#### Abstract

The title betaines are prepared: the two triazinyl betaines undergo spontaneous thermal dimerisation, and all add a variety of $2 \pi, 4 \pi$, and/or $6 \pi$ dipolarophiles. The regio- and stereo-chemistry of the addition are elucidated and rationalised. The pyridyl adducts undergo quaternisation and ring opening to tropolones.

1-Methyl-3-oxidoopyridinium (1) has been shown ${ }^{2}$ to react with activated addends to give 8 -azabicyclo[3.2.1]-oct-3-en-2-ones which are readily converted into tropones and tropolones. ${ }^{3}$ Cycloadducts are obtained more easily from 3-oxido-1-phenylpyridinium ${ }^{4}$ (2) but these are $N$ alkylated ${ }^{5}$ only with difficulty, by use of methyl fluorosulphonate ${ }^{6}$ and methyl trifluoromethanesulphonate. ${ }^{7}$ $N$-(Pyridyl) substituents should activate the betaine towards cycloaddition and it was expected that they could be cleaved readily from the cycloadducts: Schmid and Wolkoff ${ }^{8}$ made alkenes by facile thermal eliminations of 4 -alkoxy- $N$-methylpyridinium iodides. We therefore undertook the preparation of the $N$-2-pyridyl (6) and $N$-4-pyridyl (3) betaines and analogues with other heterocyclic substituents.

## RESULTS AND DISCUSSION

3-Oxido-1-(4-pyridyl)pyridinium (3) and 3-Oxido-1-(2pyridyl)pyridinium (6).-3-Hydroxy-1-(4-pyridyl)pyridinium chloride (14) (prepared from 3-hydroxypyridine and 4-chloropyridine), when treated with IRA-401 $(\mathrm{OH})^{9}$ resin, gives the hydrated betaine (3), m.p. $105-106{ }^{\circ} \mathrm{C}(\mathrm{m} / \mathrm{e} 172)$. phenylpyridinium ${ }^{4}(2)$, and unlike the 5 -nitro-2-pyridyl analogue (5), ${ }^{10}$ these 2- (6) and 4 -pyridyl (3) betaines do not undergo thermal dimerisation.

Betaines (3) and (6) react with monosubstituted olefins to give good yields of the expected ${ }^{4}$ cycloadducts: thus acrylonitrile yields the 6 -endo- [(17) and (35)], 6-exo(34), and 7 -endo-derivatives (36); methyl acrylate yields the 6 -endo- [(18) and (28)] and 6 -exo-derivatives (29); styrene yields exclusively the 6 -endo-adducts [(19) and (27)]; ethyl vinyl ether also yields exclusively the 6 -endo-adducts $[(20)$ and (30)]. 3-Chlorostyrene reacts with betaine (6) to yield the 6 -endo-aryl adduct (31) (cf. reactions of 3 -oxido-1-phenylpyridinium and sub-
betaine (6) produced both the exo- (54) and the endoadducts (56). The n.m.r. spectra (Table 1, and Table 2 of SUP 22631) confirm the exo-stereochemistry of compounds (53) and (54) since $6-\mathrm{H}$ and $7-\mathrm{H}$ form an AB quartet and the bridgehead protons, $1-\mathrm{H}$ and $5-\mathrm{H}$, exhibit a singlet and a doublet, respectively (endostereochemistry would cause the bridgehead protons, 1-H and $5-\mathrm{H}$, to exhibit a doublet or double doublet, and a triplet respectively).

