_{6}\right.\right.$-acetone $\left.)\right] 7.97$ $(1 \mathrm{H}, \mathrm{s}, 6-\mathrm{H}), 7.70(1 \mathrm{H}, \mathrm{bs}, \mathrm{OH}), 6.69(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 4 \cdot 01$ and 3.93 p.p.m. (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}$ ). Oxidative decarboxylation with alkaline hydrogen peroxide (as above) afforded 5-bromo-2,4-dimethoxybenzoic acid as needles, m.p. 201$202^{\circ}$ (lit., ${ }^{18}$ m.p. $195-196^{\circ}$ ).

3-(3,5-Dibromo-2,4-dimethoxyphenyl)-2-methoximinopropionic Acid (V; R = Me).-3,5-Dibromo-2,4-dimethoxybenzaldehyde ( 6.48 g ), acetylglycine ( 2.34 g ), fused sodium acetate ( $1 \cdot 2 \mathrm{~g}$ ), and acetic anhydride ( $5 \cdot 1 \mathrm{~g}$ ) were heated under reflux at $200^{\circ}$ for 2 h ; the cooled, solidified melt was digested with water and filtered. The resultant azlactone was hydrolysed by refluxing it with $75 \%$ aqueous acetone for 17 h . The acetone was removed and the oily suspension was extracted with sodium hydrogen carbonate to give the acetamidocinnamic acid (VII; $\mathrm{R}=\mathrm{Me}$ ) ( $3.6 \mathrm{~g}, 43 \%$ ) as needles, m.p. 220-221 ${ }^{\circ}$ (from chloroform) (Found: C, 36.6; $\mathrm{H}, 3 \cdot 3 ; \mathrm{Br}, 37 \cdot 8 ; \mathrm{N}, 3.4 . \quad \mathrm{C}_{13} \mathrm{H}_{13} \mathrm{Br}_{2} \mathrm{NO}_{5}$ requires $\mathrm{C}, 36 \cdot 9$; $\mathrm{H}, 3 \cdot 1$; $\mathrm{Br}, 37 \cdot 8$; N, 3.3\%), $\nu_{\max }$ (Nujol) 3340--2100, 3210,1690 , and $1645 \mathrm{~cm}^{-1}, \delta\left[\mathrm{CDCl}_{3}-\left({ }^{2} \mathrm{H}_{6}-\mathrm{Me}_{2} \mathrm{SO}\right)\right] 9.40$ [ $1 \mathrm{H}, \mathrm{b}, \mathrm{OH}$ or NH (one not observed), $7.78\left(1 \mathrm{H}, \mathrm{s}, 6^{\prime}-\mathrm{H}\right)$, $7.30(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 3.87$ and 3.82 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}$ ), and 2.00 p.p.m. $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{C}-\mathrm{CH}_{3}\right)$. The acetamido-acid ( 1.5 g ) was boiled with m-hydrochloric acid in $75 \%$ aqueous tetrahydrofuran (THF) for 17 h . After removal of the THF the mixture was basified with sodium hydrogen carbonate and extracted with ether. Acidification of the aqueous layer gave a precipitate which crystallised deom chloroform to give 3,5-dibromo-2,4-dimethoxyphenylpyruvic acid (VI; $\mathrm{R}=\mathrm{Me}$ ),

[^8]m.p. $164-167^{\circ}(0.76 \mathrm{~g}, 56 \%)$ (Found: C, $34.9 ; \mathrm{H}, 2.5$; $\mathrm{Br}, 41 \cdot 8 . \quad \mathrm{C}_{11} \mathrm{H}_{10} \mathrm{Br}_{2} \mathrm{O}_{5}$ requires $\mathrm{C}, \mathbf{3 4} \cdot 6 ; \mathrm{H}, \mathbf{2 \cdot 6} ; \mathrm{Br}$, $41.6 \%)$, $\nu_{\text {max }} 3300-2000,1690,1650 \mathrm{sh}$, and $1630 \mathrm{sh} \mathrm{cm}^{-1}$. In chloroform solution the pyruvic acid exists in keto and enol forms, the latter predominating in the ratio ca. $9: 2$; $\delta\left[\mathrm{CDCl}_{3}+2\right.