# Polyfunctional Bicyclo[6.3.0]undecane Intermediates 

Alan P. Chorlton, Gareth A. Morris and James K. Sutherland *<br>Chemistry Department, Victoria University of Manchester, M13 9PL, UK

On thermolysis, 2-hydroxy-1-isopropyl-2-vinylbicyclo[4.3.0]non-6-en-8-one 18 undergoes oxy-Cope rearrangement followed by an 'ene' reaction to give 5 -hydroxy-11-isopropyl-8-methyltricyclo[6.3.0.0 ${ }^{1,5}$ ] undec-10-ene-9-one 21 , which is cleaved by $\mathrm{Pb}(\mathrm{OAc})_{4}-\mathrm{I}_{2}$ to 11 -isopropyl-8-methylbicyclo[6.3.0] undeca-1,10-diene-5,9-dione 23. Aspects of the chemistry of the dione are explored.

In connection with a synthetic project we needed to prepare a number of polyfunctional bicyclo[6.3.0]undecane derivatives. In recent years a variety of routes to such compounds have been explored. ${ }^{1}$ We chose to investigate the oxy-Cope rearrangement ${ }^{2}$ (anionic or thermal) to generate the 8 -membered ring, as some close analogues had been reported previously. ${ }^{3.4}$ To this end, efficient routes to the diones $\mathbf{1}$ and $\mathbf{2}$ were required.

Isopropylation of 1,5-dimethoxycyclohexa-1,4-diene ${ }^{5}$ followed by hydrolysis gave the dione 3. Attempts to alkylate the intermediate dione with allyl bromide or ethyl bromoacetate were unsuccessful, but the dione $\mathbf{3}$ could be allylated using allyl acetate- $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$-diazabicycloundecene ${ }^{6}$ to form the alkene $4(76 \%)$. Oxidation of the alkene 4 with $\mathrm{OsO}_{4}-\mathrm{NaIO}_{4}$ gave the aldehyde $5(84 \%)$ which was converted into the acid $6(91 \%)$ with $\mathrm{CrO}_{3}-\mathrm{AcOH}-\mathrm{H}_{2} \mathrm{O}$. Reaction of the acid 6 with $\mathrm{Ac}_{2} \mathrm{O}-$ NaOAc formed the enol lactone $13(87 \%)$. In the Dauben route ${ }^{4}$ to the methylated series the ketonic carbonyl was protected as the ethylene acetal and then treated with $\mathrm{LiCH}_{2} \mathrm{PO}(\mathrm{OEt})_{3}$.

Presumably due to increased steric hindrance in the isopropyl series we were unable to prepare an acetal; in the hope that this hindrance would prevent reaction at the ketone, the lactone 13 was treated with $\mathrm{LiCH}_{2} \mathrm{PO}(\mathrm{OEt})_{3}$. The enone 1 was obtained but in only $24 \%$ yield and was accompanied by the ethyl ester 7 $(23 \%)$; reaction with $\mathrm{LiCH}(\mathrm{Me}) \mathrm{PO}(\mathrm{OEt})_{3}$ gave only the ester ( $45 \%$ ).

With this failure to exploit a common intermediate for the synthesis of the enones 1 and 2 we examined some individual approaches. Reaction of the dione 4 with $\mathrm{PdCl}_{2}-\mathrm{CuCl}_{2}-\mathrm{O}_{2}{ }^{7}$ gave the trione $8(87 \%)$. As expected from related work, aldol cyclisation was difficult to achieve; indeed the conditions successful in the methylated series (KF, 18-crown-6, xylene) failed with the isopropyl compound. Trost overcame such a problem by use of the intramolecular Wittig reaction. ${ }^{4}$ We were unable to prepare the required $\alpha$-bromo ketone 9 by direct bromination, but reaction of the alkene 4 with $N$-bromosuccinimide (NBS)- $\mathrm{Me}_{2} \mathrm{SO}-\mathrm{H}_{2} \mathrm{O}$ gave a bromohydrin which was oxidised with Jones' reagent to the ketone $9(60 \%)$. Reaction of the bromide with $\mathrm{Ph}_{3} \mathrm{P}-\mathrm{PhH}$ effected only debromination. However it had been shown ${ }^{8}$ that with $\mathrm{PhCOCH}_{2} \mathrm{Br}$, debromination can be dramatically reduced and
the yield of phosphonium salt increased (from 3 to $92 \%$ ) by the presence of a catalytic amount of $\mathrm{Et}_{3} \mathrm{~N}$. When the bromide 9 was heated with $\mathrm{Ph}_{3} \mathrm{P}-\mathrm{PhMe}$ containing $5 \mathrm{~mol} \% \mathrm{Et}_{3} \mathrm{~N}$ the trione $8(18 \%)$ and enone $1(10 \%)$ were formed and $60 \%$ of bromide recovered; increasing the $\mathrm{Et}_{3} \mathrm{~N}$ to 1.5 mol gave the enone in $86 \%$ yield. In an attempt to prepare the homologue 2 by a similar route, the dione 3 was butenylated to give the alkene 10 ( $30 \%$ from but-2-enyl acetate, $48 \%$ from but-2-enyl ethyl carbonate). The alkene 10 reacted regiospecifically with NBS$\mathrm{Me}_{2} \mathrm{SO}-\mathrm{H}_{2} \mathrm{O}$ to give the bromohydrin which was oxidised to the ketone 11 [ $\delta_{\mathrm{H}} 1.7(3 \mathrm{H}, \mathrm{d}, \mathrm{J} / \mathrm{Hz} 7]$. The high regioselectivity of the addition may be accounted for by neighbouring group participation of a carbonyl oxygen in the favoured 5-exo mode. Reaction of the bromo ketone with $\mathrm{Ph}_{3} \mathrm{P}-\mathrm{PhH}-\mathrm{Et}_{3} \mathrm{~N}$ brought about debromination to the ketone 12 .
The homologous ketone $\mathbf{2}$ was prepared using the annulation method developed by Yoshikoshi; ${ }^{9}$ reaction of the dione 3 with 2 -nitrobut-1-ene in boiling xylene containing KF gave the trione $12(91 \%)$ which on extended reaction with $\mathrm{NaH}-\mathrm{PhH}$ using vibro-mixing formed the dione $2(61 \%)$. This five-step route allows the preparation of $c a .30 \mathrm{~g}$ batches in an overall yield of $31 \%$. The dione 1 can also be prepared efficiently by this method. As expected, selective nucleophilic attack on the cyclohexanone carbonyl of the enedione 2 was possible with $\mathrm{NaBH}_{4}$ to give the alcohol showing $\delta_{\mathrm{H}} 3.52(1 \mathrm{H}, \mathrm{dd}, \mathrm{J} / \mathrm{Hz} 7$ and 2 ), in accord with bonding on the $\alpha$ face of the molecule; however neither of the enediones 1 or 2 reacted with vinylmagnesium bromide, presumably due to steric hindrance. The sterically less hindered lithium trimethylsilylethyne gave the adducts 14 and 15 from 1 and 2 respectively in excellent yields. The stereochemistry depicted is assumed on the basis of attack on the least hindered face of the molecule and has not been proven.

It would be advantageous if the oxy-Cope rearrangement could be effected on the silylalkyne 15 or on the alkyne 17 , since additional functionality would be introduced. To this end the reaction mixture from the acetylene addition to the dione 2 was allowed to stand at $25^{\circ} \mathrm{C}$ for 30 min instead of being quenched at $15^{\circ} \mathrm{C}$; however a mixture of at least six products was formed.