Unlike 3 -oxido-1-phenylpyridinium, ${ }^{4}$ both the pyridyl betaines (3) and (6) with $N$-phenylmaleimide yield single endo-adducts, (49) and (50) respectively. The endostereochemistry was demonstrated for (49) and (50) by

spectra (Table 2) were especially significant and assignments were made by analogy with the corresponding $N$ -(diphenyl-1,3,5-triazinyl)- (62) and $N$-(dimethoxy-1,3,5-triazinyl)-dimers (63) previously reported. ${ }^{13}$ Assign-

[^0]ments were confirmed by double-irradiation experiments. The signal of the bridgehead proton not located $\alpha$ to a nitrogen atom, absorbs at higher field than those of the syn-structure [(61) or (60)] as against the antiform (64). The exo-configuration of both dimers was supported by the $2-\mathrm{H}-6-\mathrm{H}$ coupling, $2.0-2.5 \mathrm{~Hz}$.
$1^{-}$Molecular models show that only in the exo-structure does the four-bond system connecting $2-\mathrm{H}$ and $6-\mathrm{H}$ assume a planar configuration required for $W$-type coupling.

The triazinyl betaine dimers (60) and (61) evidently undergo reversible de-dimerisation readily, for they form cycloadducts derived from the monomeric betaines (8) and (9) readily with a variety of $2 \pi$ and $4 \pi$ dipolarophiles. Thus acrylonitrile yields the expected ${ }^{4} 6$-endo[(41) and (43)] and 6-exo-derivatives [(46) and (44)];
methyl acrylate yields the 6 -endo- [(42) and (38)] and the 6 -exo-derivatives (48); styrene yields exclusively the 6 -endo-adducts [(40) and (45)]. In the reaction of the monophenyltriazinyl betaine (8), the 7 -endo-carbonitrile (47) was produced in $15 \%$ yield along with the expected 6 -carbonitriles [(41) $38 \%$ and (46) $24 \%$ ]. The diphenyl betaine ( 9 ) combines with 2 -chloroacrylonitrile to produce a single 6 -substituted isomer (37). The spectral data for all these ethylenic adducts are consistent with the structures proposed (see Table 5 of SUP 22631 for n.m.r. data and Experimental section for i.r. data).

Diethyl fumarate with the diphenyltriazinyl betaine (9) produced a single trans-cycloadduct (39). The n.m.r. spectrum of (39) (Table 5 of SUP 22631) exhibits a double doublet ( $J_{1,7 \text { eexo }} 8.0 ; J_{1,3} 1.5 \mathrm{~Hz}$ ) for 1-H and a doublet ( $J_{4,5} 6.0 \mathrm{~Hz}$ ) for $5-\mathrm{H}$.

Indene readily reacted as a $2 \pi$ addend with the diphenyltriazinyl betaine (9) to yield two endo-adducts (65) and (66) in low yields. The n.m.r. spectra (Table 5 of SUP 22631) of these indene adducts (65) and (66) exhibit double doublets for $1-\mathrm{H}$ confirming the endostereochemistry of the cycloadducts. Further structural features were elucidated by exhaustive spin-spin decoupling techniques. The strained $2 \pi$ addend, acenaphthylene, cycloadded to the diphenyltriazinyl betaine (9) to produce both the endo- (57) and the exoadducts (55): the n.m.r. spectrum (Table 5 of SUP 22631) confirms the stereochemistry in each case. The diphenyltriazinyl betaine (9) with $N$-phenylmaleimide

(66)
yields both endo- (51) and exo-adducts (52). The endostereochemistry of (51) was demonstrated by the n.m.r. spectrum (Table 5 of SUP 22631) since $1-\mathrm{H}$ and 5 -H exhibit a doublet and a triplet respectively. The exostereochemistry of (52) was demonstrated by the n.m.r. spectrum (Table 5 of SUP 22631) since $1-\mathrm{H}$ and $5-\mathrm{H}$ show a singlet and a doublet respectively.

Cycloadditions were also achieved readily with acety-
lenic dipolarophiles: dimethyl but-2-ynedioate and methyl prop-2-ynoate reacted with the betaine (9) to yield the 2,6 -adducts (68) and (67) respectively. The n.m.r. spectra (Table 5 of SUP 22631) for both adducts exhibit a doublet ( $J 5 \mathrm{~Hz}$ ) for $5-\mathrm{H}$ confirming the presence of a methoxycarbonyl group at C-6.

