#### Abstract

As part of a projected synthesis of gelsemine (1), the synthesis of dimethyl 7-oxobicyclo[2.2.1]hept-5-ene-2endo, 3 -exo-dicarboxylate (5) is described. The route involves the silicon-controlled rearrangement of 5 -exo-bromo-3-exo-methoxycarbonyi-7-anti-trimethylsilylbicyclo[2.2.1]heptane-2,6-carbolactone (9), catalysed by silver ions in methanol, to give dimethyl 7 -syn-hydroxybicyclo[2.2.1] hept-5-ene-2-endo,3-exo-dicarboxylate (11). Some related reactions show that a 7 -trimethylsilyl group in a norbornene can be used to synthesise other 7functionalised norbornenes. Thus the epoxide (13) of methyl 7 -anti-trimethylsilylbicyclo[2.2.1]hept-5-ene-2-endo-carboxylate (12) rearranges on treatment with boron trifluoride-ether to give methyl 7 -anti-hydroxybicylo-[2.2.1]hept-5-ene-2-exo-carboxylate (14), and treatment of (12) with bromine gives mainly the rearranged bromide, methyl 7-anti-bromobicyclo[2.2.1]hept-5-ene-2-exo-carboxylate (16). Some limitations in this approach to 7 -functionalised norbornenes are also described.

We plan to synthesise gelsemine (1) by way of a bicyclo[3.2.1] octane derivative of the general form (2). In one approach to such a compound, we have been working with norbornenes such as the ketone (7), in which the $\mathrm{C}=\mathrm{C}$ double bond will be used to expand the ring system of the bicyclo[2.2.1] heptene to a bicyclo[3.2.1]octane derivative. In this strategy, it is essential that we have
cation rearrangement, as described in a preliminary communication. ${ }^{1}$

## RESULTS AND DISCUSSION

Our first route, a conventional one (Scheme 1), used the known 7,7-diethoxycyclopentadiene (3), and gave us a 7 -oxonorbornene (5). This intermediate had the

a functional group at the 7 -position in the norbornene, in order that we can have, eventually, a functional group at the corresponding position (starred) in (2). We have, therefore, been working on various ways in which 7 -functionalised norbornenes can be synthesised. We describe here some of our work, and, in particular, that part of it in which we used a silicon-controlled carbo-

advantage that we could use the 7 -keto-group to differentiate between the two methoxycarbonyl groups, a major task, which we had to face at some stage. Thus one equivalent of alkali selectively hydrolysed the exomethoxycarbonyl group to give the acid (6), presumably because the hydroxide ion initially attacked the ketone group to give an oxy-anion which can participate in the hydrolysis of the nearby ester group. Curtius degrad-
ation of the acid to give the urethane (7) completed our first objective. ${ }^{2}$

However, to make the diethoxycyclopentadiene (3) on a large scale was troublesome and time-consuming, and the yield in the Diels-Alder reaction was not good. We therefore sought a better synthesis of the ketone (5), and found it in the silicon-controlled carbo-cation rearrangement in Scheme 2. Dimethyl fumarate, like other reactive dienophiles, ${ }^{3,4}$ captured the most abundant

Having been successful in our main aim, we examined a few other systems to see if this was a general approach to 7 -functionalised norbornenes. Methyl acrylate, like other less-reactive dienophiles, ${ }^{3}$ reacts with trimethylsilylcyclopentadiene to give a mixture of 5 - and 6silylated norbornene carboxylic esters with little regioselectivity. ${ }^{6}$ Lewis-acid catalysis, however, raised the reactivity of the ester, and the major product was the 7 -silylated norbornene (12). The epoxide (13) of this

