# Preparation of Unsaturated Hydroperoxides from $\boldsymbol{N}$-Alkenyl- $\mathbf{N}^{\prime}$ - $\boldsymbol{p}$ tosylhydrazines 

A. J. Bloodworth,* J. L. Courtneidge, ${ }^{\boldsymbol{r}}$ Richard J. Curtis, ${ }^{\text {b }}$ and Michael D. Spencer ${ }^{c}$ Chemistry Department, University College London, 20 Gordon Street, London WC1H OAJ

#### Abstract

Unsaturated hydroperoxides ( $\mathrm{R}^{1} \mathrm{R}^{2} \mathrm{CHO}_{2} \mathrm{H}$ ), 2-phenylpent-4-enyl hydroperoxide (1), 3-phenylhex-5-en-2-yl hydroperoxide (2), 5-methylhex-5-en-2-yl hydroperoxide (3), cyclo-oct-4-enyl hydroperoxide (18), and cyclo-oct-3-enyl hydroperoxide (24) have each been prepared from the corresponding carbonyl compound ( $\mathrm{R}^{1} \mathrm{R}^{2} \mathrm{CO}$ ) by the sequence: i , conversion to the $p$-tosylhydrazone ( $\mathrm{R}^{1} \mathrm{R}^{2} \mathrm{C}=\mathrm{N}-\mathrm{NHTs}$ ); ii, reduction with sodium cyanoborohydride at pH 3.5 to give the $N^{\prime}-p$-tosylhydrazine ( $\mathrm{R}^{1} \mathrm{R}^{2} \mathrm{CH}-\mathrm{NH}-\mathrm{NHTs}$ ); and iii, oxidation with hydrogen peroxide and sodium peroxide. Isomerisation occurs in the preparation of the cyclo-octenyl hydroperoxides, particuarly if the pH falls markedly below 3.5 in the reduction step.

Non-allylic alkenyl hydroperoxides are principal precursors of cyclic peroxides. Studies of the cyclisations, which occur under both radical ${ }^{1-6}$ and polar ${ }^{3.5-8}$ conditions, contribute to an understanding of important processes such as lipid peroxidation and the oxidative degradation of rubber. The cyclic peroxides themselves serve as useful models for investigating the chemistry of naturally occurring substances such as prostaglandin endoperoxides. They also provide a convenient source of theoretically interesting diradicals, and have potential as intermediates in the stereocontrolled syntheses of polyoxygenated compounds. Certain $\delta, \varepsilon$-unsaturated hydroperoxides are also precursors of gem-dialkylperoxonium ions which are a new, and as yet little studied, class of oxygen transfer reagents. ${ }^{9}$

With the single exception of 2-methylhex-5-en-2-yl hydroperoxide, which was prepared by silver(1)-assisted perhydrolysis of the corresponding bromide, ${ }^{4}$ all the non-allylic alkenyl hydroperoxides reported in the literature are primary or secondary and have been made by the perhydrolysis of alkenyl methanesulphonates under basic conditions. ${ }^{1-8,10}$ We have found several examples where these reactions fail or afford hydroperoxides in only very poor yield. In an attempt to provide an alternative route to such hydroperoxides, we decided to investigate the use of the oxidation of N -alkenyl-$N^{\prime}-p$-tosylhydrazines. The method is based on that applied by Caglioti and co-workers ${ }^{11}$ to the preparation of a small number of saturated alkyl hydroperoxides (Scheme 1). This approach appears attractive in that high yields are reported for each of the three steps. However, the method has not found general use.

$$
\mathrm{R}^{1} \mathrm{R}^{2} \mathrm{C}=\mathrm{O} \xrightarrow{\text { (i) }} \mathrm{R}^{1} \mathrm{R}^{2} \mathrm{C}=\mathrm{N}-\mathrm{NHTs} \xrightarrow{\text { (ii) }} \mathrm{R}^{1} \mathrm{R}^{2} \mathrm{CH}-\mathrm{NH}-\mathrm{NHTs}
$$

$$
\xrightarrow{\text { (iii) }} \mathrm{R}^{1} \mathrm{R}^{2} \mathrm{CH}-\mathrm{OOH}
$$

Scheme 1. Reagents: i, $\mathrm{H}_{2}$ NNHTs; ii, $\mathrm{B}_{2} \mathrm{H}_{6}$; iii, $\mathrm{H}_{2} \mathrm{O}_{2}, \mathrm{Na}_{2} \mathrm{O}_{2}$.
We reasoned that in the reduction of alkenyl p-tosyl-

[^0]hydrazones (step ii), the use of diborane would be inappropriate since complications might arise from hydroboration of the alkenyl group. Certain aryl $p$-tosylhydrazones have been reduced to the corresponding $p$-tosylhydrazines by sodium cyanoborohydride at pH 3.5 (Scheme $2 ; \mathrm{R}^{1}=\mathrm{Ar}^{2} \mathrm{CHR}^{2}$ ). ${ }^{12} \mathrm{It}$ was therefore decided to modify the sequence in Scheme 1 by incorporating a cyanoborohydride reduction at step ii.

Scheme 2.

We now report the successful application of this modified sequence to the preparation of three acyclic $\delta, \varepsilon$-unsaturated hydroperoxides and two isomeric cyclo-octenyl hydroperoxides.

## Results and Discussion

Acyclic Alkenyl Hydroperoxides.-Hydroperoxides (1)-(3) were prepared. The structures were confirmed by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopy, positive peroxide test with acidic iron(II) thiocyanate, and conversion by reaction with mercury(II) nitrate and then aqueous potassium bromide into the corresponding 3-bromomercuriomethyl-1,2-dioxanes (4)-(6) (Scheme 3).

(1)

(4)

(2)

(5)

(3)

Scheme 3.

The aldehyde precursor (8) of hydroperoxide (1) was prepared as shown in Scheme 4. The overall yield of isolated hydroperoxide (1) from aldehyde (8) was $16 \%$. This seemingly poor yield must be judged by comparison with the methane-

Scheme 4.

