## A New Stereoselective Synthesis of trans-Chrysanthemic Acid [2,2-Di-methyl-3-(2-methylprop-1-enyl)cyclopropanecarboxylic Acid] ${ }^{1,2}$

By R. W. Mills, R. D. H. Murray, " and R. A. Raphael,* $\dagger$ Department of Chemistry, The University of Glasgow, Glasgow G12 800

#### Abstract

Base-catalysed interaction of 3-chloro-3-methylbut-1-yne and 3-methylbut-2-en-1-ol has been shown to produce 2.2-dimethyl-3-(2-methylprop-1-enylidene)cyclopropylmethanol (2). Selective reduction of this allene and subsequent oxidation gave racemic trans-chrysanthemic acid. The method represents a versatile route to many analogues.

The pyrethrin family of insecticides, e.g. pyrethrin I (1), has attracted considerable attention. ${ }^{3,4}$ The combination of insecticidal properties, knock-down effect, low mammalian toxicity, and ready biodegradability contrasts favourably with some of the more vilified methods of insect control. The recent observations ${ }^{5}$ that simpler derivatives of $(+)$-trans-chrysanthemic acid (12)

[^0]show even higher insecticidal activity than the natural esters have focused attention on new synthetic approaches to this acid. Recent ingenious routes include the addition of diphenylsulphonium isopropylide to $\delta$ methylsorbic ester ${ }^{6}$ and the base-catalysed interaction of $\beta$-methylcrotonic ester and isopentenyl aryl sulphones. ${ }^{7}$ We now report a novel stereoselective synthesis of

chrysanthemic acid which has the feature that both isoprenoid ' halves' of the molecule are derived from the same readily available starting material, 2-methylbut-3-yn-2-ol.

Conversion ${ }^{8}$ of this alcohol into the corresponding chloride, followed by treatment with base has already been shown ${ }^{9}$ to produce the allenyl carbene (6). The
was, however, readily achieved by treatment with sodium in liquid ammonia, ${ }^{11}$ which gave a high yield of chrysanthemyl alcohol (7). Although a second chiral centre was thereby introduced, the two possible cis- and transdiastereoisomers were not formed in equal amounts, the trans-alcohol comprising $75 \%$ of the product. A rationalisation for this selectivity involves intramolecular

formation of this entity has been demonstrated ${ }^{9}$ by trapping with various ethylenic hydrocarbons, whereby allene cyclopropanes are formed by electrophilic attack. We have found that when the carbene acceptor is provided by the double bond of 3 -methylbut-2-en-1-ol (itself readily prepared ${ }^{10}$ from 2 -methylbut-3-yn-2-ol) there is produced in moderate yield an allene cyclopropane (2) possessing precisely the carbon skeleton of chrysanthemic acid.

Attempted reduction of the exocyclic double bond of structure (2) by hydride attack was unsuccessful, and catalytic hydrogenation of such a system is known ${ }^{9}$ to proceed in a non-specific manner to produce complex mixtures. The requisite regioselective reduction of (2) ${ }^{8}$ G. F. Hennion and K. W. Nelson, J. Amer. Chem. Soc., 1957, 79, 2142; G. F. Hennion and A. P. Boisselle, J. Org. Chem., 1961, 26, 725.

participation of the pendant hydroxy-group, which is conveniently placed to effect proton transfer to the carbanionic centre of an initially produced radical anion ${ }^{12}$ (11). Such a process would lead necessarily to trans stereochemistry in the product. Some support for this directing role of the hydroxy-group was provided by carrying out the reduction on the tetrahydropyranyl ether (3) of the alcohol (2). Reduction was again regioselective but no longer stereoselective, hydrolysis of the product producing a $\mathbf{1 : 1}$ mixture of cis- and transchrysanthemyl alcohols.

