# Synthesis of 9a-Deoxymitomycin Congeners ${ }^{1}$ 

Yoshinori Naruta,* Naoshi Nagai, and Kazuhiro Maruyama*<br>Department of Chemistry, Faculty of Science, Kyoto University, Kyoto 606, Japan

The protected mitosane (23) is prepared in stereospecific manner. The key reactions included in the synthetic scheme are (i) Lewis acid-mediated Claisen-type rearrangement of the penta-2,4-dienyl aryl ether (10) to the penta-2,4-dienylphenol (11), (ii) the regioselective incorporation of the alkoxymethyl group at the 1 -position of the pentadienyl side-chain in the protected pentadienylhydroquinone (12), and (iii) the stereospecific copper-catalysed double cyclization of the azido(penta-2,4-dienyl)quinone (15) to the $3 H$-pyrrolo[1,2-a]indole-5,8-dione (16) in one step. Subsequent stereospecific introduction of the aziridine ring furnishes the target compound (23).

Mitomycins $(\boldsymbol{H} \mathbf{a}-\mathbf{e})$ are a group of excellent antibiotics against both gram-positive and gram-negative bacteria and also against a broad spectrum of solid tumours. ${ }^{2}$ In particular, mitomycin C (1c) was shown to have the strongest and broadest activity
type rearrangement of an aryl dienyl ether (4), ${ }^{7}$ and the latter reaction was successfully attained by means of coppercatalysed reaction of the azidodienylquinone (3). ${ }^{6 a, b, 8}$ This cyclization not only gives the required dihydropyrroloindole

Scheme 1.
against tumours and has been used in medical practice in cancer chemotherapy, regardless of its relative high toxicity. These clinical uses have stimulated research into both the synthesis ${ }^{3}$ and the mechanistic action ${ }^{4}$ of these compounds. After the appearance of the total synthesis of mitomycins by Kishi, ${ }^{5}$ many reports on synthetic approaches which use shorter and flexible routes toward these compounds were published. ${ }^{3 f-h}$ We have developed an original and efficient route towards mitomycin precursors ${ }^{6}$ and disclose here the detailed synthesis of the protected 9a-deoxymitomycin derivative (2).

For accomplishment of the synthesis of compound (2) according to our strategy (Scheme 1), two new reactions are required, i.e. (i) regioselective rearrangement of a penta-2,4dienyl group to an aromatic ring for the preparation of the precursor required in the next cyclization, and (ii) the double cyclization of the azidodienylquinone to the 3 H -pyrrolo [1,2$a$ ]indole- 5,8 -dione (a '1,2-deiminomitosane' $\dagger$ ). The former reaction was accomplished by Lewis acid-mediated Claisen-
ring but also synchronously forms an olefinic double bond at the $\mathrm{C}-1$ position. This double bond is very convenient for the introduction of the required aziridine ring in the natural products. These two reactions were coupled and an original and efficient synthetic route to the protected form of 9 a deoxymitomycin was established.

The initial problem encountered was the introduction of an alkoxymethyl group at the 1-position of the pentadienyl sidechain of compound (3). According to our strategy with the Claisen-type rearrangement, ${ }^{7}$ if pentadienyl aryl ethers with an alkoxymethyl group, e.g. (5) or (6), can be selectively rearranged to the ortho position, this route would be the most efficient one. From a mechanistic study, however, hexadienyl aryl ethers with a pentasubstituted aromatic moiety showed only fragmentation under Lewis acid-mediated conditions. ${ }^{7}$ Furthermore, since our initial approach ${ }^{6 b}$ to the synthesis of ( $3 ; \mathrm{R}=\mathrm{PhCH}_{2}$ ) requires
$\dagger$ For the definition of mitosane, see Ref. $3 b$, p. 415.

(5)

(6)
a multi-step sequence, we decided on the introduction of the alkoxymethyl group to the pentadienylhydroquinone diether (12), which can be easily obtained in quantity by the established rearrangement (Scheme 2).
A fluorine atom was incorporated in the aromatic ring as a halogen functionality which would be unexchangeable with $\mathrm{Bu}^{\mathrm{n}} \mathrm{Li}$ at the stage of the synthesis of the pentadienyl anion.

Based on the above analysis, the protected fluoro(penta-2,4dienyl)hydroquinone diether (12) was the initial synthetic target. As the starting material, 5-bromo-2,4-dimethoxy-3methylphenol (8) ${ }^{7}$ was prepared from commercially available 2 methylresorcinol (7) in $56 \%$ overall yield in five steps; i.e. (i) methylation with $\mathrm{MeI}-\mathrm{NaH}$ in dimethylformamide (DMF) ( $100 \%$ ), (ii) formylation with $\mathrm{MeOCHCl}_{2}-\mathrm{TiCl}_{4}(82 \%$ ), (iii) bromination with $\mathrm{Br}_{2}(80 \%)$, (iv) Baeyer-Villiger oxidation with $m$-chloroperbenzoic acid, and (v) basic hydrolysis ( $86 \%$ yield in two steps). The bromophenol (8) thus obtained was converted into the fluoride derivative ( 9$)^{7}$ in $72 \%$ overall yield from (8) in three steps; (i) protection of the phenol (8) with $\mathrm{MeOCH}_{2} \mathrm{Cl}(\mathrm{MOMCl})$ in DMF, (ii) fluorination with perchloryl fluoride $\left(\mathrm{FClO}_{3}\right)$,* and (iii) deprotection of the

* Perchloryl fluoride is explosive in the presence of oxidizable substances. For safety treatment, see J. H. Peet and B. W. Rocket, J. Organomet. Chem., 1974, 82, C57: W. Adcock and T. C. Khor, ibid., 1975, 91, C20.

