## Studies on Heterocyclic Chemistry. Part XII. ${ }^{1}$ Tautomerism of $\alpha$-(5-Oxo-$\Delta^{3}$-isoxazolin-4-yl)benzylphosphonates

By Tarozaemon Nishiwaki * and Koichi Kondo, Department of Chemistry, Yamaguchi University, Yamaguchi City 753, Japan
$\alpha$-(5-Oxo- $\Delta^{3}$-isoxazolin-4-yl) benzylphosphonates (2) mostly exist in the NH form in the solid state, and in the OH form in non-polar solvents, owing to chelation with the phosphonyl group. The tautomeric equilibrium in solution is influenced by the nature of the 3 -substituent in the isoxazole ring; the 3-methyl compounds exist partially in the NH form. A modified synthesis of these compounds is described.

During our studies on thermal reactions of isoxazole derivatives, ${ }^{2}$ we prepared a number of $\alpha$-(5-oxo- $\Delta^{3}$ -isoxazolin-4-yl)benzylphosphonates (2) and have studied their tautomeric equilibria. Katritzky et al. ${ }^{3}$ have shown that 3 -substituted $\Delta^{2}$-isoxazolin- 5 -ones exist predominantly in the $\mathrm{C}(4) \mathrm{H}$ form in solvents with low

[^0]dielectric constant and in the solid state, whereas in 3,4 -disubstituted $\Delta^{2}$-isoxazolin-5-ones the NH form is considerably more favoured. $\Delta^{2}$-Isoxazolin-5-ones with a carbonyl function at C-4 are, however, exceptional in that they exist as the OH form, owing to chelation with the carbonyl group. ${ }^{3,4}$ As a phosphonyl group
${ }^{3}$ A. J. Boulton and A. R. Katritzky, Tetrahedron, 1961, 12, 41; A. R. Katritzky, S. Øksne, and A. J. Boulton, ibid., 1962, 18, 777.
${ }_{4}$ S. V. Sokolov and I. Ya. Postovskii, Zhur. obshchei Khim., 1960, 30, 600 .
is a strong hydrogen acceptor, ${ }^{5}$ this group, if present either directly attached to or separated by one carbon atom from the ring, could seriously influence the tautomeric equilibrium of $\Delta^{2}$-isoxazolin-5-ones. Though our conclusions of the tautomerism of compounds (2) broadly parallel those of Katritzky ${ }^{3}$ on alkyl 5 -oxo-$\Delta^{2}$-isoxazoline-4-carboxylates, an additional interesting feature has emerged.

By a modification (see Experimental section) of Arbuzov's procedure, ${ }^{6}$ a number of dimethyl $\alpha$-(5-oxo-$\Delta^{3}$-isoxazolin-4-yl)benzylphosphonates (2) with 3 -methyl, 3 -aryl, or 3 -(2-thienyl) substituents have been prepared
reactions of 5 -benzylidene-2-thioxothiazolidin-4-one derivatives. ${ }^{7}$

The isoxazolinones (2) exist in the NH form in the solid state; their i.r. spectra (Nujol mulls) show an intense carbonyl absorption characteristic of $\Delta^{3}$-isoxaz-olin-5-ones at $1725-1700 \mathrm{~cm}^{-1}$ for the 3 -methyl compounds and at $1740-1720 \mathrm{~cm}^{-1}$ for the 3 -aryl and 3 -(2-thienyl) compounds (see Table). However, in chloroform, the 3 -aryl and 3 -(2-thienyl) compounds displayed two absorptions, at $1810-1800(\varepsilon<20)$ and $1735-$ $1730 \mathrm{~cm}^{-1}(\varepsilon<30)$. It is known that $\Delta^{2}$ - and $\Delta^{3}$ -isoxazolin-5-ones show intense carbonyl absorption at ca. 1800 and $1720 \mathrm{~cm}^{-1}$ respectively; ${ }^{3}$ a decrease in these two absorptions for 3 -aryl- or 3 -(2-thienyl)substituted isoxazolinones (2) indicates that they exist mostly as the 5 -hydroxyisoxazole form (3) in chloroform, owing to chelation with the phosphonyl group. When ethanol was added to the chloroform solutions of compounds (2; $\mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{R}^{3}=\mathrm{H}$ ) and (2; $\mathrm{R}^{1}=2$-thienyl, $\mathrm{R}^{2}=\mathrm{R}^{3}=\mathrm{H}$ ), an intense carbonyl absorption due to the $\Delta^{3}$-isoxazolin-5-one system was observed at $1720 \mathrm{~cm}^{-1}$. Intramolecular association of the phosphonyl group is destroyed, and consequently the compound (2) will have to exist either as the NH or CH form in polar solvents: spectral evidence rules out the presence of the CH form. in high yield (see Table). The structures assigned are based on microanalyses, evidence for the presence of a tautomerisable hydrogen atom (see later), and mass spectral observations. The abundance of the molecular ion was ca. $30 \%$, and the $\left[M-\mathrm{PO}(\mathrm{OMe})_{2}\right]^{+}$ion was the base peak.* The preparative reaction is probably ionic in character, since it proceeds without the aid of a radical initiator. We also studied the reaction of the compound (1) with other dialkyl phosphites, but could not obtain any crystalline material, in contrast to the

