# Synthetic Studies of Carbohydrate Derivatives by Photochemical Reactions. Part 16.1 Synthesis of Dl-Apiose Derivatives by Photochemical Cycloaddition of 1,3-Dihydroxypropan-2-one Derivatives with Ethenediol or Ethenol Derivatives 

By Younosuke Araki," Jun-ichi Nagasawa, and Yoshiharu Ishido, Department of Chemistry, Faculty of Science, Tokyo Institute of Technology, O-okayama, Meguro-ku, Tokyo 152, Japan

#### Abstract

Irradiation of a benzene solution of 1,3-diacetoxypropan-2-one (5) and 1,3-dioxol-2-one (6) with a high-pressure mercury lamp gave a photocycloaddition product, (7-acetoxymethyl-3-oxo-2,4,6-trioxabicyclo[3.2.0]heptan-7-yl)methyl acetate (7) ( $55 \%$ yield). Similar photocycloadditions of (5) with (Z)-vinylene diacetate (23), with (Z)-2(benzyloxy) vinyl acetate (25), with 2,3-dihydro-1,4-dioxin (27), with vinyl acetate (28), with isopropenyl acetate (29), with ethoxyethene (30), and with 1,1-diethoxyethene (43) afforded cis-4,4-bis(acetoxymethyl)oxetan-2,3-diyl diacetate ( 31 ) ( $46 \%$ yield) and the trans-isomer ( 32 ) ( $49 \%$ yield); 2,2-bis(acetoxymethyl)-4-(benzyloxy)-oxetan- 3 -yl acetate (33) (composed of the two isomers; $11 \%$ and $26 \%$ yields) and 4,4 -bis- (acetoxymethyl)-3benzyloxy) oxetan-2-yl acetate (38) (composed of the two isomers; $11 \%$ and $9 \%$ yields); ( 8 -acetoxymethyl-2,5,7-trioxabicyclo[4.2.0]oct-8-yl) methyl acetate (34) ( $25 \%$ yield); 2,2-bis(acetoxymethyl) oxetan-3-yl acetate (35) ( $28 \%$ yield) and 4,4-bis(acetoxymethyl)oxetan-2-yl acetate (39) ( $15 \%$ yield); 2,2-bis(acetoxymethyl)-3-methyloxetan- 3 -yl acetate (36) (55\% yield) ; (2-acetoxymethyl-3-ethoxyoxetan-2-yl)methyl acetate (37) (53\% yield); and (2-acetoxymethyl-3,3-diethoxyoxetan-2-yl)methyl acetate (44) (48\% yield) and ethyl 4-acetoxy-3-acetoxymethyl-3-hydroxybutyrate (45) (19\% yield), respectively. The reaction of (5) with (43) was also induced thermally to give ethyl 4 -acetoxy-3-(acetoxymethyl)coronate (46) ( $24 \%$ yield) in addition to ( 45 ) ( $20 \%$ yield). Photocycloaddition of diethyl mesoxalate (21) with (6) gave diethyl 3-oxo-2,4,6-trioxabicyclo[3.2.0] heptane-7,7dicarboxylate (22) ( $23 \%$ yield). On the other hand, the reactions of 1,3-dimethoxy- (8) and 1,3-bis(benzyloxy)-propan-2-one (13) respectively with (6) afforded none of the expected photocycloadducts, but several products due to the intramolecular hydrogen abstraction from (8) and (13). The reaction of 2,2-dimethyl-1,3-dioxan-5-one (2) with (6) was also accompanied by predominant decomposition of (20).

We have reported a series of synthetic studies of carbohydrate derivatives by photochemical additions to enose derivatives. ${ }^{1}$ We now report the synthesis of branchedchain sugar derivatives by photocycloaddition of ketonic species to alkene derivatives, which has recently been briefly communicated. ${ }^{2}$

## RESULTS AND DISCUSSION

In the first place, the reaction was performed by use of the most easily available materials, i.e. 1,3 -diacetoxy-propan-2-one (5) and 1,3-dioxol-2-one (6); (5) was subjected to the reaction with (6) (2 equiv.) in a variety of solvents $\ddagger$ under irradiation with a high-

The Paterno-Büchi reaction is known to afford oxetans through the photocycloaddition reaction of carbonyl compounds to alkenes. ${ }^{3}$ However, the reaction has seldom been applied to synthesis of natural products, although well studied from the standpoint of synthetic and mechanistic aspects. ${ }^{4}$ This reaction should afford Dl-apiose $\dagger$ (4) if we use 1,3 -dihydroxypropan- 2 -one derivatives (1) as carbonyl species and ethene-1,2-diol derivatives (2) as alkenic species in combination with subsequent hydrolysis of the resulting oxetan derivatives (3). On the basis of such an assumption, we undertook an investigation of oxetan formation via photocyclic addition for the synthesis of DL-apiose derivatives.

[^0]pressure mercury lamp. The results thus obtained and the conditions used are summarized in Table 1. The reactions in all the solvents shown in the Table and that without solvent afforded the desired oxetan, i.e. (7-acetoxymethyl-3-oxo-2,4,6-trioxabicyclo-[3.2.0]heptan-7-yl)methyl acetate (4,4'-di-O-acetyl-1,2-$O$-carbonyl-Dl-apiotetranose) (7). Among the solvents, benzene was shown to give the highest yield, calculated on the amounts of consumed (5). The reactions in the solvents other than benzene were accompanied by sidereactions (see Table 1). On the other hand, some reactions gave no (7), according to t.l.c. analysis, but only precipitated polymers of (6), this occurred in 1,4 -dioxan, tetrahydrofuran, 1,2-dimethoxyethane, methanol, and isopropyl alcohol; the results are not shown in Table 1.

[^1]A solution containing only (6) afforded no precipitates on irradiation under the same conditions. Therefore the polymerization of (6) is presumably initiated by radical species arising from hydrogen abstraction from

${ }^{a}$ All the reactions of (5) with (6) were performed under irradiation with a high-pressure mercury lamp ( 450 W ), and the resulting mixtures were then chromatographed on a column of silica gel. $\quad$. The reactions of Entries 1-4, 5-9, and $10-15$ were performed together, respectively, to standardize the luminous intensity as far as possible. ${ }^{c}$ The yields in parentheses are of those based on the amount of (5) consumed. ${ }^{d}$ This reaction was carried out in the presence of biphenyl ( 0.5 m ).
abstraction reaction. Consequently, benzene was used in the reactions which will be described below.

In the second place, conditions for the reaction of (5) with (6) were investigated with respect to concentration,
proportions, and reaction times; the results are summarized in Table 2. As seen from Entries 1-4, the yield of (7) was improved on prolonging the reaction time. Incidentally, ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy showed the resulting mixture, after irradiation for 80 h (Entry 4), to involve 2.6 -fold mol of (6) to (5). Moreover, (7) ( $81 \%$ ) was recovered on 82 h -irradiation of a 0.1 m benzene solution under the same condition as those in Entries 1-4. Therefore, it may be concluded that the degradation reaction of (7) is considerably slower than its formation reaction. On increasing the concentration of (5) and (6) provided their ratio was maintained at 1:2 (see Entries $5-9)$, the reaction was found to be slowed down when the concentration of (5) exceeded 0.5 m ; this may be due to depression of photoefficiency of the reaction with the increase in the concentration. Moreover, (7) was obtained in comparatively good yield on performing the reaction by reducing the proportion of (5) to (6) (see' Entries 10-13). Furthermore, degradation of (5) was reduced and its conversion into (7) was improved when biphenyl was added to the system, although the yield of (7) did not vary (see Entries 14 and 15). Incidentally, a small amount of (2-oxo-5-phenyl-1,3-dioxolan-4-yl)methyl acetate (19) was obtained as a by-product. The structure of (7) was assigned by i.r. (see Experimental

section) and ${ }^{1} \mathrm{H}$ n.m.r. spectral data (see Table 3), i.e. (1) the $\mathrm{H}-1$ and $\mathrm{H}-2$ signals appeared at $\delta 6.24$ and 5.35 with $J_{1.2}$ value of 4.0 Hz ; (2) two methylene proton signals were present both with an AB splitting pattern; and (3) the i.r. spectrum had an absorption band at $1825 \mathrm{~cm}^{-1}$, which corresponds to a cyclic carbonate. The $\delta$-values for $\mathrm{H}-1$ and $\mathrm{H}-2$, and the $\mathrm{v}_{\mathrm{C}=\mathrm{o}}$ value are consistent with those ${ }^{7}$ for known oxetan derivatives prepared from the photochemical reaction of a ketone with (6). This assignment was proved by isolation of dl-apiose (4) in $90 \%$ yield by treating ( 7 ) with strongly basic ion-exchange resin [Amberlite IRA-400 $\left(\mathrm{OH}^{-}\right)$] in methanolic water; the resulting syrupy (4) was identified as its phenylosazone. ${ }^{8}$ The structure of (19) was similarly assigned as above, i.e. (1) the ${ }^{1} \mathrm{H}$ n.m.r. spectrum had phenyl signals at $\delta 7.42$, a 3 -proton acetyl signal at $\delta 2.14$, a 1 -proton doublet at $\delta 5.44$, a 1 -proton double double doublet at $\delta$ 4.74 , and two 1 -proton double doublets at $\delta 4.45$ and 4.38 ; and (2) its i.r. spectrum gave absorption bands at $v_{\mathrm{C}=\mathrm{O}} 1805$ and $1745 \mathrm{~cm}^{-1}$. One geometrical isomer was obtained, although two isomers are possible for (19).