Scheme 2. Reagents: i, MeI, $\mathrm{NaH}, \mathrm{DMF} ; \mathrm{MeOCHCl}_{2}, \mathrm{TiCl}_{4} ; \mathrm{Br}_{2} ; m-\mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{CO}_{3} \mathrm{H} ; \mathrm{KOH}, \mathrm{MeOH} ; \mathrm{ii}, \mathrm{MeOCH}, \mathrm{Cl}, \mathrm{NaH}, \mathrm{DMF} ; \mathrm{Bu}^{n} \mathrm{Li}, \mathrm{Et}_{2} \mathrm{O} ; \mathrm{FClO}{ }_{3}$; HCl , acetone; iii, $\mathrm{AlCl}_{3} . \mathrm{OEt}_{2}$; iv, $\mathrm{NaH}, \mathrm{ClCH}_{2} \mathrm{OMe}^{2}, \mathrm{v}, \mathrm{Bu}^{\mathrm{n}} \mathrm{Li}, \mathrm{ClCH}_{2} \mathrm{OCH}_{2} \mathrm{Ph} ;$ vi, $\mathrm{H}_{3} \mathrm{O}^{+}$; vii, CAN ; viii, $\mathrm{NaN} \mathrm{N}_{3}$; ix, $\mathrm{Cu}(\mathrm{acac})_{2} ; \mathrm{x}, \mathrm{Zn}, \mathrm{AcOH} ; \mathrm{xi}, \mathrm{BnBr}$, $\mathrm{K}_{2} \mathrm{CO}_{3}$; xii, $\mathrm{OsO}_{4}, N$-methylmorpholine oxide; then $\mathrm{H}_{3} \mathrm{O}^{+}$; xiii, $\mathrm{MsCl}^{2} \mathrm{Et}_{3} \mathrm{~N}$; xiv, $\mathrm{Bu}_{4}{ }_{4} \mathrm{~N}^{+} \mathrm{N}_{3}{ }^{-}$; xv, $\mathrm{MsCl}, \mathrm{Et}{ }_{3} \mathrm{~N} ; \mathrm{xvi}, \mathrm{P}(\mathrm{OMe})_{3} ; \mathrm{xvii}, \mathrm{NaH} ; \mathrm{xviii}$, $\mathrm{LiAlH}_{4}$

## Figure.

MOM group. This phenol (9) was converted into the corresponding pentadienyl ether (10) with penta-2,4-dienyl chloride$\mathrm{K}_{2} \mathrm{CO}_{3}$ in acetone in $83 \%$ yield. In the rather simple analogue, the Claisen-type rearrangement of a pentadienyl aryl ether can be best mediated by $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O} .{ }^{7}$ In this case, however, even use of 1.5 mol equiv. of $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}\left(-25^{\circ} \mathrm{C} ; 1 \mathrm{~h}\right)$ gave the required compound (11) in insufficient yield ( $39 \%$ ), presumably because the electron-withdrawing fluoride group at the ortho position decreases the electron density at the unsubstituted carbon atom. After examination of several Lewis acids, treatment with $\mathrm{AlCl}_{3} \cdot \mathrm{OEt}_{2}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(-25^{\circ} \mathrm{C} ; 1 \mathrm{~h}\right)$ afforded compound (11) in reasonable yield ( $62 \%$ ).

The next problem was the regioselective introduction of an alkoxymethyl group at the side-chain $\mathrm{C}-1$ position, which is the most crowded one on the pentadienyl moiety. We examined electrophilic reaction of the easily generated pentadienyllithium obtained by treatment of compound (12) with $\mathrm{Bu}{ }^{\mathrm{n}} \mathrm{Li}$. Anhydrous formaldehyde as an electrophile gave two isomeric adducts at the 1 - and 3-position in almost equivalent amounts in $32 \%$ overall yield. On the other hand, benzyloxymethyl chloride gave the desired adduct in $55 \%$ isolated yield in preference to the 3 -adduct ( $22 \%$ ); they were easily separated by silica gel chromatography. After deprotection of the MOM group, the obtained phenol (13) was oxidized with cerium(IV) ammonium nitrate (CAN) to give almost exclusively the corresponding $p$ quinone (14), with very little of the $o$-quinone.*

The following double cyclization of the azidodienylquinone (15), which was obtained from quinone (14) by exchange of the halogen with azide, with $\mathrm{Cu}(\mathrm{acac})_{2}$ catalyst (acac $=$ acetylacetonate) afforded the desired product (16). This reaction exhibited an appreciable effec due to substrate concentration. A similar azidoquinone with a simple penta-2,4-dienyl group showed the highest yield ( $59 \%$ ) at rather lower concentration ( 0.005 m ), ${ }^{8}$ while the optimum yield ( $49 \%$ ) of compound (16) was obtained with $0.01 \mathrm{~m}-(15)$. The product (16) showed the ${ }^{1} \mathrm{H}$ n.m.r. coupling constant $J_{9-9 \mathrm{a}} 5.2 \mathrm{~Hz}$. Since this value is analogous to the corresponding coupling constant ( $J_{9_{\alpha-9 \mathrm{a}}} 6.9$ Hz ) of the unsubstituted product at the 9 -position, in comparison with $J_{9 \beta-9 \mathrm{a}} 11.5 \mathrm{~Hz},{ }^{6 a, \dagger}$ the stereochemistry of

[^0]compound (16) was assigned to be $9 \beta$. The counter-isomer, the $\alpha$ form, was not detected either by chromatographic or by ${ }^{1} \mathrm{H}$ n.m.r. methods. This high stereoselectivity is explained in terms of the intermediate's configuration (Figure). The intermediate (A) giving the $\beta$ product is considered to possess higher stability than the (B) form owing to lower steric repulsion between the benzyloxymethyl group and the butadienyl one.