Reaction of 15 with KF and 18-crown-6 brought about desilylation, which could have been achieved more simply using $\mathrm{Bu}_{4} \mathrm{NF}-\mathrm{THF}$ (tetrahydrofuran). Attempts to bring about rearrangement of 17 thermally or with KH led to mixtures of products. Lindlar reduction of the alkynes 16 and 17 gave the alkenes 18 and 19 , which were recovered after exposure to $\mathrm{KH}-$ THF at $25^{\circ} \mathrm{C}$; on boiling, mixtures of products were formed similar to these obtained on reaction with KH and 18 -crown- 6 in THF at $0^{\circ} \mathrm{C}$. Reaction of the alkene 18 with $\mathrm{KOH}-\mathrm{MeOH}$ at $65^{\circ} \mathrm{C}$ gave the tricycle $20\left[40 \% ; v_{\max } / \mathrm{cm}^{-1} 3350,1710\right.$ and 1620 ; $\delta_{\mathrm{H}} 6.08(1 \mathrm{H}, \mathrm{s}), 2.8(1 \mathrm{H}, \mathrm{sep}, J / \mathrm{Hz} 7), 1.20(3 \mathrm{H}, \mathrm{d}, J / \mathrm{Hz} 7)$ and 1.18 ( $3 \mathrm{H}, \mathrm{d}, J / \mathrm{Hz} 7$ ]. The $\lambda_{\max } / \mathrm{nm}$ of 245 did not agree with the calculated value (226) and may be due to interaction of the hydroxy group with the enone unit. When the alkene 18 was heated in $\mathrm{O}\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}\right)_{2}$ the tricycle 20 was formed $(50 \%)$, along with the enedione $22\left(30 \% ; v_{\max } / \mathrm{cm}^{-1} 1705\right.$ and 1615 ; $\lambda_{\text {max }} / \mathrm{nm} 240$ ). Reduction of the enedione 22 with $\mathrm{H}_{2}-\mathrm{Pd}$ gave the dihydro product ( $v_{\text {max }} / \mathrm{cm}^{-1} 1750$ and 1705), and reaction of 22 with $\mathrm{KOH}-\mathrm{MeOH}$ effected a quantitative conversion into the tricycle 20. From these results it is apparent that rearrangement can only be achieved under conditions where the initial product is thermally unstable, forming the tricycle $\mathbf{2 0}$ by aldol (or 'ene') reaction and the conjugated ketone 22 by prototropic migration. Reaction of the homologue 19 with $\mathrm{KH}-$ THF gave $5 \%$ of the tricycle $21\left[\lambda_{\text {max }} / \mathrm{nm} 246 ; v_{\text {max }} / \mathrm{cm}^{-1} 3500\right.$, 1700 and $1640 ; \delta_{\mathrm{H}} 6.1(1 \mathrm{H}, \mathrm{s}), 2.8(1 \mathrm{H}$, sep, $J / \mathrm{Hz} 7), 1.2(3 \mathrm{H}, \mathrm{d}$, $J / \mathrm{Hz} 7), 1.1(3 \mathrm{H}, \mathrm{d}, J / \mathrm{Hz} 7)$ and $1.0(3 \mathrm{H}, \mathrm{s})$ ]. Attempts to trap the intermediate with $\mathrm{Me}_{3} \mathrm{SiCl}$ were unsuccessful. On heating the alcohol 19 in $\mathrm{O}\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{OH}\right)_{2}$ an $86 \%$ yield of the tricycle 21 was obtained.

28; $R^{4}=B r, R^{6}=H, X=O$

Since the tricycle 21 was readily available, we examined its conversion into a bicyclo[6.3.0] undecane derivative. To effect this by a conventional retro-aldol reaction was implausible but generation of an alkoxy radical which could fragment to an 8 -membered ring seemed possible. To this purpose the alcohol 21 was treated with $\mathrm{Pb}(\mathrm{OAc})_{4}-\mathrm{I}_{2}-\mathrm{PhH},{ }^{10}$ which resulted in formation of the diene $23(86 \%)\left(v_{\text {max }} / \mathrm{cm}^{-1} 1703\right.$ and 1692; $\lambda_{\text {max }} / \mathrm{nm} 278$ ).
To confirm the structure and obtain information on conformation relevant to the chemistry of the molecule an extensive NMR analysis was carried out. The protons of the 8 -membered ring divide into two groups of 4 - and 5 -spins respectively; the analysis of the comparatively weakly coupled 4 spin group is straightforward. The 5 -spin group poses two problems: the very strong coupling between the protons $3-\mathrm{H}$ and $4-\mathrm{H}$, and the near-exact degeneracy between $4-\mathrm{H}$ and the isopropyl methine. The programme DAVSYM2, ${ }^{11}$ which fits to the complete spectral bandshape and hence does not require the assignment of individual lines, was used to refine the parameters for the 4 -spin group and to analyse the 5 -spin ABCDX system.
A well-digitised proton spectrum of $\mathbf{2 3}$ was edited to remove sections of baseline, a calculated isopropyl CH multiplet was

Fig. 1 a Simulated isopropyl $\mathbf{C H}$ multiplet at 2.75 ppm ; b and c simulated spectra of the 4 -spin ( 5 -ring) and 5 -spin ( 8 -ring) systems respectively, after refinement with DAVSYM2; and d high field region of the experimental $300 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR spectrum of 19 , to which subspectra $b$ and $c$ were fitted

Fig. 2 Computed model of 23 using CHARMe programme

Fig. $3 \delta$ and $J$ values for 4- and 5-spin systems
substracted at 2.75 ppm , and the resultant 8 sections of spectrum were transferred to a Cyber 176 mainframe. Convergence of DAVSYM2 for the 5 -spin system was critically dependent on starting parameters; some 50 runs, typically of 1 $\min$ duration, were needed before a satisfactory fit was obtained. Final agreement factors ' R ' were 2.2 and $3.9 \%$ respectively for the 4 - and 5 -spin systems; the latter figure is particularly gratifying given the uncertainties involved in subtracting the overlapping isopropyl multiplet. The simulated component parts of the high field region of the proton spectrum of 29 may be compared with the experimental spectrum in Fig. 1. In Fig. 3 the $J^{1,3}$ values revealed by the simulation are compared with the dihedral angles derived from an energy minimised model (Fig. 2 ) of the diene $\mathbf{2 3}$ produced by the CHARMe programme on a

Fig. 4 Torsion angles from CHARMe calculation. $\alpha, \beta$ Refers to orientation relative to angular methyl.

Silicon Graphics IRIS-4D workstation. The dihedral angles of the model (Fig. 3) are consistent with the $J_{.}^{3}$ values and in particular show that one hydrogen is antiperiplanar to two vicinal hydrogens.

The model suggested that proton removal to form enolate and its reaction with electrophiles should both occur from the $\beta$ face of the molecule. Modelling of the alkene isomers corresponding to the regioisomeric enolates showed the 6 -ene to be marginally more stable ( 1 kcal )* than the 4 -ene, but the difference is probably too small to be significant. In the event, reaction of the dione 23 with $\mathrm{LiNPr}{ }_{2}{ }_{2}-\mathrm{THF}$ followed by quenching with $\mathrm{D}_{2} \mathrm{O}$ gave $>75 \%$ of a monodeuterio compound 25; from the NMR spectrum it was apparent that the signal at $\delta$ 2.92 was no longer present and that the signal at $\delta 1.59$ was now a broadened doublet indicating $6-\mathrm{H}$ abstraction and deuteriation from the $\beta$ face. This enolate did not react with MeI; however when an enolate was generated using $\operatorname{LiNPr}^{\mathrm{i}}{ }_{2}-\mathrm{THF}-$ $\mathrm{PO}\left(\mathrm{NMe}_{2}\right)_{3}$ and treated with MeI, an 8:2 mixture [capillary $\mathrm{GC}(\mathrm{CGC})]$ of monomethyl derivatives was formed. To our surprise the major product was apparently the 4-methyl isomer 26, since the 4 -spin system was intact and the signal at $\delta 2.75 \mathrm{had}$ disappeared. We were unable to determine whether the minor isomer was a stereo- or a regio-isomer; the latter is strongly indicated by reaction of the enolate with $\mathrm{Bu}^{1} \mathrm{Me}_{2} \mathrm{SiCl}$ forming an 8:2 mixture (CGC) of enol ethers. Generation of an enolate using $\mathrm{LiN}\left(\mathrm{SiMe}_{3}\right)_{2}-\mathrm{THF}-\mathrm{PO}\left(\mathrm{NMe}_{2}\right)_{3}$ followed by methylation reversed the isomer ratios giving the 6 -methyl compound 27 as the predominant isomer. It is difficult to rationalise these results, but they do afford opportunities for some selective reactions at both C-4 and C-6. Bromination of the LiNPr ${ }_{2}{ }_{2}$-derived enolate gave the 4 -bromo compound 28 which was converted into the triene 29 on reaction with DBU (1,8-diazabicyclo[5.4.0]undec7 -ene) in $\mathrm{Me}_{2} \mathrm{NCHO}$. Attempts to prepare the deconjugated diene by reduction of the triene 29 led to the tricycle 31.

