# Studies of Bridged Benzoheterocycles. Part III. ${ }^{1}$ Cycloadditions of 1,4-Epoxy-1,4-dihydronaphthalene to Some Dipolar Compounds and Dienes 

By T. Sasaki,* K. Kanematsu, K. Hayakawa, and M. Uchide, Institute of Applied Organic Chemistry, Faculty of Engineering, Nagoya University, Chikusa, Nagoya, 464 Japan

#### Abstract

The nature of the 1.4 -epoxy-1,4-dihydronaphthalene skeleton was studied by performing MO calculations and by investigating cycloadditions to some dipolar compounds and dienes. Reactions of 1,4-epoxy-1,4-dihydronaphthalene (I) with phenylglyoxylonitrile oxide, 1-methylpyridinium-3-olate, ethyl azidoformate, and phenyl azide gave the corresponding 1:1 adducts. Similar treatments of compound (I) with benzenesulphonyl and tosyl azides afforded only imine derivatives. The reaction of compound (I) with 6,6-dimethylfulvene yielded a mixure of isomeric 1:1 and 1:2 adducts. The stereochemistry of the adducts is discussed in the light of spectroscopic data. Their thermal behaviour is also reported.

Although the dipolarophilicity and dienophilicity of 1,4-epoxy-1,4-dihydronapthalene (I) are expected to be increased by ring strain (relative to 1,4 -dihydronaphthalene) and further by orbital participation of the nonbonding electrons of the oxygen atom (relative to 1,4 dily ydro-1,4-methanonaphthalene), no systematic study of the cycloaddition reactions of compounds of this type has been reported.

We have already described the cycloaddition reactions of compound (I) with azo- and acetylenic compounds ${ }^{2}$ and with tropone and tropolone ${ }^{1}$ as the electron-poor
${ }^{1}$ Part II, T. Sasaki, K. Kanematsu, and K. Hayakawa, J.C.S. Perkin I, 1972, 1951.
${ }_{2}$ T. Sasaki, K. Kanematsu, and M. Uchide, Tetrahedron Letters, 1971, 4855.
components. The abnormally high reactivity in reactions with the troponoid compounds can be explained in terms of a Diels-Alder mechanism with inverse electron demand.
The present paper describes the calculation of the charge distribution in structure (I) and cycloaddition reactions with some dipolar compounds and cyclic dienes.

While this paper was in preparation two similar cycloadditions of compound (I) with dienes such as 3,6-di-(2-pyridyl)-s-tetrazine and $\alpha$-pyrone were reported. ${ }^{3,4}$
INDO Calculation for Structure (I).-Similar studies

[^0]on norbornadiene, norbornene, and related compounds have been reported previously. ${ }^{5}$ The charge distribution in structure (I) was calculated by the INDO method (see Experimental section); the results, and those for norbornene and norbornadiene, are shown in the Table. As

Charge distributions in compound (I) and analogues

|  | Compound (I) | Norbornene | Norbornadiene * |
| :---: | :---: | :---: | :---: |
| $P_{\pi_{2} \pi_{3}}$ | 1.017 | 0.959 | 0.958 |
| Charge density | $\mathbf{4 . 0 8 8}$ | $\mathbf{4 . 0 8 5}$ | $\mathbf{4 . 0 7 5}$ |
| at C-2 | * See ref. 5. |  |  |
|  | . |  |  |

expected, the value of the $P_{\pi 2 \pi 3}$ for structure (I) is larger than those for norbornene and norbornadiene, presumably owing to orbital participation by the non-bonding electrons of the oxygen atom.

Reactions with Dipolar Compounds.-The reaction of compound (I) with phenylglyoxylonitrile oxide prepared in situ ${ }^{6}$ from phenylglyoxylohydroximic acid chloride in ether at ambient temperature gave a $1: 1$ adduct (II) in $60 \%$ yield. The i.r. spectrum showed a characteristic benzoyl band at $1648 \mathrm{~cm}^{-1}$, and the n.m.r. spectrum exhibited signals for aromatic protons at $\tau 1.70-1.87$ $(2 \mathrm{H}, \mathrm{m})$ and $2.39-2.92(7 \mathrm{H}, \mathrm{m})$, for oxygen bridgehead protons (H-4 and $\mathrm{H}-9$ ) as singlets at $\tau 4.37$ and 4.42 , and for ring-junction protons ( $\mathrm{H}-3 \mathrm{a}$ and $\mathrm{H}-9 \mathrm{a}$ ) as doublets $(J 8.0 \mathrm{~Hz})$ at $\div 5.01$ and 6.06 . The absence of vicinal couplings $J_{3 a, 4}$ and $J_{9,9 \mathrm{a}}$ indicated the isoxazoline ring to be exo to the cyclohexene ring. Thus, the product was identified as the exo-1,3-dipolar cycloadduct (II). The mass spectrum had no parent ion peak ( $m / e 291$ ) but a base peak at $m / e 118\left(\mathrm{C}_{8} \mathrm{H}_{6} \mathrm{O}\right.$, isobenzofuran) and prominent fragments at $m / e 105(20 \%)$ and $89(13 \%)$. From these results we concluded that the adduct (II) is thermally decomposed to isobenzofuran. In fact, thermolysis of the adduct in o-dichlorobenzene gave 3benzoylisoxazole (III) ( $40 \%$ ) together with large amounts of polymeric material. Attempts to isolate isobenzofuran from the mixture were unsuccessful, presumably owing to its rapid polymerization.