Reagent and conditions: $\mathrm{i}, \mathrm{BrN}_{3},-50^{\circ} \mathrm{C}$

For the formation of an aziridine ring from the unactivated $\mathrm{C}-1-\mathrm{C}-2$ double bond of compound (24), addition of halogenoazide, e.g. $\mathrm{BrN}_{3}{ }^{10}$ or $\mathrm{IN}_{3},{ }^{11}$ and subsequent reduction ${ }^{12}$ is thought to be one of the simplest procedures because it is not necessary to protect the quinone during these reactions. We examined the reaction of the indoloquinone (24) with $\mathrm{BrN}_{3}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-50^{\circ} \mathrm{C}$. Despite its excellent reactivity with $\mathrm{C}=\stackrel{\mathrm{C}}{\mathrm{C}}$
$\dagger$ The reduced forms of the isomeric analogues of (16) were reported to show $J_{9-9 \mathrm{a}} 4 \mathrm{~Hz}$ for the $\beta$ isomer and $J_{9-9 \mathrm{a}} 11.4 \mathrm{~Hz}$ for the $\alpha$ one. ${ }^{9}$
double bonds, however, aromatization preferentially occurred to give the corresponding indoloquinones (25) and (26) [equation (1)]. Mitosene (29) is known to be the active form of mitomycins. ${ }^{13}$ To examine the formation of the aziridine functionality from the double bond of the indoloquinones (25) and (27), these quinones were directly treated with 1 mol equiv. of $\mathrm{BrN}_{3}$ at $-75^{\circ} \mathrm{C}$ for 0.5 h to give a regioisomeric mixture of the adducts ( 28 a) $(20 \%$ ) and ( 28 b ) $(37 \%$ ), respectively [equation (2)].

Reagents: i, DDQ ; ii, $\mathrm{BrN}_{3}$ ( 1 mol equiv.)

(29)

However, owing to the instability of these products under the reduction conditions, further conversion was not examined.

The multistep procedure was applied to the preparation of the protected form (23) of mitosane (Scheme 2). The tribenzyl ether (17), which was prepared from the quinone (16) by reductive benzylation, was treated with $\mathrm{OsO}_{4}-N$-methylmorpholine oxide to afford diol (18), which was then converted into the aziridine as follows; (i) esterification of the $2-\mathrm{OH}$ to the monosulphonate (19) with $\mathrm{MsCl}_{-\mathrm{Et}_{3} \mathrm{~N} \text {; (ii) conversion of the }}$ ester (19) into the corresponding azide (20) with $\mathrm{Bu}_{4} \mathrm{~N}^{+} \mathrm{N}_{3}{ }^{-}$; (iii) esterification of the $1-\mathrm{OH}$ to the corresponding mesyl ester with $\mathrm{MsCl}-\mathrm{Et}_{3} \mathrm{~N}$ and phosphorylation to the phosphoramide (21) with $\mathrm{Me}_{3} \mathrm{P}$. Reductive removal of the $N$-phosphoryl group with lithium aluminium hydride gave the protected form (23) of the 9 -demethoxymitomycin in $28 \%$ overall yield from diol (18). The relative stereochemistry of the introduced aziridine ring
was confirmed by comparison of the spectral data with those of an authentic sample derived from natural mitomycin C .* The obtained product (23) is a promising precursor for the synthesis of mitomycins A, C, and porfiromycin because all four compounds have the same relative stereochemistry. The remaining problem in the total synthesis is the introduction of an oxygen functionality at the 9a-position. This is now under study in our laboratory.

## Experimental

M.p.s were determined with a Yanagimoto micromelting-point apparatus. I.r. spectra were recorded on a JASCO IRA-1 spectrometer. ${ }^{1} \mathrm{H}$ N.m.r. spectra were obtained using $\mathrm{CCl}_{4}$ or $\mathrm{CDCl}_{3}$ solutions incorporating tetramethylsilane as internal standard on JEOL JMN-PS-100 ( 100 MHz ) or JMN-FX-400 ( 400 MHz ) instruments. Mass spectra and high-resolution mass spectra were recorded on a JEOL JMS-DX-300 mass spectrometer. Column chromatography was performed on Wako-gel C-200. Microanalyses were performed by the Microanalytical Laboratory of Kyoto University. Satisfactory microanalyses of azide and aziridine derivatives were not obtained due to their inherent instability. All solvents were freshly distilled and stored under nitrogen atmosphere. Methylene dichloride was distilled from calcium hydride. Ether and tetrahydrofuran (THF) were distilled from sodium benzophenone ketyl and stored over sodium wire. Benzene was distilled and stored over molecular sieves $4 \AA$. Acetone was stored over calcium sulphate. The homogeneity of substrates was tested by t.l.c. and/or h.p.l.c.

> 2-(1-Benzyloxymethylpenta-2,4-dienyl)-3-fluoro-4,6-dimeth- oxy-5-methylphenol (13).-To a THF ( 34 ml ) solution of 1 -fluoro-2,4-dimethoxy-5-methoxymethoxy-3-methyl-6-(penta-2,4-dienyl)benzene (12) ${ }^{6 b}(1.01 \mathrm{~g}, 3.4 \mathrm{mmol})$ at $-75^{\circ} \mathrm{C}$ was added $\mathrm{Bu}^{\mathrm{n}} \mathrm{Li}$ ( 1.56 m hexane solution; $3.28 \mathrm{ml}, 5.13 \mathrm{mml}$ ) under nitrogen. After the mixture had been stirred for 0.5 h at $-40^{\circ} \mathrm{C}$, benzyloxymethyl chloride ( $0.41 \mathrm{ml}, 3.42 \mathrm{mmol}$ ) was added to the solution at $-75^{\circ} \mathrm{C}$. The reaction solution was allowed to warm to $0^{\circ} \mathrm{C}$ and was poured into water. The organic phase was separated, washed with water, dried over $\mathrm{MgSO}_{4}$, and evaporated under reduced pressure. Column chromatography of the residue on silica gel with hexane-ether (9:1) as eluant gave the 1-benzyloxymethyl adduct (13) ( $697 \mathrm{mg}, 55 \%$ ) (Found: $\mathrm{C}, 71.0 ; \mathrm{H}, 7.0 ; \mathrm{F}, 4.8 . \mathrm{C}_{22} \mathrm{H}_{25} \mathrm{FO}_{4}$ requires $\mathrm{C}, 71.0 ; \mathrm{H}, 6.8$; $\mathrm{F}, 5.1 \%$ ); $v_{\text {max. }}(\mathrm{NaCl}) 3520,2940,1460,1415,1260,1120$, $1060,1000,780$, and $750 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}\left(100 \mathrm{MHz} ; \mathrm{CCl}_{4}\right) 1.11$ (3 $\mathrm{H}, \mathrm{s}, \mathrm{Me}), 3.63\left(5 \mathrm{H}, \mathrm{OMe}\right.$ and $\left.\mathrm{CH}_{2} \mathrm{OBn}\right), 3.76(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe})$, $4.00-4.20\left(1 \mathrm{H}, \mathrm{m}, 1^{\prime}-\mathrm{H}\right), 4.43\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.88(1 \mathrm{H}, \mathrm{d}, J 10$ $\left.\mathrm{Hz}, 5^{\prime}-\mathrm{H}\right), 5.00\left(1 \mathrm{H}, \mathrm{d}, J 14 \mathrm{~Hz}, 5^{\prime}-\mathrm{H}\right), 5.80-6.30\left(2 \mathrm{H}, \mathrm{m}, 2^{\prime}-, 3^{\prime}-\right.$, and $\left.4^{\prime}-\mathrm{H}\right), 6.30(1 \mathrm{H}, \mathrm{s}, \mathrm{OH})$, and $7.13(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph}) ; m / z 372\left(M^{+}\right.$, $6 \%$ ), 252 (76), 223 (100), and 91 (32).