isomer of trimethylsilylcyclopentadiene. Bromination of the adduct (8) gave the bromolactone ( 9 ), and silver-ion-catalysed rearrangement ( 9 , arrows) gave, presumably, the lactone (10), but this intermediate opened $[(10) \rightarrow(11)]$ in the (by now) acidic methanol used as a solvent. The overall yield from fumarate was $47 \%$ when intermediates were not isolated. The poor step $(53 \%)$ was the bromolactonisation, but the key rearrangement step was very clean, giving a $98 \%$ yield of crystalline product. The trimethylsilyl group was needed; without it the starting material was the only compound which could be isolated, even after twice the time that it took for the silyl derivative to rearrange, and there was no sign of the product (11). The rearrangement was encouraged by the silyl group, because the $\mathrm{Si}-\mathrm{C}$ bond stabilises the partial (or full) positive charge developing on $\mathrm{C}-4$, and the outcome is controlled by the ready loss of the silyl group. A related reaction in the tin series has been reported by Hartmann and Traylor. ${ }^{5}$ The alcohol (11) could be oxidised to the ketone (5), completing our less conventional, yet more convenient, synthesis of this compound, and the alcohol (11) was re-formed by reduction of the ketone (5), thus confirming the stereochemistry shown for this group.
adduct rearranged on treatment with boron trifluorideether to give the 7 -hydroxynorbornene (14) ( $67 \%$ ), together with a small amount of the unrearranged lactone (15) $(3 \%)$. A closely similar reaction with bromine $[(12) \rightarrow(16)]$ shows that it is also possible to place a bromine atom at C-7 using the silicon-induced rearrangement. In contrast to the reaction of (8) with bromine, bromolactonisation $[(12) \rightarrow(18)]$ is only a minor pathway. Similarly, the epoxide (21) did not rearrange with boron trifluoride-ether but gave the lactone (22). Presumably, the presence of the second methoxycarbonyl group in (8) and (21) slows down the migration of the atom to which it is attached, thus allowing the lactonisations, already visible with (12), to take place instead.

However, it must be added that silicon-controlled rearrangement is not always a solution to the problem of placing a functional group on C-7 of a norbornene. We reported earlier ${ }^{7}$ that, although the sodium salt of the carboxylic acid corresponding to the ester (12) underwent rearrangement on treatment with bromine, the product was unstable to the reaction conditions and went on to a tricyclic dibromide. Even less straightforward, phenylsulphenyl chloride reacted with the ester (12) to
give unrearranged lactone (19) ( $\mathbf{6 6} \%$ ) as the major product, and the rearranged product ( $22 \%$ ) had reacted further with the sulphenyl chloride. Phenylselenenyl bromide was little better, giving selenolactonisation ${ }^{8}$ $[(12) \rightarrow(20)]$ as the major reaction $(46.5 \%)$ and a little of the simply rearranged product (17) ( $20 \%$ ). Finally, we have, so far, been unable to get any useful
methoxycarbonyl groups (Scheme 4), and simultaneously establishes a ketone group in (24) as a site for the ringexpansion.

Combined Procedure for Large-scale Preparation of the Hydroxy-diester (11) without Recrystallization of the Inter-mediates.-Dimethyl fumarate ( $3.68 \mathrm{~g}, 25.6 \mathrm{mmol}$ ) and trimethylsilylcyclopentadiene ${ }^{9}(4.20 \mathrm{~g}, 30.4 \mathrm{mmol})$ were kept in dichloromethane ( 70 ml ) at room temperature for 24 h . The solvent was removed in vacuo, the residue dissolved in light petroleum (b.p. $60-80^{\circ} \mathrm{C}$ ) and filtered through silica gel ( 150 g , slurried with light petroleum). Elution with light petroleum ( 500 ml ) removed non-polar impurities. The ester (8) was then eluted with light petroleum-ethyl acetate ( $2: 1 \mathrm{v} / \mathrm{v}, 500 \mathrm{ml}$ ) and obtained as a pale yellow crystalline mass ( 7.20 g , quantitative), m.p.