On the basis of the above results, the reactions of (6) with some other 1,3-dihydroxypropan-2-one derivatives (1) were undertaken. Those with 1,3-dimethoxy- (8) and 1,3 -bis(benzyloxy)-propan-2-one (13) gave no oxetan
derivatives at all, but mainly products arising from the intramolecular hydrogen abstraction of (8) and (13), respectively. In the reaction of (8), 3 -methoxymethyl-oxetan-3-ol (9), 2,4,6-trioxabicyclo[3.2.0]heptan-3-one (10), 4-acetyl-5-phenyl-1,3-dioxolan-2-one (11), and cis-transoid-cis-3,5,8,10-tetraoxatricyclo[5.3.0.0 $\left.0^{2,6}\right]$ -decane-4,9-dione (12) were obtained. In the reaction of
decomposition products. The structure of (9) was proved by its ${ }^{1} \mathrm{H}$ n.m.r. spectrum, which showed two 2 -proton doublets at $\delta 4.48$ and 4.64 . Compound (9) was obtained as a distillate [ $15 \%$ yield, containing $13 \%$ of (8)] from the resulting mixture from the irradiation of (8) in a benzene solution; the elemental analysis was satisfactory for its structure $[(8)$ and (9) have the same

(13), on the other hand, trans- (14) and cis-7-phenyl-2,4,6-trioxabicyclo[3.2.0]heptan-3-one (15), 1-benzyloxy-propan-2-one (16), 3-benzyloxymethyl-2-phenyloxetan3 -ol (17), and 1,2-diphenyl-1,2-ethanediol (18) were obtained. The resulting mixtures from both above reactions further contained other products other than those above described; although these were impossible to isolate or identify, they suggest that the reactions involve complex reaction pathways to give mainly
molecular formula]. The structure of (10) was proved by (1) the ${ }^{1} \mathrm{H}$ n.m.r. spectrum which had a l-proton doublet at $\delta 6.30$, two l-proton double doublets at $\delta 4.97$ and 4.75 , and a double double doublet at $\delta 5.45$; and (2) the i.r. spectrum showed an absorption band specific for carbonates ( $1800 \mathrm{~cm}^{-1}$ ). The structural determination of (11) was also based on spectroscopic data; i.e. (1) the ${ }^{1} \mathrm{H}$ n.m.r. spectrum showed a 5 -proton singlet at $\delta 7.42$, a 3 -proton singlet at $\delta \mathbf{2 . 4 3}$, and two mutually coupled

Table 3
${ }^{1} \mathrm{H}$ n.m.r. spectral data for the oxetan derivatives obtained ${ }^{a}$

a These spectral data were obtained with a Varian T-60 apparatus for solutions in deuteriochloroform with tetramethylsilane as internal standard. Locants for each
assigned proton are based on the numbering of the structure of

[^2] of isomers. $\quad$ Not determined due to ambiguity in determining chemical shifts. e The signals appeared as an unresolvable multiplet with $\delta 4.2-4.8$.

1-proton doublets at $\delta 5.68$ and 4.76 ; and (2) the i.r. spectrum showed characteristic absorption bands at 1800 and $1720 \mathrm{~cm}^{-1}$, respectively. Compound (12) was identical with the compound prepared according to the method reported. ${ }^{9}$ Compounds (14) and (15) were

(14)

(15)
assigned as oxetan derivatives produced by the addition of benzaldehyde to (6) on the basis of their spectral data; i.e. their i.r. spectra had specific absorption bands at 1815 and $1805 \mathrm{~cm}^{-1}$, respectively, and their ${ }^{1} \mathrm{H}$ n.m.r. spectra gave 5 -proton phenyl signals at $\delta 7.40$ and 7.38 ,
thus be proved by the values of $\delta_{(15)}-\delta_{(14)}$ for H-1 ( 0.41 p.p.m.) and those for H-5 ( 0.27 p.p.m.). For the H-7 signals, these should only slightly differ in chemical shift since they are under the anisotropic effect to almost the same extent, giving a $\delta_{(15)}-\delta_{(14)}$ value of -0.09 . Therefore, H-5 and H-7 were assigned to the signals at $\delta 5.79$ and 6.42 for (14), and those at $\delta 6.06$ and 6.33 for (15), respectively. The structure of (16) was confirmed by comparison with an authentic sample prepared according to a reported method. ${ }^{10}$ Although a pure sample could not be obtained, the structure of (17) was determined via ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy, i.e. two 5 -proton phenyl signals at $\delta 7.38$ and 7.35 , a 1 -proton singlet at $\delta$ 5.67 , a 2 -proton singlet at $\delta 4.66$, and two pairs of AB 1 -proton doublets at $\delta 4.64$ and 4.56 , and at $\delta 3.90$ and 3.72. From the ${ }^{1} \mathrm{H}$ n.m.r. spectrum, compound (18) was obtained as a mixture of racemic and meso-isomers, from which we could isolate the meso-isomer as a crystalline sample; the m.p., and i.r. and ${ }^{1} H$ n.m.r. spectra were

respectively, in addition to 1 -proton signals at $\delta 5.11$ (dd), 5.79 (d), and 6.42 (d) for (14), and 5.52 (dd), 6.06 (d), and 6.33 (d) for (15). The cis-trans isomerism of (14) and (15) was proved by ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy, on the basis of the assumption that for their $\mathrm{H}-1$ and $\mathrm{H}-5$ signals, those cis to the phenyl group in (14) are less deshielded than those trans to the phenyl group in (15), due to the anisotropic effect of the phenyl group. Since $\mathrm{H}-1$ is closer to the phenyl group than $\mathrm{H}-5$, the anisotropic effect should make the difference in chemical shifts of the H-l protons larger than that of $\mathrm{H}-5$ protons. This assumption may
identical with those of an authentic sample prepared according to a known method. ${ }^{11}$

The mechanism of the reactions of (6) with (8) or with (13) can be assumed to be as follows based on the structures of the products obtained. All the results may be explained by assuming Norrish Type II, i.e. intramolecular hydrogen abstraction, reaction of (8) or (13) in the $n \rightarrow \pi^{*}$ excited state, accompanied by ring-closure, bond-fission, and addition reactions. Product (12) might be formed through the dimerization of (6), photosensitized by (8) or its decomposition products. ${ }^{9}$

Therefore, the ketonic species having hydrogen susceptible to abstraction at the $\gamma$-position are found to undergo predominantly Norrish Type II reactions under the conditions used, and are thus unsuitable as substrates for the Paterno-Büchi reaction.

On the basis of the above results we subsequently performed the photochemical reaction of (6) with 2,2-dimethyl-1,3-dioxan-5-one (20), which is not susceptible to the intramolecular hydrogen abstraction reaction. On irradiation of (20) ( 0.25 M ) with (6) ( 2 equiv.) for 6 h , t.l.c. of the resulting mixture showed the complete consumption of $(20)$; however, the products could not be isolated due to the complexity of the mixture, which made their chromatographic separation impossible. The irradiation of (20) itself also gave a mixture, giving the same pattern on t.l.c. as that obtained in the above reaction. The above reaction may thus predominantly involve the decomposition reaction of (20), although we

(20)

(21)

(22)
could not isolate all the products for unambiguous evidence.

With this result, the reaction of (6) with diethyl mesoxalate (21) was performed; it has a low $E_{\mathrm{T}}$ of 54 $\mathrm{kcal} \mathrm{mol}^{-1},{ }^{12}$ which may facilitate the formation of the corresponding oxetan derivative. As expected, the
and the ${ }^{1} \mathrm{H}$ n.m.r. spectrum, which showed two l-proton doublets ( $J 3.5 \mathrm{~Hz}$ ) at $\delta 5.77$ and 6.37 , and two kinds of methylene proton signals. It should be noted here that chromatographic treatment of (22) in the same manner as above gave (22) in $60 \%$ yield. This may indicate that the low yield of (22) arises from its decomposition during the chromatographic separation, although we could not identify the decomposition products.

These results subsequently prompted us to perform the photochemical reaction of ethenediol derivatives and ethenol derivatives other than (6), with (5) as the ketonic species. The results thus obtained are summarized in Table 4. The reaction of (5) with ( $Z$ )-vinylene diacetate (23) gave cis-4,4-bis(acetoxymethyl)oxetan-2,3-diyl diacetate (1,2,4,4'-tetra-O-acetyl- $\alpha$-Dl-apiotetranose) (31) and the trans-isomer ( $\beta$-anomer) (32) in high yield in addition to a small amount of a product which was assumed to be 2-(1,2-diacetoxyethoxy)propenylene diacetate (41). Moreover, ( $E$ )-vinylene diacetate (24), the isomer of (23), was obtained as well as recovered (23). Incidentally, the irradiation of (23) for 80 h resulted in only $6 \%$ isomerization into (24); this may indicate the participation of (5) in the isomerization. The reaction of (5) with 2 -(benzyloxy) vinyl acetate * $(25,26)$ gave 2,2-bis(acetoxymethyl)-4-(benzyloxy)oxetan-3-yl acetate (benzyl 2,4,4'-tri-O-acetyl-DL-apiotetranoside) (33) and 4,4-bis(acetoxymethyl)-3-benzyloxyoxetan-2-yl acetate ( $1,4,4^{\prime}$-tri- $O$-acetyl-2- $O$-benzyl-DL-apiotetranose) (38) as a mixture of two isomers (anomers), respectively. In this case, the isomerization between (25) and (26) was also confirmed to have occurred, i.e. the amount of

Table 4
Photocycloaddition reactions of (5) with ethenediol and ethenol derivatives ${ }^{a}$

"All the reactions were performed using (5) and 0.5 m ethenediol or ethenol derivative under irradiation in benzene. ${ }^{6}$ Also isolated were 2 -( 1,2 -diacetoxyethoxy) propenylene diacetate (41) ( $1 \%$ yield) and ( $E$ )-vinylene diacetate ( 24 ) ( $19 \%$ yield) in addition to (23) ( $32 \%$ recovery yield). "Also isolated were (41) ( $1 \%$ yield) and (24) ( $10 \%$ yicld) in addition to ( 23 ) ( $16 \%$ yield). ${ }^{d}(Z):(E)=$ $92: 8 .{ }^{e}$ Compounds (25) ( $39 \%$ yield) and (26) ( $19 \%$ yield) were isolated. $f$ These products were shown to contain some impurities. o In these reactions, the starting material (28) was found to be almost completely consumed.
irradiation of (21) with 2 equiv. (6) for $6-7 \mathrm{~h}$ gave a mixture involving no (21) (t.l.c.), and chromatographic separation on a column of silica gel afforded a $23 \%$ yield of diethyl 3-oxo-2,4,6-trioxabicyclo[3.2.0]heptane-7,7dicarboxylate (diethyl 1,2-O-carbonyl-DL-apiotetrandiuronate) (22). The structure of (22) was confirmed from the i.r. spectrum, which showed the absorption band at $1840 \mathrm{~cm}^{-1}$ specific for cyclic carbonate esters,
recovered (26) increased; exceeding that in the starting material ( $\mathbf{1 5 4} \mathrm{mg} \rightarrow \mathbf{3 7 2} \mathrm{mg}$; see Experimental section). Furthermore, the reaction of (5) with 2,3-dihydro-1,4dioxin (27), with vinyl acetate (28), with isopropenyl acetate (29), and with ethoxyethene (30), gave (8-acetoxymethyl-2,5,7-trioxabicyclo[4.2.0]oct-8-yl)
methyl acetate (4,4'-di-O-acetyl-1,2-O-ethylene-DL-

* $(Z):(E)[(25):(26)]=92: 8$.
apiotetranose) (34); 2,2-bis(acetoxymethyl)oxetan-3-yl acetate ( $2,4,4^{\prime}$-tri- $O$-acetyl-1,3-anhydro-dL-apiitol) (35) and 4,4-bis(acetoxymethyl)oxetan-2-yl acetate (1,4,4'-tri-O-acetyl-2-deoxyapiotetranose) (39); 2,2-bis-(acetoxymethyl)-3-methyloxetan-3-yl acetate (2,4,4'-tri- $O$-acetyl-1, 3 -anhydro- 2 -C-methyl-dL-apiitol) (36); and (2-acetoxymethyl-3-ethoxyoxetan-2-yl)methyl acetate (4,4'-di-O-acetyl-1,3-anhydro-2-O-ethyl-DLapiitol) (37), respectively.