The reaction of compound (I) with 1-methylpyridin-ium-3-olate ${ }^{7}$ under reflux in tetrahydrofuran for 36 h gave a $1: 1$ adduct (IVa) in $80 \%$ yield. Structural

[^1]proof was based on spectroscopic data and chemical conversions. The i.r. spectrum had a characteristic $\alpha \beta$ unsaturated carbonyl band at $1670 \mathrm{~cm}^{-1}$, and the n.m.r. spectrum exhibited signals for aromatic protons at $\tau 2.83(4 \mathrm{H}, \mathrm{m})$, for vinyl protons as double doublets at $3.13(1 \mathrm{H}, J 10.0$ and 4.2 Hz$)$ and $4.15(1 \mathrm{H}, J 10.0$ and 2.0 Hz ), for oxygen bridgehead protons as singlets at $\tau 4.63(1 \mathrm{H})$ and $4.68(1 \mathrm{H})$, for nitrogen bridgehead protons at $\tau 6.34(1 \mathrm{H}, \mathrm{s})$ and $6.15(1 \mathrm{H}, \mathrm{d})$, for ring-junction protons as doublets $(J 7.0 \mathrm{~Hz})$ at $\tau 7.62(1 \mathrm{H})$ and 7.84 $(1 \mathrm{H})$, and for $N$-methyl protons at $\tau 7.50(3 \mathrm{H}, \mathrm{s})$. The absence of appreciable couplings $J_{2,3}$ and $J_{7,8}$, and $J_{1,2}$ and $J_{8,9}$ indicated the exo-configurations shown. Catalytic hydrogenation of adduct (IVa) in ethanol over palladiumcharcoal rapidly yielded a dihydro-compound (no olefinic proton n.m.r. signals. Treatment of adduct (IVa) with polyphosphoric acid (PPA) gave the naphthalene derivative ( IVb ) in quantitative yield. Compound (IVa) was stable in dichlorobenzene at $130-150^{\circ}$.

For comparison of the cycloaddition reactivity of compound (I), the reaction of dimethyl 7 -oxabicyclo $[\mathbf{2}, 2,1]$ -hepta-2,5-diene-2,3-dicarboxylate (V) ${ }^{8}$ with 1-methyl-pyridinium- 3 -olate was performed. When the reagents were heated under reflux in tetrahydrofuran for 3 days, the $1: 1$ adducts (VI) $(7 \cdot 4 \%)$ and (VII) ( $8 \cdot 2 \%$ ) were obtained. Unequivocal structural assignments were made on the basis of spectroscopic data. The i.r. (1740, 1720 , and $1675 \mathrm{~cm}^{-1}$ ) and n.m.r. [ $\tau\left(\mathrm{CDCl}_{3}\right) 3 \cdot 31(1 \mathrm{H}$, dd, $\mathrm{H}-5, J 6.0$ and 2.0 Hz$), 3.35(1 \mathrm{H}, \mathrm{q}, \mathrm{H}-9, J 9.3$ and 4.5 $\mathrm{Hz}), 3.63(1 \mathrm{H}, \mathrm{dd}, \mathrm{H}-4, J 6.0$ and 2.0 Hz$), 3.73(1 \mathrm{H}$, dd, $\mathrm{H}-10, J 9.3$ and 1.5 Hz ), $5.40(2 \mathrm{H}, \mathrm{m}, \mathrm{H}-3$ and $\mathrm{H}-6), 5.90$ $(1 \mathrm{H}, \mathrm{dd}, \mathrm{H}-8, J 4.5$ and 1.5 Hz$), 6.15(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-1), 6.82$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{Me}\right), 6.84\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{Me}\right)$, and $7.56(3 \mathrm{H}, \mathrm{s}$, $\mathrm{NMe})]$ spectra indicated the product (VI) to be the $1,3-$ dipolar cycloadduct with two methoxycarbonyl groups on the methine positions ( $\mathrm{C}-2$ and $\mathrm{C}-7$ ). Its exact configuration could not be determined because of the absence of protons on the 2 - and 7 -positions. However, since $\mathrm{C}-10$ was deshielded by the anisotropic effect of the bridge oxygen atom in comparison with the corresponding positions in structures (IVa) and (VII), the endo,exoconfiguration as shown is preferred. The i.r. spectrum of adduct (VII) showed characteristic bands at 1735, 1710,1675 , and $1640 \mathrm{~cm}^{-1}$, and the n.m.r. spectrum exhibited signals at $\tau 2.96(1 \mathrm{H}, \mathrm{q}, \mathrm{H}-9, J 9.0$ and 4.5 Hz$)$, $3.95(1 \mathrm{H}, \mathrm{dd}, \mathrm{H}-10, J 9.0$ and 2.0 Hz$), 4.72(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-3$ or H-6), 4.75 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H}-6$ or $\mathrm{H}-3$ ), 6.13 ( $1 \mathrm{H}, \mathrm{d}, \mathrm{H}-8, \mathrm{~J} 4.5$ $\mathrm{Hz}), 6 \cdot 15\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{Me}\right), 6 \cdot 17\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{Me}\right), 6 \cdot 41 \mathrm{br}$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-2), 7 \cdot 40(1 \mathrm{H}, \mathrm{d}, \mathrm{H}-7, J 8.7 \mathrm{~Hz}), 7.52(3 \mathrm{H}, \mathrm{s}$, NMe), and $7.66(1 \mathrm{H}, \mathrm{d}, \mathrm{H}-2, J 8.7 \mathrm{~Hz})$.

