# Structure and Absolute Configuration of (+)-Vitrenal, a Novel Carbon Skeletal Sesquiterpenoid having Plant-growth-inhibitory Activity, from the Liverwort Lepidozia vitrea 

Akihiko Matsuo,* Seiryo Uto, Hirōshi Nozaki, and Mitsuru Nakayama<br>Department of Chemistry, Faculty of Science, Hiroshima University, Naka-ku, Hiroshima 730, Japan

#### Abstract

A novel carbon skeletal sesquiterpene aldehyde (+)-vitrenal displaying plant-growth-inhibitory properties has been isolated from the liverwort Lepidozia vitrea, and its structure and absolute configuration have been determined to be ( $1 R, 6 R, 7 S, 10 R$ )-vitr-4-en-14-al (1) on the basis of chemical and spectral evidence as well as $X$-ray analysis.

In the preceding paper, ${ }^{1}$ we reported the structure elucidation of two novel sesquiterpene aldehydes, ( - )-isobicyclogermacrenal and ( - -lepidozenal, isolated from a methanol extract of the liverwort Lepidozia vitrea Steph., and displaying plant-growth-inhibitory properties. The sesquiterpenoids having cis- and trans-10,3-bicyclic nuclei are important compounds in the biogenetic sequence of liverwort sesquiterpenoids. From the same methanol extract we have now isolated an additional sesquiterpene aldehyde named $(t)$ vitrenal (1) with a novel carbon skeleton, and also exhibiting plant-growth-inhibitory activity. The structure and absolute configuration of this third plant-growth inhibitor $(+)$-vitrenal was determined as ent-vitr-4-en-14-al, or ( $1 R, 6 R, 7 S, 10 R$ )-vitr-4-en-14-al (1). $\dagger$ In the present paper, we describe details of the chemical and spectral evidence as well as the results of an $X$-ray crystal structure analysis in support of the proposed structure. ${ }^{2}$

The ${ }^{1} \mathrm{H}$ n.m.r., i.r., and u.v. spectra characterized the structure of $(+)$-vitrenal (1), $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O},[\alpha]_{\mathbf{D}}+107^{\circ}$, as a tricarbocyclic sesquiterpenoid containing a cyclopropane ring [ $\delta 0.7-0.8(2 \mathrm{H}, \mathrm{m})$ ], a secondary methyl $[\delta 0.78(3 \mathrm{H}, \mathrm{d}, J 5.5$ $\mathrm{Hz})$ ] and two tertiary methyls [ $\delta 0.96$ and 1.19 (each $3 \mathrm{H}, \mathrm{s}$ ); $v_{\text {max. }} 1379$ and $\left.1372 \mathrm{~cm}^{-1}\right]$ as well as an $\alpha, \beta$-unsaturated aldehyde group conjugated with a trisubstituted double bond [ $\delta 6.85$ ( $1 \mathrm{H}, \mathrm{br} \mathrm{s}$ ), $9.75(1 \mathrm{H}, \mathrm{s})$; $v_{\text {max. }} 2790,2695,1680,1613$, and $853 \mathrm{~cm}^{-1} ; \lambda_{\max .} 242 \mathrm{~nm}(\varepsilon 13200)$ ]. On reduction with lithium aluminium hydride the aldehyde (1) gave a primary alcohol (2), $\mathrm{C}_{15} \mathrm{H}_{24} \mathrm{O}$ [ $v_{\text {max. }} 3610$ and $3310 \mathrm{~cm}^{-1}$ ], which regenerated the original aldehyde by oxidation with manganese dioxide. The off-resonance ${ }^{13} \mathrm{C}$ n.m.r. spectrum of the alcohol (2) showed 15 signals for 3 quaternary carbons, 4 methine carbons, 5 methylene carbons, and 3 methyls which indicated the tricarbocyclic framework and the above partial structures.

In order to obtain information on the carbon skeleton, the alcohol (2) was converted by the pyridine-sulphur trioxidelithium aluminium hydride reaction ${ }^{3}$ into a sesquiterpene hydrocarbon (3), $\mathrm{C}_{15} \mathrm{H}_{24}$ (Scheme 1). The allylic alcohol (2) was also hydrogenated over Adams catalyst to give a saturated alcohol (4), $\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{O}$ [ $\mathrm{v}_{\text {nuк. }} .3610$ and $3420 \mathrm{~cm}^{-1}$ ]. The spectral properties of these compounds (1)-(4) were different from those of any of the known sesquiterpenoids, ${ }^{4.5}$ suggesting a novel carbon skeleton for the compounds. An epoxide (5), $\mathrm{C}_{15} \mathrm{H}_{24} \mathrm{O}_{2}[\delta 3.32(1 \mathrm{H}, \mathrm{s})$, and 3.66 and 3.93 (each $1 \mathrm{H}, \mathrm{d}$, $J 12.0 \mathrm{~Hz})], \ddagger$ produced by oxidation of the alcohol (2) with $m$-chloroperbenzoic acid (Scheme 2), was changed by treatment with lithium in ethylenediamine into two kinds of diol

[^0]

Scheme 1. Reagents: i, $\mathrm{LiAlH}_{4} ;$ ii, $\mathrm{MnO}_{2}$; iii, $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}-\mathrm{SO}_{3}, \mathrm{LiAlH}_{4}$ : iv, $\mathrm{H}_{2}-\mathrm{PtO}_{2}$
(6), $\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{O}_{2}[\delta 3.53(2 \mathrm{H}, \mathrm{s})]$, and (7), $\mathrm{C}_{15} \mathrm{H}_{26} \mathrm{O}_{2}[\delta 3.6-3.9$ ( $3 \mathrm{H}, \mathrm{m}$ )] in the ratio $1: 3$. They were, respectively, assigned as the 1,2 -diol (6) and the 1,3 -diol (7) on the basis of the numbers of the carbinyl protons in the ${ }^{1} \mathrm{H}$ n.m.r. spectra. The former vicinal diol (6) was, furthermore, oxidized with sodium periodate to yield a nor-ketone (8), $\mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}$, which showed a characteristic i.r. band at $v_{\text {max. }} 1740 \mathrm{~cm}^{-1}$ attributed to the cyclopentanone. Alternatively, acetylation of the alcohol (2) produced an acetate (9), $\mathrm{C}_{17} \mathrm{H}_{26} \mathrm{O}_{2}$ [ $\mathrm{v}_{\text {max. }} 1722 \mathrm{~cm}^{-1}$ ], which was then oxidized with osmium tetraoxide to a glycol (10), $\mathrm{C}_{17} \mathrm{H}_{28}{ }^{-}$ $\mathrm{O}_{4}\left[v_{\text {max. }} 3540 \mathrm{~cm}^{-1}\right]$. The diol (10) was, furthermore, transformed by reaction with $N$-chlorosuccinimide and methyl sulphide into an $\alpha$-hydroxycyclopentanone (11) (Scheme 3), $\mathrm{C}_{17} \mathrm{H}_{26} \mathrm{O}_{4}$ [ $v_{\text {max. }} 3550,3450$, and $1738 \mathrm{~cm}^{-1}$ ], which had no proton signals attributed to the adjacent positions of the carbonyl group in the ${ }^{1} \mathrm{H}$ n.m.r. spectrum. The acetate (9) was also oxidized with chromium trioxide to an $\alpha, \beta$-unsaturated cyclopentenone (12), $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{O}_{3}\left[v_{\text {nax. }} 1710 \mathrm{~cm}^{-1} ; \lambda_{\text {max. }} 227\right.$ $\mathrm{nm}(\varepsilon 8860) ; \delta 7.49(1 \mathrm{H}, \mathrm{t}, J 1.5 \mathrm{~Hz})]$. Since the ${ }^{1} \mathrm{H}$ n.m.r. spectrum of the cyclopentenone (12) exhibited a pair of AB type signals [ 82.39 and 2.75 (each $1 \mathrm{H}, \mathrm{d}, J 18.5 \mathrm{~Hz}$ )] due to the methylene group adjacent to the carbonyl group, one of the two quaternary carbon atoms was certainly located at the $\beta$ position of the carbonyl group as a spiro-carbon atom. These chemical transformations indicated the formyl group of the original molecule (1) was attached to the cyclopentene ring at $\beta$-position of the quaternary carbon atom.