Moreover, the reaction of (5) with 1,1-diethoxyethene
6.50 when C-2 is substituted by an acetoxy-group, at $\delta$ $5.29-5.64$ when substituted by an alkoxy-group, and at $\delta 4.49-4.79$ when it has no substituent. The protons at the 3 -position of the oxetan ring * appeared at $\delta 5.29$ 5.59 when C-3 is substituted by an acetoxy-group, at $\delta$ 4.2-4.8 when substituted by an alkoxy-group, and at $\delta 2.54-2.93$ when it has no substituents. The methylene protons of the acetoxymethyl group, by and large, appeared as an AB quartet due to the hindrance on their free rotation. The difference in the chemical shift of the

(41)

(42)
(43) gave (2-acetoxymethyl-3,3-diethoxyoxetan-2-yl)methyl acetate (44) and ethyl 4-acetoxy-3-aceto $2 y^{-}$ methyl-3-hydroxybutyrate (45). The formation of (45) was-also observed in the reaction performed in the dark; the reaction in benzene under reflux gave (45) and ethyl 4-acetoxy-3-(acetoxymethyl)crotonate (46) (cf. Table 5). The compounds (45) and (46) might be obtained via oxetan (40); oxetan formation from keten acetals and
gem protons of (31) and (32), i.e. 0.06 and 0.20 , and 0.27 and 0.15 , respectively, is assumed to arise from the steric hindrance by the acetoxy-group on the ring to the rotation of the acetoxymethyl group. Therefore, the stereochemistry of (31) and (32) was concluded to be cis and trans, respectively. Each of the two isomers of (33) and (38) we were unable to isolate in a pure form. However, by inspection of the ${ }^{1} \mathrm{H}$ n.m.r. spectra of frac-
(5)

carbonyl compounds in the dark has already been reported. ${ }^{13}$

The structural determination of the products was accomplished through ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy (see Table 3) and i.r. spectroscopy. The oxetan structure was assigned on the basis of the chemical shift of the oxetan ring-protons and their splitting pattern. The protons at the 2 -position of the oxetan ring * appeared at $\delta 6.24$ -
tions from column chromatography, the formation of the four isomers was confirmed, and their structures were determined. Ring-fusion in (34) is presumably cis judging from the spectral pattern of methylene proton signals in the dioxan moiety, i.e. three of them appeared

[^3]at $\delta 3.5-4.1$ and one of them at $\delta 4.1-4.6$ as a multiplet; the assignment was based on an analysis by the INDOR technique, and this pattern is in good agreement with those of the compounds having homologous ring structures. ${ }^{14}$ The structures of (35), (39), (36), (37), and (44) were determined by comparing the chemical shift of their $\mathrm{H}-1$ and $\mathrm{H}-2$ protons (see Table 3). The structure of (41) was determined on the basis of its ${ }^{1} \mathrm{H}$ n.m.r. spectrum (see Experimental section), i.e. four $O$-acetyl methyl signals, three 1 -proton signals at $\delta 6.48,4.45$, and 4.20 which are coupled to each other, a 1-proton

Table 5
Reactions of 1,3-diacetoxypropan-2-one (5) with 1,1-diethoxyethene (43) ${ }^{a}$

${ }^{a}$ All the reactions were performed using (5) ( 0.25 m ) and (43) $(0.5 \mathrm{~m})$ in benzene. ${ }^{b}$ These reactions were performed under photoirradiation. ${ }^{c}$ These reactions were performed in the dark. ${ }^{d}$ The reaction was performed under reflux without replacing the atmosphere with argon.
broad singlet at $\delta 7.06$, and a 2 -proton broad singlet at $\delta 4.57$. This product was presumably formed from the biradical intermediate (42) which is also the intermediate in the formation of (31) and (32). Compound (24) was identical with that reported in the literature ${ }^{15}$ on the basis of its i.r. and ${ }^{1} \mathrm{H}$ n.m.r. spectral data (see Experimental section). The structure of (45) was assigned on the basis of its i.r. spectrum, which showed the specific absorption band for a hydroxy-group, and the ${ }^{1} \mathrm{H}$ n.m.r. spectrum, showing proton signals of one ethoxy-group and two equivalent acetoxymethyl substituents. The structure of (46) was also determined on the basis of spectral data, i.e. i.r. absorption bands at 1750,1720 , and $1660 \mathrm{~cm}^{-1}$, and ${ }^{1} \mathrm{H}$ n.m.r. signals due to a 1 -proton quintet at $\delta 6.01$ and two 2 -proton signals at $\delta 5.29$ and 4.76, with both of which the l-proton quintet couples with a small $J$-value. The regioisomer of (37) was not isolated, and it might have been hydrolysed on the silica gel column; 2-alkoxyoxetans are generally accepted to be susceptible to hydrolysis, ${ }^{16}$ and similarly, (33) and (34) were gradually hydrolysed on standing in contact with the atmosphere. Moreover, the regioisomer of (44), i.e. (40), is assumed to be much more susceptible to hydrolysis, and was therefore transformed into (45) and then to (46) at elevated temperatures. In these photochemical reactions, furthermore, all the starting alkenes other than vinyl acetate ( 28 ) survived even after the reaction.

As in ordinary oxetan formation reactions, ${ }^{3,4}$ the photocycloaddition reactions described herein may proceed through excited (5) or (21) in the $n \rightarrow \pi^{*}$ triplet state. Addition of a typical triplet-state quencher, penta-2,4-diene, to the reaction system, however, did not
confirm the assumption, but instead the quencher reacted with compound (5). An attempt to use biphenyl ( $E_{T}$ $65.7 \mathrm{kcal} \mathrm{mol}^{-1}$ ) ${ }^{17}$ in place of penta-2,4-diene (Table 2, Entry 15) was also found not to affect the oxetan formation. This aspect of the reaction is thus impossible to discuss unambiguously, due to the difficulty in selecting a potential quencher.

## EXPERIMENTAL

The following instruments were used: i.r., Hitachi 285; ${ }^{1}$ H n.m.r., Varian T-60, EM-360, and EM-390; the spectra were recorded with a $\mathrm{T}-60$ instrument for solutions in $\mathrm{CDCl}_{3}$ containing tetram . hylsilane unless otherwise stated; g.l.c., Hitachi K-53 [1-m column of $10 \%$ SE 30 on Chromosorb W ( $60-80 \mathrm{mesh}$ )]; carrier gas; nitrogen; detection by use of FID); m.p., Yanagimoto Micro Melting Point Apparatus (mainly) or a Büchi Schmeltzpunktbestimmungsapparat [(indicated with m.p. (Büchi)].
Column chromatographic separations on silica gel were performed by use of Wakogel C-300 (Wako Pure Chemicals, Japan), and t.l.c. was performed on DC-Alufolien Kieselgel 60 F254 (thickness 0.2 mm ).

Photoirradiation of a mixture was performed by means of a Ushio 450 -W high-pressure mercury lamp in a Pyrex glass test tube at room temperature with a distance of $c a .5 \mathrm{~cm}$, after passing argon gas through the mixture. All the solvents used for the photoirradiation were purified as usual. The resulting mixtures were evaporated below $35^{\circ} \mathrm{C}$, and all evaporation was performed using a suction pump.

Microanalyses were performed by the Laboratory of Organic Analysis, Department of Chemistry, Tokyo Institute of Technology.

Vinyl acetate (28), isopropenyl acetate (29), and ethoxyethene (30) were purchased commercially, and the former two were purified by distillation prior to use. 1,3-Diacetoxy-propan-2-one (5), ${ }^{18}$ 1,3-dioxol-2-one (6), ${ }^{19}$ diethyl mesoxalate (21), ${ }^{20} 2,3$-dihydro-1,4-dioxin (27), ${ }^{21}$ and 1,1-diethoxyethene (43) ${ }^{22}$ were prepared according to known methods. We developed a novel synthetic method for 1,3-dimethoxy-propan-2-one (8) and 1,3-bis(benzyloxy)propan-2-one (13) (see later), since the known method ${ }^{23}$ gives low yields, and there is difficulty in separating product from starting materials. 2,2-Dimethyl-1,3-dioxan-5-one (20) was prepared according to the method ${ }^{24}$ used for the synthesis of an analogue (see later). The mixture of $(Z)-(25)$ and $(E)-2$ (benzyloxy) vinyl acetate (26) was prepared from 3-(benzyloxy) propane-1,2-diol ${ }^{25}$ (see later). ( $Z$ )-Vinylene diacetate (23) ${ }^{26}$ has only previously been known as a by-product. Therefore, we set out to develop a novel synthetic procedure for (23), starting from but-2-ene-1,4-diyl diacetate via formylmethyl acetate (details will be reported elsewhere). ${ }^{27}$
Photochemical Reaction of 1,3-Diacetoxypropan-2-one (5) with 1,3-Dioxol-2-one (6).-(a) Reaction without solvent. (cf. Entry 1, Table 1). Two aliquots of a mixture prepared from (5) ( $1045 \mathrm{mg}, 6.00 \mathrm{mmol}$ ) and (6) ( $1033 \mathrm{mg}, 12.0 \mathrm{mmol}$ ) (liquefied on admixture) were placed between the walls of two double-walled test tubes. The tubes were irradiated for 26 h , after replacing the atmosphere in the tubes with argon gas by four times freezing, evacuating with a waterpump, fusion, and introduction of argon gas. The resulting gelatinous mass was dissolved in acetone and the solution diluted with benzene. The diluted solution was passed through a short column of silica gel to remove insoluble
materials. The effluent was evaporated and the residue was chromatographed on a column of silica gel ( 100 ml ) using benzene-acetone; this gave (5) ( $594 \mathrm{mg}, 58 \%$ recovery yield) and (7-acetoxymethyl-3-oxo-2,4,6-trioxabicyclo-[3.2.0]-heptan-7-yl)methyl acetate (7) ( $358 \mathrm{mg}, 23 \%$ yield).
(b) Reaction in benzene. (Entry 13, Table 2). Five aliquots of a solution of (5) ( $871 \mathrm{mg}, 5.00 \mathrm{mmol}$ ) and (6) ( $2153 \mathrm{mg}, 25.0 \mathrm{mmol}$ ) in benzene ( 50 ml ) were put into testtubes, and photoirradiated for 30 h . Column chromatographic separation of the resulting mixture as above after evaporation gave ( 2 -oxo-5-phenyl-1,3-dioxolan-4-yl)methyl acetate (19) ( $52 \mathrm{mg}, 2 \%$ yield), ( 5 ) ( $281 \mathrm{mg}, 32 \%$ recovery yield), and (7) ( $709 \mathrm{mg}, 55 \%$ yield).