Oxidation of chrysanthemyl alcohol at room temperature with chromium trioxide in dry pyridine gave the

corresponding aldehyde. Addition of water then allowed the oxidation to proceed further, to the carboxylic acid. The ( $\pm$ )-trans-chrysanthemic acid (12) thus obtained was identical with an authentic sample. Similar oxidation of the allenic alcohol (2) gave the novel dehydrochrysanthemic acid (15). Attempts to by-pass the oxidation step by using the less nucleophilic double bond of 3 -methylcrotonic acid as the carbene trap in the initial condensation were uniformly unsuccessful.
Structural variations in the starting chloroacetylene and allyl alcohol give analogues of chrysanthemic acid. The cyclohexylidene (13) and cyclopentylidene (14) analogues were prepared to demonstrate the scope of the reaction.

## EXPERIMENTAL

M.p.s were determined on a Reichert hot-stage apparatus. I.r. spectra were recorded for carbon tetrachloride solutions ( 0.1 mm cell) by Mrs. F. Lawrie (Perkin-Elmer 257 and Unicam SP 100 Mark II spectrophotometers). N.m.r. spectra were recorded by Mr. A. Haetzman (Varian T-60 spectrometer) for deuteriochloroform solutions with tetramethylsilane as internal standard. Mass spectra were recorded by Mr. A. Ritchie (A.E.I.-G.E.C. MS 12 spectrometer). Microanalyses were performed by Mr. J. M. L. Cameron and his staff. Kieselgel G (Merck) was used for analytical t.l.c. $\cdot 0.25 \mathrm{~mm}$ ) and Kieselgel $\mathrm{HF}_{254}$ (Merck) for preparative t.l.c. ( 1 mm .). Analytical g.l.c. separations were performed on a Pye-Argon chromatograph (5\% Carbowax column at $100^{\circ}$ ). Light petroleum refers to the fraction of b.p. $60-80^{\circ}$.

Carbene Additions.-(a) 2,2-Dimethyl-3-(2-methylprop-1enylidene)cyclopropylmethanol (2). A flask containing 3-methylbut-2-en-1-ol ( $15 \mathrm{~g}, 0.175 \mathrm{~mol}$ ) was flushed with dry nitrogen for 30 min and potassium t -butoxide $(5.06 \mathrm{~g}$, 0.045 mol ) was added. The slurry was stirred and cooled to $-10^{\circ}$. 3-Chloro-3-methylbut-1-yne ( $4.64 \mathrm{~g}, 0.045 \mathrm{~mol}$ ) was added during 30 min with the temperature maintained at -10 to $0^{\circ}$. Stirring was continued for 3 h , during which time the mixture was allowed to warm slowly to room temperature. n -Pentane ( 50 ml ) was added to the residue and the mixture was then filtered. The solid was washed with n-pentane ( $3 \times 20 \mathrm{ml}$ ), and the solvent removed from the combined filtrates at 20 mmHg . Excess of 3 -methylbut2 -en-1-ol was recovered at $30^{\circ}$ and 0.1 mmHg . The allenic alcohol (2) was separated by column chromatography on silica (elution with light petroleum containing increasing amounts of ethyl acetate up to $15 \%$ ). Alternatively, preparative t.l.c. was employed [ethyl acetate-light petroleum ( $20: 80$ )]. The allenic alcohol (2) ( $3 \cdot 1 \mathrm{~g}, 45 \%$ ) was isolated as a mobile oil, b.p. $40^{\circ}$ at 0.02 mmHg ; $v_{\text {max. }} 3620$, 3320 , and 2000 (allene) $\mathrm{cm}^{-1}$; $m / e 152\left(M^{+}, 33 \%\right)$, 121 ( $M-\mathrm{CH}_{2} \cdot \mathrm{OH}, 100$ ), $91(64)$, and $79(53)$; $\tau 8.73$ and 8.72 (each 3 H , s, geminal tertiary Me), 8.25 ( 6 H , s, vinyl Me), $8 \cdot 15(1 \mathrm{H}, \mathrm{t}, J 7 \mathrm{~Hz})$, and $6.24(2 \mathrm{H}, \mathrm{dd}, J 7$ and 2 Hz , $\mathrm{CH}_{2} \cdot \mathrm{OH}$ ) ; $p$-nitrobenzoate, m.p. 98-99 (from ether-light petroleum) (Found: C, 67.6; H, 6.2; N, 4.6. $\mathrm{C}_{17} \mathrm{H}_{19} \mathrm{NO}_{4}$ requires $\mathrm{C}, 67.8 ; \mathrm{H}, 6 \cdot 4 ; \mathrm{N}, 4 \cdot 65 \%$ ).