Furthermore, the primary alcohol (2) was ozonolysed to a biscarbocyclic hydroxy-keto-acid (13) (Scheme 4), $\mathrm{C}_{15} \mathrm{H}_{24} \mathrm{O}_{4}$ [ $v_{\text {max. }} 3655,3500-2500,1718$, and $\left.1702 \mathrm{~cm}^{-1}\right]$. Interestingly,

Scheme 3. Reagents: i, $\mathrm{Ac}_{2} \mathrm{O}, \mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}$ : ii, $\mathrm{OsO}_{4}$. $\mathrm{Na}_{2} \mathrm{SO}_{3}$ : iii, $\mathrm{C}_{4} \mathrm{H}_{4} \mathrm{O}_{2} \mathrm{NCl}, \mathrm{Me}_{2} \mathrm{~S}$; iv, $\mathrm{CrO}_{3}-\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{~N}: \mathrm{v}, \mathrm{PhCHO}$
treatment of the hydroxy-keto-acid (13) with lead tetra-acetate followed by diazomethane afforded two kinds of monocarbocyclic esters, (14), $\mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}_{2}$, and (15), $\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{O}_{4}$, in the ratio $1: 1$; these underwent oxidative cleavage of the 1,2 -hydroxyketone moiety and decarboxylation accompanied by ring opening of the cyclopropane with the gem-dimethyl group. ${ }^{6}$ These products had an isopropenyl group [ $v_{\text {nax. }} 890 \mathrm{~cm}^{-1} ; \delta$ $1.67(3 \mathrm{H}, J 1.0 \mathrm{~Hz})$ and $4.64(2 \mathrm{H}$, br s) for (14)] or an acetoxyisopropyl group [ $\delta 1.38(6 \mathrm{H}, \mathrm{s})$ and $1.94(3 \mathrm{H}, \mathrm{s})$ for (15)] together with a trisubstituted double bond [ $v_{\text {max }} 864 \mathrm{~cm}^{-1} ; \delta$ $5.20(1 \mathrm{H}, \mathrm{br}, \boldsymbol{w} / 26.0 \mathrm{~Hz})$ for (14)] and $\left[v_{\max .} 872 \mathrm{~cm}^{-1} ; \delta\right.$

Scheme 4. Reagent : i, $\mathrm{O}_{3}, \mathrm{H}_{2} \mathrm{O}_{2}$; ii, $\mathrm{PbAc}_{4}$; iii, AcOH
$5.25(1 \mathrm{H}, \mathrm{br}, w / 25.0 \mathrm{~Hz})$ for (15)], instead of the cyclopropane ring with the gem-dimethyl group in the original molecule, respectively. Otherwise, the acetate (9) was also converted into an acetoxy-keto-acid (16) by ozonolysis, and the biscarbocyclic acid (16) thus formed was heated with acetic acid to give an acetoxy-keto-lactone (17), $\mathrm{C}_{17} \mathrm{H}_{26} \mathrm{O}_{5}$ [ $\mathrm{v}_{\text {max. }} 1750,1735$, and $\left.1705 \mathrm{~cm}^{-1}\right]$; the ${ }^{1} \mathrm{H}$ n.m.r. spectrum of this showed the two methyl signals adjacent to the oxygen atom of the lactone ring [ $\delta 1.43(6 \mathrm{H}, \mathrm{s})]^{*}$ suggesting the formation of the lactone ring accompanied by ring opening of the cyclopropane substituted with the gem-dimethyl group. When the acetoxy-ketoacid (16) was treated with lead tetra-acetate it gave two monocarbocyclic compounds (18), $\mathrm{C}_{16} \mathrm{H}_{24} \mathrm{O}_{3}$ ( $v_{\text {nax. }} 1754$ and 1735 $\mathrm{cm}^{-1}$ ), and (19), $\mathrm{C}_{18} \mathrm{H}_{28} \mathrm{O}_{5}\left(v_{\text {max. }} 1754,1734\right.$, and $1730 \mathrm{~cm}{ }^{1}$ ), which suffered only the decarboxylation and ring opening reactions but had still the acetoxy-ketone unit.

The full structure was, therefore, deduced to be the structure (1) having the spiro[4.5]decane system as well as the cyclopropane ring substituted with the gem-dimethyl group to $\alpha, \beta$-position of the spiro-carbon on the cyclohexane ring. Since a secondary methyl signal of a benzylidene derivative (20), $\mathrm{C}_{22} \mathrm{H}_{26} \mathrm{O}_{2}$, produced from the $\alpha, \beta$-unsaturated ketone (12) by treatment with benzaldehyde, resonated at high field [ $\delta 0.50(3 \mathrm{H}, \mathrm{d}, J 7.0 \mathrm{~Hz})$ ], the position of the methyl group was indicated as $\alpha$ to the spiro-carbon. This was

[^1]

Figure. A compluter-generated perspective drawing of the di-pbromobenzoate (21) derived from ( + -vitrenal (1). Hydrogen atoms have been omitted for clarity
also suggested by the biogenetic isoprene rule ${ }^{7}$ and by the similarity with respect to the secondary methyl of ${ }^{1} \mathrm{H}$ n.m.r. and i.r. spectra of the degradation products (14) and (15) to those of the corresponding epimers which had been obtained as intermediates from ( - )-trans-caran-2-one in the organic synthesis of cubebane type sesquiterpenoids. ${ }^{8}$ Furthermore, the n.O.e. value ( $4.6 \%$ ) between the secondary methyl and the vinyl proton in the $\alpha, \beta$-unsaturated cyclopentenone (12) suggested the configuration of the $C(10)$-secondary methyl to be the $\alpha$-configuration.

For confirmation of the structure including the absolute configuration and to establish the molecular conformation, several kinds of $p$-bromobenzoates were prepared for carrying out $X$-ray crystallographic analysis. A di-p-bromobenzoate (21), $\mathrm{C}_{29} \mathrm{H}_{34} \mathrm{Br}_{2} \mathrm{O}_{4}$, which was derived by treatment of the 1,3-diol (7) with p-bromobenzoyl chloride, formed crystals suitable for the purpose.