Bromine ( $1.50 \mathrm{ml}, 4.71 \mathrm{~g}, 29.4 \mathrm{mmol}$ ) in methanol ( 40 ml ) was added dropwise at $0{ }^{\circ} \mathrm{C}$ over 1 h with vigorous stirring to this ester in methanol ( 100 ml ), in which sodium hydrogencarbonate ( $2.20 \mathrm{~g}, 26.2 \mathrm{mmol}$ ) was suspended. Stirring was continued for 4 h at room temperature, the solution was concentrated in vacuo (to about 50 ml ), and then poured into dilute sodium thiosulphate solution ( 300 ml ). The aqueous solution was extracted with dichloromethane $(5 \times 60 \mathrm{ml})$, and the combined extracts were washed with brine $(2 \times 100 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$, and evaporated in vacuo to a semi-crystalline oil $(8.59 \mathrm{~g})$. This oil and silver nitrate ( $10.50 \mathrm{~g}, 61.5 \mathrm{mmol}$ ) were refluxed with vigorous mechanical stirring in methanol $(150 \mathrm{ml})$ for 10 h in the dark. The solution was filtered through Celite, concentrated in vacuo to $c a .50 \mathrm{ml}$, and poured into water $(300 \mathrm{ml})$. The aqueous solution was extracted with dichloromethane $(4 \times 40 \mathrm{ml})$, and the combined extracts were washed with brine ( 100 ml ), dried ( $\mathrm{MgSO}_{4}$ ), and evaporated in vacuo to a gum (aboug 6 g ). This gum was chromatographed on silica gel ( 130 g , slurried with $4: 1 \mathrm{v} / \mathrm{v}$ light petroleum-ether), eluting successively with $4: 1,3: 2$, and $2: 3$ light petroleum-ether. The hydroxy-diester (11) was obtained as a cream-coloured crystalline mass ( $2.73 \mathrm{~g}, \mathbf{4 7 \%}$ based on dimethyl fumarate), $\mathrm{m} . \mathrm{p} .70-73^{\circ} \mathrm{C}$. This product could be used without further purification in subsequent reactions.

Dimethyl 7-Oxobicyclo[2.2.1]hept-5-ene-2-endo,3-exodicarboxylate (5).-The oxidation procedure used was that of Huang, Omura, and Swern. ${ }^{10}$ A solution of trifluoroacetic anhydride ( $0.12 \mathrm{ml}, 180 \mathrm{mg}, 0.86 \mathrm{mmol}$ ) in dry dichloromethane ( 0.8 ml ) was added dropwise to a solution of dimethyl sulphoxide ( $85 \mu 1,93 \mathrm{mg}, 1.19 \mathrm{mmol}$ ) in dry dichloromethane ( 0.5 ml ) cooled to $-65^{\circ} \mathrm{C}$ under nitrogen, and the resulting solution was stirred for 20 min . A solution of the hydroxy-diester (11) ( $113 \mathrm{mg}, 0.5 \mathrm{mmol}$ ) in dichloromethane ( 0.8 ml ) was added dropwise during 2 min by syringe. Stirring was continued for 15 min ; the solution was warmed to room temperature over 10 min , and it was then left to stand at room temperature for a further 30 min . Triethylamine $(0.2 \mathrm{ml}$, dried over Woelm alumina) was added; and after 20 min , the reaction mixture was poured into dilute hydrochloric acid and extracted with ether ( 10 ml ) to give the keto-diester (5) ( $101 \mathrm{mg}, 90 \%$ ) as an unstable yellow oil, pure by n.m.r. and t.l.c., $R_{\mathrm{F}}\left(\mathrm{Et}_{2} \mathrm{O}\right)$ $0.45 ; \nu_{\text {max }}\left(\mathrm{CCl}_{4}\right) 1780$ (ketone) and $1730 \mathrm{~cm}^{-1}$ (ester $\mathrm{C}=\mathrm{O}$ ); $\delta\left(\mathrm{CDCl}_{3}\right) 6.66(1 \mathrm{H}, \mathrm{dd}, J 6$ and $4 \mathrm{~Hz}, \mathrm{H}-5), 6.48(1 \mathrm{H}, \mathrm{dd}$, $J 6$ and $4 \mathrm{~Hz}, \mathrm{H}-6), 3.73\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{Me}\right), 3.70(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CO}_{2} \mathrm{Me}\right), 3.54(1 \mathrm{H}, \mathrm{dd}, J 4$ and $4 \mathrm{~Hz}, \mathrm{H}-2$-exo), $3.34(1 \mathrm{H}, \mathrm{m}$, $\mathrm{H}-1)$, $3.21(1 \mathrm{H}, \mathrm{m}, \mathrm{H}-4)$, and $2.87(1 \mathrm{H}, \mathrm{d}, J 4 \mathrm{~Hz}, \mathrm{H}-3-$ endo) (Found: $M^{+}, 224.0675 . \quad \mathrm{C}_{11} \mathrm{H}_{12} \mathrm{O}_{5}$ requires $M$, $224.0685) ; m / z 224\left(0.5 \%, M^{+}\right), 209\left(4, M^{+}-\mathrm{Me}\right), 193$ (23, $M^{+}-\mathrm{MeO}$ ), 163 (22), 138 (25), 137 (93), 136 (42), 105 (100), 93 (75), and 91 (50). After l h at room temperature, the solution was poured into dilute hydrochloric acid, worked up in the usual way, and purified by t.l.c. on silica gel eluting with benzene-ethyl acetate ( $2: 1 \mathrm{v} / \mathrm{v}$ ). The hydroxy-diester (11) ( $54 \mathrm{mg}, 64 \%$ ) was recrystallised from benzene-light petroleum (b.p. $60-80{ }^{\circ} \mathrm{C}$ ) as needles, m.p. $78-79^{\circ} \mathrm{C}$, identical (mixed m.p., i.r., n.m.r., t.l.c.) with the hydroxy-diester prepared earlier.