The foregoing reaction was carried out in the presence of various solvents and bases (1:1 ratio of reactants); the results are given in the Table.
(b) 3-Cyclohexylidenemethylene-2,2-dimethylcyclopropylmethanol (4). With the same reaction conditions, work-up,
and isolation procedure given in (a), 3-methylbut-2-en-1-ol ( $10 \mathrm{~g}, 0.12 \mathrm{~mol}$ ) was treated with potassium t -butoxide $(3.38 \mathrm{~g}, 0.03 \mathrm{~mol})$ and l-ethynylcyclohexyl chloride ${ }^{7}(4.32 \mathrm{~g}$, 0.03 mol ) to yield the allenic alcohol (4) ( $1.16 \mathrm{~g}, 20 \%$ ), m.p.

Effect of variation of conditions on yield of allene (2)

| Base | Solvent | Yield of allene (\%) |

$45-46^{\circ}$; $\nu_{\text {max }} 3620,3320$, and $2000 \mathrm{~cm}^{-1} ; m / e 192\left(M^{+}\right.$, $28 \%$ ), $161(59), 105(60)$, and $91(100)$; $\tau 8.75$ and 8.73 (each $3 \mathrm{H}, \mathrm{s}), 8.28(1 \mathrm{H}, \mathrm{t}, J 7 \mathrm{~Hz}), 6.28(2 \mathrm{H}, \mathrm{dd}, J 7$ and 2 Hz$)$, $7 \cdot 84 \mathrm{br}(4 \mathrm{H}, \mathrm{m})$, and $8 \cdot 45 \mathrm{br}(6 \mathrm{H}, \mathrm{m})$; 3,5-dinitrobenzoate, m.p. 82-84 ${ }^{\circ}$ (needles from ether-light petroleum) (Found: $\mathrm{C}, 62.0 ; \mathrm{H}, 5.95 ; \mathrm{N}, 6.9 . \quad \mathrm{C}_{20} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{6}$ requires $\mathrm{C}, 62 \cdot 2 ; \mathrm{H}$, 5•7; N, 7-25\%).
(c) 3-Cyclopentylidenemethylene-2,2-dimethylcyclopropylmethanol (5). 1-Ethynylcyclopentanol ( $25 \mathrm{~g}, 0.23 \mathrm{~mol}$ ) was added to a solution of freshly prepared copper(i) chloride ( $4.5 \mathrm{~g}, 0.045 \mathrm{~mol}$ ) in concentrated hydrochloric acid ( 100 $\mathrm{ml})$. After 1 h of intermittent shaking, the upper layer was washed with concentrated hydrochloric acid ( $2 \times 80 \mathrm{ml}$ ) and shaken with anhydrous potassium carbonate. The product was immediately distilled from fresh potassium carbonate to yield 1 -ethynylcyclopentyl chloride ( 15 g , $55 \%$ ) as an unstable mobile oil, b.p. $42-50^{\circ}$ at 15 mmHg .

With the same conditions, work-up, and isolation procedure given in (a), 3-methylbut-2-en-1-ol ( $4.0 \mathrm{~g}, 0.05 \mathrm{~mol}$ ) was treated with potassium t-butoxide $(2.6 \mathrm{~g}, 0.023 \mathrm{~mol})$ and l-ethynylcyclopentyl chloride ( $3.0 \mathrm{~g}, 0.023 \mathrm{~mol}$ ) to yield the allenic alcohol (5) ( $0.415 \mathrm{~g}, 10 \%$ ) as a mobile oil; $v_{\text {max }} 3630,3320$, and $2000 \mathrm{~cm}^{-1} ; m / e 178\left(M^{+}, 4 \%\right), 147(8)$, $83(30), 67(36), 55(98)$, and $41(100) ; \tau 8.68$ and 8.71 (each $3 \mathrm{H}, \mathrm{s}), 8 \cdot 2(1 \mathrm{H}, \mathrm{m}), 8 \cdot 30 \mathrm{br}(4 \mathrm{H}, \mathrm{m}), 7 \cdot 65 \mathrm{br}(4 \mathrm{H}, \mathrm{m})$, and $6.25(2 \mathrm{H}, \mathrm{m})$; 3,5-dinitrobenzoate, m.p. 151-152 ${ }^{\circ}$ (needles from ether-light petroleum) (Found: C, 61•1; H, 5.45; N, 7.5. $\quad \mathrm{C}_{19} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{6}$ requires $\mathrm{C}, 61 \cdot 3 ; \mathrm{H}, 5 \cdot 4 ; \mathrm{N}, 7 \cdot 5 \%$ ).