However, reduction of the triene 29 with $\mathrm{NaBH}_{4}$ formed the alcohol 30, which on reduction with $\mathrm{Li}-\mathrm{NH}_{3}$ gave the diene 32 . On treatment with base the diene 32 was converted into the conjugated isomer identical with the product obtained from $\mathrm{NaBH}_{4}$ reduction of the dione 23. A variety of attempts to prepare a triene from the 4 -methyl ketone 24 were unsuccessful.

## Experimental

Light petroleum refers to the fraction b.p. $60-80^{\circ} \mathrm{C}$. Extracts were dried using $\mathrm{Na}_{2} \mathrm{SO}_{4}$. NMR spectra were measured in

[^0]$\mathrm{CDCl}_{3}$ at $300 \mathrm{MHz}, J$ values are given in Hz . IR spectra were measured in $\mathrm{CHCl}_{3}$ and UV spectra in EtOH .

2-Allyl-2-isopropylcyclohexane-1,3-dione 4.-2-Isopropyl-cyclohexane-1,3-dione ( 3 g ) and $\operatorname{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(0.6 \mathrm{~g})$ were dissolved in THF ( $75 \mathrm{~cm}^{3}$ ) and DBU ( $3.05 \mathrm{~cm}^{3}$ ) and allyl acetate $(2.33 \mathrm{~g})$ were added. The reaction mixture was stirred for 24 h in the dark. Most of the THF was removed under reduced pressure and the concentrated solution was purified by flash chromatography (light petroleum $-\mathrm{Et}_{2} \mathrm{O}$ ) (6:1) to give the dione $\mathbf{4}$ as a colourless oil ( 2.88 g ); $v_{\text {max }} / \mathrm{cm}^{-1} 1725$ and 1680 (Found: M ${ }^{+}$, 194.1307. $\mathrm{C}_{12} \mathrm{H}_{18} \mathrm{O}_{2}$ requires $M, 194.1307$ ).

2-Formylmethyl-2-isopropylcyclohexane-1,3-dione 5.-Finely powdered $\mathrm{NaIO}_{4}(2.87 \mathrm{~g})$ was added to the dione $4(1.3 \mathrm{~g}), \mathrm{Et}_{2} \mathrm{O}$ $\left(18 \mathrm{~cm}^{3}\right)$, water $\left(18 \mathrm{~cm}^{3}\right)$ and $\mathrm{OsO}_{4}(85 \mathrm{mg})$ over 45 min with continuous stirring. After 12 h the mixture was extracted with EtOAc. The combined extracts were washed with brine, dried and concentrated. Flash chromatography of the residue (light petroleum- $\left.\mathrm{Et}_{2} \mathrm{O}\right)(8: 1)$ gave the dione $5(1.1 \mathrm{~g})$, m.p. $63-64{ }^{\circ} \mathrm{C}$ (Found: C, 67.2; H, 8.3. $\mathrm{C}_{11} \mathrm{H}_{16} \mathrm{O}_{2}$ requires C, 67.4; H, $8.2 \%$ ) which was oxidised with $\mathrm{CrO}_{3}-\mathrm{AcOH}$ to the acid 6, m.p. 209$210{ }^{\circ} \mathrm{C}$ (Found: $\mathrm{C}, 62.5 ; \mathrm{H}, 7.7 . \mathrm{C}_{11} \mathrm{H}_{16} \mathrm{O}_{4}$ requires $\mathrm{C}, 62.3 ; \mathrm{H}$, $7.6 \%$ ). Reaction of 6 with $\mathrm{Ac}_{2} \mathrm{O}-\mathrm{NaOAc}$ gave the enol lactone 13, m.p. $48-49{ }^{\circ} \mathrm{C}$ (Found: C, 68.0; H, 7.4. $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{O}_{3}$ requires C , 68.0; H, 7.2\%).

## 2-(3-Bromo-2-oxopropyl)-2-isopropylcyclohexane-1,3-dione

 9.-The alkene $4(2.88 \mathrm{~g})$ and dry DMSO (dimethyl sulphoxide) ( $50 \mathrm{~cm}^{3}$ ) were cooled to $10^{\circ} \mathrm{C}$ with stirring under $\mathrm{N}_{2}$. Water ( $0.534 \mathrm{~cm}^{3}$ ) was added followed by NBS ( 5.28 g ) and stirring was continued for 1 h . Brine was added followed by extractions with $\mathrm{Et}_{2} \mathrm{O}$. The combined extracts were washed with brine, dried and evaporated under reduced pressure to give a brown oil ( 5 g ); $v_{\text {max }} / \mathrm{cm}^{-1} 3600$ and $1705 ; \delta_{\mathrm{H}} 4.5-3.8(1 \mathrm{H}, \mathrm{m}), 3.4(4$ $\mathrm{H}, \mathrm{m}), 1.5(3 \mathrm{H}, \mathrm{d}, J 7), 1.0(3 \mathrm{H}, \mathrm{d}, J 7)$ and $0.85(3 \mathrm{H}, \mathrm{d}, J 7)$ (Found: $\mathrm{M}^{+}, 290.0511$ and 292.0497. $\mathrm{C}_{12} \mathrm{H}_{19} \mathrm{BrO}_{3}$ requires $M$, 290.0518 and 292.0498). The bromohydrin ( 5 g ) was dissolved in $\mathrm{Me}_{2} \mathrm{CO}\left(100 \mathrm{~cm}^{3}\right)$. Jones' reagent ( $8 \mathrm{~mol} \mathrm{dm}{ }^{-3} ; 10 \mathrm{~cm}^{3}$ ) was added with stirring. After 12 h brine was added followed by extractions with EtOAc. The extracts were combined, washed with brine, dried and evaporated to give a brown oil ( 3.5 g ). Purification of this by flash chromatography (light petroleum$\mathrm{Et}_{2} \mathrm{O}, 1: 1$ ) gave the bromo ketone 9 as a light brown solid ( 2.56 g), m.p. $84-85^{\circ} \mathrm{C}$ (Found: C, 50.0; H, 3.7\%; $\mathbf{M}^{+}, 288.0366$ and 290.0343. $\mathrm{C}_{12} \mathrm{H}_{17} \mathrm{BrO}_{3}$ requires C, $49.8 ; \mathrm{H}, 5.9 \%$, $M, 288.0362$ and 290.0342).2-Isopropyl-2-(2-oxopropyl)cyclohexane-1,3-dione 8.- $\mathrm{CuCl}_{2}$ $(2.3 \mathrm{~g}), \mathrm{PdCl}_{2}(0.822 \mathrm{~g}), \mathrm{Me}_{2} \mathrm{NCHO}\left(28 \mathrm{~cm}^{3}\right)$ and water ( 2.8 $\mathrm{cm}^{3}$ ) were stirred under an $\mathrm{O}_{2}$ atmosphere for 10 min . The alkene $4(4.5 \mathrm{~g})$ in $\mathrm{Me}_{2} \mathrm{NCHO}\left(5 \mathrm{~cm}^{3}\right)$ was added to the reaction mixture and stirring continued for $12 \mathrm{~h} . \mathrm{HCl}(2 \mathrm{~mol}$ $\mathrm{dm}^{-3}$ ) was added followed by extractions with $\mathrm{Et}_{2} \mathrm{O}$; the combined extracts were washed with brine, dried and concentrated to give the trione $8(4.14 \mathrm{~g})$, m.p. $70-71^{\circ} \mathrm{C}$ (light petroleum- $\mathrm{Et}_{2} \mathrm{O}$ ) (Found: $\mathrm{C}, 68.4 ; \mathrm{H}, 8.7 . \mathrm{C}_{12} \mathrm{H}_{18} \mathrm{O}_{3}$ requires $\mathrm{C}, 68.6 ; \mathrm{H}, 8.6 \%) ; \delta_{\mathrm{H}} 3.15(2 \mathrm{H}, \mathrm{s})$ and $2.15(3 \mathrm{H}, \mathrm{s}) ; v_{\text {max }} / \mathrm{cm}^{-1}$ 1710 and 1690 .