Scheme 5.
sulphonate route from alcohol (7) which failed to give any hydroperoxide.
The ketone precursor (10) of hydroperoxide (2) was prepared as shown in Scheme 5. Although the $p$-tosylhydrazone from (10) was obtained in a yield of $55 \%$, the remainder of the sequence afforded only $8 \%$ of hydroperoxide (2). The small scale of the preparation probably contributed to this low yield which, as the result below for hydroperoxide (3) shows, is not general for secondary alkenyl hydroperoxides.

The acetoacetic ester synthesis was employed to prepare the ketone precursor (11) of the hydroperoxide (3) (Scheme 6). The yield of isolated hydroperoxide (3) based on the ketone (11) was $38 \%$.

Scheme 6.
Cyclo-octenyl Hydroperoxides.-The methanesulphonate route failed to yield any cyclo-oct-4-enyl hydroperoxide (18), but the $p$-tosylhydrazine route gave an overall yield of $40 \%$ based on cyclo-oct-4-enone (15). The complete synthetic pathway from commercially available cyclo-octa-1,5-diene is shown in Scheme 7, and the overall yield for the seven steps was $11 \%$.

Scheme 7.

In a similar way (Scheme 8), cyclo-oct-3-enyl hydroperoxide (24) was prepared from cyclo-octa-1,3-diene in an overall yield of $8 \%$, or $31 \%$ based on cyclo-oct-3-enone (21).

The structures of the cyclo-octenyl hydroperoxides (18) and (24) were confirmed by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopy, positive peroxide test with acidic iron(II) thiocyanate, elemental analysis, and non-identity with the known ${ }^{13}$ isomer, cyclo-oct-2-enyl hydroperoxide.

(18)

Careful control of the pH in the reduction step was particularly important with the cyclo-octenyl compounds, otherwise extensive rearrangement took place. Thus, in two preparations of cyclo-oct-4-enyl hydroperoxide (18) in which the pH was allowed to fall considerably below 3.5 , the isolated hydroperoxide contained 17 and $42 \%$ of cyclo-oct-3-enyl hydroperoxide (24). Even with careful control, the $p$-tosylhydrazone (22) afforded a sample of hydroperoxide (24) which contained about $5 \%$ of the isomer (18).

It is clear that the isomerisations take place in the reduction step and are favoured by strongly acidic conditions. Double bond migrations in the reduction to alkenes of $\alpha \beta$-unsaturated $p$-tosylhydrazones are well known, ${ }^{14.15}$ but the conditions are quite different and the mechanism is inapplicable to our compounds. With the observed formation of hydroperoxide (24) from $p$-tosylhydrazone (16) and of hydroperoxide (18) from $p$-tosylhydrazone (22), it is tempting to suggest the participation of a common intermediate. The aziridinium ion (26) could fulfil this role and a possible pathway for isomerisation is proposed in Scheme 9. This is consistent with the accepted mechanism of the cyanoborohydride reduction which involves initial protonation at the iminyl nitrogen of the $p$-tosylhydrazone. ${ }^{16}$ Fully fledged interconversion of the $p$-tosylhydrazones (16) and (22) would not be a requirement

Scheme 9.
since hydride attack on the ion (26) could provide both $p$-tosylhydrazine precursors of the isomeric hydroperoxides.
However, it is not clear why such a mechanism should be restricted to the cyclo-octenyl compounds. Neither is it obvious why the alternative enamine from $p$-tosylhydrazone (22), which would ultimately lead to formation of the undetected cyclo-oct-2-enyl hydroperoxide, should not be formed. An alternative pathway that may account for the apparent selectivity involves acid-catalysed isomerisation to the azohydrazine tautomer, ${ }^{17}$ followed by intramolecular abstraction by the NTs group of an allylic proton assisted by protonation at the double bond and deprotonation at $\mathrm{C}-1$. Molecular models indicate that the nitrogen atom can come into close proximity with the allylic hydrogen atoms that facilitate the observed isomerisations, but not with those of the cyclo-oct-3-enyl compound that would lead to the cyclo-oct-2-enyl product.

An investigation of the mechanism of these interesting isomerisations is planned, but for the present preparative purposes it is sufficient to know that careful control of pH in the reduction step minimises the risk of their occurrence.

## Experimental

NMR spectra were recorded with a Varian VXR400 or XL200 spectrometer for solutions in $\mathrm{CDCl}_{3}$. Mass spectra were obtained by using a VG7070 $\mathrm{F} / \mathrm{H}$ mass spectrometer plus Finnigan INCOS data system. IR spectra were measured with a Perkin-Elmer 983 instrument.

Unless otherwise indicated, all reagents were commercial samples which were used as received. Acidified iron(II) thiocyanate was prepared as described previously ${ }^{18}$ and the formation of a blood-red colour was taken as a positive test for peroxide. All hydroperoxide products were stored at $-30^{\circ} \mathrm{C}$.

Preparation of Carbonyl Compounds.-2-Phenylpent-4-enal (8). Styrene oxide ( $120.15 \mathrm{~g}, 1.0 \mathrm{~mol}$ ) in dry diethyl ether ( 200 $\mathrm{cm}^{3}$ ) was added with stirring to a freshly prepared solution of allylmagnesium bromide [from allyl bromide ( $133.08 \mathrm{~g}, 1.1 \mathrm{~mol}$ ) and magnesium ( $29.17 \mathrm{~g}, 1.20 \mathrm{~mol}$ )] in diethyl ether ( $450 \mathrm{~cm}^{3}$ ) cooled in an ice-salt bath. The mixture was set aside overnight. After standard aqueous ammonium chloride work-up, the crude product was distilled under reduced pressure to give 2-phenylpent-4-enol (7) $\left(52 \%\right.$ ), b.p. $87-90^{\circ} \mathrm{C}$ at 0.001 mmHg ; $\delta_{\mathrm{H}}$ $1.75(1 \mathrm{H}, \mathrm{s}), 2.43(2 \mathrm{H}, \mathrm{m}), 2.84(1 \mathrm{H}, \mathrm{m}), 3.68\left(1 \mathrm{H}, \mathrm{dd},{ }^{3} \mathrm{~J} 7.1\right.$ and $\left.{ }^{2} J 10.7 \mathrm{~Hz}\right), 3.73\left(1 \mathrm{H}, \mathrm{dd},{ }^{3} J 6.1\right.$ and $\left.^{2} J 10.7 \mathrm{~Hz}\right), 4.97(2 \mathrm{H}, \mathrm{m})$, $5.68(1 \mathrm{H}, \mathrm{m})$, and $7.20(5 \mathrm{H}, \mathrm{m}) ; \delta_{\mathrm{C}} 36.53,48.08,66.48,116.17$, $126.50,128.01,128.37,136.35$, and $142.35 ; v_{\max } 3372,3019$, $2919,1638,1598,1491,1448,1054,1027,914,757$, and 699 $\mathrm{cm}^{-1}$.