Regioselective Reduction of Vinylidenecyclopropanes.-(a) ( $\pm$ )-Chrysanthemyl alcohol [2,2-dimethyl-3-(2-methylprop-1enyl)cyclopropylmethanol] (7). (i) trans-cis, 3:1. A solution of the allenic alcohol (2) ( $300 \mathrm{mg}, 2.0 \mathrm{mmol}$ ) in dry ether ( 3 ml ) was added dropwise with stirring to a solution of sodium ( $100 \mathrm{mg}, 4.3 \mathrm{mmol}$ ) in liquid ammonia ( 10 ml ). After stirring for 1 h the excess of sodium was destroyed with ammonium chloride and the ammonia was distilled off by gentle heating. Water ( 2 ml ) was added; extraction with ether then gave, after conventional work-up, almost pure (one spot on t.l.c.) racemic chrysanthemyl alcohol ${ }^{4}$ (7) ( $270 \mathrm{mg}, 90 \%$; trans-cis, $3: 1$ by g.l.c.), identical (t.l.c., i.r., n.m.r., and mass spectra) with an authentic sample. Crystallisation of the derived 3,5-dinitrobenzoate (needles from ether-light petroleum) preferentially afforded the derivative, m.p. and mixed m.p. 97-105 , of the transisomer (Found: C, $58.6 ; \mathrm{H}, 5.7$; N, 8.1. Calc. for $\mathrm{C}_{17} \mathrm{H}_{20}{ }^{-}$ $\mathrm{N}_{2} \mathrm{O}_{6}$ : C, $58 \cdot 6 ; \mathrm{H}, 5 \cdot 8 ; \mathrm{N}, 8 \cdot 1 \%$ ). The wide m.p. range includes a period of preliminary weeping and was characteristic of both samples.
(ii) trans-cis, $1: 1$. With the same reaction conditions and work-up procedure as in (i), the readily derived allenic tetrahydropyranyl ether (3) $\left[\nu_{\text {max. }} 2000 \mathrm{~cm}^{-1} ; m / e 236\right.$ ( $M^{+}$, $2 \%), 152(10), 121(40)$, and $55(100)]$ ( $127 \mathrm{mg}, 0.55 \mathrm{mmol}$ ) in dry ether ( 4 ml ) was added to a solution of sodium ( 40 $\mathrm{mg}, 1.7 \mathrm{mmol}$ ) in liquid ammonia ( 5 ml ) to produce chrysanthemyl alcohol tetrahydropyranyl ether (8) ( 118 mg , 92\%).