2-(But-2-enyl)-2-isopropylcyclohexane-1,3-dione 10.-2-Iso-propylcyclohexane-1,3-dione $(3 \mathrm{~g})$ and $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(0.6 \mathrm{~g})$ were dissolved in THF ( $75 \mathrm{~cm}^{3}$ ) and DBU ( $3.05 \mathrm{~cm}^{3}$ ) and but-2-enyl acetate $(2.33 \mathrm{~g})$ were added. The reaction mixture was stirred for 24 h in the dark. Most of the THF was removed under reduced pressure and the concentrated solution was purified by flash chromatography (light petroleum- $\mathrm{Et}_{2} \mathrm{O}$ ) (6:1) to give the dione 10 as a colourless oil $(1.94 \mathrm{~g}) ; v_{\max } / \mathrm{cm}^{-1} 1725$ and 1690 (Found: $\mathrm{M}^{+}, 208.1461 . \mathrm{C}_{13} \mathrm{H}_{20} \mathrm{O}_{2}$ requires $M, 208.1463$ ).

2-(3-Bromo-2-oxobutyl)-2-isopropylcyclohexane-1,3-dione 11.-The alkene $10(50 \mathrm{mg})$ and dry DMSO $\left(2 \mathrm{~cm}^{3}\right)$ were cooled to $10{ }^{\circ} \mathrm{C}$ with stirring under $\mathrm{N}_{2}$. Water $\left(0.086 \mathrm{~cm}^{3}\right)$ was added followed by NBS ( 110 mg ) and stirring was continued for 1 h . Brine was added followed by extractions with $\mathrm{Et}_{2} \mathrm{O}$. The combined organic extracts were washed with brine and dried. The solvents were removed under reduced pressure to give a brown oil ( 70 mg ); $v_{\text {max }} / \mathrm{cm}^{-1} 3600$ and $1705 ; \delta_{\mathrm{H}} 4.5-3.8(2 \mathrm{H}$, $\mathrm{m}), 1.5(3 \mathrm{H}, \mathrm{d}, J 7)$ and 1.0 and $0.85(3 \mathrm{H}, \mathrm{d}, J 7)$ (Found: $\mathrm{M}^{+}$, 306.0659 and $304.0677 . \mathrm{C}_{13} \mathrm{H}_{21} \mathrm{BrO}_{3}$ requires $M, 306.0654$ and 304.0674).

The bromohydrin ( 70 mg ) was dissolved in $\mathrm{Me}_{2} \mathrm{CO}\left(10 \mathrm{~cm}^{3}\right)$. Jones' reagent ( $8 \mathrm{~mol} \mathrm{dm}{ }^{-3} ; 1 \mathrm{~cm}^{3}$ ) was added with stirring. After 5 h , brine was added followed by extractions with EtOAc. The extracts were combined, washed with brine and dried. Removal of solvent gave a brown oil ( 61 mg ). Purification by flash chromatography (light petroleum $-\mathrm{Et}_{2} \mathrm{O}$ ) $(1: 1)$ gave the bromo ketone 11 as a light brown oil ( 33 mg ); $\delta_{\mathrm{H}} 3.2(2 \mathrm{H}, \mathrm{s})$, $1.7(3 \mathrm{H}, \mathrm{d}, J 7)$ and $0.9(6 \mathrm{H}, \mathrm{d}, J 7)$ (Found: $\mathrm{M}^{+}, 304.0496$ and 302.0514. $\mathrm{C}_{13} \mathrm{H}_{19} \mathrm{O}_{3} \mathrm{Br}$ requires $M, 304.0499$ and 302.05181).

3a-Isopropyl-3,3a,5,6-tetrahydro-7H-indene-2,4-dione 1.-(a) The trione $8(105 \mathrm{mg})$ in dry $\mathrm{PhH}\left(1 \mathrm{~cm}^{3}\right)$ was added to the vibrated suspension of $\mathrm{NaH}(48 \mathrm{mg}, 50 \%$ ) in dry benzene ( 1.5 $\mathrm{cm}^{3}$ ) under $\mathrm{N}_{2}$. The reaction mixture was boiled for 4 h and then $\mathrm{AcOH}\left(0.09 \mathrm{~cm}^{3}\right)$ and water $\left(2 \mathrm{~cm}^{3}\right)$ were added, followed by extractions with $\mathrm{Et}_{2} \mathrm{O}$. The extracts were combined, washed with saturated aqueous $\mathrm{NaHCO}_{3}$ and dried; removal of solvent gave the dione $1(62 \mathrm{mg})$, m.p. $79-80^{\circ} \mathrm{C}$ (light petroleum- $\mathrm{Et}_{2} \mathrm{O}$ ) (Found: C, $74.8 ; \mathrm{H}, 8.5 \% ; \mathrm{M}^{+}, 192.1145 . \mathrm{C}_{12} \mathrm{H}_{16} \mathrm{O}_{2}$ requires C , $75.0 ; \mathrm{H}, 8.33 \% ; M, 192.1150$ ); $\lambda_{\max } / \mathrm{nm} \mathrm{238;} v_{\max } / \mathrm{cm}^{-1} 1705$, 1690 and $1625: \delta_{\mathrm{H}} 5.8(1 \mathrm{H}, \mathrm{s})$.
(b) The bromo ketone $9(4 \mathrm{~g}), \mathrm{PPh}_{3}(3.62 \mathrm{~g}), \mathrm{Et}_{3} \mathrm{~N}\left(2.88 \mathrm{~cm}^{3}\right)$ in $\mathrm{PhMe}\left(150 \mathrm{~cm}^{3}\right)$ were heated under reflux for 24 h in a $\mathrm{N}_{2}$ atmosphere. After cooling the mixture was filtered, the filtrate concentrated, and the residue purified by flash chromatography ( $\mathrm{PhMe}-\mathrm{EtOAc}, 9: 1$ ) to give the dione $1(2.3 \mathrm{~g}$ ).