The molecular model of the di-p-bromobenzoate (21) obtained by the $X$-ray crystal structure analysis is shown in the Figure. The atomic co-ordinates for non-hydrogen atoms and for hydrogen atoms are listed in Tables 1 and 2, respectively. Thus, the structure, including the absolute configuration, of $(+)$-vitrenal should be represented by structure (1) consisting of the unique spiro[4.5]decane skeleton with the cyclopropane ring. Bond lengths and bond angles of the molecule (21) are, respectively, given in Tables 3 and 4, and the selected torsion angles in Table 5. The $\mathrm{C}-\mathrm{C}$ bond lengths are widely distributed between 1.471 and $1.611 \AA$ with a mean value of $1.546 \AA$. The cyclopentane ring has a conformation somewhere between a half-chair and an envelope form based on the torsion angles and the displacements of $C(1)$ and $C(2)$ atoms from the $C(3)-C(5)$ plane $[-0.327$ and $0.288 \AA$ ]. The cyclohexane ring has a deformed chair form based on its torsion angles. The fusion of the cyclopropane ring causes the distortion of the conformation in the cyclohexane ring present. A

| C(29) | 688(18) | $6764(19)$ | 2 422(8) |

mean bond angle of the cyclohexane ring is $114.0^{\circ}$. Ring angles at the positions of $C(1), C(6), C(7)$, and $C(9)$ are enlarged to a mean value of $117.9^{\circ}$ owing to the strain caused by fusion with the cyclopropane ring. Although the cyclopropane ring is almost perpendicular to the cyclohexane ring, it is tilted a little $\left(1.35^{\circ}\right)$ toward the $C(10)$ atom by non-bonded repulsion between the axial secondary methyl group and the $\mathrm{C}(5)$ atom $[C(15) \cdots C(5), 2.954 \AA]$. This is evident from the enlargement of the angles of $\mathrm{C}(15)^{-} \mathrm{C}(10)^{-} \mathrm{C}(1)\left(116.7^{\circ}\right)$ and $\mathrm{C}(5)^{-}$ $\mathrm{C}(1)^{-C(6)}\left(114.5^{\circ}\right)$.

From the chemical and spectral evidence and the results of the $X$-ray analysis mentioned above, the structure, including the absolute configuration, of ( + )-vitrenal was determined as structure (1). This enantiomeric structure agrees with the result that most of the liverworts elaborate enantiomeric sesquiterpenoids. ${ }^{9}$ The carbon framework of ( + )-vitrenal (1) is presumably constructed by Wagner-Meerwein type migration of the $C(5)^{-} C(6)$ bond to the $C(1)-C(6)$ bond in the ent-aromadendrane structure which, as described in the preceding paper, may be formed via an anti-Markownikoff type cyclization of ent-isobicyclogermacrene. ${ }^{1}(+-)$-Vitrenal (1) inhibits completely the growth of leaves and roots of rice seedlings at a concentration of 25 p.p.m. $\left(1.1 \times 10^{4} \mathrm{~m}\right)$ and the concentration for $50 \%$ growth inhibition ( $I_{50}$ ) is 18 p.p.m. It may be acting as allomone, together with ( - )-isobicyclogermacrenal, the other constituent of this liverwort, in ecological systems. Details of the biological activity will be reported in a separate paper.

## Experimental

For general experimental details see ref. 1. The aldehyde $(+)$-vitrenal (1) was isolated as a gum in a yield of $2 \%$ from the ethereal extract as described in the preceding paper.
( + )-Vitrenal [(1R,6R,7S,10R)-vitr-4-en-14-al] (1): ix| ${ }_{\mathbf{D}}$ $+107^{\circ}(c, 1.55)$ (Found: $M^{+}, 218.1673$. $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}$ requires $M$, 218.1669); $\lambda_{\text {max. }} 242 \mathrm{~nm}(\varepsilon 13200) ; v_{\text {max. }} 3040,2790,2695$, $1680,1613,1379,1372,1175,1148,884$, and $853 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}$

Lithium Aluminium Hydride Reduction of $(+$ )-Vitrenal (1).A solution of the aldehyde (1) ( 170 mg ) in dry ether ( 5 ml ) was added to a suspension of lithium aluminium hydride ( 30 mg ) in dry ether ( 5 ml ), and the mixture was stirred at $0^{\circ} \mathrm{C}$ for 1 h . The excess of hydride was decomposed by addition of icewater ( 0.1 ml ) and $10 \%$ aqueous sodium hydroxide $(0.1 \mathrm{ml})$ and work-up afforded ( + )-vitrenol $[(1 \mathrm{R}, 6 \mathrm{R}, 7 \mathrm{~S}, 10 \mathrm{R})$-vitr-4-en-$14-\mathrm{ol}]$ (2) as needles ( 110 mg ): m.p. $60.5-61.5^{\circ} \mathrm{C}$ (from Me$\mathrm{OH}) ;[\alpha]_{\mathrm{D}}+76.6^{\circ}(c, 0.35)$ (Found: C, 81.9; H, 11.25. $\mathrm{C}_{15} \mathrm{H}_{24} \mathrm{O}$ requires $\mathrm{C}, 81.76 ; \mathrm{H}, 10.98 \%$ ) ; $v_{\text {max. }} 3610,3310,3035,1040$, 1012,945 , and $850 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.5-0.7(2 \mathrm{H}, \mathrm{m}), 0.74(3 \mathrm{H}, \mathrm{d}$,
$J 5.5 \mathrm{~Hz}$ ), 0.96 and 1.16 (each $3 \mathrm{H}, \mathrm{s}), 4.21(2 \mathrm{H}, \mathrm{s})$, and 5.63 ( $1 \mathrm{H}, \mathrm{br} \mathrm{s}$ ); $\delta_{\mathrm{c}} 17.1$ (q), $18.0(\mathrm{q}), 18.8(\mathrm{~s}), 20.4(\mathrm{q}), 20.6(\mathrm{t})$, 30.0 (t), 30,7 ( t ), 31.5 (d), 34.2 (d), 37.5 (d), 43.5 (t), 51.3 (s), 62.4 (t), 128.9 (d), and 143.0 (s); $m / z 220$ ( $M^{+}, 23 \%$ ), 202 (7), 189 (9), 177 (14), 159 (9), 147 (21), 137 (51), 119 (23), 105 (42), 81 (54), 79 (46), 67 (53), 55 (56), and 41 (100).

Oxidation of the Alcohol (2) with Manganese Dioxide.-To a solution of the alcohol (2) ( 90 mg ) in dry ether ( 10 ml ) was added manganese dioxide ( 350 mg ) with stirring, and the mixture was stirred at room temperature for 3 h . The reaction product was filtered through a column packed with silica gel to afford, upon work-up, the aldehyde (1) as a gum ( 55 mg ). The spectral properties and optical rotation were identical with those of the natural aldehyde (1).

Pyridine-Sulphur Trioxide-Lithium Aluminium Hydride Reduction of the Alcohol (2). ${ }^{3}$-Pyridine-sulphur trioxide complex ( 170 mg ) was added to the alcohol (2) ( 110 mg ) in dry tetrahydrofuran $(10 \mathrm{ml})$ at $-25^{\circ} \mathrm{C}$ and the suspension stirred at $0^{\circ} \mathrm{C}$ for 12 h under nitrogen. Addition of lithium aluminium hydride ( 200 mg ) in tetrahydrofuran at $-25^{\circ} \mathrm{C}$ was followed by stirring at $0{ }^{\circ} \mathrm{C}$ for 1 h and at room temperature for 4 h . Work-up, after decomposition of excess of hydride by addition of water and $10 \%$ aqueous sodium hydroxide, gave a crude reaction product which was separated by p.l.c. into the hydrocarbon ( + )-vitrene ( 3 ) ( 27 mg ) and recovered alcohol (2) $(40 \mathrm{mg})$.
$(+)$-Vitrene $[(1 \mathrm{R}, 6 \mathrm{R}, 7 \mathrm{~S}, 10 \mathrm{R})$-vitr-4-ene $](3):\left[\alpha_{\mathrm{D}}+67.1^{\circ}(c\right.$, $0.97)$; $v_{\text {tax. }} 3040,1655,1117,1010,985,948$, and $847 \mathrm{~cm}^{-1}$; $\delta_{H} 0.70(3 \mathrm{H}, \mathrm{d}, J 5.5 \mathrm{~Hz}), 0.95$ and 1.14 (each $\left.3 \mathrm{H}, \mathrm{s}\right), 1.73(3 \mathrm{H}$, br s), and 5.31 ( 1 H, br s); $m / z 204$ ( $M^{+}, 13 \%$ ), 147 (46), 133 (32), 121 (54), 119 (57), 105 (82), 91 (100), 79 (75), 67 (46), 55 (64), and 43 (38).