2-(1-Benzyloxymethylpenta-2,4-dienyl)-3-fluoro-6-methoxy5 -methyl-1,4-benzoquinone (14).-To an acetonitrile ( 2.7 ml ) solution of the fluorophenol (13) ( $432 \mathrm{mg}, 1.2 \mathrm{mmol}$ ) at $0^{\circ} \mathrm{C}$ was added an aqueous solution ( 2.7 ml ) of CAN $(1.39 \mathrm{~g}, 2.5$ mmol ). After being stirred for 3 min , the mixture was poured into water and extracted with water. Usual work-up and subsequent purification by column chromatography on silica gel gave the corresponding quinone (14) ( $293 \mathrm{mg}, 69 \%$ ); $v_{\text {max. }}$

[^1]( NaCl ) 1 660, $1615,1450,1360,1$ 305, 1 280, 1 200, 1 160, $1100,1000,980$, and $780 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}\left(100 \mathrm{MHz} ; \mathrm{CCl}_{4}\right) 1.88$ (3 $\mathrm{H}, \mathrm{s}, \mathrm{Me}), 3.73-3.84\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{OBn}\right), 3.98(4 \mathrm{H}, \mathrm{OMe}$ and $\left.1^{\prime}-\mathrm{H}\right), 4.42\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.95-5.18\left(2 \mathrm{H}, \mathrm{m}, 5^{\prime}-\mathrm{H}\right), 5.59-6.28$ ( $2 \mathrm{H}, \mathrm{m}, 2^{\prime}-, 3^{\prime}-$, and $4^{\prime}-\mathrm{H}$ ), and $7.18(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}) ; m / z 356\left(M^{+}\right.$, $5 \%$ ), 326 (13), 235 (100), and 207 (51).

2-Azido-3-(1-benzyloxymethylpenta-2,4-dienyl)-5-methoxy-6-methyl-1,4-benzoquinone (15).-To a $\mathrm{MeOH}(6.3 \mathrm{ml})$ solution of the quinone (14) ( $293 \mathrm{mg}, 0.82 \mathrm{mmol}$ ) was added an aqueous solution ( 1.3 ml ) of $\mathrm{NaN}_{3}(80 \mathrm{mg}, 1.2 \mathrm{mmol})$ and the mixture was stirred for 1 h in the dark, and then concentrated under reduced pressure; to the residue were added water and $\mathrm{CHCl}_{3}$. After usual work-up and chromatographic purification on silica gel, the corresponding azidoquinone (15) ( $274 \mathrm{mg}, 88 \%$ ) was obtained; $v_{\text {max. }}(\mathrm{NaCl}) 2100,1650,1595,1360,1290,1145$, 1100,1000 , and $960 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}\left(100 \mathrm{MHz} ; \mathrm{CCl}_{4}\right) 1.90(3 \mathrm{H}, \mathrm{s}$, $\mathrm{Me}), 3.68\left[3 \mathrm{H}, \mathrm{m}, \mathrm{CH}\left(\mathrm{CH}_{2} \mathrm{OBn}\right)\right], 4.02(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.35$ and $4.48\left(2 \mathrm{H}, \mathrm{ABq}, J 12 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.96\left(1 \mathrm{H}, \mathrm{d}, J 6 \mathrm{~Hz}, 5^{\prime}-\mathrm{H}\right)$, $5.10\left(1 \mathrm{H}, \mathrm{d}, J 15 \mathrm{~Hz}, 5^{\prime}-\mathrm{H}\right), 6.00\left(2 \mathrm{H}, \mathrm{m}, 2^{\prime}-, 3^{\prime}-\right.$, and $\left.4^{\prime}-\mathrm{H}\right)$, and 7.22 ( $5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}$ ).