Compound (7) had m.p. $72-73{ }^{\circ} \mathrm{C}$ (from chloroformdiethyl ether); $v_{\mathrm{C}=\mathrm{o}}(\mathrm{KBr}) 1755$ (acetate) and $1825 \mathrm{~cm}^{-1}$ (cyclic carbonate); $\delta_{\mathrm{H}}$ see Table 3 (Found: C, $46.05 ; \mathrm{H}$, 4.7. $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{8}$ requires $\mathrm{C}, 46.16 ; \mathrm{H}, 4.65 \%$ ).

Compound (19) was a syrup; $\nu_{\mathrm{C}=\mathrm{o}}(\mathrm{NaCl}) 1745$ (acetate) and $1805 \mathrm{~cm}^{-1}$ (cyclic carbonate); $\delta_{\mathrm{H}^{*}} 7.42(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}), 5.44$ ( $1 \mathrm{H}, \mathrm{d}, J_{4.5} 6.5 \mathrm{~Hz}, \mathrm{H}-5$ ), 4.74 ( 1 H , ddd, $J_{4 . \alpha} 3.0 \mathrm{~Hz}$, $\left.J_{4 . \alpha^{\prime}} 4.5 \mathrm{~Hz}, \mathrm{H}-4\right), 4.45\left(1 \mathrm{H}, \mathrm{dd}, J_{\alpha . \alpha^{\prime}} 13.0 \mathrm{~Hz}, \mathrm{H}-\alpha\right), 4.38$ ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{H}-\alpha^{\prime}$ ), and 2.14 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OCOMe}$ ) (Found: C, $60.95 ; \mathrm{H}, 5.2$. $\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{O}_{5}$ requires $\mathrm{C}, 61.01 ; \mathrm{H}, 5.12 \%$ ).
Hydrolysis of (7).-A solution of (7) ( $781 \mathrm{mg}, 3.00 \mathrm{mmol}$ ) in methanol ( 40 ml ) was stirred for 30 min after the addition of water ( 40 ml ) and Amberlite IRA-400 $\left(\mathrm{OH}^{-}\right)(9 \mathrm{ml})$; t.l.c. of the resulting solution gave a single spot. The resin was filtered off and was washed with distilled water. The filtrate and the washings were combined and evaporated to a syrup [ $406 \mathrm{mg}, 90 \%$ yield as ol-apiose (4)]; this syrup gave a single spot on $t$.l.c. with five different solvent systems. The syrup was, as usual, ${ }^{28}$ converted into 3 - $C$-(hydroxymethyl)tetrose phenylosazone (apiose phenylosazone) $[453 \mathrm{mg}, 46 \%$ yield from (7)], m.p. $155.5-157{ }^{\circ} \mathrm{C}$ (from ethanol) [lit. ${ }^{8}$ m.p. 156-157 ${ }^{\circ} \mathrm{C}$ (from ethanol)] (Found: C, 62.1; H, 6.1; $\mathrm{N}, 17.3$. Calc. for $\mathrm{C}_{17} \mathrm{H}_{20} \mathrm{~N}_{4} \mathrm{O}_{3}: \mathrm{C}, 62.18 ; \mathrm{H}, 6.14 ; \mathrm{N}$, $17.06 \%) . R_{\mathrm{F}}$ Values of (4) on t.l.c. were 0.23 [solvent system chloroform-methanol-acetic acid (20:8:1 v/v)], 0.49 [butanol-pyridine-water ( $14: 3: 3 \mathrm{v} / \mathrm{v}$ )], 0.45 [butanol-water-acetic acid (3:1:1 v/v)], 0.52 [propanol-ethyl acetate-water (3:2:1 $\mathrm{v} / \mathrm{v}$ )], and 0.56 [butanol-acetonewater (4:5:1 v/v)].

1,3-Dimethoxypropan-2-one (8).-To a solution of 3,3-bis(hydroxymethyl)-1-oxa-4-azaspiro[4.5]decane ${ }^{29} \quad(50 \quad \mathrm{~g}$, 0.25 mol ) in $N N$-dimethylformamide (DMF) ( 1000 ml ), sodium hydride ( $6 \mathrm{~g}, 0.26 \mathrm{~mol}$ ) was added with ice-cooling, and, after 1 h , methyl iodide ( $15.5 \mathrm{ml}, 35.2 \mathrm{~g}, 0.25 \mathrm{~mol}$ ) was added dropwise during 30 min . More sodium hydride ( 6 g , 0.26 mol ) was added after 1 h , and then methyl iodide ( 23.5 $\mathrm{ml}, 53.4 \mathrm{~g}, 0.38 \mathrm{~mol}$ ) was again added dropwise during 30 min. After 2 h , methanol ( 3 ml ) was added to the resulting mixture, and then diethyl ether ( 1000 ml ). The precipitated sodium iodide was filtered off, and the filtrate was distilled under reduced pressure after evaporation of diethyl ether. The residue was dissolved in chloroform ( 200 ml ), and the resulting solution was washed with water $(2 \times 200$ $\mathrm{ml})$; drying the organic layer over anhydrous magnesium sulphate and evaporation afforded an oil ( 61 g ). The oil was dissolved in 3 m hydrochloric acid ( 200 ml ), and the solution was heated at $50^{\circ} \mathrm{C}$ for 5 h ; a brown oil formed. To the resulting mixture was added solid sodium carbonate (ca. 20 g ) until the evolution of carbon dioxide gas ceased. The oily layer was extracted with chloroform ( $3 \times 100 \mathrm{ml}$ ).

[^4]The aqueous layer was diluted with water to 11 , and then treated with sodium metaperiodiate ( $56 \mathrm{~g}, 0.26 \mathrm{~mol}$ ) below $20^{\circ} \mathrm{C}$. The resulting mixture, after 2 h , was extracted with chloroform ( $6 \times 300 \mathrm{ml}$ ), and the organic layer was dried over anhydrous magnesium sulphate. After evaporation, the residue was distilled under reduced pressure to give (8) ( $13.9 \mathrm{~g}, 47 \%$ yield), b.p. $85.5-86{ }^{\circ} \mathrm{C}$ at 32 mmHg [lit., ${ }^{23}$ b.p. $71-71.5{ }^{\circ} \mathrm{C}$ at 16 mmHg$]$; $\nu_{\mathrm{C}=0}(\mathrm{NaCl}) 1730 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 4.18\left(4 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{CH}_{2}\right)$ and $3.43(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{Me})$ (Found: C, $51.0 ; \mathrm{H}, 8.5$. Calc. for $\mathrm{C}_{5} \mathrm{H}_{10} \mathrm{O}_{3}$ : C, 50.83 ; H, $8.53 \%$ ).

Photochemical Reaction of (8) with (6).-Eight aliquots of a solution of (8) ( $2364 \mathrm{mg}, 20.0 \mathrm{mmol}$ ) and (6) ( $3.44 \mathrm{~g}, 40.0$ mmol ) in benzene ( 80 ml ) were photoirradiated for 10 h . T.1.c. of the resulting mixture gave no spot due to starting material (8). During the reaction, there appeared a syrupy precipitate and a small amount of crystals on the wall of each test-tube. After removal of the solution by decantation, the syrupy residue was dissolved in methanol, and the resulting crystals of cis-transoid-cis-3,5,8,10-tetraoxatricyclo[5.3.0.0 ${ }^{2,6}$ ]decane-4,9-dione (12) (22 mg ) were filtered off. Compound (12) was identical with an authentic specimen prepared by the known method ${ }^{9}$ (i.r. spectroscopy and m.p.). The benzene solution obtained by decantation was evaporated to a syrup ( 768 mg ), which was then chromatographed on a column of silica gel ( 120 ml ) using benzene-cyclohexane-acetone and benzene-propan-2-ol, giving a mixture which contained crystalline 4 -acetyl- 5 -phenyl-1,3-dioxolan-2-one (11) ( 15 mg ) and 2,4,6-trioxa-bicyclo[3.2.0]heptan-3-one (10) ( 8 mg ), (12) ( 6 mg ), and a mixture containing 3-(methoxymetliyl)oxetan-3-ol (9) (430 mg ). Recrystallization of the mixture containing (11) from benzene-hexane gave a pure sample of (11) ( 4 mg ). For the mixture containing (9), chromatographic separation of (9) was attempted on a column of silica gel using chloro-form-methanol, but resulted only in the isolation of a mixture which is composed mainly of (9) ( 244 mg ); further purification was unsuccessful.

Compound (12) had m.p. (Büchi) $>300{ }^{\circ} \mathrm{C}$ [lit., ${ }^{9}$ m.p. 320 ${ }^{\circ} \mathrm{C}$ (from acetonitrile)]. Compound (11) had m.p. (Büchi) $97.5-100.5{ }^{\circ} \mathrm{C}$ (from benzene-hexane); $v_{\mathrm{C}=\mathrm{o}}(\mathrm{KBr}) 1800$ (carbonate) and $1720 \mathrm{~cm}^{-1}$ (ketone); $\delta_{\mathrm{H}} 7.42(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph})$, 5.68 ( $1 \mathrm{H}, \mathrm{d}, J 6.0 \mathrm{~Hz}, \mathrm{H}-5$ ), 4.76 ( $1 \mathrm{H}, \mathrm{d}, \mathrm{H}-4$ ), and 2.43 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{Me}$ ) (Found: C, 64.25; H, 5.0. $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{O}_{4}$ requires C, 64.07; H, 4.89\%).

Compound (10) had m.p. 89-90 ${ }^{\circ} \mathrm{C}$ (from benzenehexane); $v_{\mathrm{C}=\mathrm{o}}(\mathrm{KBr}) 1800 \mathrm{~cm}^{-1}$ (broad, carbonate); $\delta_{\mathrm{H}} 6.30$ ( $1 \mathrm{H}, \mathrm{d}, J_{1.5} 3.5 \mathrm{~Hz}, \mathrm{H}-5$ ), $5.45\left(1 \mathrm{H}, \mathrm{ddd}, J_{1.7} 4.0 \mathrm{~Hz}, J_{1.7^{\prime}}\right.$ $3.0 \mathrm{~Hz}, \mathrm{H}-1), 4.97\left(1 \mathrm{H}, \mathrm{dd}, J_{7,7^{\prime}} 8.0 \mathrm{~Hz}, \mathrm{H}-7\right)$, and $4.75(1 \mathrm{H}$, dd, H-7') (Found: C, 41.7; H, 3.45. $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{4}$ requires C, $41.39 ; \mathrm{H}, 3.47 \%$ ). Compound (9) was a syrup; $\delta_{\mathrm{H}} 4.64$ ( $2 \mathrm{H}, \mathrm{d}, J 6.5 \mathrm{~Hz}, \mathrm{H}-2$ and $\mathrm{H}-4$ ), $4.48\left(2 \mathrm{H}, \mathrm{d}, \mathrm{H}-2^{\prime}\right.$ and $\left.\mathrm{H}-4^{\prime}\right)$, $3.68\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{OMe}\right)$, and $3.45(3 \mathrm{H}, \mathrm{s}, \mathrm{Me})$.