Catalytic Hydrogenation of the Allylic Alcohol (2).-The allylic alcohol (2) ( 31 mg ) in ethyl acetate ( 5 ml ) was hydrogenated over Adams catalyst ( 5 mg ) at room temperature for 2 h . Work-up afforded ( + )-vitranol [(1R,4R,6R,7S,10R)-vitran-14-ol] (4) as crystals ( 24 mg ): m.p. $54-55{ }^{\circ} \mathrm{C}$ (from $\mathrm{MeOH}) ;\left[\alpha_{\mathrm{D}}+38.5^{\circ}(c, 1.87) ; v_{\text {max. }}\left(\mathrm{CHCl}_{3}\right) 3610,3420\right.$, 1238,1010 , and $906 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.5-0.8(2 \mathrm{H}, \mathrm{m}), 0.83(3 \mathrm{H}$, $\mathrm{d}, J 5.0 \mathrm{~Hz}$ ), 0.97 and 1.12 (each $3 \mathrm{H}, \mathrm{s}), 2.53(1 \mathrm{H}, \mathrm{s}$, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right)$, and $3.54(2 \mathrm{H}, \mathrm{d}, J 6.0 \mathrm{~Hz}) ; \mathrm{m} / \mathrm{z} 222\left(M^{+}, 4 \%\right.$ ), 191 (3), 179 (7), 161 (6), 140 (6), 135 (6), 121 (11), 107 (15), 93 (27), 82 (100), $67(28), 55(30)$, and 43 (15).

Epoxidation of the Alcohol (2).-To a solution of the alcohol (2) $(120 \mathrm{mg})$ in chloroform ( 4 ml ) was added $m$-chloroperbenzoic acid ( 150 mg ) in chloroform ( 5 ml ) with stirring at 0 C ; the mixture was then further stirred at $0-5^{\circ} \mathrm{C}$ for 1 h . After decomposition of the peracid with potassium iodide, ( + )-epoxyvitranol [(1R,4R,5R,6R,7S,10R)-4,5-epoxyvitran-$14-o l](5)$ was obtained as a gum ( 115 mg ): $|\alpha|_{\mathrm{D}}+118^{\circ}(c, 1.34)$ (Found: $\mathrm{C}, 75.9 ; \mathrm{H}, 10.4 . \mathrm{C}_{15} \mathrm{H}_{24} \mathrm{O}_{2}$ requires $\mathrm{C}, 76.22 ; \mathrm{H}$, $10.24 \%$ ); $v_{\text {max. }} 3460,3000,1235,1074,1042,945,935$, and $845 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.4-0.7(2 \mathrm{H}, \mathrm{m}), 0.83(3 \mathrm{H}, \mathrm{d}, J 5.5 \mathrm{~Hz}), 1.04$ and 1.25 (each $3 \mathrm{H}, \mathrm{s}$ ), $3.32(1 \mathrm{H}$, s), and 3.66 and 3.93 (each $1 \mathrm{H}, \mathrm{d}, J 12.0 \mathrm{~Hz}$ ); m/z 236 ( $M^{+}, 1 \%$ ), 218 (2), 205 (5), 189 (3), 175 (3), 163 (4), 149 (11), 126 (100), 121 (11), 105 (21), 93 (20), 79 (19), 67 (18), 55 (24), and 43 (17).

Reduction of the Epoxide (5) with Lithium in Ethylenediamine. -To a solution of the epoxide (5) ( 300 mg ) in ethylenediamine ( 12 ml ), lithium ( 200 mg ) was added at room temperature with stirring. The mixture was stirred at $50{ }^{\circ} \mathrm{C}$ under nitrogen. In 1.5 h a persistent blue colour appeared and the reaction mixture was cooled. Water ( 10 ml ) was added to
destroy excess of reagent after which the reaction mixture was extracted with chloroform and purified by column chromatography to yield the $1,2-$ diol (6) ( 25 mg ) and the 1,3 -diol (7) ( 80 mg ).
( + )-Vitrane-4,14-diol [(1R,4S,6R,7S,10R)-4.14-dihydroxyvitrane $]$ (6): m.p. $58-59^{\circ} \mathrm{C}($ from MeOH$) ;[\alpha]_{\mathrm{D}}+6.6^{\circ}(c, 0.31)$; $v_{\max }\left(\mathrm{CHCl}_{3}\right) 3575,3400,1074$, and $1.028 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}(0.6-0.7$ $(2 \mathrm{H}, \mathrm{m}), 0.81(3 \mathrm{H}, \mathrm{d}, J 6.5 \mathrm{~Hz}), 1.06$ and 1.22 (each $3 \mathrm{H}, \mathrm{s})$, and $3.53(2 \mathrm{H}, \mathrm{s}) ; m / z 238\left(M^{+}, 2 \%\right), 220(11), 207$ (6), 189 (21), 177 (9), 159 (8), 149 (35), 133 (14), 121 (19), 107 (42), 91 (54), 82 (100), 67 (67), 55 (85), and 43 (59). (+)-Vitrane-5,14diol $[(1 \mathrm{R}, 4 \mathrm{~S}, 5 \mathrm{~S}, 6 \mathrm{R}, 7 \mathrm{~S}, 10 \mathrm{R})-5,14$-dihydroxyvitrane $]$ (7): m.p. $83.5-84.5{ }^{\circ} \mathrm{C}$ (from MeOH$)$; $[\alpha]_{\mathrm{D}}+13.7^{\circ}(c, 1.95)$; $v_{\text {max. }}$ $\left(\mathrm{CHCl}_{3}\right) 3580,3425,1082$, and $1020 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.34(1 \mathrm{H}, \mathrm{d}$, $J 10.0 \mathrm{~Hz}), 0.97(3 \mathrm{H}, \mathrm{d}, J 6.5 \mathrm{~Hz}), 1.08$ and 1.26 (each 3 H , s), $3.6-3.9(3 \mathrm{H}, \mathrm{m}) ; m / z 238\left(M^{+}, 3 \%\right), 220(5), 205(3), 189$, (9), 177 (6), 159 (10), 149 (11), 135 (18), 121 (20), 107 (47), 91 (74), 79 (76), 67 (81), 55 (100), and 43 (78).