[^1]ever, formation of a hydrogen bond with the $\pi$-electrons of benzene ring could also be responsible for the stability of the 5 -hydroxyisoxazole form. As such a bond is generally weak, ${ }^{8}$ it ought to have little if any effect on the tautomeric equilibrium of compound (2). The i.r. spectra of the compounds (2) in chloroform also showed broad absorption at $c a .2500 \mathrm{~cm}^{-1}$, indicative of the presence of a hydroxy-group strongly associated with an acceptor [the effect of intramolecular association upon the $\nu(\mathrm{P}=\mathrm{O})$ band could not be ascertained because

[^2]of possible overlap of a band due to associated $\mathrm{P}-\mathrm{O}$ band with $\mathrm{Me}-\mathrm{O}-\mathrm{P}$ absorption ${ }^{9}$ ].

These views are further supported by the u.v. spectra; the isoxazolinone ( $2 ; \quad \mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{H}, \quad \mathrm{R}^{3}=\mathrm{Me}$ ) had $\lambda_{\text {max. }}$ (EtOH) $279 \mathrm{~nm}(\log \varepsilon 3.98)$, but showed only end absorption in the region $>250 \mathrm{~nm}$ in chloroform or dioxan. For comparison, the $N$-methyl derivative (4) and the $O$-methyl derivative (5) of compound ( 2 ; $\mathrm{R}^{1}=\mathrm{Ph}, \quad \mathrm{R}^{2}=\mathrm{H}, \quad \mathrm{R}^{3}=\mathrm{Me}$ ) were prepared; the former was obtained in high yield by reaction of 3 -phenyl-4- $p$-methylbenzylidene- $\Delta^{2}$-isoxazolin-5-one ( 1 ; $\mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{H}, \mathrm{R}^{3}=\mathrm{Me}$ ) with trimethyl phosphite in ether. Its u.v. spectrum (in ethanol) resembled that of compound (4) [ $\lambda_{\text {max. }}$. $\left.(\mathrm{EtOH}) 281 \mathrm{~nm}(\log \varepsilon 3.72)\right]$, but differed from that of compound (5) [ $\lambda_{\text {max. }}$ ( EtOH ) $221 \mathrm{~nm}(\log \varepsilon 4.35)]$. Thus the isoxazolinones (2) exist mostly as the NH form in ethanol.

(4)

(5)

Arbuzov et al. ${ }^{6}$ have shown that dimethyl $\alpha$-(3-methyl5 -oxo- $\Delta^{3}$-isoxazolin-4-yl)benzylphosphonate $\quad\left(2 ; \quad \mathrm{R}^{1}=\right.$ Me, $\mathrm{R}^{2}=\mathrm{R}^{3}=\mathrm{H}$ ) in chloroform has a carbonyl absorption of medium intensity at $1708 \mathrm{~cm}^{-1}$, indicating that it exists partially in the NH form. This view is further supported by the i.r. spectra of compounds (2; $\left.\mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{R}^{3}=\mathrm{H}\right),\left(2 ; \mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{H}\right.$, $\mathrm{R}^{3}=\mathrm{Me}$ ), and (2; $\left.\mathrm{R}^{1}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{H}, \mathrm{R}^{3}=\mathrm{OMe}\right)$, which showed medium-intensity absorption at 1713 $\mathrm{cm}^{-1}$ in chloroform ( $\varepsilon 80-100$ ) but no band at 1800 $\mathrm{cm}^{-1}$ [cf. $\varepsilon$ of dimethyl 2,3 -dimethyl-5-oxo- $\Delta^{3}$-isoxazolin4 -yl)benzylphosphonate, 490].

