The title cyclic phosphonium salt (1) reacted with various aldehydes to give the phosphine oxides ( $2 a-d$ ) in good yield; these when treated with aldehydes in the presence of BuLi gave the alcohols (4a, b). The alcohol (4a) was easily converted into the 1,6 -diene (5) by treatment of NaH in DMF. The stereoselectivities of these reactions are also described.

Although the Wittig reaction is one of the most versatile methods for the synthesis of alkenes, reorganization of bonding in the intermediate results in loss of the phosphorus group. If, however, the latter is retained in the product as a phosphine oxide, it is then available for Horner-Wittig reactions. Although Lednicer ${ }^{1,2}$ solved this problem in part by using phospholenes, his yields of products were low. Here we develop Muchowski's ${ }^{3}$ method which employs a five-membered phosphonium salt, to provide a powerful way of linking three separate carbon units.

## Results and Discussion

The title compound, 1,1-diphenylphosphorinanium bromide ${ }^{4}$ (1) was prepared in $89 \%$ overall yield from the reaction of $1,5-$ dibromopentane with tetraphenyldiphosphine, ${ }^{5}$ the latter being generated in situ from diphenylphosphine and chloro(diphenyl)phosphine.

The Wittig reaction of (1) with benzaldehyde in the presence of butyl-lithium in tetrahydrofuran (THF) at room temperature gave 6-phenylhex-5-enyl(diphenyl)phosphine oxide (2a) (63\%) as an $E, Z$ mixture ( $E: Z=68: 32$ ).

The ratio of the isomers was estimated by the peak areas of the vinylic protons in the n.m.r. spectrum of crude product (2a) which appeared at $\delta 5.55$ (dt, $J 11.6$ and 7.2 Hz , for $Z$ ), 6.37 (d, $J 11.6 \mathrm{~Hz}, Z), 6.10(\mathrm{dt}, J 15.8$ and $6.8 \mathrm{~Hz}, E)$, and $6.31(\mathrm{~d}, J$ $15.8 \mathrm{~Hz}, E)$ p.p.m. The ( $E$ )-hexene, ( $E$ )-(2a), was purified by recrystallization of the crude mixture of isomers from chloro-form-hexane. The n.m.r. spectrum of the product ( $\mathbf{2 b}$ ) [formed from reaction of (1) with $p$-dimethylaminobenzaldehyde] showed only $E$ vinylic protons at $\delta 5.93$ (dt, $J 15.8$ and 6.9 Hz ) and $6.26(\mathrm{~d}, J 15.8 \mathrm{~Hz})$ p.p.m. The $E: Z$ ratio of (2d) could not be determined because the vinylic protons of (2d) overlapped in the n.m.r. spectrum at $5.25-5.45$ p.p.m.

Treatment of ( $E$ )-(2a) with butyl-lithium at $-78^{\circ} \mathrm{C}$ gave a reddish orange solution which reacted readily with benzaldehyde to give exclusively the erythro-alcohol ( $E$ )-(4a) in $82 \%$ yield ( $J_{\mathrm{AB}}<1 \mathrm{~Hz}$ ).

The threo isomer ${ }^{6}$ was not detected by n.m.r. spectroscopy. Approach of the aldehyde to the carbanion (3) from the less hindered site, ${ }^{7}$ i.e. $R e-R e$ or $\mathrm{Si}-\mathrm{Si}$ faces, may explain the stereoselectivity of these reactions. In sequential Wittig and Horner-Wittig reactions in one reaction vessel, the phosphonium salt (1) was treated with benzaldehyde in the presence of BuLi in THF at room temperature and the resulting mixture then cooled, and treated with BuLi and benzaldehyde; the erythro alcohol (4a) was obtained in $87 \%$ yield.

Conversion of the erythro-(E)-(4a) into the 1,6 -diene (5) in good yield preceded elimination of the diphenylphosphinate ion by treatment of NaH in DMF. ${ }^{6}$ The isomer ratio of the product was estimated by g.l.c. and ${ }^{1} \mathrm{H}$ n.m.r. ( $E, Z: E, E<92: 8$ ).