It was therefore concluded to be the 1,3 -dipolar cycloadduct with the two methoxycarbonyl groups on the 4,5 -double bond. The coupling pattern in the n.m.r. spectrum, similar to that of adduct (IVa) indicated the exo,exo-configuration shown.

When compound ( V ) and 1-methylpyridinium-3-olate

[^2]were heated at $130^{\circ}$ in chlorobenzene, only the adduct (VII) was obtained ( $22 \%$ yield). Heating the adduct (VI) in chlorobenzene at $130^{\circ}$ for 20 h gave the isomer (VII) in appreciable yield. Thus adducts (VI) and (VII) are considered to be the products of kinetic control and thermodynamic control, respectively.
illustrated in Scheme 4; the rearrangements would appear to be facilitated by rearside participation of the double bond. ${ }^{9}$ Such participation in the 1,4 -epoxy- 1,4 dihydronaphthalene adduct might be energetically unfavourable because of destruction of the aromaticity in the fused benzene ring.

(1)

Scheme 2

Reactions with Azides.-The reactions of compound (I) with ethyl azidoformate and phenyl azide in benzene at room temperature gave adducts (VIIIa) and (VIIIb) in 78 and $98 \%$ yield, respectively. Analyses and spectroscopic data (Experimental section) showed the products to be 1,3 -dipolar cycloadducts; the exo-configurations were confirmed by the n.m.r. spectra. The mass spectra of both adducts had no molecular ion; that of the adduct (VIIIa) had a base peak at $m / e 130$ and prominent fragments at $m / e 131(64 \%), 158(64)$, and 118 (61), and that of (VIIIb) exhibited a base peak at 206 and a characteristic peak at $m / e 118(40 \%)$. These fragmentations indicated the thermal instability of the adducts; the peak at $m / e 118$ was due to isobenzofuran.

Heating adduct (VIIIa) in toluene at $110^{\circ}$ gave an intractable tar, whereas heating adduct (VIIIb) in benzene at $170^{\circ}$ gave 1-phenyltriazole (IX) in $63 \%$ yield.

Similar reactions of compound (I) with benzenesulphonyl azide and tosyl azide in benzene at room temperature gave products ( Xa ) and $(\mathrm{Xb})$ in 90 and $70 \%$ yield, respectively. The loss of nitrogen from the corresponding $1: 1$ adducts was shown by elemental analyses and mass spectra. The i.r. spectra of both products showed a characteristic band at $1627 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{N})$. The n.m.r. spectra had no olefinic proton signals and confirmed the imine structures shown. Hydrolysis gave the corresponding benzensulphonic acids. The imines are probably formed by loss of nitrogen from the initially produced 1,3 -dipolar cycloadducts. No direct formation of triazoline, aziridine, or rearranged enamine was observed.

In contrast, the reactions of norbornadiene with benzenesulphonyl azide and cyanogen azide gave the rearranged enamines (C) via a Cope rearrangement as
${ }^{9}$ A. C. Oehlschalager and L. H. Zalkow, J. Org. Chem., 1965, 30, 4205.