Preparation of 4-Hydroxy-3a-isopropyl-4-trimethylsilyl-ethynyl-3,3a,4,5,6,7-hexahydroinden-2-one 14 and 4-Hydroxy-3a-isopropyl-1-methyl-4-trimethylsilylethynyl-3,3a,4,5,6,7-hexa-hydroinden-2-one 15.-(a) $\mathrm{Me}_{3} \mathrm{SiCCH}\left(5.68 \mathrm{~cm}^{3}\right)$ and THF (92 $\mathrm{cm}^{3}$ ) were cooled to $-78{ }^{\circ} \mathrm{C}$ under $\mathrm{N}_{2} . \mathrm{BuLi}$ ( $1.6 \mathrm{~mol} \mathrm{dm}{ }^{-3}$; $25.12 \mathrm{~cm}^{3}$ ) was added dropwise over 5 min with stirring. After 30 min the dione $2(6.9 \mathrm{~g})$ in THF ( $35 \mathrm{~cm}^{3}$ ) was added to the reaction mixture over 10 min . After 15 min the mixture was warmed to $-5^{\circ} \mathrm{C}$ and saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ was added followed by extractions with $\mathrm{Et}_{2} \mathrm{O}$. The combined extracts were washed with brine, dried, and evaporated to give the alkyne 15 $(11.12 \mathrm{~g})$, m.p. $105-106^{\circ} \mathrm{C}$ (light petroleum- $\mathrm{Et}_{2} \mathrm{O}$ ) (Found: C , $70.8 ; \mathrm{H}, 9.0 \% ; \mathrm{M}^{+}, 220.1463 . \mathrm{C}_{18} \mathrm{H}_{28} \mathrm{O}_{2}$ Si requires $\mathrm{C}, 71.0 \mathrm{H}$, $9.2 \% ; M, 304.1858$ ); $i_{\text {max }} / \mathrm{nm} \mathrm{242;} v_{\text {max }} / \mathrm{cm}^{-1} 3600,2108,1710$ and 1618; $\delta_{\mathrm{H}} 2.64$ and $2.30(1 \mathrm{H}, J 20), 2.60(1 \mathrm{H}$, br d, $J 8), 2.4(1 \mathrm{H}$, septet, $J 7$ ), $1.66(3 \mathrm{H}, \mathrm{s}), 1.18$ and $0.6(3 \mathrm{H}, \mathrm{d}, J 7)$ and $0.08(9 \mathrm{H}, \mathrm{s})$.
(b) In a similar manner the dione $1(50 \mathrm{mg})$ was converted into the alkyne 14 ( 73 mg ), m.p. 101-103 ${ }^{\circ} \mathrm{C}$ (light petroleum$\mathrm{Et}_{2} \mathrm{O}$ ) (Found: C, 70.2; H, 9.2\%; $\mathrm{M}^{+}, 290.1702 . \mathrm{C}_{17} \mathrm{H}_{26} \mathrm{O}_{2} \mathrm{Si}$ requires $\mathrm{C}, 70.3 ; \mathrm{H}, 9.0 \% ; M, 290.1702$ ); $i_{\text {max }} / \mathrm{nm} 242 ; v_{\text {max }} /$ $\mathrm{cm}^{-1} 3600,2180$ and $1710 ; \delta_{\mathrm{H}} 5.84(1 \mathrm{H}, \mathrm{s}), 2.66$ and $2.26(1 \mathrm{H}$, $\mathrm{d}, J 19), 1.07$ and $0.62(3 \mathrm{H}, \mathrm{d}, J 7)$ and $0.08(9 \mathrm{H}, \mathrm{s})$.

2-Isopropyl-2-(2-oxobutyl)cyclohexane-1,3-dione 12.-2-Iso-propylcyclohexane-1,3-dione ( 50 g ) and dry KF ( 18.8 g ) in xylene ( $800 \mathrm{~cm}^{3}$ ) were stirred under $\mathrm{N}_{2}$ for 30 min . 2-Nitrobut-1-ene ( 49.18 g ) was added to the reaction mixture, which was stirred and boiled for 16 h . Most of the xylene was removed under reduced pressure and the concentrated solution was chromatographed on silica gel (light petroleum- $\mathrm{Et}_{2} \mathrm{O}$ ) to give
the trione $12(67.5 \mathrm{~g})$, crystallised from $\mathrm{Et}_{2} \mathrm{O}$, m.p. $65.5-67^{\circ} \mathrm{C}$ (Found: C, 69.4; H, 8.9\%; $\mathrm{M}^{+}, 224.1414 . \mathrm{C}_{13} \mathrm{H}_{20} \mathrm{O}_{3}$ requires C, $69.64 ; \mathrm{H}, 8.9 \% ; M, 224.1412$ ); $v_{\text {max }} / \mathrm{cm}^{-1} 1710$ and $1690 ; \delta_{\mathrm{H}} 3.15$ $(2 \mathrm{H}, \mathrm{s}), 3.0(2 \mathrm{H}, \mathrm{q}, J 7), 2.1(3 \mathrm{H}, \mathrm{t}, J 7)$ and $0.9(6 \mathrm{H}, \mathrm{d}, J 7)$.

3a-Isopropyl-1-methyl-3,3a,5,6-tetrahydro-7H-indene-2,4dione 1.-The trione $12(13.44 \mathrm{~g})$ in dry $\mathrm{PhH}\left(60 \mathrm{~cm}^{3}\right)$ was added to a vibrated suspension of $\mathrm{NaH}(50 \%, 5.76 \mathrm{~g})$ in dry $\mathrm{PhH}(90$ $\mathrm{cm}^{3}$ ) under $\mathrm{N}_{2}$. The reaction mixture was boiled for 52 h . After cooling, AcOH ( $12 \mathrm{~cm}^{3}$ ) and water ( $80 \mathrm{~cm}^{3}$ ) were added, followed by extraction with $\mathrm{Et}_{2} \mathrm{O}$. The combined extracts were washed with saturated aqueous $\mathrm{NaHCO}_{3}$ and evaporated to give the dione 2 as a light brown solid ( 7.85 g ), crystallised from light petroleum- $\mathrm{Et}_{2} \mathrm{O}$, m.p. $82^{\circ} \mathrm{C}$ (Found: $\mathrm{C}, 75.8 ; \mathrm{H}, 8.7 \% ; \mathrm{M}^{+}$, 206.1311. $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{O}_{2}$ requires $\mathrm{C}, 75.7 ; \mathrm{H}, 8.7 \% ; M, 206.1307$ ); $\lambda_{\text {max }} / \mathrm{nm} \mathrm{244} ; v_{\text {max }} / \mathrm{cm}^{-1} 1705$ and $1655 ; \delta_{\mathrm{H}} 2.9$ and $2.1(1 \mathrm{H}, \mathrm{d}, J$ 19), $1.7(3 \mathrm{H}, \mathrm{s})$ and 0.8 and $0.7(3 \mathrm{H}, \mathrm{d}, J 7)$.

Preparation of 4-Ethynyl-4-hydroxy-3a-isopropyl-3,3a,-4,5,6,7-hexahydroinden-2-one 16 and 4-Ethynyl-4-hydroxy-3a-isopropyl-1-methyl-3,3a,4,5,6,7-hexahydroinden-2-one 17.-(a) The alkyne $15(10.18 \mathrm{~g})$, THF ( $100 \mathrm{~cm}^{3}$ ) and $\mathrm{Bu}_{4} \mathrm{NF}(1 \mathrm{~mol}$ $\mathrm{dm}^{-3} ; 36.85 \mathrm{~cm}^{3}$ ) were stirred at ambient temperature for 30 $\min . \mathrm{HCl}\left(2 \mathrm{~mol} \mathrm{dm}{ }^{-3}\right)$ was added, the organic layer was separated and the aqueous layer was extracted with ether. The extracts were combined, washed with water, then brine, and dried. Concentration followed by flash chromatography (light petroleum $-\mathrm{Et}_{2} \mathrm{O}, 1: 1$ ) afforded the alkyne $17(6.95 \mathrm{~g})$, m.p. $142-145^{\circ} \mathrm{C}$ (Found: $\mathrm{C}, 77.5 ; \mathrm{H}, 8.8 \% ; \mathrm{M}^{+}$, 232.1458. $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{O}_{2}$ requires $\mathrm{C}, 77.6 ; \mathrm{H}, 8.6 \% ; M, 232.1458$ ); $\lambda_{\max } / \mathrm{nm} 244 ; v_{\max } /$ $\mathrm{cm}^{-1} 3600,2185,1710$ and $1620 ; \delta_{\mathrm{H}} 2.7$ and $2.35(1 \mathrm{H}, \mathrm{d}, J 20)$, $2.6(1 \mathrm{H}, \mathrm{bd}, J 8), 2.4(1 \mathrm{H}$, septet, $J 7), 2.25(1 \mathrm{H}, \mathrm{s}), 1.7(3 \mathrm{H}, \mathrm{s})$, and 1.2 and $0.62(3 \mathrm{H}, \mathrm{d}, J 7)$.
(b) The silylalkyne $14(0.68 \mathrm{~g})$, was converted into a similar way into the alkyne $16(0.46 \mathrm{~g})$, m.p. $134-135^{\circ} \mathrm{C}$ (light petroleum- $\mathrm{Et}_{2} \mathrm{O}$ ) (Found: C, $76.9 ; \mathrm{H}, 8.4 \% ; \mathrm{M}^{+}, 218.1310$. $\mathrm{C}_{14} \mathrm{H}_{18} \mathrm{O}_{2}$ requires $\mathrm{C}, 77.1 ; \mathrm{C}, 8.3 \% ; M, 218.1307$ ); $\lambda_{\text {max }} / \mathrm{nm}$ 236; $v_{\text {max }} / \mathrm{cm}^{-1} 3600,3300,1705$ and $1680 ; \delta_{\mathrm{H}} 5.9(1 \mathrm{H}, \mathrm{s}), 2.65$ and $2.35(1 \mathrm{H}, \mathrm{d}, J 19), 2.6(1 \mathrm{H}, \mathrm{d}, J 8), 2.28(1 \mathrm{H}, \mathrm{s}), 1.68(3 \mathrm{H}, \mathrm{s})$ and 1.2 and $0.62(3 \mathrm{H}, \mathrm{d}, J 7)$.