To a rapidly stirred suspension of pyridinium chlorochromate $(39.87 \mathrm{~g}, 185 \mathrm{mmol})$ in dry dichloromethane $\left(200 \mathrm{~cm}^{3}\right)$ was added 2-phenylpent-4-enol (7) ( $20.00 \mathrm{~g}, 123 \mathrm{mmol}$ ) in dry dichloromethane ( $20 \mathrm{~cm}^{3}$ ). After 18 h , the supernatant liquid was decanted off and the solid residue extracted with dry diethyl ether ( $3 \times 100 \mathrm{~cm}^{3}$ ). The combined dichloromethane and ether solutions were filtered through Celite and silica and the solvent removed under reduced pressure. Distillation of the crude product afforded 2-phenylpent-4-enal (8) $\left(65 \%\right.$ ) b.p. $77-78{ }^{\circ} \mathrm{C}$ at $0.3-0.4 \mathrm{mmHg} ; \delta_{\mathrm{H}} 2.50(1 \mathrm{H}, \mathrm{m}), 2.82(1 \mathrm{H}, \mathrm{m}), 3.62\left(1 \mathrm{H}, \mathrm{dt},{ }^{3} \mathrm{~J}\right.$ 1.7 and 7.3 Hz$), 5.04(2 \mathrm{H}, \mathrm{m}), 5.71(1 \mathrm{H}, \mathrm{m}), 7.36(5 \mathrm{H}, \mathrm{m})$, and $9.70\left(1 \mathrm{H}, \mathrm{d},{ }^{3} J 1.7 \mathrm{~Hz}\right.$ ); $\delta_{\mathrm{c}} 33.94,58.71,117.15,127.65,128.86$, 129.04, 134.87, 135.69, and 200.06.

3-Phenylhex-5-en-2-one (10). 2-Phenylpent-4-enal (8) (10.55 $\mathrm{g}, 65.9 \mathrm{mmol}$ ) in dry diethyl ether ( $20 \mathrm{~cm}^{3}$ ) was added slowly with stirring to a freshly prepared solution of methylmagnesium iodide [from methyl iodide ( $9.82 \mathrm{~g}, 69.2 \mathrm{mmol}$ )] in diethyl ether ( $30 \mathrm{~cm}^{3}$ ) cooled in an ice-bath. The mixture was set aside
overnight. After standard aqueous ammonium chloride workup, crude 3-phenylhex-5-en-2-ol (9) ( $96 \%$ ) was isolated.

Oxidation of $(9)(11.52 \mathrm{~g} ; 65.3 \mathrm{mmol})$ with pyridinium chlorochromate ( $21.14 \mathrm{~g}, 98 \mathrm{mmol}$ ) (see above) and distillation under reduced pressure gave 3 -phenylhex-5-en-2-one (10) ( $57 \%$ ), b.p. $64-66^{\circ} \mathrm{C}$ at $0.3 \mathrm{mmHg} ; \delta_{\mathrm{H}} 2.06(3 \mathrm{H}, \mathrm{s}), 2.46(1 \mathrm{H}, \mathrm{m}), 2.75(1 \mathrm{H}$, $\mathrm{m}), 3.70\left(1 \mathrm{H}, \mathrm{t},{ }^{3} \mathrm{~J} 7.5 \mathrm{~Hz}\right), 4.98(2 \mathrm{H}, \mathrm{m}), 5.62(1 \mathrm{H}, \mathrm{m})$, and 7.31 ( $5 \mathrm{H}, \mathrm{m}$ ); $\delta_{\mathrm{C}} 28.99,36.14,59.29,116.55,127.31,128.22,128.89$, 135.72, 138.36, and 207.39.

5-Methylhex-5-en-2-one (11). ${ }^{19}$ Ethyl acetoacetate ( 130.14 g , 1.0 mol ) was added to a solution of sodium ethoxide [from sodium ( $23.0 \mathrm{~g}, 1.0 \mathrm{~mol}$ )] in ethanol ( $600 \mathrm{~cm}^{3}$ ) and the mixture brought to reflux. 1-Chloro-2-methylpropene ( $90.55 \mathrm{~g}, 1.0 \mathrm{~mol}$ ) was added during 30 min and the mixture heated at reflux for 4 h. After cooling, the mixture was filtered and most of the ethanol was removed from the filtrate under reduced pressure. The resultant product was hydrolysed by heating with aqueous sodium hydroxide ( $120 \mathrm{~g}, 800 \mathrm{~cm}^{3}$ ) to give a distillate containing the ketone, water, and ethanol. The mixture was washed with water, dried $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right)$, and distilled under reduced pressure to give 5 -methylhex-5-en-2-one (11) $\left(42 \%\right.$ ), b.p. $60^{\circ} \mathrm{C}$ at 18 $\mathrm{mmHg} \delta_{\mathrm{H}} 1.74(3 \mathrm{H}, \mathrm{s}), 2.17(3 \mathrm{H}, \mathrm{s}), 2.28(2 \mathrm{H}, \mathrm{t}), 2.59(2 \mathrm{H}, \mathrm{t})$, $4.67(1 \mathrm{H}, \mathrm{s})$, and $4.74(1 \mathrm{H}, \mathrm{s})$.