Reactions with Cyclic Dienes.-The reaction of compound (I) with furan at $130^{\circ}$ gave a $1: 1$ adduct (XI) in $85 \%$ yield, identified as a $[4+2] \pi$ cycloadduct by the n.m.r. spectrum (Experimental section). The values of

Scheme 3
3.0 Hz for $J_{2,3}$ and $J_{6,7}$ indicated the exo,endo-configuration. Heating the adduct (XI) in o-chlorobenzene at
$160^{\circ}$ for 8 h gave an isomer（XII）in $19 \%$ yield．The lack of appreciable couplings $J_{7,8}$ and $J_{1,2}$ ，and $J_{2,3}$ and $J_{6,7}$ indicated the exo，exo－configuration shown．The conver－ sion（XI）$\rightarrow$（XII）could be explained in terms of either

of two different pathways．In one case，isomer（XII） could be formed by a Diels－Alder reaction of 1,4 －epoxy－ 1,4 －dihydronaphthalene and furan，initiaily formed by a retro－Diels－Alder reaction of adduct（XI）．In the other， a Diels－Alder reaction of isobenzofuran and the epoxide （I），formed by cycloreversion of adduct（XI），could give the isomer（XII）．The mass spectrum of adduct（XI） showed a weak parent peak at $m / e 212$ and characteristic peaks at $m / e 118(40 \%)$ and $144(24 \%)$ ；these peaks might be caused by both cycloreversion and retro－Diels－ Alder fragmentations．

A similar reaction of compound（I）with 6，6－dimethyl－ fulvene in benzene at $130^{\circ}$ for 7 h afforded a mixture of three products（XIII）$(60 \%$ ），（XIV）（ $8 \%$ ），and（XV）（ $7 \%$ ）． Elemental analyses and mass spectra indicated（XIII）
and（XIV）to be $\mathbf{1 : 1}$ adducts and（XV）to be a $\mathbf{1 : 2}$ adduct．The nature of adducts（XIII）and（XIV）was confirmed by their n．m．r．spectra，which showed the adduct（XIII）to be the exo，endo－isomer（ $J_{1,2}=J_{7,8}=0$ ， $J_{6,7}=J_{2,3}=2.8 \mathrm{~Hz}$ ），and the adduct（XIV）to be the exo，exo－isomer（ $J_{1,2}=J_{7,8}=J_{6,7}=J_{2,3}=0$ ）．

The exo，endo，exo，endo－configuration of the $\mathbf{1 : 2}$ adduct （XV）was also confirmed by the n．m．r．spectrum．
The foregoing results show that 1,4 －epoxy－1，4－di－ hydronaphthalene is a more effective dipolarophile and dienophile than the 1,4 －methano－analogue．${ }^{10}$ This seems to agree with the result of the MO calculation．

3-Benzoyl-3a, 4, 9, 9a-tetrahydronaphth[2,3-d]isoxazole (II). -Phenylglyoxylonitrile oxide was prepared in situ from phenylglyoxylohydroxamic acid chloride ( 0.336 g ) and triethylamine $(0.2 \mathrm{~g})$ in anhydrous ether ( 15 ml ) and condensed with compound (I) ( $0 \cdot 274 \mathrm{~g}$ ) in anhydrous ether ( 15

Molecular co-ordinate system and $p$-orbital orientation used for structure (I)
ml ) at room temperature; the mixture was filtered to remove triethylamine hydrochloride. The solution was concentrated in vacuo to give the $1: 1$ adduct (II) $(0.3 \mathrm{~g}$, $60 \%$ ), m.p. $136-137^{\circ}$ (Found: C, $74 \cdot 0 ; \mathrm{H}, 4 \cdot 65$; N, 4.75 . $\mathrm{C}_{18} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires $\left.\mathrm{C}, 74 \cdot 2 ; \mathrm{H}, 4.5 ; \mathrm{N}, 4.8 \%\right)$, $\tau\left(\mathrm{CDCl}_{3}\right)$ $1.70-1.87(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 2.39-2.92(7 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 4.37$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-4$ or $\mathrm{H}-9), 4.42(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-9$ or $\mathrm{H}-4), 5.01(1 \mathrm{H}, \mathrm{d}$, $\mathrm{H}-9 \mathrm{a}, J 8.0 \mathrm{~Hz})$, and $6.06(1 \mathrm{H}, \mathrm{d}, \mathrm{H}-3 \mathrm{a}, J 8.0 \mathrm{~Hz}), m / e 118$ ( $100 \%$ ), 105 (20), 89 (13), and 77 (31).

Thermolysis of the Adduct (II).-A solution of adduct (II) $(0.153 \mathrm{~g})$ in $o$-dichlorobenzene ( 3 ml ) was heated at $160^{\circ}$ for 5 h . Chromatography on silica gel (benzene as eluant), followed by recrystallization from benzene gave 3 -benzoylisoxazole (III) ( $0.035 \mathrm{~g}, 40 \%$ ) as an oil, $\nu_{\text {max. }}$ (neat) $1660 \mathrm{~cm}^{-1}$, $\tau\left(\mathrm{CDCl}_{3}\right) 1.57(1 \mathrm{H}, \mathrm{d}, J 2.0 \mathrm{~Hz}), 1.7-1.9(2 \mathrm{H}, \mathrm{m}), 2.4-2.7$ ( $3 \mathrm{H}, \mathrm{m}$ ) , and $3.20(1 \mathrm{H}, \mathrm{d}, J 2.0 \mathrm{~Hz}) ; 2,4$-dinitrophenylhydrazone, m.p. 235-239 (Found: C, 54.4; H, 3.45; N, 19.55. $\quad \mathrm{C}_{16} \mathrm{H}_{11} \mathrm{~N}_{5} \mathrm{O}_{5}$ requires $\mathrm{C}, 54 \cdot 4 ; \mathrm{H}, 3 \cdot 15 ; \mathrm{N}, 19 \cdot 8 \%$ ).