$ drops $\left.\left({ }^{2} \mathrm{H}_{8}-\mathrm{Me}_{2} \mathrm{SO}\right)\right]$, enol form $8.44(\mathrm{~s}, 6-\mathrm{H})$, $8.15(\mathrm{~b}, \mathrm{OH}), 6.75(\mathrm{~s}, \mathrm{CH}=\mathrm{C}), 3.89$ and $3.83\left(\mathrm{~s}, \mathrm{OCH}_{3}\right)$; keto form, 6-H not observed, $8 \cdot 15(\mathrm{~b}, \mathrm{OH}), 4 \cdot 14\left(\mathrm{~s}, \mathrm{ArCH}_{2}\right)$, 3.80 p.p.m. (s, $\mathrm{OCH}_{3}$ ), the second $\mathrm{OCH}_{3}$ signal underlies a methoxy-peak of the enol form. (Phenylpyruvic acid itself is also a keto-enol mixture in chloroform solution.) The pyruvic acid ( 573 mg ) and $O$-methylhydroxylamine hydrochloride ( 750 mg ) were kept in water ( 10 ml ) containing sodium hydrogen carbonate ( 882 mg ) for 16 h at room temperature. Acidification followed by chloroform extraction gave an oil which was treated with ethereal diazomethane. Distillation in vacuo gave the methyl ester $(290 \mathrm{mg})$ identical (i.r., n.m.r., and t.l.c.) with that described above. Hydrolysis, as before, gave the propionic $\operatorname{acid}\left(\mathrm{V} ; \mathrm{R}=\mathrm{Me}\right.$ ), m.p. 104-105 ${ }^{\circ}$, identical (mixed m.p. and i.r.) with that derived from (VIII; $\mathrm{R}=\mathrm{Me}$ ).

2-Benzyloximino-3-(2-benzyloxy-3,5-dibromo-4-methoxyphenyl)propionic Acid (V; $\mathrm{R}=\mathrm{PhCH}_{2}$ ).-2-Benzyloxy-3,5-dibromo-4-methoxybenzaldehyde was condensed with acetylglycine, as above, and the resulting azlactone was hydrolysed in hot aqueous acetone to give the acetamidocinnamic acid (VII; $\mathrm{R}=\mathrm{PhCH}_{2}$ ) which separated from chloroform as prisms, m.p. 214-215 (Found: C, 45.5; $\mathrm{H}, 3 \cdot 4 ; \mathrm{Br}, 32 \cdot 0 ; \mathrm{N}, 3 \cdot 1 . \quad \mathrm{C}_{19} \mathrm{H}_{17} \mathrm{Br}_{2} \mathrm{NO}_{5}$ requires $\mathrm{C}, 45 \cdot 7$; $\mathrm{H}, 3 \cdot 4 ; \mathrm{Br}, 32 \cdot 0 ; \mathrm{N}, 2 \cdot 8 \%$ ), $\nu_{\text {max }}$ (Nujol) 3230, 3300-2100, 1692,1655 , and $1510 \mathrm{~cm}^{-1} ; \delta\left[\mathrm{CDCl}_{3}+\left({ }^{2} \mathrm{H}_{8}-\mathrm{Me}_{2} \mathrm{SO}\right)\right] 8.75$ $1 \mathrm{H}, \mathrm{s}, \mathrm{OH}$ or NH$), 7.75\left(1 \mathrm{H}, \mathrm{s}, 6^{\prime}-\mathrm{H}\right), 7.48\left(6 \mathrm{H}, \mathrm{m}, \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2}\right.$ and $\mathrm{CH}=\mathrm{C}), 4.97\left(2 \mathrm{H}, \mathrm{s}, \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2}\right), 3.90\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, and 2.04 p.p.m. $\left(3 \mathrm{H}\right.$, s, $\left.