Oxidation of the 1,2-Diol (6) with Sodium Metaperiodate.A solution of sodium metaperiodate ( 120 mg ) in water ( 1 ml ) was added to a solution of the $1,2-\mathrm{diol}(20 \mathrm{mg})$ in methanol ( 5 ml ), and the mixture was stirred at room temperature for 24 h . Work-up gave (--)-4-oxo-14-norvitrane [(1R,6R,7S,10R)14 -norvitran-4-one $](8)$ as a gum ( 10 mg ): $[\alpha]_{\mathrm{D}}-63.0^{\circ}(c, 0.46)$ (Found: $M^{+}, 206.1658 . \mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}$ requires $M, 206.1668$ ); $v_{\max }$ $1740,1410,1378,1372,1242$, and $1147 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.5-$ $0.7(2 \mathrm{H}, \mathrm{m}), 0.79(3 \mathrm{H}, \mathrm{d}, J 6.0 \mathrm{~Hz})$, and 0.96 and 1.10 (each $3 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{H}}\left(\mathrm{C}_{6} \mathrm{H}_{6}\right) 0.57(3 \mathrm{H}, \mathrm{d}, J 5.5 \mathrm{~Hz})$, and 0.87 and 0.97 (each $3 \mathrm{H}, \mathrm{s}$ ); $m / z 206.1658\left(M^{+}, \mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}\right.$ requires $M$, 206.1688, $6 \%$ ), 191 (2), 177 (3), $163.1119\left(\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{O}\right.$ requires 161.1121, 8), $150.1408\left(\mathrm{C}_{11} \mathrm{H}_{18}\right.$ requires $\left.150.1408,16\right), 135.1177$ $\left(\mathrm{C}_{10} \mathrm{H}_{15}\right.$ requires $\left.135.1173,37\right), 123.0783\left(\mathrm{C}_{8} \mathrm{H}_{11} \mathrm{O}\right.$ requires 123.0809, 24), $107.0860\left(\mathrm{C}_{8} \mathrm{H}_{11}\right.$ requires 107.0860, 60), 91.0558 $\left(\mathrm{C}_{7} \mathrm{H}_{7}\right.$ requires $\left.91.0547,96\right), 79(100), 67$ (89), 53 (83), and 47 (33).

Acetylation of the Alcohol (2).-A mixture of the alcohol (2) ( 140 mg ), dry pyridine ( 1 ml ), and acetic anhydride ( 3.5 $\mathrm{ml})$ was allowed to react overnight at room temperature. Work-up afforded ( + )-vitrenoyl acetate $[(1 \mathrm{R}, 6 \mathrm{R}, 7 \mathrm{~S}, 10 \mathrm{R})$-14-acetoxyvitr-4-ene $]$ (9) as a gum ( 90 mg ): $[\alpha]_{\mathrm{D}}+62.7^{\circ}(c, 1.35)$ (Found: C, $77.95 ; \mathrm{H}, 10.25 . \mathrm{C}_{17} \mathrm{H}_{20} \mathrm{O}_{2}$ requires $\mathrm{C}, 77.82 ; \mathrm{H}$, $9.99 \%$ ) ; $v_{\text {max. }}\left(\mathrm{CHCl}_{3}\right) 3015,1722,1250,1023,957,905$, and $853 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.5-0.7(2 \mathrm{H}, \mathrm{m}), 0.72(3 \mathrm{H}, \mathrm{d}, J 5.5 \mathrm{~Hz}), 0.93$ and 1.12 (each $3 \mathrm{H}, \mathrm{s}), 2.06(3 \mathrm{H}, \mathrm{s}), 4.63(2 \mathrm{H}, \mathrm{s})$, and 5.66 ( $1 \mathrm{H}, \mathrm{br} \mathrm{s}$ ); $m / z 262\left(M^{+}, 6 \%\right.$ ), 220 (3), 219 (3), 202 (22), 187 (8), 179 (14), 159 (30), 145 (35), 131 (25), 119 (87), 105 (31), 91 (44), 79 (25), 69 (24), 55 (27), and 43 (100).

Oxidation of the Acetate (9) with Osmium Tetraoxide.-To a solution of the acetate (9) ( 68 mg ) in dry pyridine ( 3 ml ) was added osmium tetraoxide ( 40 mg ) with cooling in an ice-bath; the reaction mixture was then allowed to stand at room temperature for 5 d . The solvent was distilled out, the residual substance dissolved in ethanol ( 3 ml ), and the solution mixed with a solution of sodium sulphite ( 250 mg ) in water ( 5 ml ). The mixed solution was heated under reflux for 2 h , and the resulting precipitates were filtered off and the filtrate extracted with chloroform. Work-up gave [(1R,4R,5R,6R,7S,10R)-14-acetoxyvitrane-4,5-diol $]$ (10) as a gum ( 43 mg ): $[\alpha]_{\mathrm{D}}+13.5^{\circ}(c$, 1.85); $v_{\text {max. }}\left(\mathrm{CHCl}_{3}\right) 3540,1733,1245,1092,1080,1035$, 972 , and $840 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.3-0.9(2 \mathrm{H}, \mathrm{m}), 0.97(3 \mathrm{H}, \mathrm{d}, J 6.5 \mathrm{~Hz})$, 1.06 and 1.26 (each $3 \mathrm{H}, \mathrm{s}), 2.13(3 \mathrm{H}, \mathrm{s}), 2.56(1 \mathrm{H}, \mathrm{d}, J 8.0$ Hz , exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right), 3.17(1 \mathrm{H}, \mathrm{s}$, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right), 3.64\left(1 \mathrm{H}, \mathrm{d}, J 8.0 \mathrm{~Hz}\right.$, singlet by addition of $\left.\mathrm{D}_{2} \mathrm{O}\right)$, and $4.06(2 \mathrm{H}, \mathrm{s}) ; \mathrm{m} / \mathrm{z} 296\left(\mathrm{M}^{+}, 3 \%\right), 278(35), 236(13), 218$ (43), 205 (62), 189 (13), 178 (41), 163 (46), 150 (97), 149 (100), 135
(55), 123 (47), 121 (48), 107 (76), 93 (65), 82 (72), 69 (51), 55 (65), and 41 (90).

Oxidation of the Glycol (10) with N -Chlorosuccinimide and Methyl Sulphide.-To a solution of N -chlorosuccinimide ( 55 mg ) in toluene ( 2 ml ) was added methyl sulphide ( 0.1 ml ) at $0^{\circ} \mathrm{C}$ under nitrogen. A white precipitate appeared immediately after addition of the sulphide. The mixture was cooled to $-25^{\circ} \mathrm{C}$, and a solution of the glycol (10) ( 35 mg ) in toluene $(0.5 \mathrm{ml})$ was added dropwise. The mixed solution was stirred for 3 h at $-25^{\circ} \mathrm{C}$, and then a solution of trimethylamine ( 60 mg ) in toluene ( 0.3 ml ) was added dropwise. The cooling bath was removed and after 5 min , ether ( 4 ml ) was added. Workup gave ( $1 \mathrm{R}, 4 \mathrm{R}, 6 \mathrm{R}, 7 \mathrm{~S}, 10 \mathrm{R}$ )-14-acetoxy-4-hydroxyvitran-4one (11) as crystals ( 29 mg ): m.p. $137.5-138.5{ }^{\circ} \mathrm{C}$ (from $\mathrm{MeOH}) ;[\alpha]_{\mathrm{D}}+60.8^{\circ}(c, 1.53)$ (Found: $M^{+}, 294.1888$. $\mathrm{C}_{17} \mathrm{H}_{20} \mathrm{O}_{4}$ requires $M, 294.1830$ ); $v_{\text {miax. }}\left(\mathrm{CHCl}_{3}\right) 3550,3450$, $1738,1235,1117,1040,1018$, and $897 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.3-0.7$ $(2 \mathrm{H}, \mathrm{m}), 0.80(3 \mathrm{H}, \mathrm{d}, J 5.5 \mathrm{~Hz}), 0.97$ and 1.03 (each $3 \mathrm{H}, \mathrm{s}$ ), $2.08(3 \mathrm{H}, \mathrm{s})$, and 3.95 and 4.19 (each $1 \mathrm{H}, \mathrm{d}, J 11.5 \mathrm{~Hz}) ; m / z$ $294.1888\left(M^{+}, \mathrm{C}_{17} \mathrm{H}_{26} \mathrm{O}_{4}\right.$ requires 294.1830, $16 \%$ ), 234.1566 $\left(\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}_{2}\right.$ requires 234.1618, 10), $221.1502\left(\mathrm{C}_{14} \mathrm{H}_{21} \mathrm{O}_{2}\right.$ requires $221.1539,100), 203$ (7), $178.1339\left(\mathrm{C}_{12} \mathrm{H}_{18} \mathrm{O}\right.$ requires 178.1356, 64), $163.1123\left(\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{O}\right.$ requires $\left.163.1122,21\right), 150.1400$ $\left(\mathrm{C}_{11} \mathrm{H}_{18}\right.$ requires $\left.150.1407,69\right), 135.1149\left(\mathrm{C}_{10} \mathrm{H}_{15}\right.$ requires 135.1172, 64), 121 (23), 107 (50), 93 (36), 79 (31), 67 (23), 55 (30), and 43 (81).