This solution was added to a stirred mixture of the silyl compound ( 8 ) ( $1.27 \mathrm{~g}, 5 \mathrm{mmol}$ ) and anhydrous sodium carbonate ( $2.39 \mathrm{~g}, 22.5 \mathrm{mmol}$ ) in dry dichloromethane ( 5 ml ) under $\mathrm{N}_{2}$ at $25{ }^{\circ} \mathrm{C}$ and the mixture refluxed for 30 min , kept at $25^{\circ} \mathrm{C}$ for 3 h , and then filtered through Celite. The product mixture was reacted again (using three-quarters of the above amounts, and following the same procedure) to give material containing a high proportion of epoxide. Purification by column chromatography [silica gel ( 150 g ) made up in hexane; gradient elution using successive amounts ( 250 ml ) of $0,1,2,5,10,20,40$, and $60 \% \mathrm{Et}_{2} \mathrm{O}-$ hexane solutions, $50-\mathrm{ml}$ fractions being collected] and recrystallisation from hexane gave the epoxide (21) as a white crystalline solid ( $860 \mathrm{mg}, 85 \%$ ), m.p. $83-86{ }^{\circ} \mathrm{C}$, $R_{\mathrm{F}}\left(\mathrm{Et}_{2} \mathrm{O}\right) 0.57$ (Found: C, 56.35; H, 7.5. $\mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}_{5} \mathrm{Si}$ requires C, $56.2 ; \mathrm{H}, 7.4 \%)$; $\delta 3.68(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe})$ and 3.67 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), 3.62 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-4$ and H-5), 3.14 ( $2 \mathrm{H}, \mathrm{m}$, $\mathrm{H}-1$ and $\mathrm{H}-4$ ), 2.87 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-2$ ), 2.68 ( $1 \mathrm{H}, \mathrm{m}, \mathrm{H}-3$ ), $1.44(1 \mathrm{H}, \mathrm{s}, \mathrm{H}-7)$, and $0.02\left(9 \mathrm{H}, \mathrm{s}, \mathrm{SiMe}_{3}\right)$; $\nu_{\text {max. }} 1735$, 1256,1198 , and $1180 \mathrm{~cm}^{-1} ; m / z 298\left(M^{+}, 17 \%\right)$ and 266 (100).

7-syn-Acetoxy-3-exo-methoxycarbonyl-5-oxobicyclo[2.2.1]-heptane-2,6-carbolactone.-The hydroxy-lactone (23) (1.78 g, 6.57 mmol ) was dissolved in dry, alcohol-free chloroform $(15 \mathrm{ml})$. Sodium periodate $(1.680 \mathrm{~g}, 7.84 \mathrm{mmol})$, hydrated ruthenium dioxide ( 50 mg ), and water ( 2 ml ) were added and the mixture stirred vigorously at room temperature for 17.5 h before being diluted with more chloroform ( 15 ml ). Propan-2-ol ( 1 ml ) was added to destroy any unreacted ruthenium tetraoxide and the mixture was drawn by suction through a short column (packed from the bottom) of Celite, charcoal, and magnesium sulphate, eluting with more chloroform ( 50 ml ). The solvent was removed in vacuo.