9ß-Benzyloxymethyl-9,9aß-dihydro-7-methoxy-6-methyl-3Hpyrrolo [1,2-a $]$ indole- 5,8 -dione (16).-To a refluxing dry benzene ( 36 ml ) solution of $\mathrm{Cu}(\mathrm{acac})_{2}(204 \mathrm{mg}, 0.78 \mathrm{mmol})$ was added a dry benzene ( 3 ml ) solution of the azidoquinone (15) ( 133 mg , 0.35 mmol ) and the mixture was stirred for 2 h at $80^{\circ} \mathrm{C}$. After cooling to room temperature, the mixture was filtered and the solvent was removed under reduced pressure. Usual purification gave the dihydropyrroloindoloquinone (16) $(60 \mathrm{mg}, 49 \%$ ) (Found: $\mathrm{C}, 71.7 ; \mathrm{H}, 5.8 ; \mathrm{N}, 4.1 . \mathrm{C}_{21} \mathrm{H}_{21} \mathrm{NO}_{4}$ requires $\mathrm{C}, 71.8 ; \mathrm{H}, 6.0$; $\mathrm{N}, 4.0 \%$ ); $\lambda_{\text {max }}(\mathrm{MeOH}) 213\left(\varepsilon 20400 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right), 224 \mathrm{sh}$, 255 (7400), 314 (7400), and 535 nm ( 1100 ); $v_{\text {max. }}(\mathrm{NaCl})$ $1620,1575,1400,1300,1255,1133,730$, and $658 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 1.86(3 \mathrm{H}, \mathrm{s}, \mathrm{Me}), 3.50\left(1 \mathrm{H}, \mathrm{dd}, J_{\mathrm{gem}} 16.1\right.$, $\left.J_{10,9} 8.9 \mathrm{~Hz}, 10-\mathrm{H}\right), 3.53\left(1 \mathrm{H}\right.$, ddd, $J_{\text {gem }} 16.1, J_{9, \text { ga }} 5.2, J_{10,9} 2.4$ $\mathrm{Hz}, 9-\mathrm{H}), 3.94\left(1 \mathrm{H}, \mathrm{dd}, J_{\mathrm{gem}} 16.1, J_{10,9} 2.4 \mathrm{~Hz}, 10-\mathrm{H}\right), 4.02(1 \mathrm{H}$, dddd, $J_{\text {gem }} 16.4, J_{3 \text { в,9a }} 3.6, J_{3 \text { в, } 1} 2.1, J_{3 \text { в, } 2} 1.5 \mathrm{~Hz}, 3 \beta-\mathrm{H}$ ), 4.03 ( 3 $\mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.31\left(1 \mathrm{H}\right.$, dddd, $J_{\mathrm{gem}} 16.4, J_{3 \alpha, 9 \mathrm{a}} 3.6, J_{3 \alpha, 1} 1.8, J_{3 \alpha, 2}$ $1.8 \mathrm{~Hz}, 3 \alpha-\mathrm{H}), 4.56\left(2 \mathrm{H}, \mathrm{ABq}, J 12.2 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.82(1 \mathrm{H}, \mathrm{m}$, $9 \mathrm{a}-\mathrm{H}), 5.82(1 \mathrm{H}, \mathrm{m}, 1-\mathrm{H}), 5.86(1 \mathrm{H}, \mathrm{m}, 2-\mathrm{H})$, and $7.21(5 \mathrm{H}, \mathrm{m}$, $\mathrm{Ph}) ; m / z 351\left(M^{+}\right)$.

5,8-Dibenzyloxy-9 3 -benzyloxyme thyl-9,9a $\beta$-dihydro-7-meth-oxy-6-methyl-3H-pyrrolo[1,2-a]indole (17).-To zinc powder ( 60 mg ) was added a $\mathrm{CH}_{2} \mathrm{Cl}_{2}(2 \mathrm{ml})$ solution of the quinone (16) ( $306 \mathrm{mg}, 0.87 \mathrm{mmol}$ ) and AcOH $(0.5 \mathrm{ml})$ under nitrogen and the mixture was stirred until the solution became colourless. The mixture was filtered and the filtrate was concentrated under reduced pressure. A mixture of the residue, benzyl bromide (2.1 $\mathrm{ml}, 17 \mathrm{mmol})$, and $\mathrm{K}_{2} \mathrm{CO}_{3}(2.39 \mathrm{~g}, 17 \mathrm{mmol})$ in DMF ( 5 ml ) was refluxed for 12 h . After having cooled to room temperature, the mixture was poured into water, and extracted with ether. Usual work-up and chromatographic purification on silica gel gave the benzyl ether (17) $(242 \mathrm{mg}, 52 \%) ; \delta_{\mathrm{H}}\left(100 \mathrm{MHz} ; \mathrm{CCl}_{4}\right) 2.00$ (3 $\mathrm{H}, \mathrm{s}, \mathrm{Me}$ ), $3.20-3.40(1 \mathrm{H}, \mathrm{m}, 9-\mathrm{H}$ ), 3.63 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), 3.68$4.04\left(3 \mathrm{H}, \mathrm{m}, 10-\mathrm{H}_{2}, 3-\mathrm{H}\right), 4.39(2 \mathrm{H}, \mathrm{m}, 3-\mathrm{and} 9 \mathrm{a}-\mathrm{H}), 4.48$ and $4.85\left(2 \mathrm{H}, \mathrm{ABq}, J 10 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.59$ and $5.14(2 \mathrm{H}, \mathrm{ABq}, J 10$ $\mathrm{Hz}, \mathrm{CH}_{2} \mathrm{Ph}$ ), 4.87 and $5.32\left(2 \mathrm{H}, \mathrm{ABq}, J 10 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right)$, 5.63 ( 2 $\mathrm{H}, \mathrm{m}, 1-\mathrm{and} 2-\mathrm{H}$ ), and $7.18--7.22(15 \mathrm{H}, \mathrm{m}, \mathrm{Ph}) ; m / z 533\left(\mathrm{M}^{+}\right)$ (Found: $M^{+}, 533.2567 . \mathrm{C}_{35} \mathrm{H}_{35} \mathrm{NO}_{4}$ requires $M, 533.2566$ ).