17-Methyl-16-oxa-17-azapentacyclo[7,6,1, $\left.1^{3,7}, 0^{2,8} 0^{10,15}\right]$ -heptadeca-5,10,12,14-tetraen-4-one (IVa).—A solution of compound (I) ( 0.73 g ) and 1-methylpyridinium-3-olate $(0.55 \mathrm{~g})$ in tetrahydrofuran ( 20 ml ) was refluxed for 36 h . After evaporation to dryness, chromatography on silica gel (benzene as eluant) followed by recrystallization from benzene-hexane gave the adduct (IVa) ( 0.8 g ) as yellow prisms, m.p. 158- $159^{\circ}$ (Found: C, 76.15 ; H, 6.25; N, 5.7. $\mathrm{C}_{16} \mathrm{H}_{15} \mathrm{NO}_{2}$ requires $\mathrm{C}, 75.85 ; \mathrm{H}, 5.95 ; \mathrm{N}, 5.55 \%$ ), $\nu_{\text {max. }}$ $(\mathrm{KBr}) 1670 \mathrm{~cm}^{-1}, m / e 253(73 \%)$ and $118(49), \tau\left(\mathrm{CDCl}_{3}\right) 2 \cdot 83$ $(4 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 3 \cdot 13(1 \mathrm{H}, \mathrm{q}, \mathrm{H}-6, J 10 \cdot 0$ and $4 \cdot 2 \mathrm{~Hz}), 4 \cdot 15$ ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{H}-3, J 10.0$ and 2.0 Hz ), $4.63(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-9), 4.68(1 \mathrm{H}$, s, H-1), $6.15(1 \mathrm{H}, \mathrm{d}, \mathrm{H}-7), 6.34(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-3), 7.50(3 \mathrm{H}, \mathrm{s}$, NMe), $7 \cdot 62(1 \mathrm{H}, \mathrm{d}, \mathrm{H}-8, J 7 \cdot 0 \mathrm{~Hz})$, and $7.84(1 \mathrm{H}, \mathrm{d}, \mathrm{H}-2$, $J 7.0 \mathrm{~Hz}$ ).

Hydrogenation of the Adduct (IVa).-Hydrogenation of compound (IVa) ( 0.68 g ) in ethanol over $5 \%$ palladiumcharcoal (uptake 65 ml at $20^{\circ}$ and 1 atm . Calc. for one double bond, 59.5 ml ), filtration, evaporation to dryness, and recrystallization gave the 5,6-dihydro-compound ( 0.58 g ) as needles, m.p. $153-155^{\circ}$ (Found: C, $75.5 ; \mathrm{H}, 6.75$; N, $5.5 . \quad \mathrm{C}_{16} \mathrm{H}_{17} \mathrm{NO}_{2}$ requires $\mathrm{C}, 75 \cdot 25 ; \mathrm{H}, 6 \cdot 7 ; \mathrm{N}, 5.5 \%$ ), ${ }_{\text {max }}$. $(\mathrm{KBr}) 2940$ and $1700 \mathrm{~cm}^{-1}, \tau\left(\mathrm{CDCl}_{3}\right) 2 \cdot 80(4 \mathrm{H}, \mathrm{m}), 4 \cdot 62(1 \mathrm{H}$, s), $4 \cdot 67(1 \mathrm{H}, \mathrm{s}), 6 \cdot 49(2 \mathrm{H}, \mathrm{m}), 7 \cdot 49(3 \mathrm{H}, \mathrm{s}), 7 \cdot 72(4 \mathrm{H}, \mathrm{m})$, and $8.18(2 \mathrm{H}, \mathrm{m})$.

Dehydrogenation of the Adduct (IVa).-A mixture of adduct (IVa) ( 0.4 g ) and polyphosphoric acid ( 3 g ) was heated on a steam-bath for 3 h with occasional stirring. The mixture was left overnight at room temperature, then added to ice-water ( 50 ml ). Extraction with chloroform followed by evaporation of the extract to dryness and recrystallization from benzene-n-hexane, gave 6,10-dihydro-