Cyclo-oct-4-enone (15). 1-Acetoxycyclo-oct-4-ene (13) was prepared from cyclo-octa-1,5-diene by acetoxymercuriation and reduction as previously described; ${ }^{20} \delta_{\mathrm{c}} 20.70,21.85,24.37$, $25.07, \quad 33.18, \quad 33.23,74.89,129.07,129.19$, and 169.40 . Saponification was carried out by heating the acetate ( 103 g ) at reflux with aqueous potassium hydroxide ( $100 \mathrm{~g}, 100 \mathrm{~cm}^{3}$ ) for 5 h. After cooling, the mixture was extracted with dichloromethane ( $3 \times 50 \mathrm{~cm}^{3}$ ) and the extract washed with water, dried $\left(\mathrm{MgSO}_{4}\right)$, and the solvent removed under reduced pressure. Distillation under reduced pressure afforded cyclo-oct-4-enol (14) ${ }^{20}(58 \%)$, b.p. $45-52{ }^{\circ} \mathrm{C}$ at $0.1 \mathrm{mmHg} ; \delta_{\mathrm{C}} 22.73,24.89,25.49$, $36.21,37.14,72.06,129.06$, and 129.85 .

Aqueous potassium dichromate ( $104 \mathrm{~g}, 900 \mathrm{~cm}^{3}$ ) and conc. sulphuric acid ( $74.5 \mathrm{~cm}^{3}$ ) were added very slowly to a stirred solution of cyclo-oct-4-enol ( 44.7 g ) in diethyl ether ( $650 \mathrm{~cm}^{3}$ ) cooled in an ice-acetone bath, the temperature of the mixture being kept below $-1^{\circ} \mathrm{C}$. After 30 min , water ( $750 \mathrm{~cm}^{3}$ ) was added and the mixture was extracted with diethyl ether $\left(4 \times 500 \mathrm{~cm}^{3}\right)$. The combined extract was washed with water $\left(2 \times 100 \mathrm{~cm}^{3}\right)$, dried $\left(\mathrm{MgSO}_{4}\right)$, and the solvent removed under reduced pressure. Distillation under reduced pressure gave cyclo-oct-4-enone (15) ${ }^{21}\left(59 \%\right.$ ), b.p. $40-42^{\circ} \mathrm{C}$ at 0.2 mmHg ; $\delta_{\mathrm{C}}$ $21.64,23.79,26.15,40.13,47.05,130.11,130.54$, and 214.45 .

Cyclo-oct-3-enone (21). 3,4-Epoxycyclo-octene (19) was prepared by epoxidation of cyclo-octa-1,3-diene with peroxyacetic acid as described previously; ${ }^{22} \delta_{\mathrm{C}} 25.30,25.83,27.52$, $29.13,53.55,57.97,122.92$, and 134.14. The epoxide was reduced with lithium aluminium hydride as described previously ${ }^{22}$ to give cyclo-oct-3-enol ( 20 ) ( $53 \%$ from cyclo-octa-1,3-diene), which was purified by distillation under reduced pressure, b.p. $59-61^{\circ} \mathrm{C}$ at $0.2 \mathrm{mmHg} ; \delta_{\mathrm{C}} 21.37,25.68,28.34,33.97,34.84,71.91$, 126.35, and 131.97.

The alcohol was oxidised by chromic acid following the procedure described above for the isomer (15). Distillation under reduced pressure afforded cyclo-oct-3-enone (21), ${ }^{21}$ ( $48 \%$ ), b.p. $38-42^{\circ} \mathrm{C}$ at $0.3 \mathrm{mmHg} ; \delta_{\mathrm{c}} 24.55,25.61,27.03,42.11$, $44.15,124.11,131.33$, and 213.67.

Preparation of p-Tosylhydrazones. ${ }^{23}$-To a stirred suspension of $p$-tosylhydrazine in ethanol at $40-50^{\circ} \mathrm{C}$ was added 1 mol equiv. of the carbonyl compound. After 5-15 min, when all the solid had dissolved, the solution was cooled to $0^{\circ} \mathrm{C}$ and the $p$ tosylhydrazone crystallised out. The product was recrystallised from ethanol or ethanol-water and dried at 20 then 0.01 mmHg .
2-Phenylpent-4-enal p-tosylhydrazone [from (8)]. Yield
$42 \%$; m.p. $109-111^{\circ} \mathrm{C} ; \delta_{\mathrm{H}} 2.43(3 \mathrm{H}, \mathrm{s}), 2.40-2.68(2 \mathrm{H}, \mathrm{m}), 3.52(1$ $\mathrm{H}, \mathrm{m}), 4.89(2 \mathrm{H}, \mathrm{m}), 5.53(1 \mathrm{H}, \mathrm{m}), 7.00-7.32(8 \mathrm{H}, \mathrm{m}), 7.50(1 \mathrm{H}$, s), and $7.78\left(2 \mathrm{H}, \mathrm{d},{ }^{3} J 8.3 \mathrm{~Hz}\right) ; \delta_{\mathrm{c}} 21.62$, 37.03. $48.27,116.87$, 127.07, 127.99, 128.01, 128.66, 129.58, 135.06, 135.22, 139.52, 144.12, and 153.31; m/z $329\left(M^{+}+1,3.2 \%\right), 173$ (20.0), 155 (11.3), 133 (29.4), 131 (75.7), 128 (22.2), 115 (20.6), 103 (60.8), 91 (100), 77 (39.2), 51 (27.6), and 41 (57.7) (Found: C, 65.7; H, 6.15; N, 8.7. $\mathrm{C}_{18} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}$ requires $\mathrm{C}, 65.83 ; \mathrm{H}, 6.14 ; \mathrm{N}$, $8.53 \%$ ).