5,8-Dibenzyloxy-9 3 -benzyloxymethyl-2,3,9,9a-tetrahydro-7-methoxy-6-methyl-1H-pyrrolo[1,2-a]indole-1 $\alpha, 2 \alpha$-diol (18).To a THF ( 2.1 ml ) solution of the benzyl ether ( 17 ) ( $363 \mathrm{mg}, 0.68$ mmol ) and $N$-methylmorpholine oxide ( $75 \mathrm{mg}, 0.75 \mathrm{mmol}$ ) was added a catalytic amount of $\mathrm{OsO}_{4}$ in $\mathrm{Bu}^{1} \mathrm{OH}(1.3 \mathrm{ml})$ and water $(0.15 \mathrm{ml})$, and the solution was stirred for 12 h . The mixture was
poured into water and extracted with ether. Usual work-up and purification gave the $\operatorname{diol}(18)(294 \mathrm{mg}, 76 \%$ ) (Found: $\mathrm{C}, 74.3 ; \mathrm{H}$, $6.5 ; \mathrm{N}, 2.4 . \mathrm{C}_{35} \mathrm{H}_{37} \mathrm{O}_{6}$ requires $\mathrm{C}, 74.1 ; \mathrm{H}, 6.6 ; \mathrm{N}, 2.5 \%$ ); $v_{\text {max }} .\left(\mathrm{CHCl}_{3}\right) 3400,1440,1190$, and $1090 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}(400 \mathrm{MHz}$; $\mathrm{CDCl}_{3}$ ) $2.12(3 \mathrm{H}, \mathrm{s}, \mathrm{Me}), 2.53(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}), 2.89(1 \mathrm{H}, \mathrm{br} \mathrm{s}$, $\mathrm{OH}), 3.18(1 \mathrm{H}, \mathrm{dd}, J 6.4$ and $10.1 \mathrm{~Hz}, 10-\mathrm{H}), 3.43(1 \mathrm{H}, \mathrm{t}, J 8.9$ $\mathrm{Hz}, 3-\mathrm{H}), 3.65$ ( $1 \mathrm{H}, \mathrm{dd}, J 10.8$ and $5.8 \mathrm{~Hz}, 3.75$ ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), $3.95(1 \mathrm{H}, \mathrm{m}, 2-\mathrm{H}), 4.01(1 \mathrm{H}, \mathrm{t}, J 5.5 \mathrm{~Hz}, 9-\mathrm{H}), 4.08(1 \mathrm{H}, \mathrm{m}, 3-\mathrm{H})$, $4.10(1 \mathrm{H}, \mathrm{m}, 1-\mathrm{H}), 4.30(1 \mathrm{H}, \mathrm{m}, 9 \mathrm{a}-\mathrm{H}), 4.48$ and $4.54(2 \mathrm{H}, \mathrm{ABq}$, $\left.J 12.2 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.67$ and $5.13\left(2 \mathrm{H}, \mathrm{ABq}, J 11 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right)$, 4.96 and $5.05\left(2 \mathrm{H}, \mathrm{ABq}, J 11 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right)$, and $7.40(15 \mathrm{H}, \mathrm{m}, \mathrm{Ph})$.

2-Azido-5,8-dibenzyloxy-9-benzyloxymethyl-2,3,9,9a-tetra-hydro-7-methoxy-6-methyl-1H-pyrrolo [1,2-a $]$ indol-1-ol (20).To a $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{ml})$ solution of the diol (18) $(114 \mathrm{mg}, 0.2 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$ were added $\mathrm{Et}_{3} \mathrm{~N}(43 \mu \mathrm{l}, 0.46 \mathrm{mmol})$ and methanesulphonyl chloride ( MsCl ) $(17 \mu \mathrm{l}, 0.22 \mathrm{mmol})$ under nitrogen. After being stirred for 2 h , the mixture was poured into water and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. After usual work-up, the monomesyl ester (19) was obtained; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 2.10(3 \mathrm{H}, \mathrm{s}$, Me), $2.96(3 \mathrm{H}, \mathrm{s}, \mathrm{Ms}), 3.46-3.49\left(3 \mathrm{H}, \mathrm{m}, 10-\mathrm{H}_{2}\right.$ and $\left.3-\mathrm{H}\right), 3.74$ ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), $4.05(3 \mathrm{H}, \mathrm{m}, 9 \mathrm{a}-, 9-$, and $3-\mathrm{H}), 4.36(1 \mathrm{H}, \mathrm{m}, 1-\mathrm{H})$, 4.46 and $4.53\left(2 \mathrm{H}, \mathrm{ABq}, J 12 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.68$ and $5.07(2 \mathrm{H}$, $\left.\mathrm{ABq}, J 11 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.94$ and $5.03(2 \mathrm{H}, \mathrm{ABq}, J 11 \mathrm{~Hz}$, $\left.\mathrm{CH}_{2} \mathrm{Ph}\right)$, $5.11(1 \mathrm{H}, \mathrm{m}, 2-\mathrm{H})$, and $7.24-7.41(15 \mathrm{H}, \mathrm{Ph})$.

To a dry benzene solution of the monomesyl ester (19) (103 $\mathrm{mg}, 0.16 \mathrm{mmol}$ ) was added $\mathrm{Bu}^{\mathrm{n}}{ }_{4} \mathrm{NN}_{3}(820 \mathrm{mg}, 2.8 \mathrm{mmol})$ and the solution was refluxed for 3 h . The mixture was poured into water and the benzene solution was washed with water five times. After usual work-up, the azido alcohol (20) was obtained in $56 \%$ yield, $v_{\text {max. }}\left(\mathrm{CHCl}_{3}\right) 3400,2100,1460$, and $1100 \mathrm{~cm}^{-1}$.

4,7-Dibenzyloxy-8 $\beta$-benzyloxymethyl-1,1a $\alpha, 2,8,8 \mathrm{a} \beta, 8 \mathrm{~b}-$ hexa-hydro-6-methoxy-5-methylazirino $\left[2^{\prime}, 3^{\prime} ; 3,4\right]$ pyrrolo $[1,2-\mathrm{a}]$ indole (23).-To a $\mathrm{CH}_{2} \mathrm{Cl}_{2}(0.5 \mathrm{ml})$ solution of the azido alcohol (20) $(53 \mathrm{mg}, 0.89 \mathrm{mmol})$ at $0^{\circ} \mathrm{C}$ were added $\mathrm{Et}_{3} \mathrm{~N}(40 \mu 1,0.29 \mathrm{mmol})$ and $\mathrm{MsCl}(20 \mu \mathrm{l}, 0.24 \mathrm{mmol})$ under nitrogen. After being stirred for 2 h , the mixture was poured into water and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Usual work-up gave the corresponding mesyl ester.

To a THF ( 15 ml ) solution of the mesyl ester was added trimethyl phosphite ( $38 \mu \mathrm{l}, 0.33 \mathrm{mmol}$ ) and the mixture was refluxed for 4 h . After the solvent was removed under reduced pressure, the crude phosphoramide (21) was obtained.

To a THF ( 1 ml ) suspension of $\mathrm{NaH}(60 \mathrm{wt} \% ; 36 \mathrm{mg}, 0.89$ $\mathrm{mmol})$ at $0^{\circ} \mathrm{C}$ was added a THF ( 1 ml ) solution of the phosphoramide (21) under nitrogen and the mixture was stirred for 4 h , poured into water, and extracted with ether, usual workup gave compound (22).