It is concluded that, in a non-polar solvent, $\alpha$-(5-oxo-$\Delta^{3}$-isoxazolin-4-yl)benzylphosphonates (2) with 3 -aryl or a 3 -(2-thienyl) substituent exist mostly in the OH form, whereas in a non-polar solvent compounds (2) with a 3-methyl group exist as a mixture of the NH and OH forms. The tautomeric equilibrium of $\Delta^{2}$-isoxazolin5 -ones thus depends on the nature of the 3 -substituent; an adequate explanation for this cannot be offered at present.

## EXPERIMENTAL

Light petroleum refers to the fraction of b.p. $100-120^{\circ}$ unless otherwise stated.
${ }^{9}$ L. C. Thomas and R. A. Chittenden, Spectrochim. Acta, 1964, 20, 489.

Reaction of 4-Arylidene- $\Delta^{2}$-isoxazolin-5-ones (1) with Dimethyl Phosphite.-Typically the compound (1) ( 0.01 mol ) and dimethyl phosphite ( 0.02 or 0.03 mol ) were heated in toluene ( 10 ml ) under reflux for $0.5-1 \mathrm{~h}$. The mixture was cooled and light petroleum ( 10 ml ) was added. The precipitates were filtered off, washed with ether, and recrystallised from benzene-light petroleum (see Table).

5-Amino-3-(2-thienyl) isoxazole.-This compound was prepared ( $63 \%$ ) from (2-thenoyl)acetonitrile [prepared in $35 \%$ yield, as described for $p$-chlorobenzoylacetonitrile; ${ }^{2} \mathrm{~m} . \mathrm{p}$. 134-135 (from benzene-hexane) (Found: C, 55.7; $\mathrm{H}, \mathbf{3 \cdot 4}$. $\quad \mathrm{C}_{7} \mathrm{H}_{5}$ NOS requires $\mathrm{C}, 55 \cdot 6 ; \mathrm{H}, \mathbf{3 \cdot 3} \%$ )] and hydroxylamine according to the method of Obrègia; ${ }^{10} \mathrm{~m} . \mathrm{p} .96-97^{\circ}$ (from carbon tetrachloride) (Found: C, $50.4 ; \mathrm{H}, 3.75$; $\mathrm{N}, 16 \cdot 65 . \quad \mathrm{C}_{7} \mathrm{H}_{6} \mathrm{~N}_{2} \mathrm{OS}$ requires $\mathrm{C}, 50 \cdot 6 ; \mathrm{H}, 3 \cdot 6 ; \mathrm{N}, 16.9 \%$ ). 3-(2-Thienyl)- $\Delta^{2}$-isoxazolin-5-one.-5-Amino-3-(2-thienyl)isoxazole ( 2.50 g ), methanol ( 15 ml ), and 6 N -sulphuric acid ( 15 ml ) were heated under reflux for 30 min . On concentration of the solution, a solid was obtained which afforded needles ( $1.29 \mathrm{~g}, 53 \%$ ), m.p. $136-138^{\circ}$ (decomp.) (from water) (Found: C, $50 \cdot 4 ; \mathrm{H}, 2 \cdot 9 . \quad \mathrm{C}_{7} \mathrm{H}_{5} \mathrm{NO}_{2} \mathrm{~S}$ requires C, $50.3 ; \mathrm{H}, 3.0 \%$ ).