6,10-methyliminocyclohepta[b]naphthalen-7-one (IVb) ( 0.26 g ) as yellow needles, m.p. 131-133 (Found; C, 81.45 ; H, $5.75 ; \mathrm{N}, 5.75 . \quad \mathrm{C}_{16} \mathrm{H}_{13} \mathrm{NO}$ requires $\mathrm{C}, 81.7 ; \mathrm{H}, 5.55 ; \mathrm{N}$, $5.95 \%), \nu_{\text {max }}(\mathrm{KBr}) 1685$ and $1610 \mathrm{~cm}^{-1}$, $\tau\left(\mathrm{CDCl}_{3}\right) 2.23$ $(4 \mathrm{H}, \mathrm{m}), 2.58(2 \mathrm{H}, \mathrm{m}), 2.65(1 \mathrm{H}, \mathrm{q}, J 9.8$ and 6.0 Hz$), 4.92$ ( 1 H , dd, $J 9.8$ and 1.5 Hz ), $5.51(1 \mathrm{H}, \mathrm{d}, J 6.0), 5.54(1 \mathrm{H}, \mathrm{s})$, and $7 \cdot 55(3 \mathrm{H}, \mathrm{s})$.

Reaction of Dimethyl 7-Oxabicyclo[2,2,1]hepta-2,5-diene-2,3-dicarboxylate (V) and 1-Methylpyridinium-3-olate.-(a) A solution of the diester (V) (1.16g) and the zwitterion ( 0.60 g ) in tetrahydrofuran was refluxed for 3 days. Chromatography on silica gel gave dimethyl 12-methyl-11-oxo-13-oxa-12-aza-tetracyclo $\left[6,3,1,1^{3,6}, 0^{2,7}\right]$ trideca-4,9-diene-2,7-dicarboxylate (VI) $(0 \cdot 13 \mathrm{~g})$ as yellow plates, m.p. $177-179^{\circ}$ (decomp.) (Found: $\mathrm{C}, 60 \cdot 3 ; \mathrm{H}, 5 \cdot 45 ; \mathrm{N}, 4 \cdot 1 . \mathrm{C}_{16} \mathrm{H}_{17} \mathrm{NO}_{6}$ requires C, $60 \cdot 2 ; \mathrm{H}, 5 \cdot 35 ; \mathrm{N}, 4 \cdot 4 \%$ ), $\nu_{\text {max }}(\mathrm{KBr}) 1740,1720$, and 1675 $\mathrm{cm}^{-1}, m / e 319\left(M^{+}\right)$, and the isomeric 4,5-diester (VII) ( $0 \cdot 14$ g) as yellow prisms, m.p. 161- $163^{\circ}$ (Found: C, $60.2 ; \mathrm{H}, 5 \cdot 5$; $\mathrm{N}, 4 \cdot 7 \%), \nu_{\max .}(\mathrm{KBr}) 1735,1710,1675$, and $1640 \mathrm{~cm}^{-1}, m / e$ $319\left(M^{+}\right)$.
(b) A solution of the diester (V) ( 1.55 g ) and the zwitterion $(0.8 \mathrm{~g})$ in toluene ( 5 ml ) was heated in a sealed tube at $130^{\circ}$ for 15 h . The same treatment as in (a) gave the adduct (VII) $(0.52 \mathrm{~g})$.

Thermolysis of the Adduct (VI).-A solution of compound (VI) $(0.05 \mathrm{~g})$ in benzene was heated in a sealed tube at $130^{\circ}$ for 1 day. The formation of the isomer (VII) was detected by g.l.c. (retention time 6.4 min at $220^{\circ}$ ).

Ethyl 4,9-Epoxy-3a,4,9,9a-tetrahydronaphtho[2,3-d]tri-azole-1-carboxylate (VIIIa).-A solution of compound (I) $(0.66 \mathrm{~g})$ and ethyl azidoformate ( 0.7 g ) in benzene ( 4 ml ) was stirred at room temperature. Evaporation to dryness and chromatography on silica gel (benzene) gave the adduct (VIIIa) ( $1.07 \mathrm{~g}, 78 \%$ ) as prisms, m.p. $163-165^{\circ}$ (decomp.) (Found: C, $60.45 ; \mathrm{H}, 5 \cdot 1 ; \mathrm{N}, 16.5 . \quad \mathrm{C}_{13} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires $\mathrm{C}, 60.2 ; \mathrm{H}, 5.05 ; \mathrm{N}, 16.2 \%)$, $\tau\left(\mathrm{CDCl}_{3}\right) 2.72(4 \mathrm{H}, \mathrm{m}), 4.35$ $(1 \mathrm{H}, \mathrm{s}), 4.49(1 \mathrm{H}, \mathrm{s}), 5.05(1 \mathrm{H}, \mathrm{d}, J 8.0 \mathrm{~Hz}), 5.61(2 \mathrm{H}, \mathrm{q}, J$ $7.0 \mathrm{~Hz}), 5.96(1 \mathrm{H}, \mathrm{d}, J 8.0 \mathrm{~Hz})$, and $8.57(3 \mathrm{H}, \mathrm{t}, J 7.0 \mathrm{~Hz})$, $m / e 231(64 \%), 158(64), 131(48), 130(100)$ and 118 (61).