To an ethereal ( 1.5 ml ) solution of compound (22) at $0^{\circ} \mathrm{C}$ was added an ethereal suspension of $\mathrm{LiAlH}_{4}(1 \mathrm{~m} ; 0.16 \mathrm{ml})$ under nitrogen and the mixture was stirred for 2 h . To the mixture at $0^{\circ} \mathrm{C}$ was added $20 \%$ aqueous $\mathrm{NaOH}(0.32 \mathrm{ml})$ and the product was extracted with ether. After usual work-up and purification, the aziridine derivative (23) was obtained in $28 \%$ yield from the diol (18); $\delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 2.19(3 \mathrm{H}, \mathrm{s}, \mathrm{Me}), 2.95(1 \mathrm{H}, \mathrm{m}$, $1 \mathrm{a}-\mathrm{H}), 3.05(1 \mathrm{H}, \mathrm{m}, 8 \mathrm{~b}-\mathrm{H}), 3.31(1 \mathrm{H}$, dd, J 4.9 and 11 Hz , CHHOBn), $3.46(1 \mathrm{H}, \mathrm{m}, 2-\mathrm{H}), 3.65(1 \mathrm{H}, \mathrm{m}, \mathrm{CHHOBn}), 3.71$ ( 1 $\mathrm{H}, \mathrm{d}, J 11 \mathrm{~Hz}, 2-\mathrm{H}), 3.74(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.20(1 \mathrm{H}, \mathrm{m}, 8 \mathrm{a}-\mathrm{H}), 4.22$ $(1 \mathrm{H}, \mathrm{m}, 8-\mathrm{H}), 4.45$ and $4.92\left(2 \mathrm{H}, \mathrm{ABq}, J 11 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.53$ and $4.65\left(2 \mathrm{H}, \mathrm{ABq}, J 11 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.99$ and $5.20(2 \mathrm{H}, \mathrm{ABq}, J$ $\left.11 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right)$, and $7.37(15 \mathrm{H}, \mathrm{m}, \mathrm{Ph}) ; m / z 548\left(M^{+}, 10 \%\right)$ and 457 (100) (Found: $M^{+}, 548.2679 . \mathrm{C}_{35} \mathrm{H}_{36} \mathrm{~N}_{2} \mathrm{O}_{4}$ requires $M$, 548.2674).

Reaction of the Dihydropyrroloindoloquinone (24) with $\mathrm{BrN}_{3}$.- $\mathrm{To} \mathrm{a} \mathrm{CH} \mathrm{Cl}_{2}$ ( 2 ml ) solution of the quinone (24) $(46 \mathrm{mg}$, 0.2 mmol ) at $-50^{\circ} \mathrm{C}$ was added a $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of $\mathrm{BrN}_{3}{ }^{10}$ ( $1 \mathrm{~m} ; 0.6 \mathrm{ml}$ ) under nitrogen and the mixture was stirred for 1 h .

The mixture was poured into water and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Usual work-up and purification gave the corresponding indoloquinone (25) (30\%) and the 3-azido derivative (26) (35\%).

Compound (25): red needles, m.p. $151-152^{\circ} \mathrm{C}$ (Found: C, 68.0; $\mathrm{H}, 4.6 ; \mathrm{N}, 6.3 . \mathrm{C}_{13} \mathrm{H}_{11} \mathrm{NO}_{3}$ requires $\mathrm{C}, 68.1 ; \mathrm{H}, 4.8 ; \mathrm{N}$, $6.1 \%$ ); $v_{\text {max. }} 1670,1640,1610,1320,1080$, and $1010 \mathrm{~cm}^{-1}$; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 1.97(3 \mathrm{H}, \mathrm{s}, \mathrm{Me}), 3.99(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.72$ $\left(2 \mathrm{H}, \mathrm{m}, 3-\mathrm{H}_{2}\right), 6.36(1 \mathrm{H}, \mathrm{s}, 9-\mathrm{H}), 6.57(1 \mathrm{H}, \mathrm{ddd}, J 5.8,2.1$, and $1.8 \mathrm{~Hz}, 2-\mathrm{H}$ ), and 6.67 ( 1 H , ddd, $J 5.8,2.1$, and $1.8 \mathrm{~Hz}, 1-\mathrm{H}$ ); $m / z$ $229\left(M^{+}, 100\right), 214(34), 200(58)$, and 186 (37).
Compound (26): $v_{\text {max. }}(\mathrm{KBr}) 2$ 100, 1660,1630 , and 1310 $\mathrm{cm}^{-1} ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 1.99(3 \mathrm{H}, \mathrm{s}, \mathrm{Me}), 4.02(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe})$, $6.40(1 \mathrm{H}, \mathrm{s}, 9-\mathrm{H}), 6.54(1 \mathrm{H}, \mathrm{dd}, J 5.8$ and $1.5 \mathrm{~Hz}, 2-\mathrm{H}), 6.60(1 \mathrm{H}$, dd, $J 5.8$ and $0.9 \mathrm{~Hz}, 1-\mathrm{H})$, and $6.76(1 \mathrm{H}, \mathrm{dd}, J 1.5$ and 0.9 Hz , 3-H); $m / z 228\left(M-\mathrm{N}_{3}\right)$.

Reaction of the Indoloquinones (25) and (27) with $\mathrm{BrN}_{3}$.-To a $\mathrm{MeOH}(20 \mathrm{ml})$ solution of the quinone (24) $(67 \mathrm{mg}, 0.29 \mathrm{mmol})$ was added a MeOH solution of 2,3-dichloro-5,6-dicyano- $p$ benzoquinone ( $77 \mathrm{mg}, 0.35 \mathrm{mmol}$ ) and the mixture was stirred for 1.5 h . The solvent was removed under reduced pressure and the residue was purified by column chromatography on silica gel to give the indoloquinone (25) in $67 \%$ yield.