components. Heating the diphenyltriazinyl dimer (60) with cyclopentadiene gives a mixture of the products [(69)-(71)] which were separated by chromatography. The dimer (60) itself undergoes, without de-dimerisation, a Diels-Alder cycloaddition with cyclopentadiene acting as a diene to yield the compound (71). The dimer (60) also acts as a source of the triazinyl betaine (9) which reacts with cyclopentadiene, at elevated temperature, to yield the 2,6-adduct (69). Adduct (69), in part, undergoes a Diels-Alder reaction with more cyclopentadiene giving the adduct (70). We have previously reported ${ }^{14}$ the comparable double addition of cyclopentadiene to 1-(5-nitro-2-pyridyl)-3-oxidopyridinium (5). The evidence for the structures of (70) and (71) includes the absence of the $\alpha \beta$-unsaturated carbonyl stretching frequency initially present in the 2,6 -adduct (69) and the dimer ( $64 ; \mathrm{R}=\mathrm{Ph}$ ), respectively. No simple 2,4adducts were detected in the reaction of dimer (60) and cyclopentadiene, in contrast to the reaction ${ }^{14}$ of pyrimidinyl betaine dimer with cyclopentadiene. We believe that the absence of 2,4 -adducts is a result of the 2,6 adduct being thermodynamically more stable. However, 2,3-dimethylbuta-1,3-diene reacts with the betaine (9) to yield the 2,4 -adduct (73), and buta-1,3-diene (prepared in situ from 2,5-dihydrothiophen sulphone) also combines as a diene with both betaines (9) and (8) to afford the 2,4 -adducts (74) and (72) respectively. The i.r. spectra of the 2,4 -adducts exhibit saturated carbonylstretching frequencies for the bridgehead carbonyl groups at $1720-1725 \mathrm{~cm}^{-1}$; their structures and the exo-stereochemistry were confirmed by the n.m.r. spectra (Table 5 of SUP 22631).

3-Oxido-1-(quinoxolin-2-yl)pyridinium (7).-2-Chloroquinoxoline and 3 -hydroxypyridine readily afforded the corresponding quaternary salt (15) which was characterised as the crystalline perchlorate, m.p. $195-197{ }^{\circ} \mathrm{C}$. From this salt, the quinoxolinyl betaine (7) was readily prepared in situ by the addition of triethylamine. The $2 \pi$ addends acrylonitrile, 2 -chloroacrylonitrile, methyl

Stereoselectivity and Regioselectivity.-endo-Addition of conjugated olefins is favoured by secondary orbital overlap ${ }^{15}$ but disfavoured by steric factors and dipoledipole interactions. ${ }^{16}$ The exclusive formation of the endo-adduct from the reaction of $N$-phenylmaleimide and the betaines (3) and (6) is the result of strong interaction between the lowest-unoccupied molecular orbital (LUMO) of the betaine and the highest-occupied molecular orbital (HOMO) of $N$-phenylmaleimide, cf. the dinitrophenyl ${ }^{17}$ (4) and nitropyridyl ${ }^{14}(5)$ betaines which also give exclusively the endo-adducts. The formation of the thermodynamically more stable exo-product (52) in the reaction of $N$-phenylmaleimide and betaine ( 9 ) is probably the result of thermal isomerism of the initially
formed kinetic product, the endo-isomer (51) [cf. the $N$ -(diphenyl-1,3,5-triazinyl)-dimer (62)]. ${ }^{13}$

Generally, stereoselectivity is lost in the addition of N -aryl betaines to acrylonitrile, methyl acrylate, and methyl vinyl ketone: here the secondary overlap is weaker and the steric and dipole-dipole interactions are stronger, which leads to considerable formation of the exo-adduct (see Table 3), with the exception of betaine (3) with which acrylonitrile and methyl acrylate yield exclusively the endo-adducts. The conjugated dipolarophile, styrene, yields exclusively the endo-adduct since the secondary overlap predominates over the weak dipole-dipole interaction. However, with acenaphthylene steric factors lead to the formation of the exoisomer as the predominant isomer. Reversal of polarity of ethyl vinyl ether leads to a favourable dipole-dipole interaction which is responsible for the sole formation of the endo-adduct.