Allylic Oxidation of the Acetate (9) with Chromium Trioxide (Sarett Oxidation).-Chromiumı trioxide ( 2.5 g ) was added to dry pyridine ( 8 ml ) at $-5^{\circ} \mathrm{C}$ under nitrogen and the mixture was stirred for 20 min . To the stirred slurry, the acetate (9) $(110 \mathrm{mg})$ in dry dichloromethane $(12 \mathrm{ml})$ was added and refluxed at $60^{\circ} \mathrm{C}$ for 10 h . The mixture was filtered through an alumina column and the solution was washed with water and $5 \%$ hydrochloric acid. Evaporation of the solvent left the crude product which was submitted to p.l.c. to isolate the recovered acetate (9) ( 40 mg ) and ( $1 \mathrm{R}, 6 \mathrm{R}, 7 \mathrm{~S}, 10 \mathrm{R}$ )-14-acetoxyvitr-4-en-3-one (12) ( 20 mg ): $[\alpha]_{\mathbf{D}}+46.4^{\circ}(c, 1.51)$ (Found: C, 73.6; H, 8.85. $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{O}_{3}$ requires $\mathrm{C}, 73.88 ; \mathrm{H}$, $8.75 \%) ; \lambda_{\text {max. }} 227 \mathrm{~nm}(\varepsilon 8860) ; v_{\text {max. }} 1748,1711,1643,1226$, 1022 , and $967 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.5-0.8(2 \mathrm{H}, \mathrm{m}), 0.68(3 \mathrm{H}, \mathrm{d}, J 6.0$ $\mathrm{Hz}), 0.96$ and 1.25 (each $3 \mathrm{H}, \mathrm{s}$ ), $2.09(3 \mathrm{H}, \mathrm{s}), 2.39$ and 2.75 (each $1 \mathrm{H}, \mathrm{d}, J 18.5 \mathrm{~Hz}), 4.77(2 \mathrm{H}, \mathrm{d}, J 1.5 \mathrm{~Hz})$, and $7.49(1 \mathrm{H}$, $\mathrm{t}, J 1.5 \mathrm{~Hz}) ; m / z 276\left(M^{+}, 6 \%\right), 234$ (15), 216 (73), 201 (15), 191 (26), 174 (55), 159 (28), 145 (21), 134 (55), 121 (19), 105 (21), 95 (36), 83 (43), 67 (28), 55 (36), and 43 (100).

Ozonolysis of the Alcohol (2).-Ozonized oxygen gas was passed through a solution of the alcohol (2) ( 500 mg ) in ethyl acetate ( 40 ml ) at $-70^{\circ} \mathrm{C}$ for 40 min . The solvent was evaporated under reduced pressure and the residue heated at $50-60$ C with water $(20 \mathrm{ml})$ and $35 \%$ hydrogen peroxide $(0.3 \mathrm{ml})$ for 2 h. Work-up gave (1R,6R,7S,10R)-14-hydroxy-4-oxo-4,5-secovitran-5-oic acid (13) as a gum ( 380 mg ): $\alpha_{10}+36.7^{\circ}(c$, 2.98) ; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) 3655,3500-2500,1718,1702,1404$, $1267,1073,1017$, and $940 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.4-0.8(2 \mathrm{H}, \mathrm{m}), 1.02$ $(3 \mathrm{H}, \mathrm{s}), 1.03(3 \mathrm{H}, \mathrm{d}, J 7.0 \mathrm{~Hz}), 1.05(3 \mathrm{H}, \mathrm{s})$, and $4.30(2 \mathrm{H}$, s); m/z $268\left(M^{+}, 5 \%\right), 250.1614\left([M \cdots 18]^{+}, \mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}_{3}\right.$ requires $250.1567,6), 235.1429\left(\mathrm{C}_{14} \mathrm{H}_{19} \mathrm{O}_{3}\right.$ requires 235.1333, 5), $222.1581\left(\mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}_{2}\right.$ requires 222.1617, 14), 209.1544 $\left(\mathrm{C}_{13} \mathrm{H}_{21} \mathrm{O}_{2}\right.$ requires 209.1540, 9), $195.1369\left(\mathrm{C}_{12} \mathrm{H}_{19} \mathrm{O}_{2}\right.$ requires $195.1383,16), 181.1231\left(\mathrm{C}_{11} \mathrm{H}_{17} \mathrm{O}_{2}\right.$ requires 181.1228, 11), $168.0791\left(\mathrm{C}_{9} \mathrm{H}_{12} \mathrm{O}_{3}\right.$ requires $\left.168.0786,14\right)$, $161.1333\left(\mathrm{C}_{12} \mathrm{H}_{17}\right.$ requires $161.1330,17), 161.0955\left(\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{O}\right.$ requires 161.0965 , $6), 149.1238\left(\mathrm{C}_{11} \mathrm{H}_{17}\right.$ requires $\left.149.1329,37\right)$, $135.1104\left(\mathrm{C}_{10} \mathrm{H}_{15}\right.$ requires $135.1104,26$ ), 121 (19), 107 (43), 93 (52), 83 (100), 67 (30), 51 (44), 43 (72), and 41 (73).