To a $\mathrm{CH}_{2} \mathrm{Cl}_{2}(6 \mathrm{ml})$ solution of the indoloquinone (25) was added a $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of $\mathrm{BrN}_{3}(1 \mathrm{~m} ; 0.31 \mathrm{ml})$ at $-75^{\circ} \mathrm{C}$ for 2 min . After being stirred at this temperature for 0.5 h , the mixture was poured into aqueous $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. After usual work-up and purification, compounds (28a) ( $22 \mathrm{mg}, 20 \%$ ) and ( 25 ) ( $15 \%$ recovery) were obtained. The pyrroloindole (28a) was a mixture of two regioisomers (A and B).
A isomer of ( $28 a$ ) had $\delta_{\mathbf{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 1.96(3 \mathrm{H}, \mathrm{s}, \mathrm{Me})$, 4.03 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), $4.37(1 \mathrm{H}, \mathrm{dd}, J 13.7$ and $1.3 \mathrm{~Hz}, 3-\mathrm{H})$, 4.55 $(1 \mathrm{H}, \mathrm{dd}, J 13.7$ and $5.1 \mathrm{~Hz}, 3-\mathrm{H}), 4.88(1 \mathrm{H}, \mathrm{dd}, J 5.1$ and 1.3 Hz , $2-\mathrm{H})$, $5.29(1 \mathrm{H}, \mathrm{s}, 1-\mathrm{H})$, and $6.57(1 \mathrm{H}, \mathrm{s}, 9-\mathrm{H})$.
B isomer of (28a) had $\delta_{\mathbf{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 1.97(3 \mathrm{H}, \mathrm{s}, \mathrm{Me})$, 4.03 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), 4.69 ( $1 \mathrm{H}, \mathrm{d}, J 14.5 \mathrm{~Hz}, 3-\mathrm{H}$ ), 4.78 ( $1 \mathrm{H}, \mathrm{dd}, J$ $4.3 \mathrm{and} 14.5 \mathrm{~Hz}, 3-\mathrm{H}), 5.04(1 \mathrm{H}, \mathrm{d}, J 4.3 \mathrm{~Hz}, 2-\mathrm{H})$, $5.45(1 \mathrm{H}, \mathrm{s}$, $1-\mathrm{H})$, and $6.60(1 \mathrm{H}, \mathrm{s}, 9-\mathrm{H})$.

The mixture of both isomers showed $v_{\text {max. }}(\mathrm{NaCl}) 2100$, 1660,1640 , and $1320 \mathrm{~cm}^{-1}$.
The indoloquinone (27) was prepared in $94 \%$ yield from the dihydroindoloquinone (16) in the same manner as for the synthesis of the indoloquinone (25), and gave red needles, m.p. $155-157^{\circ} \mathrm{C}$ (Found: $\mathrm{C}, 72.4 ; \mathrm{H}, 5.6 ; \mathrm{N}, 4.2 . \mathrm{C}_{21} \mathrm{H}_{19} \mathrm{NO}_{4}$ requires $\mathrm{C}, 72.2 ; \mathrm{H}, 5.5 ; \mathrm{N}, 4.0 \%$ ); $v_{\text {max. }}(\mathrm{KBr}) 1650,1630$, $1600,1500,1310$, and $1100 \mathrm{~cm}^{-1} ; \delta_{\mathbf{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 1.97$ ( $3 \mathrm{H}, \mathrm{s}, \mathrm{Me}$ ), $4.00(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.64$ ( $2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{OBn}$ ), 4.71 ( 2 $\left.\mathrm{H}, \mathrm{s}, 3-\mathrm{H}_{2}\right), 4.84\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 6.53(1 \mathrm{H}, \mathrm{d}, J 6 \mathrm{~Hz}, 2-\mathrm{H}), 6.77$ ( $1 \mathrm{H}, \mathrm{d}, J 6.1 \mathrm{~Hz}, 1-\mathrm{H}$ ), and $7.32-7.46(10 \mathrm{H}, \mathrm{m}, \mathrm{Ph})$.

The indoloquinone (27) was treated with $\mathrm{BrN}_{3}$ by the same procedure as was the quinone (25) to afford compounds (28b) and (27) in $37 \%$ yield and $19 \%$ recovery, respectively. The pyrroloindole (28b) was a mixture of two regioisomers (C and D).

C isomer of (28) showed $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) 2100,1660,1640$, and $1100 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 1.94(3 \mathrm{H}, \mathrm{s}, \mathrm{Me}), 4.00$ ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), $4.18(1 \mathrm{H}, \mathrm{dd}, J 12$ and $8.5 \mathrm{~Hz}, 3-\mathrm{H}), 4.67(1 \mathrm{H}$, ddd, $J 5.6,7.3$, and $8.5 \mathrm{~Hz}, 2-\mathrm{H}), 4.68\left(2 \mathrm{H}, \mathrm{ABq}, J 11 \mathrm{~Hz}, 10-\mathrm{H}_{2}\right)$,
$4.73(1 \mathrm{H}, \mathrm{dd}, J 12$ and $7.3 \mathrm{~Hz}, 3-\mathrm{H}), 4.83(2 \mathrm{H}, \mathrm{ABq}, J 14 \mathrm{~Hz}$, $\left.\mathrm{CH}_{2} \mathrm{Ph}\right), 5.08(1 \mathrm{H}, \mathrm{d}, J 5.6 \mathrm{~Hz}, 1-\mathrm{H})$, and $7.38(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph})$.

D isomer of (28) showed $v_{\text {max. }}(\mathrm{KBr}) 2100,1660,1640$, 1500 , and $1100 \mathrm{~cm}^{-1} ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 1.96(3 \mathrm{H}, \mathrm{s}$, Me ), 4.02 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), $4.59(1 \mathrm{H}, \mathrm{d}, J 4.7 \mathrm{~Hz}, 2-\mathrm{H}), 4.64(1 \mathrm{H}$, d, $J 14.1 \mathrm{~Hz}, 3-\mathrm{H}), 4.69\left(2 \mathrm{H}, \mathrm{ABq}, J 11.5 \mathrm{~Hz}, 10-\mathrm{H}_{2}\right), 4.69(1 \mathrm{H}$, d, $J 4.7$ and $14.1 \mathrm{~Hz}, 3-\mathrm{H}), 4.87\left(2 \mathrm{H}, \mathrm{ABq}, J 14.1 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{Ph}\right)$, $5.23(1 \mathrm{H}, \mathrm{s}, 1-\mathrm{H})$, and $7.39(5 \mathrm{H}, \mathrm{s}, \mathrm{Ph})$.

## Acknowledgements

We thank Dr. T. Kaneko, Bristol-Myers Co., for a generous gift of mitomycin C .