\mathrm{CH}_{3} \mathrm{CO}\right)$. Hydrolysis, as above, gave the pyruvic acid (VI; $\mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}$ ) which crystallised from benzene as prisms, m.p. $150-152^{\circ}$ (Found: C, 44.3 ; H , $3 \cdot 1 ; \mathrm{Br}, 34 \cdot 6 . \quad \mathrm{C}_{17} \mathrm{H}_{14} \mathrm{Br}_{2} \mathrm{O}_{5}$ requires $\mathrm{C}, 44 \cdot 6 ; \mathrm{H}, 3 \cdot 1 ; \mathrm{Br}$, $34.9 \%$ ), $\nu_{\max }$ (Nujol) $3300-2100,1690$, and $1655 \mathrm{~cm}^{-1}$; $\delta\left[\mathrm{CDCl}_{3}+3\right.$ drops $\left({ }^{2} \mathrm{H}_{6}-\mathrm{Me}_{2} \mathrm{SO}\right)$, in this solvent the compound was almost entirely in the enol form] $10.72(2 \mathrm{H}, \mathrm{b}$, enol and acid HO), 8.50 (s, enol $6-\mathrm{H}), 7.55(5 \mathrm{H}, \mathrm{m}$, $\mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2}$ ), 6.83 (s, enol $\mathrm{CH}=\mathrm{C}$ ), 4.92 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2} \mathrm{O}$ ), $4 \cdot 10$ (s, enol $\mathrm{ArCH}_{2} \mathrm{CO}$ ), and 3.92 p.p.m. ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}$ ). Treatment of the pyruvic acid with $O$-benzylhydroxylamine hydrochloride in the usual way gave the benzyloximinoderivative ( $\mathrm{V} ; \mathrm{R}=\mathrm{PhCH}_{2}$ ) as needles, m.p. 161.5-162.5 (from ethanol) (Found: C, $50.9 ; \mathrm{H}, 3 \cdot 7 ; \mathrm{Br}, 28 \cdot 3 ; \mathrm{N}, 2.5$. $\mathrm{C}_{24} \mathrm{H}_{21} \mathrm{Br}_{2} \mathrm{NO}_{5}$ requires $\mathrm{C}, 51 \cdot 2 ; \mathrm{H}, 3 \cdot 8 ; \mathrm{Br}, 28 \cdot 4 ; \mathrm{N}, 2 \cdot 5 \%$ ), $\nu_{\text {max. }}$ (Nujol) 3300-2300 and $1700 \mathrm{~cm}^{-1}$; $\delta\left(\mathrm{CDCl}_{3}\right) 7 \cdot 40$ $[12 \mathrm{H}, \mathrm{m}, \mathrm{ArH}+(?) \mathrm{HO}], 5.25\left(2 \mathrm{H}, \mathrm{s}, \mathrm{PhCH}_{2} \mathrm{ON}\right), 5.02$ $\left(2 \mathrm{H}, \mathrm{s}, \mathrm{PhCH}_{2} \mathrm{OAr}\right)$, and 3.90 p.p.m. $\left(5 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right.$ and $\mathrm{ArCH}_{2}$ ).
$\mathrm{NN}^{\prime}$-Bis-(2-methoxyimino-3-phenylpropionyl)-1,4-diaminobutane (II; $\mathrm{R}=\mathrm{Me}$ ).-Phenylpyruvic acid ( $1 \cdot 25 \mathrm{~g}$ ) was kept with $O$-methylhydroxylamine hydrochloride ( $1 \cdot 25 \mathrm{~g}$ ) in aqueous sodium hydrogen carbonate for 16 h and then acidified to give 2 -methoxyimino-3-phenylpropionic acid which formed needles, m.p. $91-92^{\circ}$ (from benzene-light petroleum) (Found: C, 62.4; H, 5.6; N, 7.5. $\mathrm{C}_{10} \mathrm{H}_{11} \mathrm{NO}_{3}$ requires $\mathrm{C}, 62 \cdot 2 ; \mathrm{H}, 5 \cdot 7 ; \mathrm{N}, 7 \cdot 3 \%$ ), $\nu_{\text {max. }}$ ( Nujol ) $3360-2100$ and $1708 \mathrm{~cm}^{-1} ; \delta\left(\mathrm{CDCl}_{3}\right) 10.63(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 7.22(5 \mathrm{H}, \mathrm{s}$, $\mathrm{ArH}), 4.07\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, and 3.88 p.p.m. ( $2 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}$ ). Boiling the acid ( 0.58 g ) with an excess of thionyl chloride
${ }^{18}$ M. G. S. Rao, C. Srikantia, and M. S. Iyengar, J. Chem. Soc., 1929, 1578.