We have previously ${ }^{14}$ shown that frontier molecular orbital ${ }^{11}$ theory correctly predicts that electron-donating, electron-accepting, and conjugated monosubstituted olefins all add to give exclusively the 6-regioisomers; this holds also in the present case.

Our present studies have shown that the 3-oxido-1heteroarylpyridinium betaines form a series which displays increasing reactivity in pericyclic reactions with olefinic dipolarophiles viz. (8) $\approx(9)>(7)>$ $(6)>(3)>(2)>(1)$. The ease of thermal dimerisation of an $N$-substituted 3-oxidopyridinium is a function of the $N$-substituent. In general, the more electronwithdrawing the $N$-substituent, the smaller is the energy difference between the frontier orbitals of the two reacting betaine molecules and the more favoured is dimerisation. The $N$-(5,6-diphenyl-1,2,4-triazin-3-yl) (9) and $N$-(5-phenyl-1,2,4-triazin-3-yl) betaine (8) possess strong electron-withdrawing $N$-substituents and readily dimerise, although not as readily as the analogous symmetrical triazinyl betaine (62). ${ }^{13}$

The $4^{\prime}$-aza-substituent in 3-oxido-1-phenylpyridinium should exert ${ }^{11}$ a considerable lowering effect on the LUMO resulting in a smaller frontier-orbitals energy separation. The present study has shown that this activation is not sufficient for dimerisation. To further increase this reactivity, the pyridyl betaine (3) was methylated with MeI to yield the bis-salt (75), characterised as the perchlorate (76). However, attempts to prepare the corresponding betaine (77) by base treatment proved unsuccessful; presumably the betaine (77) is unstable.

Tropone Formation.-The cycloadducts (17)-(20), (53), (27), (26), and (24) were readily quaternised by methyl iodide, methyl perchlorate, or methyl toluene- $p$ sulphonate on the ring nitrogen, as expected, to give the salts (78)-(83), (85), (84), (86), and (87). the corresponding tropone perchlorate (88), m.p. $250^{\circ} \mathrm{C}$. Further hydrolysis ${ }^{18}$ of this perchlorate to the corresponding tropolone (89) proved unsuccessful, presumably owing to the intervention of the tautomer (90) under basic conditions. Pietra et al. ${ }^{19}$ have described the facile nucleophilic displacement of chlorine and the tosyloxy-group from 2 -chloro- and 3-tosyloxy-tropones by alkoxide. Attempted acid-catalysed hydrolysis of the diphenyltriazinyl adduct (45) yielded only benzil, derived from the hydrolysis ${ }^{20}$ of the triazinyl ring.

M.p.s were determined with a Reichert apparatus. The spectra were recorded with a Perkin-Elmer 257 grating i.r. spectrophotometer, a Hitachi-Perkin-Elmer RMU-6E mass spectrometer, and a Varian HA-100 n.m.r. spectrometer. Compounds were purified until they were observed as single spots on t.l.c. using Kieselgel GF 254 (Type 60).

7-endo-(5,6-Diphenyl-1,2,4-triazin-3-yl)-3,4-dimethyl-7-azabicyclo[4.3.1]deca-3,8-dien-10-one (73).-The dimer (60) $(0.4 \mathrm{~g}, 0.6 \mathrm{mmol})$ and 2,3 -dimethylbuta-1,3-diene ( $3 \mathrm{~g}, 37$ mmol ) in $\mathrm{MeCN}(20 \mathrm{ml}$ ) were heated under reflux (b.p. $81^{\circ} \mathrm{C}$ ) for 48 h . The reaction mixture was evaporated to dryness to yield a residue which was purified by preparative t.l.c. [light petroleum (b.p. $40-60{ }^{\circ} \mathrm{C}$ )-EtOAc (2:1)]. The title compound (73) ( $0.06 \mathrm{~g}, 11.5 \%$ ) was isolated as yellow microcrystals, m.p. $88-90^{\circ} \mathrm{C}$ [from light petroleum (b.p. $40-60^{\circ} \mathrm{C}$ )] (Found: C, 73.5; H, $5.9 ; \mathrm{N}, 13.4$. $\mathrm{C}_{26} \mathrm{H}_{24} \mathrm{~N}_{4} \mathrm{O} \cdot \mathrm{H}_{2} \mathrm{O}$ requires $\mathrm{C}, 73.2 ; \mathrm{H}, 6.1 ; \mathrm{N}, 13.1 \%$ ); $\nu_{\text {max. }}$ (Nujol) $3400\left(\mathrm{H}_{2} \mathrm{O}\right)$, 1725 (saturated $\mathrm{C}=\mathrm{O}$ ), and 1640 $\mathrm{cm}^{-1}$ (enamine, $\mathrm{C}=\mathrm{C}-\mathrm{N}$ ); $m / e 426$.