Hydrolysis of (8) ( 110 mg ) with a catalytic amount of toluene- $p$-sulphonic acid in ethanol ( 4 ml ) produced chrysanthemyl alcohol (7) ( $64 \mathrm{mg}, 90 \%$ ) in a cis-trans ratio of $1: 1$ (by n.m.r. and g.l.c.).
(b) 3-Cyclohexylidenemethyl-2,2-dimethylcyclopropylmethanol (9). With the same reaction conditions and work-up procedure as in (a), the allenic alcohol (4) $195 \mathrm{mg}, 1 \cdot 0$ mmol ) in dry ether ( 4 ml ) was added to a solution of sodium ( $50 \mathrm{mg}, 2.2 \mathrm{mmol}$ ) in liquid ammonia ( 10 ml ) to produce, as a mobile oil, the alcohol (9) ( $177 \mathrm{mg}, 90 \%$; trans-cis, $3: 1$ ); $\nu_{\text {max }} 3620$ and $3330 \mathrm{~cm}^{-1}$; m/e 194 ( $M^{+}, 16 \%$ ), 163(100), $91(98)$, and $79(97)$; $\tau 8.96$ and 8.89 (each $3 \mathrm{H}, \mathrm{s}$ ), 8.50 br $(6 \mathrm{H}, \mathrm{m}), 7.92 \mathrm{br}(4 \mathrm{H}, \mathrm{m}), 5 \cdot 28 \mathrm{br}(1 \mathrm{H}, \mathrm{d}, J 7 \mathrm{~Hz}$; in the cisisomer this signal appears at $\tau 5 \cdot 16), 6 \cdot 43(2 \mathrm{H}, \mathrm{AB}$ of ABX , $\left.J_{\mathrm{AB}} 12 \mathrm{~Hz}, \mathrm{CH}_{2} \cdot \mathrm{OH}\right), c a .8 \cdot 8(1 \mathrm{H}, \mathrm{m})$, and $c a .9 \cdot 2(1 \mathrm{H}, \mathrm{m})$. Crystallisation of the derived 3,5-dinitrobenzoate from etherlight petroleum preferentially afforded the trans-isomer as needles, m.p. 110-112 (Found: C, 61.8; H, 6.0; N, 7.0. $\mathrm{C}_{20} \mathrm{H}_{24} \mathrm{~N}_{2} \mathrm{O}_{6}$ requires, $\mathrm{C} \cdot 61 \cdot 9 ; \mathrm{H}, 6 \cdot 2 ; \mathrm{N}, 7.2 \%$ ). The relative proportions of cis- and trans-isomers in this series can conveniently be assessed by comparison of the intensity of the signals for the vinyl proton associated with each, that of the former appearing at slightly lower field.
(c) 3-Cyclopentylidenemethyl-2,2-dimethylcyclopropylmethanol (10). With the same reaction conditions and work-up procedure as in (a), the allenic alcohol (5) ( $240 \mathrm{mg}, 1.35$ mmol ) in dry ether ( 4 ml ) was added to a solution of sodium ( $70 \mathrm{mg}, 3.0 \mathrm{mmol}$ ) in liquid ammonia ( 10 ml ) to produce, as a mobile oil, the alcohol ( 10 ) ( $195 \mathrm{mg}, 80 \%$; trans-cis, $3: 1$ ); $\nu_{\max } 3630$ and $3320 \mathrm{~cm}^{-1} ; m / e 180\left(M^{+}, 15 \%\right)$, $149(100)$, $93(57)$, and $79(50)$; $\tau 9.0$ and 8.94 (each $3 \mathrm{H}, \mathrm{s}$ ), 8.4 br $(4 \mathrm{H}, \mathrm{m}), 7 \cdot 8 \mathrm{br}(4 \mathrm{H}, \mathrm{m}), 5 \cdot 10 \mathrm{br}(1 \mathrm{H}, \mathrm{d}, J 7 \mathrm{~Hz}$; in the cisisomer this signal appears at $\tau 5 \cdot 0), 6.45(2 \mathrm{H}, \mathrm{AB}$ of ABX , $J_{\mathrm{AB}} 11 \mathrm{~Hz}, \mathrm{CH}_{2} \cdot \mathrm{OH}$ ), and ca. $9 \cdot 0(2 \mathrm{H})$. Crystallisation of the derived 3,5-dinitrobenzoate from ether-light petroleum preferentially afforded the trans-isomer as prisms, m.p. 106-108 (Found: C, 61.0; H, 6.0; N, 7.4. $\mathrm{C}_{19} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{6}$ requires $\mathrm{C}, 60.95 ; \mathrm{H}, 5 \cdot 9 ; \mathrm{N}, 7.5 \%$ ).