Photochemical Reaction of (8).-Twenty-nine aliquots of a solution of (8) ( $8.56 \mathrm{~g}, 72.4 \mathrm{mmol}$ ) in benzene ( 290 ml ) were similarly photoirradiated for 10 h ; almost all the (8) was found to be consumed (t.l.c.), affording syrupy precipitates at the bottom of each test-tube. The benzene solutions were collected together by decantation from each test-tube, and evaporated. The residue was distilled under reduced pressure to give a mixture of starting material (8) and (9) (13:87, by ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy, equivalent to $2 \%$ and $13 \%$ yield, respectively, based on the weight of the mixture, i.e., 1.3 g ); b.p. $77-85{ }^{\circ} \mathrm{C}$ at 12 mmHg (Found: C, 51.1; $\mathrm{H}, 8.45 . \mathrm{C}_{5} \mathrm{H}_{10} \mathrm{O}_{3}$ requires C, 50.83 ; $\mathrm{H}, 8.53 \%$ ).

1,3-Bis(benzyloxy)propan-2-one (13).-Sodium hydride
( $9.6 \mathrm{~g}, 0.40 \mathrm{~mol}$ ) was added to a solution of 3,3 -bis(hydroxy-methyl)-1-oxa-4-azaspiro[4.5]decane ${ }^{29}$ ( $30 \mathrm{~g}, 0.15 \mathrm{~mol}$ ) in DMF ( 1000 ml ) under ice-cooling with stirring, to which was next added benzyl chloride ( $50 \mathrm{ml} ; 55 \mathrm{~g}, 0.43 \mathrm{~mol}$ ) during 30 min . In order to quench the excess of sodium hydride, methanol was added to the resulting mixture after 5 h , and then diethyl ether ( 1000 ml ) was added. The resulting precipitate was filtered off, the filtrate was evaporated, and then DMF removed by distillation under reduced pressure. The residue was dissolved in benzene $(200 \mathrm{ml})$, and the solution was washed with water $(2 \times 200$ $\mathrm{ml})$. Evaporation of the solution, followed by the addition of 3 m hydrochloric acid ( 200 ml ), afforded a crystalline precipitate, which, on heating at $60^{\circ} \mathrm{C}$, turned into an oil and separated from the aqueous layer. The mixture was stirred for 2 h , and then cooled with ice-water; solid sodium hydrogencarbonate was then added until evolution of carbon dioxide ceased. The mixture was extracted with chloroform ( $2 \times 200 \mathrm{ml}$ ), and dried over anhydrous sodium sulphate. After evaporation of the solvent, the residue was crystallized by addition of benzene to give 1,1-bis(benzyl-oxymethyl)-2-hydroxyethylammonium chloride $(45 \mathrm{~g}, 89 \%$ yield); m.p. 131.5-133 ${ }^{\circ} \mathrm{C}$ (Found: C, 64.05; H, 7.05; N, 4.0. $\mathrm{C}_{18} \mathrm{H}_{23} \mathrm{NO}_{3} \cdot \mathrm{HCl}$ requires $\mathrm{C}, 63.99 ; \mathrm{H}, 7.16 ; \mathrm{N}, 4.15 \%$ ).

The chloride ( $36 \mathrm{~g}, 0.11 \mathrm{~mol}$ ) was then dissolved in water $(500 \mathrm{ml})$, sodium hydroxide ( $2 \mathrm{~g}, 0.05 \mathrm{~mol}$ ) was added, and then sodium metaperiodiate ( 24 g ) was added in portions with stirring during 2 h . The resulting mixture was extracted with benzene ( 500 ml ) and the organic layer was washed with water ( $2 \times 500 \mathrm{ml}$ ). After drying over anhydrous magnesium sulphate, the benzene solution was evaporated to dryness to yield crystals of (13) ( $27 \mathrm{~g}, 94 \%$ yield). Recrystallization from ethanol ( 10 ml ) afforded a pure sample ( $21 \mathrm{~g}, 74 \%$ yield); m.p. $38.5-39{ }^{\circ} \mathrm{C}$; * $\mathrm{v}_{\mathrm{C}=0}$ ( KBr ) $1740 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 7.31(10 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{Ph}$ ), $4.57(4 \mathrm{H}$, s, $\mathrm{PhCH}_{2} \times 2$ ), and $4.23\left(4 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{COCH}_{2}\right.$ ) (Found: C , $75.65 ; \mathrm{H}, 6.7$. $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{O}_{3}$ requires $\mathrm{C}, 75.53 ; \mathrm{H}, 6.71 \%$ ).

Photochemical Reaction of (13) with (6).-Two aliquots of a solution of (13) ( $1351 \mathrm{mg}, 5.00 \mathrm{mmol}$ ) and (6) ( 860 mg , 10.0 mmol ) in benzene ( 20 ml ) were photoirradiated for 30 h . The resulting mixture was evaporated and the residue was chromatographed on a column of silica gel ( 70 ml ) using benzene-cyclohexane-acetone, and benzene-acetone. Thus, were obtained a mixture of (6) and trans-7-phenyl-2,4,6-trioxabicyclo[3.2.0]heptan-3-one (14) ( 329 mg , fraction 1), (14) and 1-benzyloxypropan-2-one (16) ( 153 mg ; fraction 2), (16) and (13) ( 106 mg ; fraction 3), (13) and cis-7-phenyl-2,4,6-trioxabicyclo[3.2.0]heptan-3-one (15) ( 95 mg ; fraction 4), 3-benzyloxymethyl-2-phenyloxetan-3-ol (17) and other products ( 155 mg ; fraction 5), a mixture ( 131 mg ; fraction 6), and 1,2-diphenylethane-1,2-diol (18) and other products ( 202 mg ; fraction 7).

Fraction 1, after concentration by use of a high-vacuum pump, was chromatographed again on a column of silica gel by using cyclohexane-acetone to give (14) ( 275 mg ). Fractions 2 and 3 were combined and rechromatographed on a silica gel column by using benzene-acetone, affording (14) ( 38 mg ), ( 16 ) ( 126 mg ), an unidentified compound [ 25 mg ; containing $15 \%$ of (13)], and (13) ( 3 mg ). Rechromatography of fraction 4 on a column of silica gel using cyclohexane-propan-2-ol afforded (13) (62 mg, containing a small amount of impurity) and (15) ( 27 mg ). Re-chromatography of fraction 5 using benzene-cyclo-

[^5]hexane-acetone gave a mixture containing (17) ( 8 mg ) (17) ( 32 mg ), and another mixture containing (17) ( 5 mg ). Separation of fraction 6 by the same method was unsuccessful. For fraction 7, crystallization was induced by the addition of benzene to give (18) (meso-isomer) ( 19 mg ). To summarize the compounds isolated above; (14) (313 $\mathrm{mg}, 16 \%$ yield), ( 16 ) ( $126 \mathrm{mg}, 15 \%$ yield), ( 13 ) ( $69 \mathrm{mg}, 5 \%$ recovery yield), ( 15 ) ( $27 \mathrm{mg}, 1 \%$ yield), ( 17 ) ( $32 \mathrm{mg}, 2 \%$ yield), and (18) ( $19 \mathrm{mg}, 2 \%$ yield). Compound (16) was identified with an authentic specimen prepared according to a known method ${ }^{10}$ by means of i.r. and ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy.

Compound (14) had 111.p. 71-72 ${ }^{\circ} \mathrm{C}$ (from benzenehexane) ; $\nu_{\mathrm{C}=\mathrm{O}}(\mathrm{KBr}) 1815 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 7.40(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}), 6.42$ ( $1 \mathrm{H}, \mathrm{d}, J_{1,7} 4.0 \mathrm{~Hz}, \mathrm{H}-7$ ), $5.79\left(1 \mathrm{H}, \mathrm{d}, J_{1.5} 2.5 \mathrm{~Hz}, \mathrm{H}-5\right)$, and 5.11 ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{H}-1$ ) (Found: $\mathrm{C}, 62.4 ; \mathrm{H}, 4.15 . \quad \mathrm{C}_{10} \mathrm{H}_{8} \mathrm{O}_{4}$ requires $\mathrm{C}, 62.50 ; \mathrm{H}, 4.20 \%$ ).
Compound (15) had m.p. 104-105 ${ }^{\circ} \mathrm{C}$ (from methanol); $\nu_{\mathrm{C}=\mathrm{o}}(\mathrm{KBr}) 1805 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 7.38(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}), 6.33(1 \mathrm{H}, \mathrm{d}$, $\left.J_{1,7} 3.5 \mathrm{~Hz}, \mathrm{H}-7\right), 6.06\left(1 \mathrm{H}, \mathrm{d}, J_{1.5} 4.5 \mathrm{~Hz}, \mathrm{H}-5\right)$, and 5.52 ( $1 \mathrm{H}, \mathrm{dd}, \mathrm{H}-1$ ) (Found: C, 62.65; H, 4.25. $\mathrm{C}_{10} \mathrm{H}_{8} \mathrm{O}_{4}$ requires $\mathrm{C}, 62.50 ; \mathrm{H}, 4.20 \%$ ).
Compound (16) was a syrup, and had $\nu_{\mathrm{C}=\mathrm{O}}(\mathrm{NaCl}) 1730$ $\mathrm{cm}^{-1} ; \delta_{\mathrm{H}} 7.32(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}), 4.59\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.03(2 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{CH}_{2} \mathrm{Ac}\right)$, and $2.15(3 \mathrm{H}, \mathrm{s}, \mathrm{Me})$.

Compound (17) was a syrup, and had $\nu_{\mathrm{O}-\mathrm{H}}(\mathrm{NaCl}) 3400$ $\mathrm{cm}^{-1}$; $\delta_{\mathrm{H}} 7.38(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}), 7.35(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}), 5.67(1 \mathrm{H}, \mathrm{s}$, $\mathrm{H}-2), 4.66\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.64\left(1 \mathrm{H}, \mathrm{d}, J_{\mathrm{HCH}} 7.5 \mathrm{~Hz}\right.$, $\mathrm{HCHOCH}_{2} \mathrm{Ph}$ ), $4.56\left(1 \mathrm{H}, \mathrm{d}, \mathrm{HCHOCH}_{2} \mathrm{Ph}\right), 3.90(1 \mathrm{H}, \mathrm{d}$, $\left.J_{4,4^{\prime}} 9.5 \mathrm{~Hz}, \mathrm{H}-4\right)$, and $3.72\left(1 \mathrm{H}, \mathrm{d}, \mathrm{H}-4^{\prime}\right)$.
Compound (18) (meso-isomer) had m.p. $135-136{ }^{\circ} \mathrm{C}$ (from benzene) (lit., ${ }^{11} \mathrm{~m} . \mathrm{p} .137^{\circ} \mathrm{C}$ ).