7-endo-(5,6-Diphenyl-1,2,4-triazin-3-yl)-7-azabicyclo-
[4.3.1]deca-3,8-dien-10-one (74).-The dimer (60) ( 0.5 g , $7.66 \times 10^{-6} \mathrm{~mol}$ ) and thiophen sulphone $(2.5 \mathrm{~g}, 20 \mathrm{mmol})$ in toluene ( 20 ml ) were heated under reflux (b.p. $120^{\circ} \mathrm{C}$ ) for 48 h . The reaction mixture was evaporated to dryness in vacuo to yield a dark residue which was purified by preparative t.l.c. [light petroleum (b.p. $60-80^{\circ} \mathrm{C}$ )-EtOAc (2:1)]. The title compound (74) $(0.078 \mathrm{~g}, 13 \%)$ was isolated as yellow needles, m.p. $178-180^{\circ} \mathrm{C}$ (EtOH) (Found: C, 75.7; $\mathrm{H}, 5.2 ; \mathrm{N}, 14.5 . \quad \mathrm{C}_{24} \mathrm{H}_{20} \mathrm{~N}_{4} \mathrm{O}$ requires $\mathrm{C}, 75.8 ; \mathrm{H}$, $5.3 ; \mathrm{N}, 14.7 \%$ ); $\nu_{\max .}$ (Nujol) 1720 (saturated $\mathrm{C}=\mathrm{O}$ ) and 1655 (enamine, $\stackrel{\mathrm{C}}{\mathrm{max}}=\mathrm{C}-\mathrm{N})$; $m / e 380$ ( $M^{+\cdot}$ ).

Similarly prepared was 7 -endo-(5-phenyl-1,2,4-triazin-3-yl)-7-azabicyclo[4.3.1]deca-3,8-dien-10-one (72) (22.9\%), m.p. $148-150{ }^{\circ} \mathrm{C}$, as yellow needles ( EtOH ) (Found: C, 70.2; $\mathrm{H}, 5.3 ; \mathrm{N}, 18.1 . \mathrm{C}_{18} \mathrm{H}_{16} \mathrm{~N}_{4} \mathrm{O} \cdot 0.25 \mathrm{H}_{2} \mathrm{O}$ requires C , 70.0 ; H, 5.4; N, $18.1 \%$ ); $\nu_{\text {max. }}$ (Nujol) 1720 (saturated $\mathrm{C}=\mathrm{O}$ ), 1655 (enamine, $\mathrm{C}=\mathrm{C}-\mathrm{N}$ ), and $1600 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{C})$.

3-Hydroxy-1-(1-methyl-4-pyridyl)pyridinium Di-iodide (75).-The pyridinium salt (14) ( $\left.1.09 \mathrm{~g}, 5.3 \times 10^{-3} \mathrm{~mol}\right)$ and $\operatorname{MeI}\left(5 \mathrm{~g}, 3.5 \times 10^{-2} \mathrm{~mol}\right)$ in $\mathrm{EtOH}(25 \mathrm{ml})$ were heated under reflux for 10 h . The precipitate ( $1.7 \mathrm{~g}, 73 \%$ ) was crystallised from EtOH-EtOAc to yield the methiodide (75) as brown needles, m.p. $162-164{ }^{\circ} \mathrm{C}$ (Found: C, 29.5; H, 2.9; $\mathrm{N}, 6.4$. $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{I}_{2} \mathrm{~N}_{2} \mathrm{O}$ requires $\mathrm{C}, 29.9 ; \mathrm{H}, 2.7 ; \mathrm{N}$, $6.3 \%$ ) ; $\nu_{\text {max }}$ (Nujol) $1630 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{C}-\mathrm{N})$.