Oxidations.-(a) Chrysanthemic acid [2,2-dimethyl-3-(2-methylprop-1-enyl)cyclopropanecarboxylic acid] (12). AnalaR chromium trioxide ( $1 \mathrm{~g}, 0.01 \mathrm{~mol}$ ) was added carefully to dry pyridine ( 10 ml ) at $0^{\circ}$. The alcohol (7) ( $380 \mathrm{mg}, 2.5$ mmol ) in dry pyridine ( 3 ml ) was added in one portion and the mixture stirred at room temperature for 24 h , after which the aldehyde had formed [ $\tau 8.8$ and 8.69 (each 3 H , s, geminal tertiary Me), $8.28(6 \mathrm{H}$, s, vinyl Me), $5 \cdot 05 \mathrm{br}(1 \mathrm{H}, \mathrm{d}$, $J 7 \mathrm{~Hz}$; a weak signal at $\tau 6 \cdot 6$ indicated the presence of the cis-isomer), and $0.58(1 \mathrm{H}, \mathrm{d}, J 6 \mathrm{~Hz})]$. Normally, the aldehyde was not isolated, but after the addition of 5 drops of water, the mixture was stirred for a further 4 days.

The mixture was then poured into water ( 25 ml ) and ether was added ( 5 ml ). Powdered sodium hydrogen sulphate was added until the pH reached $3-4$ and the product was then extracted with ether ( $3 \times 50 \mathrm{ml}$ ). The combined extracts were washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$, and warmed under reduced pressure to remove the solvent. The product ( 300 mg ) was shown (t.l.c., i.r. and n.m.r.
spectra) to comprise about $25 \%$ chrysanthemaldehyde and $75 \%$ chrysanthemic acid (12) (trans-cis, 3:1), the latter being obtained in a yield of $55 \%$ based on chrysanthemyl alcohol. Preparative t.l.c. (ethyl acetate-light petroleum, $2: 3$ ) followed by sublimation ( $60^{\circ}$ and 0.01 mmHg ) afforded racemic trans-chrysanthemic acid, identical with an authentic sample (i.r., n.m.r., and mass spectra, t.l.c.); m.p. and mixed m.p. 46-48 ${ }^{\circ}$.
(b) 3-Cyclohexylidenemethyl-2,2-dimethylcyclopropanecarboxylic acid (13). The alcohol (9) ( $175 \mathrm{mg}, 0.9 \mathrm{mmol}$ ) in dry pyridine ( 2 ml ) was treated with chromium trioxide ( $370 \mathrm{mg}, 3.7 \mathrm{mmol}$ ) in dry pyridine ( 5 ml ) as in (a). Water ( 3 drops) was added after 24 h and the mixture was stirred for a further 4 days. After work-up as before the product ( 100 mg ) was shown (t.l.c., i.r. and n.m.r. spectra) to comprise about $90 \%$ of the acid ${ }^{7}$ (13) (trans-cis, $3: 1$ ) and $10 \%$ of the corresponding aldehyde, the yield of acid, purified by preparative t.l.c. (ethyl acetate-light petroleum, 2:3), being $50 \%$ based on (9). Although the acid (13) slowly solidified, preferential crystallisation of the trans-isomer could not be effected. The product showed $m / e 208\left(M^{+}\right.$, $25 \%$ ), 163(56), $121(42), 111(56), 81(100)$, and $55(70)$; $\tau 8.82$ and 8.70 (each $3 \mathrm{H}, \mathrm{s}), 8 \cdot 44 \mathrm{br}(6 \mathrm{H}, \mathrm{m}), 7 \cdot 9 \mathrm{br}(4 \mathrm{H}, \mathrm{m})$, and, for the trans-isomer $5 \cdot 12 \mathrm{br}(1 \mathrm{H}, \mathrm{d}, J 7 \mathrm{~Hz})$, the corresponding signal for the cis-isomer appearing at $\tau 4 \cdot 70$.