4,9-Epoxy-3a,4,9,9a-tetrahydro-1-phenylnaphtho [2,3-d]triazole (VIIIb).-A solution of compound (I) $(0.42 \mathrm{~g})$ and phenyl azide $(0.4 \mathrm{ml})$ in ether ( 20 ml ) was stirred at room temperature. Work-up as for compound (VIIIa) gave the adduct (VIIIb) ( 0.66 g ), m.p. $169-171^{\circ}$ (Found: C, $72 \cdot 8 ; \mathrm{H}$, $4.9 ; \mathrm{N}, 15.9 . \mathrm{C}_{16} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}$ requires $\mathrm{C}, 73.0 ; \mathrm{H}, 5.0 ; \mathrm{N}$, $15 \cdot 9 \%$ ), $m / e 206$ ( $100 \%$ ), 118 ( 40 ), and 77 (50).

Thermolysis of the Adduct (VIIIb).-A solution of compound (VIIIb) $(0.29 \mathrm{~g})$ in benzene $(8 \mathrm{ml})$ was heated in a sealed tube at $170^{\circ}$ for 2 days. Similar work-up gave 1phenyltriazole ( $0.1 \mathrm{~g}, 63 \%$ ), m.p. $50-54^{\circ}$ (lit., ${ }^{11} 56^{\circ}$ ).

1,4-Epoxy-1,2,3,4-tetrahydro-2-phenylsulphonyliminonaphthalene (Xa).-A solution of compound (I) ( 0.29 g ) and benzenesulphonyl azide ( 0.38 g ) in benzene ( 10 ml ) was stirred at room temperature. Similar work-up gave the product (Xa) ( $0.58 \mathrm{~g}, 90 \%$ ), m.p. 208- $211^{\circ}$ (decomp.), $v_{\text {max }}(\mathrm{KBr}) 1627 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{N}), \tau\left(\mathrm{CDCl}_{3}\right) 2 \cdot 7(9 \mathrm{H}, \mathrm{m}), 4 \cdot 6 \mathrm{br}$ $(2 \mathrm{H})$, and $6.8 \mathrm{br}(2 \mathrm{H})$ (Found: C, $64.35 ; \mathrm{H}, 4.55$; N, 4.35. $\mathrm{C}_{16} \mathrm{H}_{13} \mathrm{NO}_{3} \mathrm{~S}$ requires $\mathrm{C}, 64 \cdot 2 ; \mathrm{H}, 4 \cdot 4 ; \mathrm{N}, 4.7 \%$ ).*

1,4-Epoxy-1,2,3,4-tetrahydro-2-p-tolylsulphonyliminonaphthalene ( Xb ).-A solution of compound (I) $(0.299 \mathrm{~g})$ and tosyl azide $(0.47 \mathrm{~g})$ in benzene ( 6 ml ) was stirred at room temperature. Similar work-up gave the product ( Xb )

[^3]$(0.438 \mathrm{~g})$, m.p. $145-147^{\circ}$ (decomp.), $\nu_{\max }(\mathrm{KBr}) 1627 \mathrm{~cm}^{-1}$ $(\mathrm{C}=\mathrm{N}), \tau\left(\mathrm{CDCl}_{3}\right) 2 \cdot 8(8 \mathrm{H}, \mathrm{m}), 4 \cdot 6 \mathrm{br}(2 \mathrm{H}), 6 \cdot 9 \mathrm{br}(2 \mathrm{H})$, and $7 \cdot 60(3 \mathrm{H}, \mathrm{s})$ (Found: C, $64 \cdot 9 ; \mathrm{H}, 4 \cdot 85 ; \mathrm{N}, 4 \cdot 55 . \quad \mathrm{C}_{17} \mathrm{H}_{15} \mathrm{NO}_{3} \mathrm{~S}$ requires $\mathrm{C}, 65 \cdot 1 ; \mathrm{H}, 4 \cdot 8 ; \mathrm{N}, 4 \cdot 45 \%$ ).*

15,16-Dioxapentacyclo $\left[6,6,1,1,,^{3,6}, 0^{2,7}, 0^{9,14}\right]$ hexadeca-4,9,11,13 -tetraene (XI).-A mixture of compound (I) ( 0.328 g ) and furan ( 2 ml ) was heated in a sealed tube at $130^{\circ}$ for 8 h . Similar work-up gave the adduct (XI) ( $0.41 \mathrm{~g}, 85 \%$ ), m.p. $146-150^{\circ}$ (Found: C, $79 \cdot 15 ; \mathrm{H}, 5 \cdot 85 . \quad \mathrm{C}_{14} \mathrm{H}_{12} \mathrm{O}_{2}$ requires $\mathrm{C}, 79 \cdot 2 ; \mathrm{H}, 5 \cdot 7 \%), \tau\left(\mathrm{CDCl}_{3}\right) 2 \cdot 91(4 \mathrm{H}, \mathrm{m}), 3 \cdot 63(2 \mathrm{H}, \mathrm{s}), 5 \cdot 17$ $(4 \mathrm{H}, \mathrm{m})$, and $7.48(2 \mathrm{H}, \mathrm{dd}, J 15$ and 3.0 Hz$), m / e 212(1 \%)$, 144 (24), 128 (15), 118 (40), 116 (100), and 115 (58).