5-Methylhex-5-en-2-on p-tosylhydrazone [from (11)]. Yield $64 \%$; m.p. $110-11{ }^{\circ} \mathrm{C}$; $\delta_{\mathrm{H}} 1.61(3 \mathrm{H}, \mathrm{s}), 1.76(3 \mathrm{H}, \mathrm{s}), 2.14(2 \mathrm{H}$, $\mathrm{m}), 2.35(2 \mathrm{H}, \mathrm{m}), 2.43(3 \mathrm{H}, \mathrm{s}), 4.60(2 \mathrm{H}, \mathrm{m}), 7.312 \mathrm{H}, \mathrm{d},{ }^{3} \mathrm{~J} 8.5$ Hz ), $7.85\left(2 \mathrm{H}, \mathrm{d},{ }^{3} \mathrm{~J} 8.5 \mathrm{~Hz}\right.$ ), and $8.12(1 \mathrm{H}, \mathrm{br} \mathrm{s}) ; \delta_{\mathrm{c}} 15.68,21.59$, $22.23,33.84,36.86,110.42,128.05,129.44,135.46,143.85,144.47$, and 157.81; m/z $281\left(M^{+}+1,1.4 \%\right), 155(13.1), 126$ (22.9), 125 (37.7), 111 (19.9), 95 (44.9), 91 (73.8), 89 (25.7), 81 (15.9), 67 (31.1), 55 (47.9), and 41 (100) (Found: C, 60.05; H, 7.25; N, 10.1. $\mathrm{C}_{14} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}$ requires $\mathrm{C}, 59.97 ; \mathrm{H}, 7.18 ; \mathrm{N}, 9.99 \%$ ).

Cyclo-oct-4-enone p-tosylhydrazone (16). Yield $87 \%$, a $4: 1$ mixture of two geometrical isomers; m.p. $132-134{ }^{\circ} \mathrm{C}$; $\delta_{\mathrm{H}} 1.41-$ $1.51(2 \mathrm{H}, \mathrm{m}), 1.77-1.84$ and 1.94-2.00 ( $2 \mathrm{H}, \mathrm{m}$ ), 2.14-2.33 ( 6 H , $\mathrm{m}), 2.41(3 \mathrm{H}, \mathrm{s}), 5.26\left(\mathrm{dt},{ }^{3} J 8.13 \mathrm{and} 10.45 \mathrm{~Hz}\right)$ and $5.45\left(\mathrm{dt},{ }^{3} J\right.$ 7.58 and 10.45 Hz ) (major isomer), and 5.38 (dt, ${ }^{3} \mathrm{~J} 8.15$ and 10.42 Hz ) and 5.61 ( $\mathrm{dt},{ }^{3} \mathrm{~J} 8.15$ and 10.42 Hz ) (minor isomer) ( 2 H), 7.20 and $7.33(1 \mathrm{H}, \mathrm{br} \mathrm{s}), 7.28\left(2 \mathrm{H}, \mathrm{d},{ }^{3} J 8.28 \mathrm{~Hz}\right)$, and 7.80 and $7.79\left(2 \mathrm{H}, \mathrm{d},{ }^{3} \mathrm{~J} 8.28 \mathrm{~Hz}\right)$; $\delta_{\mathrm{c}}$ major isomer $21.50,21.56,23.69$, $25.77,28.48,39.44,127.86,128.05,129.49,130.07,135.73,143.75$, and 161.61 , minor isomer $21.06,22.11,25.42,27.30,31.40,34.73$, $128.34,128.75,129.49,130.07,130.76,131.01$, and 162.79 (Found: C, 61.9; H, 6.9; N, 9.55. $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}$ requires C, 61.62; H, 6.89; N, 9.58\%).

Cyclo-oct-3-enone p-tosylhydrazone (22). Yield $75 \%$, a $1: 1$ mixture of two geometrical isomers; m.p. $126-128^{\circ} \mathrm{C}$; $\delta_{\mathrm{H}} 1.4-2.0$ ( $6 \mathrm{H}, \mathrm{m}$ ), 2.25 and $2.35(2 \mathrm{H}, \mathrm{m}), 2.42(3 \mathrm{H}, \mathrm{s}), 2.93\left(\mathrm{~d},{ }^{3} J 5.2 \mathrm{~Hz}\right)$ and $\left.3.00\left(\mathrm{~d},{ }^{3} \mathrm{~J} 4.5 \mathrm{~Hz}\right), 2 \mathrm{H}\right), 5.4-5.6(2 \mathrm{H}, \mathrm{m}), 7.30\left(2 \mathrm{H}, \mathrm{d},{ }^{3} \mathrm{~J} 8.3\right.$ $\mathrm{Hz}), 7.86\left(2 \mathrm{H}, \mathrm{d},{ }^{3} \mathrm{~J} 8.3 \mathrm{~Hz}\right.$ ), and $7.8(1 \mathrm{H}, \mathrm{br} \mathrm{s})$; $\delta_{\mathrm{C}} 21.60$ (both isomers), 22.49, 24.15, 24.47 (both isomers), 27.30, 27.98, 28.35, $29.39,36.60,37.94,123.24,126.53,127.94$ (both isomers), 128.28, 129.50 (both isomers), $129.92,131.63,135.53,135.71,143.88$, 162.89, and 163.21 (Found: C, 61.45; H, 7.15; N, 9.4. $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}$ requires $\mathrm{C}, 61.62 ; \mathrm{H}, 6.89 ; \mathrm{N}, 9.58 \%$ ).

Preparation of N -Alkenyl- $\mathrm{N}^{\prime}$-p-tosylhydrazines. ${ }^{12}$-p-Tosylhydrazone ( 10 mmol ) and Bromocresol Green ( $c a .5 \mathrm{mg}$ ) were dissolved in tetrahydrofuran ( $50 \mathrm{~cm}^{3}$ ) under a gentle stream of nitrogen, the exit gases being passed through a scrubbing line consisting of three Dreschel bottles, the final two of which contained solutions of bleach. To the stirred solution was added, in one portion, sodium cyanoborohydride ( $2.51 \mathrm{~g} ; 40$ mmol ) washed in with tetrahydrofuran ( $50 \mathrm{~cm}^{3}$ ). A solution of toluene-p-sulphonic acid ( $3.8 \mathrm{~g}, 20 \mathrm{mmol}$ ) in tetrahydrofuran ( $40 \mathrm{~cm}^{3}$ ) was added in small portions so as to keep the indicator a tan colour ( pH 3.5 ). After 4 h , the reaction mixture was filtered through Celite to remove the white precipitate. The filtrate was concentrated under reduced pressure, water ( $100 \mathrm{~cm}^{3}$ ) was added, and the mixture was extracted with dichloromethane $\left(3 \times 50 \mathrm{~cm}^{3}\right)$. The extract was dried $\left(\mathrm{MgSO}_{4}\right)$ and the solvent
removed under reduced pressure to afford the crude $N$-alkenyl-$N^{\prime}$-p-tosylhydrazine as a yellow oil.