2,2-Dimethyl-1,3-dioxan-5-one (20).-5-Amino-5-hydroxy-methyl-2,2-dimethyl-1,3-dioxan for the preparation of (20) was synthesized according to a known method; ${ }^{30}{ }^{31} 85-90 \%$ yield, m.p. $72-73^{\circ} \mathrm{C}$ (from methanol-diethyl ether) [lit., ${ }^{30}$ $55{ }^{\circ} \mathrm{C}$ (from diethyl ether), lit., ${ }^{31} 54.5-55.5^{\circ} \mathrm{C}$ (from diethyl ether)]; $\delta_{\mathrm{H}}\left(\mathrm{CD}_{3} \mathrm{SOCD}_{3}\right) 3.58(2 \mathrm{H}, \mathrm{d}, J 10.5 \mathrm{~Hz}, \mathrm{H}-4$ and H-6), 3.42 ( $2 \mathrm{H}, \mathrm{d}, \mathrm{H}-4^{\prime}$ and H-6'), 3.37 ( $2 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{CH}_{2} \mathrm{OH}$ ), $1.36(3 \mathrm{H}, \mathrm{s}, \mathrm{Me})$, and $1.28(3 \mathrm{H}, \mathrm{s}, \mathrm{Me})$ (Found: C, 52.05 ; $\mathrm{H}, 9.35 ; \mathrm{N}, 8.6 . \quad \mathrm{C}_{7} \mathrm{H}_{15} \mathrm{NO}_{3}$ requires $\mathrm{C}, 52.15 ; \mathrm{H}, 9.38$; $\mathrm{N}, 8.69 \%$ ). The m.p.s reported in the papers were of the hemihydrate, and there have been no data on elemental analysis reported. The hemihydrate was obtained and had m.p. (Büchi) $53.5-54.5{ }^{\circ} \mathrm{C}$ (from aqueous methanoldiethyl ether) (Found: C, 49.55; H, 9.21; N, 8.18. $\mathrm{C}_{7} \mathrm{H}_{15} \mathrm{NO}_{3} \cdot \frac{1}{2} \mathrm{H}_{2} \mathrm{O}$ requires $\mathrm{C}, 49.40 ; \mathrm{H}, 9.48$; $\mathrm{N}, 8.23 \%$ ).

The 1,3 -dioxan derivative ( $17.5 \mathrm{~g}, 0.11 \mathrm{~mol}$ ) thus obtained was dissolved in water ( 500 ml ), and treated with sodium metaperiodate ( $25 \mathrm{~g}, 0.12 \mathrm{~mol}$ ) with stirring; the mixture was kept below $20^{\circ} \mathrm{C}$. After l h , the mixture was extracted with dichloromethane ( $5 \times 200 \mathrm{ml}$ ), and the organic layer was dried over anhydrous magnesium sulphate. The organic layer was then evaporated and the residue was distilled under reduced pressure to give compound (20) ( $6.3 \mathrm{~g}, 45 \%$ yield), b.p. $65{ }^{\circ} \mathrm{C}$ at 23 mmHg ; $\nu_{\mathrm{C}=\mathrm{o}} 1750 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 4.16$ $\left(4 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \times 2\right)$ and 1.46 ( $6 \mathrm{H}, \mathrm{s}, \mathrm{Me} \times 2$ ) (Found: C , $55.15 ; \mathrm{H}, 7.7 . \quad \mathrm{C}_{6} \mathrm{H}_{10} \mathrm{O}_{3}$ requires $\mathrm{C}, 55.37 ; \mathrm{H}, 7.75 \%$ ); this compound was susceptible to hydrolysis.

Photochemical Reaction of (20) with (6).--Four aliquots of a solution of ( 20 ) ( $1301 \mathrm{mg}, 10.0 \mathrm{mmol}$ ) and (6) ( 1724 mg , 20.0 mmol ) in benzene ( 40 ml ) were photoirradiated. After 6 h reaction, the resulting solution, whose t.l.c. showed no spot of (20), was evaporated. The residue was chromatographed on a column of silica gel ( 80 ml ) using benzene-
acetone and benzene-methanol. However, no products could be isolated.

Photochemical Reaction of Diethyl Mesoxalate (21) ${ }^{20}$ with (6).-Three aliquots of a solution of (21) (1307 mg, 7.51 mmol ) and (6) ( $1290 \mathrm{mg}, 15.0 \mathrm{mmol}$ ) in benzene ( 30 ml ) were photoirradiated for 6 h , after which t.l.c. of the resulting solution showed substantial consumption of (21). The mixture was evaporated and was further concentrated by use of a high-vacuum pump to remove unchanged (6). The residue was chromatographed on a column of silica gel ( 60 ml ) using benzene-cyclohexane-acetone to yield diethyl 3-oxo-2,4,6-trioxabicyclo[3.2.0]heptane-7,7-dicarboxylate (22) ( $441 \mathrm{mg}, 23 \%$ yield) as a syrup; $\nu_{\mathrm{C}=\mathrm{O}}(\mathrm{NaCl}) 1745$ (ethyl ester) and $1840 \mathrm{~cm}^{-1}$ (cyclic carbonate); $\delta_{\mathrm{H}} 6.37(1 \mathrm{H}, \mathrm{d}$, $\left.J_{1.5} 3.5 \mathrm{~Hz}, \mathrm{H}-5\right), 5.77(1 \mathrm{H}, \mathrm{d}, \mathrm{H}-1), 4.38(2 \mathrm{H}, \mathrm{q}, J 7.0 \mathrm{~Hz}$, $\left.\mathrm{OCH}_{2}\right), 4.36\left(2 \mathrm{H}, \mathrm{q}, J 7.0 \mathrm{~Hz}, \mathrm{OCH}_{2}\right)$ and $1.33(6 \mathrm{H}, \mathrm{t}, \mathrm{Me} \times$ 2) (Found: $\mathrm{C}, 46.35 ; \mathrm{H}, 4.65 . \mathrm{C}_{10} \mathrm{H}_{12} \mathrm{O}_{8}$ requires $\mathrm{C}, 46.16$; H, $4.65 \%$ ).

Photochemical Reaction of 1,3-Diacetoxypropan-2-one (5) with (Z)-Vinylene Diacetate (23).-Two aliquots of a solution of (5) ( $870 \mathrm{mg}, 5.00 \mathrm{mmol}$ ) and (23) ( $1442 \mathrm{mg}, 10.0 \mathrm{mmol}$ ) in benzene $(20 \mathrm{ml})$ were photoirradiated for 40 h . The resulting mixtures were combined and evaporated, and the residue was chromatographed on a column of silica gel $(100 \mathrm{ml})$ using benzene-cyclohexane-acetone and benzeneacetone. Thus, were obtained a mixture of $(E)$ - and $(Z)$ vinylene diacetate (24) and (23) $[(24):(23)=42: 58$, calculated by means of ${ }^{1} \mathrm{H}$ n.m.r. integration] ( 644 mg ), (23) ( 85 mg ), (5) ( 229 mg ), a mixture of (5), 2-(1,2-diacetoxyethoxy)propenylene diacetate (41), and trans-4,4-bis-(acetoxymethyl)oxetan-2,3-diyl diacetate (32) (40 mg), and a mixture of (32) and its cis-isomer (31) [(32): (31) = 48:52] (1 117 mg ). The mixture of (5), (41), and (32) (40 mg ) was re-chromatographed on a column of silica gel using benzene-acetone, to give (5) ( 5 mg ), (41) ( 16 mg ), and (32) $(12 \mathrm{mg}$ ). The mixture of (32) and (31) was similarly rechromatographed using benzene-cyclohexane-acetone to give each pure sample. Thus were obtained (24) $(270 \mathrm{mg}$, $19 \%$ yield), ( 23 ) ( $459 \mathrm{mg}, 32 \%$ yield), (5) ( $234 \mathrm{mg}, 27 \%$ recovery yield), (41) ( $16 \mathrm{mg}, 1 \%$ yield), (32) ( $547 \mathrm{mg}, 34 \%$ yield), and (31) ( $582 \mathrm{mg}, 37 \%$ yield).

Compound (31) was a syrup; $\nu_{\mathrm{C}=\mathrm{O}}(\mathrm{NaCl}) 1750 \mathrm{~cm}^{-1}$ (broad) ; ${ }^{1} \mathrm{H}$ n.m.r. data: see Table 3 (Found: C, 49.1; H, 5.6. $\quad \mathrm{C}_{13} \mathrm{H}_{18} \mathrm{O}_{9}$ requires $\mathrm{C}, 49.06 ; \mathrm{H}, 5.70 \%$ ).

Compound (32) was a syrup; $v_{\mathrm{O}=\mathrm{O}}(\mathrm{NaCl}) 1750 \mathrm{~cm}^{-1}$ (broad) ; ${ }^{1} \mathrm{H}$ n.m.r. data: see Table 3 (Found: C, $49.1 ; \mathrm{H}$, 5.7. $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{O}_{9}$ requires $\mathrm{C}, 49.06 ; \mathrm{H}, 5.70 \%$ ).

Compound (41) was a syrup; $v_{\mathrm{C}=\mathrm{O}}(\mathrm{NaCl}) 1740-1760$ $\mathrm{cm}^{-1} ; \delta_{\mathrm{H}} 7.06(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{CH}=\mathrm{C}), 6.48(1 \mathrm{H}, \mathrm{dd}, J 4.5$ and 5.5 $\mathrm{Hz}, \mathrm{C} H-\mathrm{CH}_{2}$ ), $4.57\left(2 \mathrm{H}\right.$, br s, $\left.\mathrm{CH}_{2}-\mathrm{C}=\right), 4.45(1 \mathrm{H}$, dd, $J$ $4.5 \mathrm{~Hz}, H \mathrm{CH}-\mathrm{CH}), 4.20(1 \mathrm{H}, \mathrm{dd}, \mathrm{HCH}-\mathrm{CH}), 2.20(3 \mathrm{H}, \mathrm{s}$, $\mathrm{Me}), 2.12(3 \mathrm{H}, \mathrm{s}, \mathrm{Me})$, and $2.10(6 \mathrm{H}, \mathrm{s}, \mathrm{Me} \times 2)$ (Found: C, $49.15 ; \mathrm{H}, 5.7 . \quad \mathrm{C}_{13} \mathrm{H}_{18} \mathrm{O}_{9}$ requires $\mathrm{C}, 49.06 ; \mathrm{H}, 5.70 \%$ ).