gave the acid chloride $\left[\nu_{\max }\right.$ (film) $1750 \mathrm{~cm}^{-1}$ ] which was stirred with l,4-diaminobutane ( $0 \cdot 13 \mathrm{~g}$ ) in pyridine ( 5 ml ) for 15 h . Acidification with 4 m -hydrochloric acid gave the diamide, m.p. $132-133^{\circ}$ (from benzene-light petroleum) $(0.59 \mathrm{~g}, 88 \%)$ (Found: C, $65.9 ; \mathrm{H}, 7 \cdot 1 ; \mathrm{N}, 12.8 . \quad \mathrm{C}_{24} \mathrm{H}_{30^{-}}$ $\mathrm{N}_{4} \mathrm{O}_{4}$ requires $\mathrm{C}, 66 \cdot 1 ; \mathrm{H}, 6 \cdot 6$; $\mathrm{N}, 12.5 \%$ ); $\nu_{\text {max. }}$ (Nujol) $3295,1673,1657$, and $1530 \mathrm{~cm}^{-1} ; \delta\left(\mathrm{CDCl}_{3}\right) 7 \cdot 4-7 \cdot 0(10 \mathrm{H}$, $\mathrm{m}, \mathrm{ArH}), 6.73\left(2 \mathrm{H}, \mathrm{b}, \mathrm{N} H \mathrm{CH}_{2}\right), 3.95\left(6 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.90$ $\left(4 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}\right), 3.25\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2}\right)$, and 1.50 p.p.m. ( $4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2} \mathrm{CH}_{2}$ ).

NN'-Bis-(2-benzyloximino-3-phenylpropionyl)-1,4-diaminobutane ( $\mathrm{II} ; \mathrm{R}=\mathrm{CH}_{2} \mathrm{Ph}$ ).-Treatment of phenylpyruvic acid with $O$-benzylhydroxylamine hydrochloride gave the benzyloximino-derivative as needles, m.p. 83-84 ${ }^{\circ}$ (from benzene-light petroleum) (Found: $\mathrm{C}, 71 \cdot 6 ; \mathrm{H}, 5 \cdot 5$; $\mathrm{N}, 4.9 . \quad \mathrm{C}_{16} \mathrm{H}_{15} \mathrm{NO}_{3}$ requires $\mathrm{C}, 71 \cdot 4 ; \mathrm{H}, 5 \cdot 6 ; \mathrm{N}, 5 \cdot 2 \%$ ). Conversion into the acid chloride and reaction of this with 1,4-diaminobutane in pyridine gave the diamide as needles, m.p. 121-122 (from benzene-light petroleum) (Found: C, $73.1 ; \mathrm{H}, 6.3 ; \mathrm{N}, 9.4 . \quad \mathrm{C}_{36} \mathrm{H}_{38} \mathrm{~N}_{4} \mathrm{O}_{4}$ requires $\mathrm{C}, 73 \cdot 2 ; \mathrm{H}$, $6.5 ; \mathrm{N}, 9.5 \%$ ), $\nu_{\text {max. }}$ (Nujol) 3300,1650 , and $1525 \mathrm{~cm}^{-1}$; $\delta\left(\mathrm{CDCl}_{3}\right) 7.25(10 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 6.73(2 \mathrm{H}, \mathrm{bt}, \mathrm{NHCH} 2), 5 \cdot 22$ $\left(4 \mathrm{H}, \mathrm{s}, \mathrm{PhCH}_{2} \mathrm{O}\right), 3.97\left(4 \mathrm{H}, \mathrm{s}, \mathrm{PhCH}_{2} \mathrm{C}\right), 3.25(4 \mathrm{H}, \mathrm{m}$, NHCH ${ }_{2}$ ), and 1.50 p.p.m. ( $4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2} \mathrm{CH}_{2}$ ).