N -(2-Phenylpent-4-enyl)- N '-p-tosylhydrazine. $\delta_{\mathrm{C}} 21.25,38.09$, $43.36,56.21,116.17,127.44,127.75,128.33,129.41,134.38$, 135.60, 144.81, and 143.96 .

N -(5-Methylhex-5-en-2-yl)-N'-p-tosylhydrazine. $\delta_{\mathrm{C}}$ 18.23, $21.37,22.26,32.17,33.65,54.91,109.64,128.00,129.28,135.18$, 143.58, and 145.28.

N -(Cyclo-oct-4-enyl)- $\mathrm{N}^{\prime}$-p-tosylhydrazine (17). $\delta_{\mathrm{C}} 21.50,23.29$, $25.86,26.25,31.54,32.96,60.12,129.48,129.58,129.67,129.94$, 135.98, and 143.61.

N -(Cyclo-oct-3-enyl)- $\mathrm{N}^{\prime}$-p-tosylhydrazine (23). $\delta_{\mathrm{C}} 21.51,22.21$, 25.84, 28.73, 28.91, 29.75, 60.59, 126.81, 128.09, 129.40, 131.74, 135.41, and 143.61 .

In earlier experiments, the reduction of $p$-tosylhydrazone (16) by sodium borohydride under various conditions was examined. This gave inferior yields to the sodium cyanoborohydride method (above), but an analytically pure sample of the $p$-tosylhydrazine (17) was isolated as follows.

Sodium borohydride ( 1.14 g ) was added with stirring to an ice-cold solution of p-tosylhydrazone (16) $(1.00 \mathrm{~g})$ in dichloromethane ( $40 \mathrm{~cm}^{3}$ ) followed by cautious addition of methanol ( $10 \mathrm{~cm}^{3}$ ). After stirring for 2 h , water $\left(50 \mathrm{~cm}^{3}\right)$ was added and the layers separated. The aqueous layer was extracted with dichloromethane ( $3 \times 10 \mathrm{~cm}^{3}$ ). The combined dichloromethane extracts were washed with water $\left(50 \mathrm{~cm}^{3}\right)$, dried $\left(\mathrm{MgSO}_{4}\right)$, and the solvent was removed at 10 mmHg and $30^{\circ} \mathrm{C}$. The crude product was recrystallised twice from absolute ethanol to give N -(cyclo-oct-4-enyl)- $\mathrm{N}^{\prime}$-p-tosylhydrazine (17) as a white crystalline solid, m.p. $87-89^{\circ} \mathrm{C}$ (Found: C, $60.9 ; \mathrm{H}$, $7.5 ; \mathrm{N}, 9.55 . \mathrm{C}_{15} \mathrm{H}_{22} \mathrm{~N}_{2} \mathrm{O}_{2} \mathrm{~S}$ requires $\mathrm{C}, 61.18 ; \mathrm{H}, 7.55 ; \mathrm{N}$, $9.52 \%$ ).

Preparation of Hydroperoxides. ${ }^{11}$-To a stirred solution of crude $N$-alkenyl- $N^{\prime}$ - $p$-tosylhydrazine ( 7.5 mmol ) in tetrahydrofuran ( $100 \mathrm{~cm}^{3}$ ) cooled in an ice-bath was added $30 \%$ aqueous hydrogen peroxide ( $80 \mathrm{~cm}^{3}, c a .750 \mathrm{mmol}$ ) and sodium peroxide $(0.88 \mathrm{~g}, 11 \mathrm{mmol})$. The mixture was stirred for 24 h at room temperature, then water ( $200 \mathrm{~cm}^{3}$ ) was added. The solution was neutralised with 2 m hydrochloric acid and extracted with dichloromethane ( $3 \times 75 \mathrm{~cm}^{3}$ ). (Ammonium chloride was added if an emulsion was formed.) The combined extracts were dried $\left(\mathrm{MgSO}_{4}\right)$ and the solvent was removed under reduced pressure to afford the crude hydroperoxide.

The crude hydroperoxide was dissolved in light petroleum (b.p. $\leqslant 40^{\circ} \mathrm{C} ; 20 \mathrm{~cm}^{3}$ ), cooled to $0^{\circ} \mathrm{C}$, and extracted with icecold 4 m sodium hydroxide ( $5 \times 10 \mathrm{~cm}^{3}$ ). The combined aqueous extracts were washed with light petroleum (b.p. $\leqslant 40^{\circ} \mathrm{C} ; 2 \times 10 \mathrm{~cm}^{3}$ ), mixed with dichloromethane ( $20 \mathrm{~cm}^{3}$ ), and neutralised with ice-cold 2 m hydrochloric acid, the temperature being kept below $5^{\circ} \mathrm{C}$. The mixture was extracted with dichloromethane ( $3 \times 20 \mathrm{~cm}^{3}$ ). The combined extracts were washed with water $\left(10 \mathrm{~cm}^{3}\right)$, dried $\left(\mathrm{MgSO}_{4}\right)$, and the solvent was removed under reduced pressure to give the hydroperoxide. Yields are overall from p-tosylhydrazone.