Transformation of the Hydroxy-keto-acid (13) into the Monocarbocyclic Esters (14) and (15).-A mixture of the hydroxy-keto-acid (13) ( 380 mg ), lead tetra-acetate ( 700 mg ), dry benzene ( 10 ml ) and pyridine $(1.2 \mathrm{ml})$ was stirred at $0-5$ ${ }^{\circ} \mathrm{C}$ for 1 h under nitrogen. The reaction mixture was filtered through a silica gel column followed by washing with water, and extraction with chloroform. After evaporation of the solvent, the extract was dissolved in methanol ( 4 ml ) and treated with ethereal diazomethane. The solvent was distilled off and the residue was subjected to column chromatography to provide the two esters; the less polar compound (14) $(25 \mathrm{mg})$ and the more polar ester (15) ( 22 mg ).
(1R,4S)-2-(2-Methoxycarbonylethyl)-p-mentha-2,8-diene (14): $[\alpha]_{\mathbf{D}}-29.8^{\circ}(c, 1.04)$ (Found: $M^{+}, 222.1644 . \mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}_{2}$ requires $M, 222.1619)$; $v_{\text {max. }}\left(\mathrm{CHCl}_{3}\right) 3060,1730,1659$, $1642,1260,1227,1155,890$, and $864 \mathrm{~cm}^{-1} ; \delta\left(\mathrm{CCl}_{4}\right) 1.04$ $(3 \mathrm{H}, \mathrm{d}, J 7.0 \mathrm{~Hz}), 1.67(3 \mathrm{H}, \mathrm{d}, J 1.0 \mathrm{~Hz}), 3.59(3 \mathrm{H}, \mathrm{s}), 4.64$ ( $2 \mathrm{H}, \mathrm{br} s$ ), and $5.20(1 \mathrm{H}, \mathrm{br} \mathrm{s}) ; m / z 222.1644\left(M^{+}, \mathrm{C}_{14} \mathrm{H}_{22} \mathrm{O}_{2}\right.$ requires $M, 222.1619,55 \%$ ), $196(16), 191$ (8), 175 (7), 162.1388 $\left(\mathrm{C}_{12} \mathrm{H}_{18}\right.$ requires $\left.162.1406,20\right), 148.1187\left(\mathrm{C}_{11} \mathrm{H}_{16}\right.$ requires $148.1250,100), 135.1135\left(\mathrm{C}_{10} \mathrm{H}_{15}\right.$ requires $\left.135.1172,54\right), 119$ (41), 105 (62), 93 (58), 83 (45), 67 (17), 55 (35), and 41 (48).
(1R,4S)-8-Acetoxy-2-(2-methoxycarbonylethyl)-p-menth-2ene (15): $[\alpha]_{\mathbf{D}}+31.5^{\circ}(c, 0.73)$ (Found: C, 67.75; H, 9.25. $\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{O}_{4}$ requires $\mathrm{C}, 68.05 ; \mathrm{H}, 9.28 \%$ ); $\mathrm{v}_{\text {max. }}\left(\mathrm{CHCl}_{3}\right) 3015$, $1735,1268,1127,1015,947$, and $872 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}\left(\mathrm{CCl}_{4}\right) 1.05$ $(3 \mathrm{H}, \mathrm{d}, J 7.0 \mathrm{~Hz}), 1.38(6 \mathrm{H}, \mathrm{s}), 1.94(3 \mathrm{H}, \mathrm{s}), 3.63(3 \mathrm{H}, \mathrm{s})$, and $5.25(1 \mathrm{H}, \mathrm{br} s) ; m / z 222\left([M-60]^{+}, 83 \%\right), 207(8), 191(15)$, 181 (24), 162 (17), 149 (34), 135 (31), 119 (13), 107 (33), 93 (25), 79 (15), 59 (26), and 43 (100).

Ozonolysis of the Acetate (9).-To a solution of the acetate (9) $(275 \mathrm{mg})$ in ethyl acetate ( 30 ml ) ozonized oxygen gas was passed at $-70^{\circ} \mathrm{C}$ for 35 min . The solvent was removed under reduced pressure and the residue heated with water $(10 \mathrm{ml})$ and hydrogen peroxide $(0.3 \mathrm{ml})$ at $50-60^{\circ} \mathrm{C}$ for 2 h . Work-up gave (1R,6R,7S,10R)-14-acetoxy-4-oxo-4,5-secovitran-5-oic acid (16) as a gum ( 195 mg ): $\delta_{\mathrm{H}} 1.02$ and 1.04 (each $3 \mathrm{H}, \mathrm{s}$ ), 2.18 $(3 \mathrm{H}, \mathrm{s}), 4.68(2 \mathrm{H}, \mathrm{s})$, and $7.93(1 \mathrm{H}$, br, exchangeable with $\mathrm{D}_{2} \mathrm{O}$ ).

Treatment of the Acetoxy-keto-acid (14) with Acetic Acid.A solution of the acid (16) ( 30 mg ) in acetic acid ( 0.5 ml ) was heated at $190{ }^{\circ} \mathrm{C}$ for 1 h , to give, in the customary fashion, (1S,7S,10R)-14-acetoxy-4-oxo-4,5:6,11-disecovitrane-5,11carbolactone (17) as a gum ( 21 mg ) : $\alpha_{1}$ ) $-36.4^{(c, 1.86)}$; $v_{\text {max. }}\left(\mathrm{CHCl}_{3}\right) 1750,1735,1705,1415,1390,1375,1220$, 1131 , and $1099 \mathrm{~cm}^{1} ; \delta_{\mathrm{H}} 0.93(3 \mathrm{H}, \mathrm{d}, J 5.5 \mathrm{~Hz}), 1.43(6 \mathrm{H}, \mathrm{s})$, $2.16(3 \mathrm{H}, \mathrm{s})$, and $4.66(2 \mathrm{H}, \mathrm{s}) ; \delta_{\mathrm{c}} 16.3(\mathrm{q}), 20.5(\mathrm{q}), 26.3(\mathrm{q})$, 27.7 (t), 28.6 (t), 29.4 (t), 30.2 (q), 32.3 ( t$), 33.9$ ( t$), 35.9$ (d), 41.5 (d), 45.4 (s), 67.9 (t), 85.2 (s), 170.3 (s), 172.9 ( s$)$, and 203.6 (s); m/z 310 ( $M^{+}, 4 \%$ ), 295 (7), 262 (7), 250 (6), 237 (100), 224 (7), 209 (42), 191 (20), 163 (7), 150 (46), 135 (9), 108 (23), 95 (9), 81 (9), and 47 (88).

Decarborylation of the Acetory-keto-acid (16) with Lead Tetra-acetate.-To a solution of the acetoxy-keto-acid (16) $(190 \mathrm{mg})$ in dry benzene ( 5 ml ) and pyridine $(0.3 \mathrm{ml})$ was added lead tetra-acetate ( 350 mg ), and the reaction mixture was stirred at $20^{\circ} \mathrm{C}$ for 2 h under nitrogen. The same procedures as for the hydroxy-keto-acid (13) gave the menthadiene (18) ( 34 mg ) and the acetoxymenthene (19) ( 25 mg ).
(1R,4S)-2-(4-Acetoxy-3-oxobutyl)-p-mentha-2,8-diene (18): $[\alpha]_{\mathrm{D}}-29.3^{\circ}(c, 1.38) ; v_{\text {mix. }} 3060,1754,1735,1658,1642,1414$, 1227,1058 , and $890 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 1.04(3 \mathrm{H}, \mathrm{d}, J 7.0 \mathrm{~Hz}), 1.71$ (3 $\mathrm{H}, \mathrm{d}, J 1.0 \mathrm{~Hz}), 2.16(3 \mathrm{H}, \mathrm{s}), 4.66(4 \mathrm{H}, \mathrm{br}$ s), and $5.24(1 \mathrm{H}$, d, J 3.0 Hz ); m/z $264\left(M^{+}, 1 \%\right), 222$ (3), 191 (2), 148 (18), 133
(8), 119 (7), 105 (10), 91 (13), 79 (14), 67 (6), 55 (10), and 43 (100).
(1R,4S)-8-Acetoxy-2-(4-acetoxy-3-oxobutyl)-p-menth-2-ene (19): $[\alpha]_{\mathrm{D}}+17.6^{\circ}(c, 1.45) ; v_{\text {max. }} 1754,1734,1730,1658$, $1413,1253,1223,1132,1057$, and $1014 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 1.03$ $(3 \mathrm{H}, \mathrm{d}, J 7.5 \mathrm{~Hz}$ ), 1.39 and 1.43 (each $3 \mathrm{H}, \mathrm{s}$ ), 2.00 and 2.18 (each $3 \mathrm{H}, \mathrm{s}), 4.67(4 \mathrm{H}, \mathrm{s})$, and $5.26(1 \mathrm{H}, \mathrm{br}$ s); m/z 263 $\left([M-61]^{+}, 2 \%\right), 221(1), 204(1), 161$ (14), 148 (10), 133 (7), 119 (8), 105 (15), 91 (13), 79 (12), 67 (8), 55 (16), and 43 (100).