4-Arylidene- $\Delta^{2}$-isoxazolin-5-ones (1). -The following $\Delta^{2}$ -isoxazolin-5-ones were prepared as described in ref. 11; 4-benzylidene-3-(2-thienyl)- ( $1 ; \mathrm{R}^{1}=2$-thienyl, $\mathrm{R}^{2}=\mathrm{R}^{3}=\mathrm{H}$ ), m.p. 132-133 (from methanol) (Found: C, 65•6; H, 3.8. $\mathrm{C}_{14} \mathrm{H}_{9} \mathrm{NO}_{2} \mathrm{~S}$ requires $\mathrm{C}, 65.9 ; \mathrm{H}, 3.55 \%$ ); 4-benzylidene3 -p-methoxyphenyl ( $\mathrm{l} ; \mathrm{R}^{1}=p-\mathrm{MeO} \cdot \mathrm{C}_{6} \mathrm{H}_{4}, \mathrm{R}^{2}=\mathrm{R}^{3}=\mathrm{H}$ ), m.p. 169-171 ${ }^{\circ}$ (from ethanol) (Found: C, 73.3; H, 4.65. $\mathrm{C}_{17} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires $\mathrm{C}, 73 \cdot 1 ; \mathrm{H}, 4.7 \%$; 3-p-methoxyphenyl-4-p-methylbenzylidene $\quad\left(1 ; \quad \mathrm{R}^{1}=p-\mathrm{MeO} \cdot \mathrm{C}_{6} \mathrm{H}_{4}, \quad \mathrm{R}^{2}=\mathrm{H}\right.$, $\mathrm{R}^{3}=\mathrm{Me}$ ), m.p. 141-142 (from ethanol) (Found: C, $73 \cdot 7 ; \mathrm{H}, 5 \cdot 4 . \quad \mathrm{C}_{18} \mathrm{H}_{15} \mathrm{NO}_{3}$ requires $\mathrm{C}, 73 \cdot 7 ; \mathrm{H}, 5 \cdot 15 \%$ ); and 4-(o-methoxybenzylidene)-3-phenyl- $\left(1 ; \mathrm{R}^{1}=\mathrm{Ph}, \mathrm{R}^{2}\right.$ $=\mathrm{OMe}, \mathrm{R}^{3}=\mathrm{H}$ ), m.p. $166-167^{\circ}$ (from ethanol) (Found: $\mathrm{C}, 72 \cdot 8 ; \mathrm{H}, 4 \cdot 45 . \quad \mathrm{C}_{17} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires $\mathrm{C}, 73 \cdot 1 ; \mathrm{H}, 4 \cdot 7 \%$ ).

Dimethyl $\quad \alpha$-(2-Methyl-5-oxo-3-phenyl- $\Delta^{3}$-isoxazolin-4-yl)-p-methylbenzylphosphonate (4).-The compound (1; $\mathrm{R}^{1}$ $\left.=\mathrm{Ph}, \mathrm{R}^{2}=\mathrm{H}, \mathrm{R}^{3}=\mathrm{Me}\right)(2.6 \mathrm{~g}, 0.01 \mathrm{~mol})$, trimethyl phosphite ( $1.5 \mathrm{~g}, 0.012 \mathrm{~mol}$ ), and ether ( 20 ml ) were heated under reflux for 1.5 h . The resulting solid ( $2.7 \mathrm{~g} ; 71 \%$ ) crystallised from ether-light petroleum (b.p. 30-70 ${ }^{\circ}$ ) as plates, m.p. $105-107^{\circ}$ (Found: C, $62 \cdot 3 ; \mathrm{H}, 5 \cdot 8 ; \mathrm{N}, 3 \cdot 6$. $\mathrm{C}_{20} \mathrm{H}_{22} \mathrm{NO}_{5} \mathrm{P}$ requires $\mathrm{C}, 62 \cdot 0 ; \mathrm{H}, 5 \cdot 7 ; \mathrm{N}, 3 \cdot 6 \%$ ), $\nu_{\text {max }}$ $\left(\mathrm{CHCl}_{3}\right) 1735 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{O})$.

Dimethyl $\quad \alpha$-(5-methoxy-3-phenylisoxazol-4-yl)-p-methylbenzylphosphonate (5). -The compound (2; $\mathrm{R}^{1}=\mathrm{Ph}$, $\left.\mathrm{R}^{2}=\mathrm{H}, \mathrm{R}^{3}=\mathrm{Me}\right)(\mathrm{l} .72 \mathrm{~g})$ was treated with diazomethane in ether and the product ( $1.49 \mathrm{~g}, 84 \%$ ) crystallised from light petroleum as plates, m.p. $122^{\circ}$ (Found: C, 62.0; $\mathrm{H}, 5.7$; N, 3.5. $\mathrm{C}_{20} \mathrm{H}_{29} \mathrm{NO}_{5} \mathrm{P}$ requires $\mathrm{C}, 62 \cdot 0 ; \mathrm{H}, 5 \cdot 7$; N, $3 \cdot 6 \%$ ).