The resulting gum (ca. 2 g ) was distilled twice, first at $190^{\circ} \mathrm{C} / 0.05 \mathrm{mmHg}$, and again at $160-170^{\circ} \mathrm{C} / 0.03 \mathrm{mmHg}$; the keto-lactone was obtained as a glass ( $1.448 \mathrm{~g}, \mathbf{8 2} \%$ ), $R_{\text {F }}$ (benzene-acetone $\left.2: 1 \mathrm{v} / \mathrm{v}\right) 0.31$; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) 1780(\mathrm{br}$, lactone and ketone), $1737 \mathrm{~cm}^{-1}$ (ester), $\delta\left(\left[{ }^{2} \mathrm{H}_{6}\right]\right.$ acetone) $5.27(1 \mathrm{H}, \mathrm{t}, J 1.5 \mathrm{~Hz}, \mathrm{H}-7), 4.70(1 \mathrm{H}, \mathrm{td}$ ?, $J 1.5$ and 5 Hz , $\mathrm{H}-6), 3.75\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{Me}\right), 3.45$ ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-2$ and $\mathrm{H}-3$ ?), 3.25 ( $2 \mathrm{H}, \mathrm{m}, \mathrm{H}-\mathrm{l}$ and $\mathrm{H}-4$ ?), 1.97 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OAc}$ ) (Found: $M^{+}$, 268.058 6. $\mathrm{C}_{12} \mathrm{H}_{12} \mathrm{O}_{7}$ requires $M, 268.0583$ ); $\mathrm{m} / \mathrm{z}$ 268 ( $11 \%, M^{+}$), 240 (18), 210 (33), 208 (37), 180 (29), 157 (57), 151 (54), 127 (100), 125 (38), 122 (37), 115 (59), 95 (26), and 93 (38). The dimethyl acetal was prepared with hydrogen chloride gas in methanol and purifying the product by t.l.c., eluting with ether to give needles, m.p. 149$151{ }^{\circ} \mathrm{C}$ (from methanol) (Found: C, 53.3; H, 6.0. $\mathrm{C}_{14} \mathrm{H}_{18} \mathrm{O}_{8}$ requires $\mathrm{C}, 53.5 ; \mathrm{H}, 5.75 \%), R_{\mathrm{F}}\left(\mathrm{Et}_{2} \mathrm{O}\right) 0.34 ; \nu_{\text {max. }}\left(\mathrm{CHCl}_{3}\right)$ 1779 (lactone $\mathrm{C}=\mathrm{O}$ ) and $1730 \mathrm{~cm}^{-1}$ (ester $\mathrm{C}=\mathrm{O}$ ); $\delta\left(\mathrm{CDCl}_{3}\right)$ $4.96(1 \mathrm{H}, \mathrm{t}, J 1.7 \mathrm{~Hz}, \mathrm{H}-7), 4.31(1 \mathrm{H}, \mathrm{dd}, J 0.7$ and 5 Hz , $\mathrm{H}-6), 3.70\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{Me}\right)$, $3.4-3.1$ with $3.30,3.24$ and $3.10(10 \mathrm{H}, \mathrm{m}$ with $2 \times \mathrm{s}$ and d, J $2.3 \mathrm{~Hz}, \mathrm{H}-1, \mathrm{H}-2$, and $\mathrm{H}-4$ with $2 \times \mathrm{OMe}$ and $\mathrm{H}-3$ ), and 1.91 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OAc}$ ); $\mathrm{m} / \mathrm{z}$ $314\left(20 \%, M^{+}\right), 283\left(14, M^{+}-\mathrm{MeO}\right), 271\left(17, M^{+}-\mathrm{OAc}\right)$, 257 (25), 255 (28), 254 (28), 225 (26), 209 (41), 197 (100), 167 (33), 165 (28), 164 (33), 159 (49), 151 (98), and 135 (28). The keto-lactone is hygroscopic and it is more than probable that the ketone hydrate is formed. For this reason, it is essential to minimise the quantity of water used in the oxidation; the putative ketone hydrate is very soluble in water and can only be extracted from aqueous solution with great difficulty.