Preparation of 4-Hydroxy-3a-isopropyl-4-vinyl-3,3a,4,5,6,7-hexahydroinden-2-one 18 and 4-Hydroxy-3a-isopropyl-1-methyl-4-vinyl-3,3a,4,5,6,7-hexahydroinden-2-one 19.-The alkyne 17 $(6.5 \mathrm{~g})$ was dissolved in EtOAc ( $50 \mathrm{~cm}^{3}$ ). Lindlar catalyst ( 65 mg ) was added and the reaction mixture was stirred under an atmosphere of $\mathrm{H}_{2}$ for 5 h at ambient temperature. The catalyst was removed by filtration through Celite and the EtOAc was removed. Purification of the residue by flash chromatography (light petroleum- $\mathrm{Et}_{2} \mathrm{O}, 3: 1$ ) afforded the alkene 19, m.p. 111$112{ }^{\circ} \mathrm{C}(5.5 \mathrm{~g})$ (light petroleum- $\mathrm{Et}_{2} \mathrm{O}$ ) (Found: $\mathrm{C}, 76.7$; $\mathrm{H}, 9.3 \%$; $\mathrm{M}^{+}$, 234.1617. $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}_{2}$ requires $\mathrm{C}, 76.7 ; \mathrm{H}, 9.4 \% ; M$, 234.1620); $\dot{\lambda}_{\text {max }} / \mathrm{nm} \mathrm{248;} v_{\text {max }} / \mathrm{cm}^{-1} 3500,1705$ and $1615 ; \delta_{\mathrm{H}}$ $6.0(1 \mathrm{H}, \mathrm{dd}, J 4$ and 14$), 5.4(1 \mathrm{H}, \mathrm{d}, J 18), 5.15(1 \mathrm{H}, \mathrm{d}, J 14), 2.75$ $(1 \mathrm{H}, \mathrm{dd}, J 3), 1.95(1 \mathrm{H}, \mathrm{bs}), 1.7(3 \mathrm{H}, \mathrm{s})$ and 1.2 and $0.6(3 \mathrm{H}, \mathrm{d}, J 7)$.

The alkyne 16 ( 35 mg ) was reduced in a similar fashion to the alkene 18, m.p. $108-109{ }^{\circ} \mathrm{C}$ (light petroleum- $\mathrm{Et}_{2} \mathrm{O}$ ) (Found: C , $73.5 ; \mathrm{H}, 9.2 \% ; \mathrm{M}^{+}, 220.1461 . \mathrm{C}_{14} \mathrm{H}_{20} \mathrm{O}_{2}$ requires $\mathrm{C}, 73.1 ; \mathrm{H}$, $9.1 \% ; M, 220.1463) ; \lambda_{\text {max }} / \mathrm{nm} 241 ; v_{\text {max }} / \mathrm{cm}^{-1} 3550,3400,1710$ and $1618 ; \delta_{\mathrm{H}} 6.0(1 \mathrm{H}, \mathrm{dd}, J 4$ and 14$), 5.9(1 \mathrm{H}, \mathrm{s}), 5.3(1 \mathrm{H}, \mathrm{d}, J$ 18), $5.1(1 \mathrm{H}, \mathrm{d}, J 14), 2.75(1 \mathrm{H}, \mathrm{dd}, J 8$ and 3$), 2.55(1 \mathrm{H}, \mathrm{m}), 1.9$ $(1 \mathrm{H}, \mathrm{br} \mathrm{s}), 1.72(3 \mathrm{H}, \mathrm{s})$ and 1.2 and $0.62(3 \mathrm{H}, \mathrm{d}, J 7)$.

Pyrolysis of the Alkene 18.-The alkene $18(40 \mathrm{mg})$ was boiled in diethylene glycol $\left(5 \mathrm{~cm}^{3}\right)$ for 2 h under an atmosphere of $\mathrm{N}_{2}$. After dilution with water the mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$. The extracts were combined, washed with brine, dried and evaporated. Separation by flash chromatography (light petrol-
eum- $\left.\mathrm{Et}_{2} \mathrm{O}\right)(7: 3)$ gave the 8 -hydroxy-2-isopropyltricyclo[6.3.0.0 ${ }^{1.5}$ ]undec-2-en-4-one $20(20 \mathrm{mg})$, m.p. $79{ }^{\circ} \mathrm{C}$ (light petroleum) (Found: C, $76.3 ; \mathrm{H}, 9.2 \% ; \mathrm{M}^{+}, 220.1463 . \mathrm{C}_{14} \mathrm{H}_{20} \mathrm{O}_{2}$ requires $\mathrm{C}, 76.4 ; \mathrm{H}, 9.2 \% ; M, 220.1463$ ); $\lambda_{\text {max }} / \mathrm{nm} 245 ; v_{\text {max }} /$ $\mathrm{cm}^{-1} 3500,3300,1700$ and $1640 ; \delta_{\mathrm{H}} 6.08(1 \mathrm{H}, \mathrm{s})$; and the bicyclo[6.3.0] undecenedione 23 as an oil ( 12 mg ); $i_{\text {max }} / \mathrm{nm} 240$; $v_{\text {max }} / \mathrm{cm}^{-1} 1705$ and $1620 ; \delta_{\mathrm{H}} 2.84(1 \mathrm{H}, \mathrm{br} \mathrm{s}), 2.76(1 \mathrm{H}, \mathrm{m})$ and 1.0 and $0.66(3 \mathrm{H}, \mathrm{d}, J 7)$ (Found: $\mathrm{M}^{+}, 220.1463 . \mathrm{C}_{14} \mathrm{H}_{20} \mathrm{O}_{3}$ requires $M, 220.1463$ ).

Preparation of 8-Hydroxy-2-isopropyl-5-methyltricyclo[6.3.0.0 ${ }^{1.5}$ ] undec-2-en-4-one 21.-The alkene $19(6.7 \mathrm{~g})$ was boiled in diethylene glycol ( $60 \mathrm{~cm}^{3}$ ) for 10 min under an atmosphere of $\mathrm{N}_{2}$. After cooling, water and $\mathrm{Et}_{2} \mathrm{O}$ were added. The organic layer was separated and the aqueous layer extracted with $\mathrm{Et}_{2} \mathrm{O}$. The combined extracts were washed with brine, dried and concentrated to give the tricycle $21(5.95 \mathrm{~g})$, m.p. $82^{\circ} \mathrm{C}$ (light petroleum) (Found: $76.9 ; \mathrm{H}, 9.4 \% ; \mathrm{M}^{+}$, 334.1615. $\mathrm{C}_{15} \mathrm{H}_{22} \mathrm{O}_{2}$ requires $\mathrm{C}, 76.9 ; \mathrm{H}, 9.4 \% ; M, 234.1620$ ); $i_{\text {max }} / \mathrm{nm} \mathrm{245} ; v_{\text {max }} / \mathrm{cm}^{-1} 3500,1700$ and $1640 ; \delta_{\mathrm{H}} 6.1(1 \mathrm{H}, \mathrm{s}), 2.8$ ( 1 H , septet, $J 7$ ), $1.4(1 \mathrm{H}, \mathrm{dt}, J 12)$ and 1.2 and $1.1(3 \mathrm{H}, \mathrm{d}, J 7)$ and $1.0(3 \mathrm{H}, \mathrm{s})$.