NN'-Bis-[3-(3,5-dibromo-2,4-dimethoxyphenyl)-2-methoxy-iminopropionyl]-1,4-diaminobutane (VIII; $\mathrm{R}=\mathrm{Me}$ ).-The acid ( $\mathrm{V} ; \mathrm{R}=\mathrm{Me}$ ) ( 154 mg ) was converted into the acid chloride ( $\nu_{00} 1750 \mathrm{~cm}^{-1}$ ) in the usual way and stirred with l,4-diaminobutane ( 16 mg ) in pyridine ( 2 ml ) for 15 h . Acidification with 4 m -hydrochloric acid and chloroform extraction afforded the diamide ( $83 \mathrm{mg}, 51 \%$ ) which was purified on silica-gel plates in ethyl acetate-benzene (3:7); it crystallised from benzene-light petroleum as needles, m.p. 130-131 ${ }^{\circ}$ [Found: $M$, 871.9081 (1:4:6:4:1 quintet). $\mathrm{C}_{28} \mathrm{H}_{34}{ }^{79} \mathrm{Br}_{3}{ }^{81} \mathrm{BrN}_{4} \mathrm{O}_{8}$ requires $\left.871 \cdot 9092\right]$, identical (mixed m.p., t.l.c., i.r., and n.m.r.) with that derived from aerothionin.

NN'-Bis-[3-(3,5-dibromo-2,4-dimethoxyphenyl)-2-methoxyiminopropionyl $]$-1,5-diaminopentane ( $\mathrm{XV} ; \mathrm{R}=\mathrm{Me}$ ).-This compound was prepared in the usual way using the chloride of the acid ( $\mathrm{V} ; \mathrm{R}=\mathrm{Me}$ ) and 1,5 -diaminopentane ( 24 mg ) in pyridine ( 4 ml ). Preparative t.l.c. afforded the diamide ( $68 \mathrm{mg}, 33 \%$ ) as an oil which separated from methanol in nodules, m.p. 35-39 (Found: $M$, 883.9293. $\mathrm{C}_{29} \mathrm{H}_{36}{ }^{-}$ ${ }^{79} \mathrm{Br}_{4} \mathrm{~N}_{4} \mathrm{O}_{8}$ requires 883.9268 ), identical (mixed m.p., t.l.c., i.r., and n.m.r.) with that derived from homoaerothionin.

NN'-Di-(acetamidoacetyl)-1,4-diaminobutane (XI).-Ethyl acetamidoacetate ( 14.5 g , b.p. $158^{\circ} / 17 \mathrm{~mm}$ ) and 1,4 -diaminobutane $(4.4 \mathrm{~g})$ were heated at $145^{\circ}$ for 1 h . Ethanol distilled off and the tetra-amide precipitated, m.p. $247-248^{\circ}$ (from water) (Found: $\mathrm{C}, 50 \cdot 0 ; \mathrm{H}, 7.5 ; \mathrm{N}, 19.5 . \mathrm{C}_{12} \mathrm{H}_{22^{-}}$ $\mathrm{N}_{4} \mathrm{O}_{4}$ requires $\mathrm{C}, 50.3 ; \mathrm{H}, 7 \cdot 7 ; \mathrm{N}, 19 \cdot 6 \%$ ), $\nu_{\text {max. }}$ (Nujol) $3300 \mathrm{sh}, 3285$, and $1640 \mathrm{~cm}^{-1}$; $\delta\left(\mathrm{D}_{2} \mathrm{O}, \mathrm{Bu}^{t} \mathrm{OH}\right.$ as internal reference) $2.63\left(4 \mathrm{H}, \mathrm{s}, \mathrm{NHCH}_{2} \mathrm{CO}\right), 1.96\left(4 \mathrm{H}, \mathrm{m}, \mathrm{NHCH}_{2}\right)$, $0.82\left(6 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{CONH}\right)$, and 0.28 p.p.m. ( $4 \mathrm{H}, \mathrm{m}$, $\mathrm{NHCH}_{2} \mathrm{CH}_{2}$ ).