Compound (24) had m.p. 23.5- $27{ }^{\circ} \mathrm{C}$ (lit., ${ }^{15} 23^{\circ} \mathrm{C}$ ); $v_{\mathrm{C}=0}$ $1760 \mathrm{~cm}^{-1}$, no absorption bands were observed between 1600 and $1700 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 7.47(2 \mathrm{H}, \mathrm{s}, \mathrm{CH} \times 2), 2.16(6 \mathrm{H}$, $\mathrm{s}, \mathrm{Me} \times 2)\left[\delta_{\mathrm{H}}\left(\mathrm{CCl}_{4}\right) 7.41\right.$ and 2.12 (lit., ${ }^{15} \delta_{\mathrm{H}} 7.33$ and 2.10)].
(Z)- (25) and (E)-2-(Benzyloxy)vinyl acetate (26).-To a solution of 3-benzyloxypropane-1,2-diol ${ }^{25}$ ( $73 \mathrm{~g}, 0.41 \mathrm{~mol}$ ) in water ( 1000 ml ) (not completely dissolved), sodium metaperiodate ( $90 \mathrm{~g}, 0.42 \mathrm{~mol}$ ) was added with stirring below $20^{\circ} \mathrm{C}$, and the resulting mixture was extracted with ethyl acetate $(6 \times 500 \mathrm{ml})$, after 1 h stirring. The organic layer was dried over anhydrous magnesium sulphate, and evapor-
ated to a syrup ( 62 g ). The residue was mixed with sodium acetate ( $1 \mathrm{~g}, 0.012 \mathrm{~mol}$ ) and acetic anhydride ( 100 ml ), and the mixture was refluxed for 30 min . After cooling, the mixture was poured into a saturated solution of sodium hydrogencarbonate in water ( 1500 ml ) with stirring. After 1 h , the resulting mixture was extracted with chloroform $(1000 \mathrm{ml})$ and the organic layer was washed with water ( $2 \times 500 \mathrm{ml}$ ). After drying over anhydrous magnesium sulphate, the solution was evaporated to remove the solvent and acetic anhydride, and then distilled at 2 mmHg . Thus were obtained the first fraction ( 28 g ; b.p. $139-148{ }^{\circ} \mathrm{C}$ ) as a $56: 12: 32$ mixture of (25), (26), and 2-(benzyloxy)ethylidene diacetate (47) (the proportion was obtained by ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy), and the second fraction ( 12 g ; b.p. $148-165{ }^{\circ} \mathrm{C}$ ) as a $15: 10: 75$ mixture of (25), (26), and (47). Crystallization of the distillation residue gave 5 -benzyloxy-2,6-bis(benzyloxymethyl)-1,3-dioxan-4-yl acetate (48) (6.9 g, $10 \%$ yield). Compounds (25), (26), and (47) were obtained in a total yield of $17.5 \mathrm{~g}(23 \%$ yield $), 4.5 \mathrm{~g}(6 \%$ yield), and $18 \mathrm{~g}(18 \%$ yield), respectively. Re-distillation of the first fraction gave a pale yellow mixture of (25), (26), and (47) (77:12:11) (74.5 g; b.p. $107-110^{\circ} \mathrm{C}$ at 0.6 mmHg$)$, a part of which was chromatographed on a column of silica gel using hexane-acetone to give a colourless mixture of (25) and (26) (92:8). This mixture was used for the photochemical reaction. Re-chromatography of the mixture yielded pure (25), and the structure of (26) was confirmed by isolating it in a photochemical reaction which will be described later.

Compound (25) was a syrup; $\nu_{\mathrm{C}=\mathrm{O}}(\mathrm{NaCl}) 1755 \mathrm{~cm}^{-1}$ and $\nu_{\mathrm{C}=\mathrm{C}} \mathrm{l} 690 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 7.33(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}), 6.51(1 \mathrm{H}, \mathrm{d}, J 3.5 \mathrm{~Hz}$, $\mathrm{CH}), 5.69(1 \mathrm{H}, \mathrm{d}, \mathrm{CH}), 4.87\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right)$, and $2.15(3 \mathrm{H}, \mathrm{s}$, OCOMe) (Found: $\mathrm{C}, 68.65$; $\mathrm{H}, 6.2$, and the $92: 8$ mixture gave $\mathrm{C}, 68.75 ; \mathrm{H}, 6.35 . \quad \mathrm{C}_{11} \mathrm{H}_{12} \mathrm{O}_{3}$ requires $\mathrm{C}, 68.73 ; \mathrm{H}$, $6.29 \%$ ).

Compound (47) was a syrup; $\delta_{H} 7.31(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}), 6.96$ $(1 \mathrm{H}, \mathrm{t}, J 5.0 \mathrm{~Hz}, \mathrm{CH}), 4.61\left(2 \mathrm{H}, \mathrm{s}, \mathrm{PhCH}_{2}\right), 3.66(2 \mathrm{H}, \mathrm{d}$, $\left.\mathrm{CHCH}_{2} \mathrm{O}\right)$, and $2.08(6 \mathrm{H}, \mathrm{s}, \mathrm{OCOMe} \times 2)$.

Compound (48) had m.p. $100-101{ }^{\circ} \mathrm{C}$ (from methanol); $\nu_{\mathrm{C}=\mathrm{O}}(\mathrm{KBr}) 1760 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 7.29(15 \mathrm{H}, \mathrm{s}, \mathrm{Ph} \times 3), 7.16(1 \mathrm{H}$, br d, $J 7.0 \mathrm{~Hz}, \mathrm{H}-4), 4.93(1 \mathrm{H}, \mathrm{t}, J 4.5 \mathrm{~Hz}, \mathrm{H}-2), 4.58(6 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{PhCH}_{2} \times 3\right), 3.5-3.9\left(6 \mathrm{H}_{8} \mathrm{~m}\right)$, and $2.04(3 \mathrm{H}, \mathrm{s}, \mathrm{COMe})$ (Found: $\mathrm{C}, 70.65 ; \mathrm{H}, 6.6 . \quad \mathrm{C}_{29} \mathrm{H}_{32} \mathrm{O}_{7}$ requires $\mathrm{C}, 70.71 ; \mathrm{H}$, $6.55 \%$ ).

Photochemical Reaction of (5) with (25), (26).-Two aliquots of a solution of (5) ( $871 \mathrm{mg}, 5.00 \mathrm{mmol}$ ) and (25), (26) (92:8) ( $1923 \mathrm{mg}, 10.0 \mathrm{mmol}$ ) in benzene ( 20 ml ) were similarly photoirradiated for 30 h . After the reaction, the resulting mixture was concentrated in vacuo and the residue was chromatographed on a column of silica gel ( 120 ml ) using benzene-cyclohexane-acetone and benzene-acetone. Thus were obtained (26) ( 222 mg ), a $56: 44$ mixture of (25) and (26) ( 342 mg ), (25) ( 551 mg ), a mixture of (5), 2,2-bis(ace-toxymethyl)-4-(benzyloxy)oxetan-3-yl acetate (33a), (33b), and 4,4-bis(acetoxymethyl)-3-(benzyloxy) oxetan-2-yl acetate (38a), (38b) ( 391 mg ; fraction 4), a mixture of (5), (33), and (38) ( 664 mg ; fraction 5), and a $42: 24: 34$ mixture of (33b), (38a), and (38b) ( 342 mg ). Re-chromatography of fractions 4 and 5 on a column of silica gel ( 70 ml ) using cyclohexane-propan-2-ol gave (33a) ( 108 mg ; containing impurity), a mixture of (33) and (38a) [291 mg; (33a) : (33b) : (38a) = $33: 59: 8]$, a mixture of (33b) and (38) [305 mg; (33b) : (38a) : (38b) $=52: 30: 18]$, and (5) ( $329 \mathrm{mg}, 38 \%$ recovery yield) (proportions calculated by means of ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy). Thus the compounds obtained were as follows:
(26) ( $372 \mathrm{mg}, 19 \%$ yield), (25) ( $743 \mathrm{mg}, 39 \%$ yield), (33a) ( $204 \mathrm{mg}, 11 \%$ yield, containing impurity), ( 33 b ) ( 474 mg , $26 \%$ yield; containing impurity), ( 38 a) ( $197 \mathrm{mg}, 11 \%$ yield; containing impurity), (38b) ( $171 \mathrm{mg}, 9 \%$ yield), and (5) ( 329 $\mathrm{mg}, 38 \%$ recovery yield).

Compound (26) was a syrup; $v_{\mathrm{O}=\mathrm{O}}(\mathrm{NaCl}) 1750 \mathrm{~cm}^{-1}$ and $\nu_{\mathrm{O}=\mathrm{o}} 1670 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 7.32(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}), 7.11(1 \mathrm{H}, \mathrm{d}, J 11.0 \mathrm{~Hz}$, $\mathrm{CH})$, $6.78(1 \mathrm{H}, \mathrm{d}, \mathrm{CH})$, $4.71\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right)$, and $2.08(3 \mathrm{H}$, $\mathrm{s}, \mathrm{OCOMe}$ ) (Found: $\mathrm{C}, 68.6 ; \mathrm{H}, 6.35 . \quad \mathrm{C}_{11} \mathrm{H}_{12} \mathrm{O}_{3}$ requires C, 68.73 ; H, $6.29 \%$ ).

Compounds (33) and (38); ${ }^{1} \mathrm{H}$ n.m.r. data, see Table 3 [Found: C, 58.8; H, 6.0 for a mixture of (33b), (38a), and (38b). $\quad \mathrm{C}_{18} \mathrm{H}_{22} \mathrm{O}_{8}$ requires C, $\left.59.01 ; \mathrm{H}, 6.05 \%\right]$.

Photochemical Reaction of (5) with 2,3-Dihydro-1,4-dioxin (27).-Two aliquots of a solution of (5) ( $870 \mathrm{mg}, 5.00 \mathrm{mmol}$ ) and (27) ( $862 \mathrm{mg}, 10.0 \mathrm{mmol}$ ) in benzene $(20 \mathrm{ml})$ were photoirradiated in the same way as above for 30 h . The i.r. spectrum of the resulting mixture showed $v_{\mathrm{C}=\mathrm{C}}$ at $1650 \mathrm{~cm}^{-1}$, due to unchanged (27). The mixture was evaporated and the residue was chromatographed on a column of silica gel ( 70 ml ) using benzene-acetone to give (5) ( 418 mg ) a $12: 88$ mixture of (5) and (8-acetoxymethyl-2,5,7-trioxabicyclo-[4.2.0]octan-8-yl)methyl acetate (34) ( 51 mg ), and (34) (285 mg ) [proportions of (5) and (34) in the mixture calculated by means of ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy]. Thus, were obtained (5) ( $424 \mathrm{mg}, 49 \%$ yield), and ( 34 ) ( $320 \mathrm{mg}, 25 \%$ yield).

Compound (34) had m.p. $65-65.5{ }^{\circ} \mathrm{C}$ (from benzenehexane); $\nu_{\mathrm{O}=0}$ ( KBr ) $1740 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ n.m.r. data, see Table 3 (Found: C, 50.9; H, 6.15. $\mathrm{C}_{11} \mathrm{H}_{16} \mathrm{O}_{7}$ requires C , 50.77; H, $6.20 \%$ ).