Claisen-Schmidt Reaction of the $\alpha, \beta$-Unsaturated Ketone (12) with Benzaldehyde.-To a solution of sodium hydroxide (23 mg ) in water ( 0.3 ml ) and methanol ( 1 ml ) was added the $\alpha, \beta$ unsaturated ketone (12) ( 235 mg ) with stirring. Benzaldehyde ( 53 mg ) was added to the solution at $0^{\circ} \mathrm{C}$, and the mixture stirred at $0^{\circ} \mathrm{C}$ for 1 h and a further 12 h at room temperature. Work-up gave (1R,6R,7S,10R)-14-acetoxy-2-benzylidenevitr4 -en-3-one (20) as a gum ( 16 mg ): $[\alpha]_{\mathrm{D}}+229^{\circ}(c, 0.80) ; \lambda_{\text {max }}$. 229 and $309 \mathrm{~nm}(\varepsilon 7450$ and 11600$)$; $v_{\text {max. }}\left(\mathrm{CHCl}_{3}\right) 3675$, $3510,1712,1643,1526,1408,1390,1382,1020,960$, and $905 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.50(3 \mathrm{H}, \mathrm{d}, J 7.0 \mathrm{~Hz}), 1.02$ and 1.38 (each 3 H , s), $4.58(2 \mathrm{H}, \mathrm{d}, J 1.5 \mathrm{~Hz})$, and $7.3-8.2(7 \mathrm{H}, \mathrm{m}) ; m / z 322$ ( $M^{+}, 16 \%$ ), 304 (5), 291 (4), 279 (4), 261 (5), 249 (4), 239 (6), 219 (4), 207 (6), 191 (6), 178 (8), 165 (8), 152 (5), 141 (5), 131 (5), 108 (21), 91 (28), 83 (100), 79 (26), 67 (9), 55 (15), 47 (43), and 41 (24).

Preparation of the Di-p-bromobenzoate Derivative (21) of the $1,3-$ Diol (7). - $p$-Bromobenzoyl chloride ( 80 mg ) was added to the 1,3-diol (7) $(40 \mathrm{mg})$ in dry pyridine ( 1 ml ) and the mixture was refluxed at $90^{\circ} \mathrm{C}$ for 8 h with stirring under nitrogen. The product, recovered in the usual way, was purified by p.l.c. to give (1R,4S,5S,6R,7S,10R)-vitrane-5,14-diyl di-p-bromobenzoate (21) $(30 \mathrm{mg})$, m.p. $114-115^{\circ} \mathrm{C}$ (from MeOH and chloroform, $2: 1) ;[\alpha]_{\mathrm{D}}+8.5^{\circ}(c, 1.18)$ (Found: C, 57.7; H, 5.45. $\mathrm{C}_{29} \mathrm{H}_{34} \mathrm{Br}_{2} \mathrm{O}_{4}$ requires C, $57.44 ; \mathrm{H}, 5.65 \%$ ); $v_{\text {max. }}\left(\mathrm{CHCl}_{3}\right) 3040$, $1712,1589,1483,1282,1270,1126,1110,1077,1019$, and $852 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}} 0.3-0.8(2 \mathrm{H}, \mathrm{m}), 0.88$ and 0.98 (each $\left.3 \mathrm{H}, \mathrm{s}\right), 0.98$ $(3 \mathrm{H}, \mathrm{d}, J 7.0 \mathrm{~Hz}), 4.42(2 \mathrm{H}, \mathrm{d}, J 8.0 \mathrm{~Hz}), 5.53(1 \mathrm{H}, \mathrm{d}, J 4.0$ $\mathrm{Hz}), 7.54(2 \mathrm{H}, \mathrm{d}, J 9.0 \mathrm{~Hz}), 7.58(2 \mathrm{H}, \mathrm{d}, J 9.0 \mathrm{~Hz})$, and 7.94 $(4 \mathrm{H}, \mathrm{d}, J 9.0 \mathrm{~Hz}) ; m^{\prime} / z 608,606$, and $604\left(M^{+}, 1,2\right.$, and $1 \%$ ), 404 (4), 402 (4), 219 (12), 202 (100), 183 (54), 173 (7), 159 (29), 146 (16), 133 (12), 120 (20), 105 (17), 91 (14), 82 (20), 67 (13), 55 (17), and 41 (18).

Crystal Structure Determination of the Di-p-Bromobenzoate (21).-Crystal data. $\mathrm{C}_{29} \mathrm{H}_{34} \mathrm{Br}_{2} \mathrm{O}_{4}, M=606.5$, Orthorhombic, $a=9.568(3), b=11.290(1), c=24.814(11) \AA, U=2681.5$ $\AA^{3}, D_{\mathrm{c}}=1.50 \mathrm{~g} \mathrm{~cm}^{3}, Z=4, F(000)=1240, \mu\left(\mathrm{Mo}-K_{x}\right)=$ $32.4 \mathrm{~cm}^{-1}$, space group $P 2_{1} 2_{1} 2_{1}$.

The intensity data were collected on a Syntex R3 four-circle diffractometer using monochromated Mo- $K_{\alpha}$ radiation ( $\lambda=$ $0.7107 \AA$ ). The reflections of 1170 were judged to be observed after correction for the Lorentz, polarization, and background effects. The positions of the two bromineatoms were determined from the Patterson synthesis. The subsequent electron density synthesis revealed the non-hydrogen atom skeleton, and the 34 hydrogen atoms were located using the difference electron density synthesis. Refinement by the full-matrix least-squares, using the anisotropic temperature factors, converged to a current $R$ value of 0.073 . At this stage, the anomalous scattering factor corrections for the bromine atoms were introduced into the structure-factor calculations to establish the absolute configuration. For the configuration (21), the $R$ value was 0.070 whereas for the inverted configuration it was $0.081 .{ }^{10}$ Further full-matrix least-squares iterations reduced the $R$ factor to 0.067 for 1170 reflections. The anisotropic thermal parameters, and the observed and calculated structure factors have been listed in Supplementary Publication No. 23774 (25 pp.).*

## Acknowledgements

We are grateful to Professor Shûichi Hayashi (Professor Emeritus of Hiroshima University) for his guidance and encouragement. We thank Dr. Yoshihiko Kushi (Department of Chemistry, Hiroshima University) for suggesting the $X$-ray analysis, and Professor Akira Yoshikoshi (Department of Chemistry, Tohoku University) for providing the spectral data of the menthane derivatives. Part of this work was supported by a Grant-in-Aid (to A. M.) for Scientific Research from the Ministry of Education, Science and Culture.

Received 14th June 1983, Paper 3/1003

[^0]:    $\dagger$ We propose the name vitrane for the new carbon skeleton and suggest the numbering shown in the structure (1).
    $\ddagger$ Orientations of the epoxy ring of the epoxide (5) and of the hydroxy groups of the glycol (10) were assigned on the basis of the results of an $X$-ray analysis of the di- $p$-bromobenzoate (21).

[^1]:    * The size of the lactone ring is not concluded but is tentatively assigned to $\delta$-lactone.