2-Phenylpent-4-enyl hydroperoxide (1). Yield $39 \% ; \delta_{\mathrm{H}} 2.45$ $2 \mathrm{H}, \mathrm{m}), 3.13(1 \mathrm{H}, \mathrm{m}), 4.15\left(1 \mathrm{H}, \mathrm{d},{ }^{3} \mathrm{~J} 6.9 \mathrm{~Hz}\right), 4.19\left(1 \mathrm{H}, \mathrm{d}^{3} \mathrm{~J} 7.0\right.$ Hz ), $5.06(2 \mathrm{H}, \mathrm{m}), 5.69(1 \mathrm{H}, \mathrm{m}), 7.30(5 \mathrm{H}, \mathrm{m})$, and $8.05(1 \mathrm{H}, \mathrm{s})$; $\delta_{\mathrm{C}} 36.92,43.71,80.42,116.48,126.59,127.88,128.40,136.00$, and 141.66.

3-Phenylhex-5-en-2-yl hydroperoxide (2). The compound was further purified by column chromatography [Merck Kieselgel $60,70-230$ mesh, $0.063-0.20 \mathrm{~mm} ; 30 \%$ diethyl ether in light petroleum (b.p. $60-80^{\circ} \mathrm{C}$ )]. Yield $8 \%$, a $1: 1$ mixture of two diastereoisomers; $\delta_{\mathrm{H}} 1.06$ (d, ${ }^{3} J 6.3 \mathrm{~Hz}$ ) and $1.18\left(\mathrm{~d},{ }^{3} J 6.4 \mathrm{~Hz}\right)$ ( 3 H ), $2.55(2 \mathrm{H}, \mathrm{m}), 2.94(1 \mathrm{H}, \mathrm{m}), 4.22(1 \mathrm{H}, \mathrm{m}), 5.06(2 \mathrm{H}, \mathrm{m})$, $5.60(1 \mathrm{H}, \mathrm{m}), 7.28(5 \mathrm{H}, \mathrm{m})$, and $7.74(1 \mathrm{H}, \mathrm{br} \mathrm{s}) ; \delta_{\mathrm{C}} 15.26,15.94$, $34.41,36.25,48.84,48.92,84.37,84.53,116.17,116.32,126.26$,
$126.54,128.26,128.26,128.51,128.69,136.59,136.66,140.65$, and 140.88 .

5-Methylhex-5-en-2-yl hydroperoxide (3). Yield $59 \% ; \delta_{\mathrm{H}} 1.25$ ( $3 \mathrm{H}, \mathrm{d},{ }^{3} \mathrm{~J} 6.1 \mathrm{~Hz}$ ), 1.5-1.9 ( $2 \mathrm{H}, \mathrm{m}$ ), $1.74(3 \mathrm{H}, \mathrm{s}), 2.09(2 \mathrm{H}, \mathrm{m})$, $4.08(1 \mathrm{H}, \mathrm{m}), 4.73(2 \mathrm{H}, \mathrm{m})$, and $8.1(1 \mathrm{H}, \mathrm{br} \mathrm{s}) ; \delta_{\mathrm{C}} 18.11,22.45$, $31.91,33.41,81.19,110.00$, and 145.44 .

Cyclo-oct-4-enyl hydroperoxide (18). Yield $46 \% ; \delta_{\mathrm{H}} 1.5-2.4$ $(10 \mathrm{H}, \mathrm{m}), 4.00(1 \mathrm{H}, \mathrm{m}), 5.66(2 \mathrm{H}, \mathrm{m})$, and $81.3(1 \mathrm{H}, \mathrm{br} \mathrm{s}) ; \delta_{\mathrm{C}}$ $22.24,25.30,25.67,31.61,31.77,86.85,129.76$, and 129.84. An analytically pure sample was obtained by trap-to-trap distillation (Found: C, 67.3; $\mathrm{H}, 9.8 . \mathrm{C}_{8} \mathrm{H}_{14} \mathrm{O}_{2}$ requires $\mathrm{C}, 67.56 ; \mathrm{H}$, $9.94 \%$ ).

Cyclo-oct-3-enyl hydroperoxide (24). Yield $41 \% ; \delta_{\mathbf{H}}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$ 1.3-1.85 (6 H, m), 2.0-2.25 (2 H, m), 2.3-2.5 ( $2 \mathrm{H}, \mathrm{m}$ ), $4.00(1 \mathrm{H}$, $\mathrm{m}), 6.55-6.8(2 \mathrm{H}, \mathrm{m})$, and $8.1(1 \mathrm{H}, \mathrm{br} \mathrm{s}) ; \delta_{\mathrm{C}} 21.46,25.81,28.38$, $28.80,29.13,85.67,125.67$, and 132.45. An analytically pure sample was isolated by HPLC $\left[5 \mu \mathrm{~m} \mathrm{SiO}_{2}, 50 \times 4.6 \mathrm{~mm}+\right.$ $250 \times 10 \mathrm{~mm}+250 \times 10 \mathrm{~mm}, 10 \%$ diethyl ether in light petroleum (b.p. $60-80^{\circ} \mathrm{C}$ )] from a mixture containing $58 \%$ of isomer (18), which was obtained by oxidation of the $N$-cyclo-octenyl- $N^{\prime}$-p-tosylhydrazine formed from $p$-tosylhydrazone (16) when all the toluene-p-sulphonic acid was added and the pH fell considerably below 3.5 during reduction (Found: $\mathrm{C}, 67.7 ; \mathrm{H}$, $10.15 . \mathrm{C}_{8} \mathrm{H}_{14} \mathrm{O}_{2}$ requires $\mathrm{C}, 67.56 ; \mathrm{H}, 9.94 \%$ ).

Preparation of 3-Bromomercuriomethyl Substituted 1,2-Dioxanes. ${ }^{7}$-A solution of the alkenyl hydroperoxide ( 2.8 mmol ) in dichloromethane ( $30 \mathrm{~cm}^{3}$ ) was added dropwise over 15 min to a stirred suspension of mercury(iI) nitrate hemihydrate $(0.98 \mathrm{~g}$, 2.95 mmol ) in dichloromethane ( $70 \mathrm{~cm}^{3}$ ) under nitrogen. The mixture was stirred for 15 min , then most of the supernatant liquid was decanted off. Water $\left(20 \mathrm{~cm}^{3}\right)$ then potassium bromide $(0.37 \mathrm{~g}, 3.1 \mathrm{mmol})$ were added and the mixture was stirred for $c a .10 \mathrm{~min}$ until the white precipitate had disappeared from the aqueous phase. The dichloromethane layer was isolated and combined with a further dichloromethane extract ( $20 \mathrm{~cm}^{3}$ ) of the aqueous layer. The dichloromethane solution was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and the solvent removed under reduced pressure to give the crude 1,2 -dioxane which was purified by column chromatography (Merck Kieselgel 60, 70-230 mesh, $0.063-0.20 \mathrm{~mm}$; dichloromethane).