Photochemical Reaction of (5) with Vinyl Acetate (28).Three aliquots of a solution of (5) ( $1306 \mathrm{mg}, 7.50 \mathrm{mmol}$ ) and (28) ( $1.30 \mathrm{~g}, 15.0 \mathrm{mmol}$ ) in benzene ( 30 ml ) were photoirradiated in the same way as above; g.l.c. showed consumption of $>90 \%$ (28) after irradiating for 15 h . The resulting mixture was evaporated and the residue was chromatographed on a column of silica gel ( 80 ml ) using benzeneacetone to give (5) ( $708 \mathrm{mg}, 54 \%$ recovery yield), 2,2-bis-(acetoxymethyl)oxetan-3-yl acetate (35) ( 134 mg ), a $65: 35$ mixture of (35) and 4,4-bis(acetoxymethyl)oxetan-2-yl acetate (39) ( 244 mg ) and (39) ( 33 mg ). On the whole, were obtained ( 35 ) ( $292 \mathrm{mg}, 15 \%$ yield) and (39) ( $118 \mathrm{mg}, 6 \%$ yield). The mixture of (35) and (39) was further repeatedly chromatographed using cyclohexane-propan-2-ol to give pure samples. Retention time of (28) on g.l.c. was 3.6 min under the conditions used [oven temperature, $60^{\circ} \mathrm{C}$; injection temperature, $130^{\circ} \mathrm{C}$; and carrier gas, nitrogen at 0.4 $\mathrm{kg} \mathrm{cm}^{-2} \mathrm{~J}$.

Compound (35) was a syrup; $\nu_{\mathrm{C}=0}(\mathrm{NaCl}) 1740-1750$ $\mathrm{cm}^{-1}$; ${ }^{1} \mathrm{H}$ n.m.r. data, see Table 3 (Found: C, 50.9; H, 6.25. $\mathrm{C}_{11} \mathrm{H}_{16} \mathrm{O}_{7}$ requires $\mathrm{C}, 50.77 ; \mathrm{H}, 6.20 \%$ ).

Compound (39) was a syrup; $v_{\mathrm{C}=\mathrm{o}}(\mathrm{NaCl}) 1745 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ n.m.r. data, see Table 3 (Found: $\mathrm{C}, 50.7$; $\mathrm{H}, 6.15 . \mathrm{C}_{11^{-}}$ $\mathrm{H}_{16} \mathrm{O}_{7}$ requires C, $50.77 ; \mathrm{H}, 6.20 \%$ ).
Photochemical Reaction of (5) with Isopropenyl Acetate (29). -Five aliquots of a solution of (5) ( $870 \mathrm{mg}, 5.00 \mathrm{mmol}$ ) and (29) ( $2.50 \mathrm{~g}, 25 \mathrm{mmol}$ ) in benzene ( 50 ml ) were photoirradiated for 20 h . After the reaction, the i.r. spectrum of the mixture still showed the absorption band of $1670 \mathrm{~cm}^{-1}$ ( $\mathrm{C}=\mathrm{C}$ ) due to (29). The resulting mixture was evaporated and the residue was chromatographed on a column of silica gel ( 70 ml ) using cyclohexane-propan-2-ol, to give 2,2-bis-(acetoxymethyl)-3-methyloxetan-3-yl acetate (36) ( 750 mg , $55 \%$ yield) and ( 5 ) ( $323 \mathrm{mg}, 37 \%$ recovery yield).
Compound (36) was a syrup; $v_{\mathrm{O}=0}(\mathrm{NaCl}) 1745 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$
n.m.r. data, see Table 3 (Found: C , 52.5 ; $\mathrm{H}, 6.85 . \mathrm{C}_{12}{ }^{-}$ $\mathrm{H}_{18} \mathrm{O}_{7}$ requires C, $52.55 ; \mathrm{H}, 6.62 \%$ ).

Photochemical Reaction of (5) with Ethoxyethene (30).Two aliquots of a solution of (5) ( $871 \mathrm{mg}, 5.00 \mathrm{mmol}$ ) and (30) ( $720 \mathrm{mg}, 10.0 \mathrm{mmol}$ ) in benzene ( 20 ml ) were similarly photoirradiated for 30 h . G.l.c. of the mixture obtained indicated that $>50 \%$ of (30) was remained unchanged. After evaporation of the resulting mixture, the residue was chromatographed on a column of silica gel ( 70 ml ) using cyclohexane-propan-2-ol to give (2-acetoxymethyl-3-ethoxyoxetan-2-yl)methyl acetate (37) ( $587 \mathrm{mg}, 48 \%$ yield) and (5) ( $275 \mathrm{mg}, 32 \%$ recovery yield). Retention time of (30) on g.l.c. was 2.6 min (oven temperature, $60^{\circ} \mathrm{C}$; injection temperature, $130{ }^{\circ} \mathrm{C}$; carrier gas, nitrogen at 0.4 kg $\mathrm{cm}^{-2}$ ).

Compound (37) was a syrup; $\nu_{\mathrm{C}=0}(\mathrm{NaCl}) 1750 \mathrm{~cm}^{-1}$; ${ }^{1} \mathrm{H}$ n.m.r. data, see Table 3 (Found: C, 53.55; H, 7.5. $\mathrm{C}_{11}{ }^{-}$ $\mathrm{H}_{18} \mathrm{O}_{6}$ requires C, $53.65 ; \mathrm{H}, 7.37 \%$ ).

Photochemical Reaction of (5) with 1,1-Diethoxyethene ${ }^{22}$ (43). -Two aliquots of a solution of (5) ( $871 \mathrm{mg}, 5.00 \mathrm{mmol}$ ) and (43) ( $1.06 \mathrm{~g}, 10.0 \mathrm{mmol}$ ) in benzene ( 20 ml ) were photoirradiated for 30 h . After the reaction, the resulting solutions were combined and evaporated, and the residue was chromatographed on a column of silica gel ( 80 ml ) using benzene-cyclohexane-acetone to give (2-acetoxymethyl-3,3-diethoxyoxetan-2-yl)methyl acetate (44) ( 350 mg ), a $40: 60$ mixture of (44) and (5) ( 404 mg ; proportions by ${ }^{1} \mathrm{H}$ n.m.r. spectroscopy), (5) ( 169 mg ), and ethyl 4 -acetoxy-3-acetoxy-methyl-3-hydroxybutyrate (45) ( $220 \mathrm{mg}, 17 \%$ yield). Overall were obtained (44) ( $512 \mathrm{mg}, 35 \%$ yield) and (5) (411 $\mathrm{mg}, \mathbf{4 7} \%$ recovery yield). As a control, another two aliquots were kept in the dark, and treated in the same way as above, giving ( 45 ) ( $78 \mathrm{mg}, 6 \%$ yield) and (5) ( $802 \mathrm{mg}, 92 \%$ recovery yield).

Compound (44) was a syrup; $v_{\mathrm{C}=0}(\mathrm{NaCl}) 1745 \mathrm{~cm}^{-1} ;{ }^{1} \mathrm{H}$ n.m.r. data, see Table 3 (Found: C, 53.9; H, 7.6. $\mathrm{C}_{13} \mathrm{H}_{22} \mathrm{O}_{7}$ requires $\mathrm{C}, 53.78 ; \mathrm{H}, 7.64 \%$ ).

Compound (45) was a syrup; $v_{\mathrm{C}=0}(\mathrm{NaCl}) 1740 \mathrm{~cm}^{-1}$ (br) ; $\delta_{\mathrm{H}} 4.23$ ( $2 \mathrm{H}, \mathrm{q}, J 7.0 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Me}$ ), $4.18(4 \mathrm{H}, \mathrm{s}$, $\mathrm{CH}_{2} \mathrm{OAc} \times 2$ ), $2.67\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2} \mathrm{Et}\right), 2.12(6 \mathrm{H}, \mathrm{s}, \mathrm{MeCO}$ $\times 2$ ), and $1.30\left(3 \mathrm{H}, \mathrm{t}, \mathrm{Me} \mathrm{CH}_{2}\right.$ ) (Found: C, $50.45 ; \mathrm{H}, 6.9$. $\mathrm{C}_{11} \mathrm{H}_{18} \mathrm{O}_{7}$ requires $\mathrm{C}, 50.37 ; \mathrm{H}, 6.92 \%$ ).

Thermal Reaction of (5) with (43).-A solution of (5) (870 $\mathrm{mg}, 5.00 \mathrm{mmol})$ and (43) ( $1.16 \mathrm{~g}, 10.0 \mathrm{mmol}$ ) in benzene ( 20 ml ) was refluxed for 50 h . The resulting solution was evaporated and the residue was chromatographed in the same way as above to give ethyl 4-acetoxy-3-acetoxymethylcrotonate (46) ( $288 \mathrm{mg}, 24 \%$ yield), (5) ( $469 \mathrm{mg}, 54 \%$ recovery yield), and ( 45 ) ( $268 \mathrm{mg}, 20 \%$ yield).

Compound (46) was a syrup; $v_{\mathrm{C}=0}(\mathrm{NaCl}) 1750$ and 1720 $\mathrm{cm}^{-1}, v_{\mathrm{O}=0} 1660 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}} 6.01(1 \mathrm{H}$, quintet, $J 1.5 \mathrm{~Hz}$, $\left.=\mathrm{CHCO}_{2} \mathrm{Et}\right), 5.29\left(2 \mathrm{H}\right.$, br s, $\left.\mathrm{CH}_{2} \mathrm{OAc}\right), 4.76(2 \mathrm{H}$, br s, $\left.\mathrm{CH}_{2} \mathrm{OAc}\right), 4.22\left(2 \mathrm{H}, \mathrm{q}, J 7.0 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Me}\right), 2.14(3 \mathrm{H}, \mathrm{s}$, COMe), $2.10(3 \mathrm{H}, \mathrm{s}, \mathrm{COMe})$, and $1.31\left(3 \mathrm{H}, \mathrm{t}, \mathrm{MeCH} \mathrm{C}_{2}\right)$ (Found: C, 53.85; H, 6.6. $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{O}_{6}$ requires $\mathrm{C}, 54.09$; H, $6.60 \%$ ).

We thank the Japanese Ministry of Education for a Scientific Research Grant-in-aid.

[^0]:    $\dagger$ There have been a number of papers reported on the synthesis of DL-apiose, and the details are available in a review. ${ }^{5}$ Recently, Ho ${ }^{6}$ reported a novel and simple synthetic method. However, no synthetic method involving photochemical reaction, has been previously reported.

[^1]:    $\ddagger$ The solubility of both (5) and (6) in cyclohexane was too low for their reactions to be investigated in this solvent.

[^2]:    $b$ The chemical shifts were also determined through the INDOR technique with a Varian EM-390 apparatus. c $\delta 4.0-5.0$; assignment was impossible due to the mixture

[^3]:    * These are different from the locants given in Table 3; the 2and 3 -position correspond to the 1 - and 2 -position given in Table 3, respectively (see footnote $a$ in Table 3).

[^4]:    * Locants used here correspond to those indicated in the struc-
    ure of ( 19 ) in the text. ture of (19) in the text.

[^5]:    * This compound was not obtained in crystalline form by the previously reported method. ${ }^{23}$