Preparation of 11-Isopropyl-8-methylbicyclo[6.3.0]undec-1,10-diene-5,9-dione 23.-The tricycle $21(2.26 \mathrm{~g}), \mathrm{Pb}(\mathrm{OAc})_{4}$ $(14.97 \mathrm{~g})$ and $\mathrm{I}_{2}(4.29 \mathrm{~g})$ were boiled in dry $\mathrm{PhH}\left(50 \mathrm{~cm}^{3}\right)$ for 10 min under $\mathrm{N}_{2}$. The solution was cooled and saturated aqueous $\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{5}$ and $\mathrm{Et}_{2} \mathrm{O}$ were added to give a yellow precipitate which was filtered off. The organic layer was separated, washed with brine, dried and concentrated to a brown oil. Flash chromatography (light petroleum- $\mathrm{Et}_{2} \mathrm{O}, 2: 3$ ) of the latter gave the dione $23(1.93 \mathrm{~g})$, m.p. $83-84^{\circ} \mathrm{C}$ (light petroleum- $\mathrm{Et}_{2} \mathrm{O}$ ) (Found: C, $77.4 ; \mathrm{H}, 8.7 \% ; \mathrm{M}^{+}, 232.1463 . \mathrm{C}_{15} \mathrm{H}_{20} \mathrm{O}_{2}$ requires C , $77.6 ; \mathrm{H}, 8.6 \% ; M, 232.1458$ ); $\lambda_{\text {max }} / \mathrm{nm} \mathrm{278;} v_{\text {max }} / \mathrm{cm}^{-1} 1703,1692$ and 1605 .

Methylation of the Dione 23.-(a) $\operatorname{Pr}^{i}{ }_{2} \mathrm{NH}\left(0.66 \mathrm{~cm}^{3}\right)$ and THF ( $15 \mathrm{~cm}^{3}$ ) were cooled to $-78^{\circ} \mathrm{C}$ under $\mathrm{N}_{2} . \mathrm{BuLi}(1.6 \mathrm{~mol}$ $\mathrm{dm}^{-3} ; 2.96 \mathrm{~cm}^{3}$ ) was added. After 5 min the diene $23(1 \mathrm{~g})$ in THF ( $5 \mathrm{~cm}^{3}$ ) was added dropwise, followed by HMPA (hexamethylphosphoramide) $\left(0.824 \mathrm{~cm}^{3}\right)$. After 5 min MeI was added to the reaction mixture. The mixture was stirred for 3 h and then allowed to warm to ambient temperature when saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ was added to it. The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and the combined extracts were concentrated to give a brown oil which, on flash chromatography (light petroleum$\mathrm{Et}_{2} \mathrm{O}, 2: 3$ ), gave starting material ( 16 mg ) and the methylated isomers as a waxy solid ( 700 mg ). GLC and NMR spectroscopy of the latter indicated that the 6-methyl compound $27 ; \lambda_{\text {max }} / \mathrm{nm}$ 276; $v_{\text {max }} / \mathrm{cm}^{-1} 1705$ and $1605 ; \delta_{\mathrm{H}} 6.04(1 \mathrm{H}, \mathrm{dd}, J 11$ and 8$)$, $5.98(1 \mathrm{H}, \mathrm{s}), 3.1(2 \mathrm{H}, \mathrm{m}), 2.1(1 \mathrm{H}, \mathrm{m}), 1.96(1 \mathrm{H}, \mathrm{m}), 1.54(1 \mathrm{H}$, bt, $J 7$ ) and 1.15 and $1.05(3 \mathrm{H}, \mathrm{d}, J 7)$ (Found: $\mathrm{M}^{+}, 246.1623$. $\mathrm{C}_{16} \mathrm{H}_{22} \mathrm{O}_{2}$ requires $M, 246.1620$ ), was contaminated with the 4-methyl isomer 26.
(b) The tricycle ( 0.54 g ), HMPA ( $0.48 \mathrm{~cm}^{3}$ ) and the THF (10 $\mathrm{cm}^{3}$ ) were cooled to $0^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$ with stirring. $\mathrm{LiN}\left(\mathrm{SiMe}_{3}\right)_{2}$ ( $1 \mathrm{~mol} \mathrm{dm}{ }^{-3} ; 2.8 \mathrm{~cm}^{3}$ ) was added. After $10 \mathrm{~min} \mathrm{MeI}\left(0.217 \mathrm{~cm}^{3}\right.$ ) was added to the reaction mixture followed by saturated aqueous $\mathrm{NaHCO}_{3}$. The mixture was extracted with $\mathrm{Et}_{2} \mathrm{O}$ and the extract concentrated to give a yellow oil $(0.48 \mathrm{~g}) . \mathrm{GLC}$ and NMR spectroscopy of the latter indicated that 1-isopropyl-4,8dimethylbicyclo[6.3.0] undeca-1,10-diene-5,9-dione 26 was the major ( $80 \%$ ) product; $\lambda_{\text {max }} / \mathrm{nm} 278 ; v_{\text {max }} / \mathrm{cm}^{-1} 1705$ and 1605 ; $\delta_{\mathrm{H}} 6.04(1 \mathrm{H}, \mathrm{dd}, J 10.8$ and 7.8$), 5.98(1 \mathrm{H}, \mathrm{s}), 3.1(1 \mathrm{H}, \mathrm{td}, J$ 13.2 and 2.4$), 2.8(2 \mathrm{H}, \mathrm{m}), 2.45(2 \mathrm{H}, \mathrm{m}), 2.1(1 \mathrm{H}, \mathrm{dd}, J 8.2$ and 2.2), $1.92(1 \mathrm{H}, \mathrm{m}), 1.55(1 \mathrm{H}, \mathrm{dt}, J 12$ and 2.2$), 1.34(3 \mathrm{H}, \mathrm{s}), 1.25$ and $1.13(3 \mathrm{H}, \mathrm{d}, J 6.8)$ and 1.2 and $0.83(3 \mathrm{H}, \mathrm{d}, J 7)$ (Found: $\mathrm{M}^{+}$, 246.1620. $\mathrm{C}_{16} \mathrm{H}_{22} \mathrm{O}_{2}$ requires $M, 246.1620$ ).

Bromination of the Dione 23.-The enolate (ex LDA-HMPA) of the dione $23(1 \mathrm{~g})$ was prepared as above. After $5 \mathrm{~min} \mathrm{Br}_{2}$ $\left(0.26 \mathrm{~cm}^{3}\right)$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(2 \mathrm{~cm}^{3}\right)$ was added to the reaction mixture. Saturated aqueous $\mathrm{NaHCO}_{3}$ was added after 1 min and the mixture extracted with $\mathrm{Et}_{2} \mathrm{O}$. Concentration of the extract gave a dark brown oil which, on flash chromatography (light petroleum- $\mathrm{Et}_{2} \mathrm{O}, 4: 1$ ), gave the bromide $28(0.8 \mathrm{~g}) ; \lambda_{\text {max }} / \mathrm{nm} \mathrm{278;}$ $v_{\text {max }} / \mathrm{cm}^{-1} 1710$ and $1615 ; \delta_{\mathrm{H}} 6.0(1 \mathrm{H}$, dd, $J 10.8$ and 7.8$)$, $5.95(1 \mathrm{H}, \mathrm{s}), 3.8(1 \mathrm{H}, \mathrm{m}), 2.95(2 \mathrm{H}, \mathrm{m}), 2.85(1 \mathrm{H}, \mathrm{td}, J 13.2$ and 2.4), $2.7(1 \mathrm{H}, \mathrm{m}), 1.85(1 \mathrm{H}, \mathrm{m}), 1.48(1 \mathrm{H}, \mathrm{dt}, J 12$ and 2$), 1.32$ (3 $\mathrm{H}, \mathrm{s})$ and 1.22 and $1.10(3 \mathrm{H}, \mathrm{d}, J 7)$ (Found: $\mathrm{M}^{+}, 310.0569$ and 312.0549. $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{BrO}_{2}$ requires $M, 310.0574$ and 312.0556).