3-Bromomercuriomethyl-5-phenyl-1,2-dioxane (4). Yield 75\%, a 3: 1 mixture of two diastereoisomers; $\delta_{\mathrm{H}} 1.6-2.3(4 \mathrm{H}, \mathrm{m}), 3.23$ $(1 \mathrm{H}, \mathrm{m}), 4.21(\mathrm{~d}, J 8.3 \mathrm{~Hz})$ and $4.46(\mathrm{~m})(2 \mathrm{H}), 4.74(1 \mathrm{H}, \mathrm{m})$, and $7.36(5 \mathrm{H}, \mathrm{m}) ; \delta_{\mathrm{C}}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right)$ major isomer (cis) $37.51\left[J\left({ }^{199} \mathrm{Hg}\right)\right.$ $1522 \mathrm{~Hz}], 40.35,41.63\left[J\left({ }^{199} \mathrm{Hg}\right) 29 \mathrm{~Hz}\right], 77.15,80.47\left[J\left({ }^{199} \mathrm{Hg}\right)\right.$ $108 \mathrm{~Hz}], 127.36,127.62,128.98$, and 140.66 ; minor isomer (trans) 76.22, 77.45, 126.89, 128.16, and 128.80 (Found: C, 28.6; H, 2.65. $\mathrm{C}_{11} \mathrm{H}_{13} \mathrm{BrHgO}_{2}$ requires $\mathrm{C}, 28.87 ; \mathrm{H}, 2.86 \%$ ).

3-Bromomercuriomethyl-6-methyl-5-phenyl-1,2-dioxane (5). Yield 70\%, a 7:5:5:3 mixture of four diastereoisomers; $\delta_{H} 0.96$ $\left(\mathrm{d},{ }^{3} J 6.3 \mathrm{~Hz}\right)$ and $1.03\left(\mathrm{~d},{ }^{3} J 6.8 \mathrm{~Hz}\right)$ and $1.08\left(\mathrm{~d},{ }^{3} J 6.4 \mathrm{~Hz}\right)$ and $1.14\left(\mathrm{~d},{ }^{3} J 6.6 \mathrm{~Hz}\right)(3 \mathrm{H}), 1.6-3.0(5 \mathrm{H}, \mathrm{m}), 3.5-5.0(2 \mathrm{H}, \mathrm{m})$, and $7.31(5 \mathrm{H}, \mathrm{m}) ; \delta_{\mathrm{c}} 12.58,16.09,16.41,16.93,32.62,36.75,37.13$, $37.29,37.43,37.59,40.38,41.83,42.93,43.03,43.29,48.83,75.22$, $78.39,79.53,79.59,80.00,80.18,81.38,81.88,126.57,126.86$, 127.02, 127.40, 127.67, 127.78, 128.37, 128.59, 128.74, 129.39, $140.18,140.98$, and 141.19 (Found: C, $30.1 ; \mathrm{H}, 3.1 . \mathrm{C}_{12} \mathrm{H}_{15} \mathrm{Br}-$ $\mathrm{HgO}_{2}$ requires $\mathrm{C}, 30.55 ; \mathrm{H}, 3.20 \%$ ).

3-Bromomercuriomethyl-3,6-dimethyl-1,2-dioxane (6). Yield $45 \%$, a $1: 1$ mixture of two diastereoisomers; $\delta_{H} 1.15$ (d, ${ }^{3} J 6.4$ $\mathrm{Hz})$ and $1.20\left(\mathrm{~d},{ }^{3} J 6.4 \mathrm{~Hz}\right)(3 \mathrm{H}), 1.31(\mathrm{~s})$ and $1.46(\mathrm{~s})(3 \mathrm{H}), 1.72$ $(4 \mathrm{H}, \mathrm{m}), 2.11\left(\mathrm{~d},{ }^{2} J 12.1 \mathrm{~Hz}\right)$ and $2.53(\mathrm{~d})\left[{ }^{2} J\left({ }^{199} \mathrm{Hg}\right) 206 \mathrm{~Hz}\right]$ and 2.15 and $2.18\left(\mathrm{AB},{ }^{2} J 11.7 \mathrm{~Hz}\right)\left[{ }^{2} J\left({ }^{199} \mathrm{Hg}\right) 194 \mathrm{~Hz}\right](2 \mathrm{H})$, and $4.22(1 \mathrm{H}, \mathrm{m}) ; \delta_{\mathrm{C}} 18.55,18.72,24.59,28.09,28.52,29.67$, $34.67,36.38,43.1\left[J\left({ }^{199} \mathrm{Hg}\right) 1500 \mathrm{~Hz}\right], 47.05\left[J\left({ }^{199} \mathrm{Hg}\right) 1489\right.$ $\mathrm{Hz}], 76.94,76.94,80.34\left[J\left({ }^{199} \mathrm{Hg}\right) 95 \mathrm{~Hz}\right]$, and $80.50\left[J\left({ }^{199} \mathrm{Hg}\right)\right.$ 105 Hz ] (Found: $\mathrm{C}, 20.4 ; \mathrm{H}, 3.2 . \mathrm{C}_{7} \mathrm{H}_{13} \mathrm{BrHgO}_{2}$ requires C , 20.52; H, 3.20\%).

## Acknowledgements

We thank Dr. T. Melvin for carrying out exploratory work which led us to incorporate sodium cyanoborohydride reduction into the overall method. Financial support by the SERC and by Interox Chemicals Ltd. is gratefully acknowledged.