The iodide ( 75 ) ( $1.0 \mathrm{~g}, 2.3 \times 10^{-3} \mathrm{~mol}$ ) in water ( 5 ml ) was treated with IRA-401 $\left(\mathrm{ClO}_{4}{ }^{-}\right)$to give the perchlorate (76) ( $0.7 \mathrm{~g}, 72.2 \%$ ) as white needles, m.p. $138-140{ }^{\circ} \mathrm{C}$ (EtOH) (Found: C, 34.4; H, 3.4; N, 7.5. $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{Cl}_{2} \mathrm{~N}_{2} \mathrm{O}_{9}$ requires C, 34.1 ; H, 3.1; N, 7.2\%) ; $\nu_{\max .}$ (Nujol) $1640(\mathrm{C}=\mathrm{C}-\mathrm{N})$ and $1100 \mathrm{~cm}^{-1}\left(\mathrm{ClO}_{4}^{-}\right)$.

Methyl 2-Oxo-6-endo-phenyl-8-(2-pyridinium)-8-azabi-cyclo[3.2.1]oct-3-ene Toluene-p-sulphonate (85).-The cyclo-
adduct (27) ( $4.8 \mathrm{~g}, 1.7 \times 10^{-2} \mathrm{~mol}$ ) and methyl toluene- $p$ sulphonate ( $5.0 \mathrm{~g}, 2.7 \times 10^{-2} \mathrm{~mol}$ ) were heated at $120^{\circ} \mathrm{C}$ for 24 h . The black product was washed with EtOAc to yield the required toluene-p-sulphonate (85) ( $5.8 \mathrm{~g}, 76.5 \%$ ) as colourless needles, m.p. $162-164{ }^{\circ} \mathrm{C}$ (EtOH-EtOAc) (Found: C, 67.2; H, 5.6; N, 6.1. $\mathrm{C}_{26} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{~S}$ requires C, 67.5; H, 5.7; N, 6.1\%) ; $\nu_{\text {max. }}$ (Nujol) 1690 ( $\alpha \beta$-unsaturated $\mathrm{C}=\mathrm{O}$ ), 1640 (enamine, $\mathrm{C}=\mathrm{C}-\mathrm{N}$ ), and $1580 \mathrm{~cm}^{-1}$ (aromatic $\mathrm{C}=\mathrm{C}$ ).

Methyl 2-Oxo-6-endo-phenyl-8-(2-pyridinium)-8-azabi-cyclo[3.2.1]oct-3-ene Iodide (84).-The styrene adduct (27) $\left(0.15 \mathrm{~g}, 0.5 \times 10^{-3} \mathrm{~mol}\right)$ and $\mathrm{MeI}(15 \mathrm{ml})$ in EtOAc ( 25 ml ) were heated under reflux for 36 h . The white precipitate was collected to yield the iodide (84) ( $70 \mathrm{mg}, 30 \%$ ) as colourless microcrystals, m.p. $185-186{ }^{\circ} \mathrm{C}(\mathrm{EtOH})$ (Found: C, $53.3 ; \mathrm{H}, 4.8 ; \mathrm{N}, 6.8 . \quad \mathrm{C}_{19} \mathrm{H}_{19} \mathrm{IN}_{2} \mathrm{O} \cdot 0.5 \mathrm{H}_{2} \mathrm{O}$ requires C, 53.4; H, 4.7; N, 6.6\%); $\nu_{\text {max }}$ (Nujol) $3400\left(\mathrm{H}_{2} \mathrm{O}\right)$, 1690 ( $\alpha \beta$-unsaturated $\mathrm{C}=\mathrm{O}$ ), 1640 (enamine, $\mathrm{C}=\mathrm{C}-\mathrm{N}$ ), and $1580 \mathrm{~cm}^{-1}$ (aromatic $\mathrm{C}=\mathrm{C}$ );