(c) 3-Cyclopentylidenemethyl-2,2-dimethylcyclopropanecarboxylic acid (14). The alcohol (10) ( $495 \mathrm{mg}, 2.9 \mathrm{mmol}$ ) in dry pyridine ( 5 ml ) was treated with chromium trioxide ( 1 g , 0.01 mol ) in dry pyridine ( 15 ml ) as in (a). Water ( 5 drops) was added after 24 h and the mixture was stirred for a further 6 days. After work-up as before the product (336 mg ) was shown (t.l.c., i.r. and n.m.r. spectra) to comprise about $70 \%$ of the acid ${ }^{7}$ (14) (trans-cis, $3: 1$ ) and $20 \%$ of the corresponding aldehyde, the yield of acid, isolated as a viscous oil by preparative t.l.c. (ethyl acetate-light petroleum, $2: 3$ ), being $45 \%$, based on (10). The product showed $m / e 194\left(M^{+}, 10 \%\right), 149(24), 111(31), 67(54)$, and $41(100)$; $\tau 8.84$ and 8.68 (each $3 \mathrm{H}, \mathrm{s}$ ), $8.3 \mathrm{br}(4 \mathrm{H}, \mathrm{m})$, $7 \cdot 7 \mathrm{br}(4 \mathrm{H}, \mathrm{m})$, and for the trans-isomer, $4.96 \mathrm{br}(1 \mathrm{H}, \mathrm{d}, J 7$ Hz ), the corresponding signal for the cis-isomer appearing at $\tau 4.50$.
(d) 2,2-Dimethyl-3-(2-methylprop-1-enylidene)cyclopropanecarboxylic acid (15). The allenic alcohol (2) $(460 \mathrm{mg}$, 3.0 mmol ) in dry pyridine ( 5 ml ) was treated with chromium trioxide ( $1.1 \mathrm{~g}, 0.011 \mathrm{~mol}$ ) in dry pyridine ( 15 ml ) as in (a). Water ( 5 drops) was added after 24 h and the mixture was stirred for 14 days. After work-up as before the product ( 265 mg ) was shown (t.l.c., n.m.r. spectrum) to comprise about $80 \%$ of the allenic acid (15) and $20 \%$ of the corresponding aldehyde, the yield of acid isolated as a viscous oil by preparative t.l.c. (ethyl acetate-light petroleum, 2:3) being $40 \%$ based on (2). The product showed $m / e 166$ $\left(M^{+}, 8 \%\right), 151(12), 74(55)$, and $59(100)$; $\nu_{\max } 1715$ and $2025 \mathrm{~cm}^{-1}$; $\tau 8.66$ and 8.50 (each $3 \mathrm{H}, \mathrm{s}$ ) and $8.20(6 \mathrm{H}, \mathrm{s}$, vinyl Me).
(e) 3-Cyclohexylidenemethylene-2,2-dimethylcyclopropanecarboxylic acid (16). The allenic alcohol (4) ( $200 \mathrm{mg}, 1 \cdot 0$ mmol ) in dry pyridine ( 4 ml ) was treated with chromium trioxide ( $570 \mathrm{mg}, 5.7 \mathrm{mmol}$ ) in dry pyridine ( 6 ml ) as in (a). Water ( 3 drops) was added after 24 h and the mixture was stirred for 14 days. After work-up as before, the product ( 75 mg ) was shown (t.l.c., i.r. and n.m.r. spectra) to comprise about $75 \%$ of the allenic acid (16) and about $25 \%$ of the corresponding aldehyde. Preparative t.l.c. (ethyl acetate-light petroleum, 2:3) afforded the pure acid (56
$\mathrm{mg}, \mathbf{2 5 \%}$ ), m.p. $138-139^{\circ}$ (prisms from ether-light petroleum) ; $v_{\max } 1700$ and $2015 \mathrm{~cm}^{-1}$; $m / e 206(72 \%)$, $191(59)$, $119(43)$, $105(62)$, and $91(100)$; $\tau 8.65$ and 8.58 (each $3 \mathrm{H}, \mathrm{s}$ ), $8.44(6 \mathrm{H}, \mathrm{m})$, and $7.84(4 \mathrm{H}, \mathrm{m})$ (Found: C, $75 \cdot 6 ; \mathrm{H}, 8.9$. $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{O}_{2}$ requires $\mathrm{C}, 75 \cdot 7 ; \mathrm{H}, 8.8 \%$ ).

We thank Professor L. Crombie (Nottingham) for samples of ( $\pm$ )-trans-chrysanthemic acid and ( $\pm$ )-cis- and ( $\pm$ )-trans-chrysanthemyl alcohols. We also thank the S.R.C. for a studentship (to R. W. M.).