3-Acetamido-6,8-dibromo-7-methoxycoumarin ( $\mathrm{X} ; \quad \mathrm{R}=$ NHAc). - 3,5-Dibromo-2-hydroxy-4-methoxybenzaldehyde $(3.0 \mathrm{~g})$ was converted into the acetate with cold acetic anhydride/pyridine ( 17 h ), and this oil ( $\nu_{\mathrm{CO}} 1775$ and $1695 \mathrm{~cm}^{-1}$ ) was heated at $200^{\circ}$ with acetylglycine ( 1.2 g )
and sodium acetate ( 0.8 g ) in acetic anhydride ( 2.6 g ) for 1 h . Solid began to deposit in a few min. After evaporation of the acetic anhydride the residue was boiled with $75 \%$ aqueous acetone for 11 h ; the acetone was then removed and the aqueous suspension was digested with sodium hydrogen carbonate and chloroform. The insoluble coumarin ( $1.15 \mathrm{~g}, 30 \%$ ) was collected and crystallised from $\mathrm{Me}_{2} \mathrm{SO}$-water to give needles, m.p. 292-294 ${ }^{\circ}$ (Found: C, $37 \cdot 0 ; \mathrm{H}, 2 \cdot 3 ; \mathrm{Br}, 41 \cdot 0 ; \mathrm{N}, 3.3 . \quad \mathrm{C}_{12} \mathrm{H}_{9} \mathrm{Br}_{2} \mathrm{NO}_{4}$ requires C , $36.9 ; \mathrm{H}, 2.3 ; \mathrm{Br}, 40.9 ; \mathrm{N}, 3.6 \%$ ), $\mathrm{v}_{\text {max. }}$ (Nujol) 3340,1720 , and $1690 \mathrm{~cm}^{-1}, \delta\left({ }^{2} \mathrm{H}_{6}-\mathrm{Me}_{2} \mathrm{SO}\right) 8.39(1 \mathrm{H}, \mathrm{s}, 5-\mathrm{H}), 7.90(1 \mathrm{H}, \mathrm{s}$, $4-\mathrm{H}), 3 \cdot 88\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, and $2 \cdot 17$ p.p.m. $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{CON}\right)$.
Benzylation of 3,5-Dibromo-2-hydroxy-4-methoxybenzalde-hyde.-(a) The aldehyde ( 4.65 g ), benzyl chloride ( 1.9 g ), sodium iodide ( $2 \cdot 3 \mathrm{~g}$ ), and anhydrous potassium carbonate $(16 \mathrm{~g})$ were stirred for 20 h in dimethylformamide ( 20 ml ). The precipitate obtained on dilution with water was chromatographed on a column of silica gel in benzene to give 2-benzyloxy-3,5-dibromo-4-methoxybenzaldehyde $(5 \cdot 1 \mathrm{~g}$, $85 \%$ ) which crystallised from benzene-light petroleum as needles, m.p. 92-92.5 (Found: C, 44.8 ; H, 2.8; $\mathrm{Br}, 40 \cdot 2$. $\mathrm{C}_{15} \mathrm{H}_{12} \mathrm{Br}_{2} \mathrm{O}_{3}$ requires $\mathrm{C}, 45 \cdot 0 ; \mathrm{H}, \mathbf{3 . 0} ; \mathrm{Br}, 40.0 \%$ ), $\nu_{\text {max. }}$ (Nujol) $1687 \mathrm{~cm}^{-1} ; \delta\left(\mathrm{CDCl}_{3}\right) 9.94(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO}), 7.99(1 \mathrm{H}$, $\mathrm{s}, 6-\mathrm{H}), 7 \cdot 40\left(5 \mathrm{H}, \mathrm{s}, \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2}\right), 5 \cdot 13\left(2 \mathrm{H}, \mathrm{s}, \mathrm{PhCH}_{2} \mathrm{O}\right)$, and 3.97 p.p.m. $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right)$.