Similarly prepared were: methyl 2 -oxo-6-endo-phenyl-8-(2-quinoxolinium)-8-azabicyclo[3.2.1]oct-3-ene iodide (86) ( $61 \%$ ), m.p. $218-220{ }^{\circ} \mathrm{C}$ as orange microcrystals (EtOH). Compound (86) was unstable to repeated recrystallisation thus precluding satisfactory elemental analysis; $\nu_{\text {max. }}$ (Nujol) 1690 ( $\alpha \beta$-unsaturated $\mathrm{C}=\mathrm{O}$ ) and $1640 \mathrm{~cm}^{-1}$ (enamine, $\mathrm{C}=\mathrm{C}-\mathrm{N})$; methyl 6-endo-methoxycarbonyl-2-oxo-8-(2-quinoxo-linium)-8-azabicyclo[3.2.1]oct-3-ene iodide (87) (50\%), m.p. $193-195^{\circ} \mathrm{C}$, as yellow microcrystals ( EtOH ), which was also unstable to repeated recrystallisation thus precluding satisfactory elemental analysis; $v_{\text {max. }}$ (Nujol) 1735 (saturated $\mathrm{C}=\mathrm{O}$ ), 1680 ( $\alpha \beta$-unsaturated $\mathrm{C}=\mathrm{O}$ ), and $1640 \mathrm{~cm}^{-1}$ (enamine, $\mathrm{C}=\mathrm{C}-\mathrm{N}$ ).

Methyl 4-(1-Oxo-4-phenylcyclohepta-2,4,6-trien-2-ylamino) pyridinium Perchlorate (88).-The iodide (81) ( 2.65 g , $\left.6.2 \times 10^{-3} \mathrm{~mol}\right)$ and $\mathrm{Ag}_{2} \mathrm{O}\left(1.8 \mathrm{~g}, 7.8 \times 10^{-3} \mathrm{~mol}\right)$ were stirred in water ( 110 ml ) at room temperature for 3 h and the solid was then removed by filtration to yield a yellow filtrate. $\mathrm{NaClO}_{4}$ was added dropwise to yield the perchlorate (88) ( $2.09 \mathrm{~g}, 73.6 \%$ ) as a yellow amorphous solid, m.p. $250{ }^{\circ} \mathrm{C}$ (decomp.) (MeOH) (Found: C, 56.1; H, 4.5; N, 6.6. $\mathrm{C}_{19} \mathrm{H}_{17} \mathrm{ClN}_{2} \mathrm{O}_{5} \cdot \mathrm{H}_{2} \mathrm{O}$ requires $\mathrm{C}, 56.1 ; \mathrm{H}, 4.7 ; \mathrm{N}, 6.9 \%$ ); $\nu_{\max }$ (Nujol) $3500(\mathrm{O}-\mathrm{H}), 1650$ ( $\alpha \beta$-unsaturated $\mathrm{C}=\mathrm{O}$ ), and $110 \mathrm{~cm}^{-1}\left(\mathrm{ClO}_{4}^{-}\right) ; ~ \delta\left(\mathrm{D}_{2} \mathrm{O}\right) 4.04\left(3 \mathrm{H}, \mathrm{s}, \mathrm{N}^{+}-\mathrm{Me}\right), 7.14$ ( 11 H , br $\mathrm{s}, 3,5,6,7,3^{\prime}, 5^{\prime}-\mathrm{H}+\mathrm{Ph}$ ), and $8.24(2 \mathrm{H}$, br s, $\left.2^{\prime}, 6^{\prime}-\mathrm{H}\right)$.

We thank Dr. A. D. McNaught (Chemical Society) for help with nomenclature.