6-Phenylhex-5-enyl(diphenyl)phosphine Oxide (2a).-(a) At room temperature. A solution of butyl-lithium ( $15 \%$ in hexane; $18.5 \mathrm{ml}, 28.9 \mathrm{mmol}$ ) was added dropwise to a suspension of the phosphonium salt (1) $(8.83 \mathrm{~g}, 26.3 \mathrm{mmol})$ in dry THF ( 200 ml ) at room temperature under nitrogen. After 30 min , a solution of benzaldehyde ( $3.07 \mathrm{~g}, 28.9 \mathrm{mmol}$ ) in dry THF ( 20 ml ) was added to the wine coloured solution, and the resultant mixture was stirred for 1 h at this temperature (the colour disappeared). Water was added, and the mixture extracted with ether (80 $\mathrm{ml} \times 3$ ). The organic extracts were combined, washed with water and brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated under reduced pressure to give creamy solids which were chromatographed on silica gel using ethyl acetate as eluant to give the title compound ( $\mathbf{2 a}$ ) ( $5.97 \mathrm{~g}, 63 \%$ ) and 1-hydroxy-1,7-diphenylhept-6-en-2-yl(diphenyl)phosphine oxide (4a) ( $0.66 \mathrm{~g}, 5 \%$ ). Recrystallization of crude (2a) from $\mathrm{CHCl}_{3}$-hexane gave pure ( $E$ )-(2a) m.p. $91.4-92.5^{\circ} \mathrm{C}$; $v_{\text {max. }} 1590 \mathrm{~cm}^{-1}(\mathrm{C}=\mathrm{C}) ; m / z(75 \mathrm{eV}) 360$ $\left(M^{+}\right) ; \delta_{\mathbf{H}}\left(\mathrm{CDCl}_{3}\right) 1.57-1.77\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.17-2.36(4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\right), 6.10\left(1 \mathrm{H}, \mathrm{dt}, J 15.8\right.$ and $\left.6.8 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHPh}\right), 6.31$ ( 1 $\left.\mathrm{H}, \mathrm{d}, J 15.8 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CHPh}\right), 7.17-7.35(5 \mathrm{H}, \mathrm{m}, \mathrm{C}=\mathrm{CPh})$, $7.41-7.51,(6 \mathrm{H}, \mathrm{m}, m-$ and $p-\mathrm{H})$, and $7.71-7.79(4 \mathrm{H}, \mathrm{m}, o-\mathrm{H})$ (Found: C, 80.3; H, 7.0. $\mathrm{C}_{24} \mathrm{H}_{25} \mathrm{OP}$ requires $\mathrm{C}, 80.0 ; \mathrm{H}, 7.0 \%$ ). ${ }^{13} \mathrm{C}$ N.m.r. data are summarized in Table 2.

The $E: Z$ ratio of crude ( $\mathbf{2 a}$ ) was estimated from the peak area of the vinylic protons at $\delta 6.10(\mathrm{dt}, J 15.8$ and $6.8 \mathrm{~Hz}, E), 6.31$ (dt, $J 15.8 \mathrm{~Hz}, E), 5.55(\mathrm{dt}, J 11.6$ and $7.2 \mathrm{~Hz}, Z$ ), and 6.37 p.p.m. (d, $J$ $11.6 \mathrm{~Hz}, Z$ ).

After 30 min, the deep red solution was cooled to $-78^{\circ} \mathrm{C}$, a solution of benzaldehyde $(0.70 \mathrm{~g}, 6.6 \mathrm{mmol})$ in THF $(10 \mathrm{ml})$ was added, and the mixture was stirred for 1 h . The mixture was then extracted with ether, and the ether extract was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated to give ( 2 a ) $(1.26 \mathrm{~g}, 58 \%)$. The ratio of $E: Z$ isomers was 38:62.

The organic extract was washed with water and brine, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated to give (4a) $(2.7 \mathrm{~g}, 87 \%)$ as an $E: Z$ mixture ( $E: Z=$ 76:24); the ratio of $E: Z$ was estimated by the peak areas of the ${ }^{1}$ H n.m.r. spectrum at $\delta 6.03(E)$ and $6.19(Z)$.

Similarly, $\quad 3$-hydroxy-1,9-diphenylnona-1,8-dien-4-yl(diphenyl)phosphine oxide (4b) was obtained ( $2.40 \mathrm{~g}, 98 \%$ ) from (E)-(2a) $(1.80 \mathrm{~g}, 5.0 \mathrm{mmol}), \mathrm{BuLi}(3.5 \mathrm{ml}, 5.5 \mathrm{mmol})$, and cinnamaldehyde ( $0.73 \mathrm{~g}, 5.5 \mathrm{mmol}$ ) at $-78{ }^{\circ} \mathrm{C}$. 1,7-Diphenylhepta-1,6-diene (5).-A solution of the alcohol (E)-(4a) ( $2.00 \mathrm{~g}, 4.29 \mathrm{mmol}$ ) in dry dimethylformamide (DMF) ( 50 ml ) was added dropwise to a suspension of sodium hydride ( $60 \%$ in oil, washed with dry hexane; $0.26 \mathrm{~g}, 6.50 \mathrm{mmol}$ ) and the mixture was heated at $50^{\circ} \mathrm{C}$ for 3 h .