Thermolysis of $\operatorname{Adduct}$ (XI).-A solution of compound (I) $(0 \cdot 119 \mathrm{~g})$ in o-dichlorobenzene ( 3 ml ) was heated at $160^{\circ}$ for 8 h . Work-up as before gave an isomeric adduct (XII) ( $0.023 \mathrm{~g}, 20 \%$ ), m.p. $255^{\circ}$ (Found: C, 78.2; H, 5.65. $\mathrm{C}_{14} \mathrm{H}_{12} \mathrm{O}_{2}$ requires C, $\left.78 \cdot 2 ; \mathrm{H}, 5 \cdot 7 \%\right)$, $\tau\left(\mathrm{CDCl}_{3}\right) 2 \cdot 9(4 \mathrm{H}, \mathrm{m})$, $3.65(2 \mathrm{H}, \mathrm{s}), 4.77(2 \mathrm{H}, \mathrm{s}), 5.01(2 \mathrm{H}, \mathrm{s})$, and $8.03(2 \mathrm{H}, \mathrm{s}), m / e$ 144 (33\%), 118 (100), 116 (95), and 115 (47).

16-Isopropylidene-15-oxapentacyclo $\left[6,6,1,1^{3,6}, 0^{2,7}, 0^{9,14}\right]$ -hexadeca-4,9,11,13-tetraene (XIII).-A solution of compound
(I) ( 0.35 g ) and 6,6-dimethylfulvene $(0.50 \mathrm{~g})$ in benzene ( 5 ml ) was heated in a sealed tube at $130^{\circ}$ for 7 h . Work-up as before gave the adducts (XIII) $(0.36 \mathrm{~g}, 60 \%)$, (XIV) ( $0.048 \mathrm{~g}, 8 \%$ ), and (XV) ( $0.06 \mathrm{~g}, 7 \%$ ).

Compound (XIII) had m.p. 153-158 (Found: C, 86.6; $\mathrm{H}, 7 \cdot 25 . \quad \mathrm{C}_{18} \mathrm{H}_{18} \mathrm{O}$ requires $\left.\mathrm{C}, 86 \cdot 35 ; \mathrm{H}, 7 \cdot 25 \%\right), \tau\left(\mathrm{CDCl}_{3}\right)$ $2.90(4 \mathrm{H}, \mathrm{m}), 3.77(2 \mathrm{H}$, dd, J 1.8 and 2.1 Hz ), $5.01(2 \mathrm{H}, \mathrm{s})$, $6.58(2 \mathrm{H}, \mathrm{m}), 7.72(2 \mathrm{H}$, dd, $J 1.8$ and 2.8 Hz ), and 8.53 $(6 \mathrm{H}, \mathrm{s}), m / e 250\left(M^{+}\right)$. The isomer (XIV) had m.p. 142$146^{\circ}$ (Found: C, $86.35 ;$ H, $7.4 \%$ ), $\tau 2.91(4 \mathrm{H}, \mathrm{m}), 3.73(2 \mathrm{H}$, $\mathrm{t}, J 1.9 \mathrm{~Hz}), 5.04(2 \mathrm{H}, \mathrm{s}), 6.70(2 \mathrm{H}, \mathrm{t}, J 1.9 \mathrm{~Hz}), 8.14(2 \mathrm{H}, \mathrm{s})$, and $8.39(6 \mathrm{H}, \mathrm{s}), m / e 250\left(M^{+}\right)$. The $1: 2$ adduct (XV) had m.p. 161-165 ${ }^{\circ}$ (Found: C, 87.85; H, 8.1. $\mathrm{C}_{26} \mathrm{H}_{28} \mathrm{O}$ requires C, $87.6 ; \mathrm{H}, 7.9 \%)$, $2.94(4 \mathrm{H}, \mathrm{m}), 4.12(2 \mathrm{H}, \mathrm{t}, \mathrm{J} 1.9$ $\mathrm{Hz}), 4.88(2 \mathrm{H}, \mathrm{s}), 6.79(2 \mathrm{H}, \mathrm{m}), 7.40(2 \mathrm{H}, \mathrm{s}), 7.56(2 \mathrm{H}, \mathrm{m})$, $8.26(2 \mathrm{H}$, dd, $J 1.9$ and 3.0 Hz$), 8.50(6 \mathrm{H}, \mathrm{s})$, and $8.66(6 \mathrm{H}$, s), $m / e 356\left(M^{+}\right)$.

We thank Professor H. Kato for a discussion and advice on the MO calculation.