(b) The aldehyde ( $2 \cdot 33 \mathrm{~g}$ ), benzyl chloride ( 1.9 g ), sodium iodide ( $1 \cdot 14 \mathrm{~g}$ ), and anhydrous potassium carbonate ( 8 g ) were heated under reflux in acetone ( 50 ml ) for 9 h . Filtration and evaporation left a residue which was chromatographed on a column of silica gel in benzene to give 4-(2-benzyloxy-3,5-dibromo-4-methoxyphenyl)-4-hydroxybutan-2-
one as prisms, m.p. 98-99 (from benzene-light petroleum) ( $1.61 \mathrm{~g}, 47 \%$ ) (Found: C, $47.5 ; \mathrm{H}, 4.3$; $\mathrm{Br}, 35 \cdot 0$. $\mathrm{C}_{18} \mathrm{H}_{18} \mathrm{Br}_{2} \mathrm{O}_{4}$ requires $\mathrm{C}, 47 \cdot 2 ; \mathrm{H}, 4 \cdot 0 ; \mathrm{Br}, 34 \cdot 9 \%$ ), ${ }_{\text {max. }}$. (Nujol) 3420 and $1694 \mathrm{~cm}^{-1}$; $\delta\left(\mathrm{CDCl}_{3}\right) 7.70\left(1 \mathrm{H}, \mathrm{s}, 6^{\prime}-\mathrm{H}\right)$, $7.43\left(5 \mathrm{H}, \mathrm{s}, \mathrm{C}_{6} H_{5} \mathrm{CH}_{2}\right), 5 \cdot 32(1 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}), 5 \cdot 15$ and $4.91(2 \mathrm{H}$, $\left.\mathrm{q}, J 10.5 \mathrm{~Hz}, \mathrm{C}_{6} \mathrm{H}_{5} \mathrm{CH}_{2}\right), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.45(1 \mathrm{H}, \mathrm{d}$, $J 3.5 \mathrm{~Hz}, \mathrm{OH}), 2.78(1 \mathrm{H}, \mathrm{s})$ and $2.68(1 \mathrm{H}, \mathrm{d}, J 2.5 \mathrm{~Hz}$, $\mathrm{CH}_{2} \mathrm{CO}$ ), and $2 \cdot 09$ p.p.m. $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{CO}\right)$.
(c) The aldehyde ( $1 \cdot 17 \mathrm{~g}$ ), benzyl chloride ( 0.95 g ), sodium iodide $(0.57 \mathrm{~g})$, and anhydrous potassium carbonate $(4 \mathrm{~g})$ were stirred for 2 h at $100^{\circ}$ in dimethylformamide $(10 \mathrm{ml})$. Dilution with water and chloroform extraction gave an oil which was chromatographed on silica gel in benzene-light petroleum ( $1: 1$ ). The first fraction ( $0 \cdot 1 \mathrm{~g}$ ) was a dibenzyloxyaldehyde and later fractions ( 0.8 g ) were mixtures of this with the desired monobenzyl derivative (t.l.c.). Crystallisation of the mixture from benzene-light petroleum afforded 2,4-dibenzyloxy-3,5-dibromobenzaldehyde, m.p. $121-124^{\circ}(0.16 \mathrm{~g}$; overall $14 \%$ ) (Found: C, 52.7; $\mathrm{H}, 3 \cdot 2 ; \mathrm{Br}, 33 \cdot 5 . \quad \mathrm{C}_{21} \mathrm{H}_{16} \mathrm{Br}_{2} \mathrm{O}_{3}$ requires $\mathrm{C}, 52 \cdot 9 ; \mathrm{H}, 3 \cdot 4$; $\mathrm{Br}, 33.5 \%), \nu_{\text {max }}$ (Nujol) $1686 \mathrm{~cm}^{-1} ; \delta\left(\mathrm{CDCl}_{3}\right) 9.96(1 \mathrm{H}, \mathrm{s}$, CHO), $8.03(1 \mathrm{H}, \mathrm{s}, 6-\mathrm{H}), 7.40(10 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$, and $5 \cdot 14$ p.p.m. $\left(4 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{2}\right)$.

Two of us (K. M. and R. H. T.) are greatly indebted to Messrs. Elliott Smith and J. W. McBeth for collecting V. thiona and to the Nuffield Foundation for financial support. We also thank the S.R.C. Physicochemical Measurements Unit, Aldermaston, for mass spectra.