Preparation of 11-Isopropyl-8-methylbicyclo[6.3.0]undeca-1,3,10-triene-5,9-dione 29.-The bromo ketone $28(500 \mathrm{mg})$ was dissolved in DMF ( $10 \mathrm{~cm}^{3}$ ) and DBU $\left(0.26 \mathrm{~cm}^{3}\right)$ added. After 2 h water was added and the mixture extracted with $\mathrm{Et}_{2} \mathrm{O}$. The extracts were combined, washed with water and brine, dried and concentrated. The resulting brown oil was purified by flash chromatography (light petroleum- $\mathrm{Et}_{2} \mathrm{O}, 3: 2$ ) to give the triene 29 ( 230 mg ); $\lambda_{\text {max }} / \mathrm{nm} 326$ and $243 ; v_{\text {max }} / \mathrm{cm}^{-1} 1710$ and $1640 ; \delta_{\mathrm{H}} 6.7(1 \mathrm{H}, \mathrm{d}, J 7), 6.06(1 \mathrm{H}, \mathrm{s}), 6.0(1 \mathrm{H}, \mathrm{d}, J 12.5), 2.96(2$ $\mathrm{H}, \mathrm{m}), 2.32(1 \mathrm{H}, \mathrm{bd}, J 12), 2.1(1 \mathrm{H}, \mathrm{t}, J 14), 1.9(1 \mathrm{H}, \mathrm{m}), 1.24(6$ $\mathrm{H}, \mathrm{dd}, J 7$ ) and $1.2(3 \mathrm{H}, \mathrm{s})$ (Found: $\mathrm{M}^{+}, 230.1302 . \mathrm{C}_{15} \mathrm{H}_{18} \mathrm{O}_{2}$ requires $M, 230.1307$ ).

Preparation of 5-Hydroxy-11-isopropyl-8-methylbicyclo[6.3.0] undec-1,3,10-trien-9-one $\mathbf{3 0}$.- $\mathrm{CeCl}_{3}(595 \mathrm{mg})$ was dissolved in hot $\mathrm{Pr}^{\mathrm{i} O H}\left(10 \mathrm{~cm}^{3}\right)$ and the solution cooled to $0^{\circ} \mathrm{C}$. The trienedione 29 ( 330 mg ) was added to it, followed by $\mathrm{NaBH}_{4}(60 \mathrm{mg})$. The reaction mixture was then stirred at $10^{\circ} \mathrm{C}$ for 3 h . After this it was diluted with water and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; the aqueous layer was then extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extracts were combined, washed with brine, dried and concentrated to give the alcohol $30(270 \mathrm{mg}) ; i_{\text {max }} / \mathrm{nm} 294 ; v_{\text {max }} / \mathrm{cm}^{-1} 3520$, 3400,1710 and $1620 ; \delta_{\mathrm{H}} 6.3(1 \mathrm{H}, \mathrm{d}, J 3), 6.15(1 \mathrm{H}, \mathrm{dd}, J 7$ and 3), $6.07(1 \mathrm{H}, \mathrm{s}), 5.8(1 \mathrm{H}, \mathrm{dd}, J 6), 4.0(1 \mathrm{H}, \mathrm{br}$ s $), 2.9(1 \mathrm{H}$, septet, $J$ 7) and 1.24 and $1.20(3 \mathrm{H}, \mathrm{d}, J 7), 0.96(3 \mathrm{H}, \mathrm{s})$ (Found: $\mathrm{M}^{+}$, 232.1463. $\mathrm{C}_{15} \mathrm{H}_{20} \mathrm{O}_{2}$ requires $M, 232.1462$ ).

Reduction of the Trieneol $\mathbf{3 0} .-\mathrm{Li}(18 \mathrm{mg})$ was added to liquid $\mathrm{NH}_{3}\left(10 \mathrm{~cm}^{3}\right)$ under $\mathrm{N}_{2}$ with stirring. The resulting dark blue solution was stirred for 15 min and then the trienol ( 15 mg ) in THF ( $2 \mathrm{~cm}^{3}$ ) was added over 1 min . On discharge of the blue colouration (ca. 1 min ) $\mathrm{NH}_{4} \mathrm{Cl}$ was added and $\mathrm{NH}_{3}$ evaporated. Water and $\mathrm{Et}_{2} \mathrm{O}$ were added, the organic layer was separated, and the aqueous layer was extracted with $\mathrm{Et}_{2} \mathrm{O}$. The extracts were combined, washed with brine, dried and concentrated to give the diene $32(12 \mathrm{mg}) ; v_{\text {max }} / \mathrm{cm}^{-1} 3400,1750$ and $1640 ; \delta_{\mathrm{H}} 6.1$ $(1 \mathrm{H}, \mathrm{d}, J 10.5), 5.8(1 \mathrm{H}, \mathrm{m}), 3.08(1 \mathrm{H}, \mathrm{m}), 2.9$ and $2.84(1 \mathrm{H}, \mathrm{dd}, J$ 20 and 2), $0.98(3 \mathrm{H}, \mathrm{s})$ and $0.96(6 \mathrm{H}, \mathrm{d}, J 7)$ (Found: $\mathrm{M}^{+}$, $234.16321 ; \mathrm{C}_{15} \mathrm{H}_{20} \mathrm{O}_{2}$ requires $M, 234.1619$ ).

Silylation of the Dienedione 23 Enolates.-The dione 23 (500 mg ) was converted into the enolates with $\mathrm{LiNPr}^{\mathrm{i}}{ }_{2}-\mathrm{HMPA}$ as above. $\mathrm{Bu}^{t} \mathrm{Me}_{2} \mathrm{SiCl}(480 \mathrm{mg})$ in THF $\left(1 \mathrm{~cm}^{3}\right)$ was added to the reaction mixture which was then stirred at $-78^{\circ} \mathrm{C}$ for 10 min before being allowed to warm to $0^{\circ} \mathrm{C}$. Saturated aqueous $\mathrm{NaHCO}_{3}$ was added to the mixture which was then extracted with diethyl ether. The combined extracts were washed with brine, dried and concentrated to give the ethers ( 520 mg ). GC showed the presence of two ethers $(8: 2)$. The major product showed $\lambda_{\text {max }} / \mathrm{nm} \mathrm{276} ; v_{\text {max }} / \mathrm{cm}^{-1} 1705$ and $1610 ; \delta_{\mathrm{H}} 6.1(1 \mathrm{H}$, $\mathrm{t}, J 10.5), 6.0(1 \mathrm{H}, \mathrm{s}), 5.0(1 \mathrm{H}, \mathrm{t}, J 10.5), 3.1(1 \mathrm{H}, \mathrm{m}), 1.25(3 \mathrm{H}$, s), 1.12 and $1.08(3 \mathrm{H}, \mathrm{d}, J 7), 0.86(9 \mathrm{H}, \mathrm{s})$ and $0.05(6 \mathrm{H}, \mathrm{s})$ (Found: $\mathrm{M}^{+}, 346.2327 . \mathrm{C}_{21} \mathrm{H}_{34} \mathrm{O}_{2} \mathrm{Si}$ requires $M, 346.2308$ ). The minor product showed $\delta_{\mathrm{H}} 6.0(1 \mathrm{H}, \mathrm{t}, J 10.5), 5.9(1 \mathrm{H}, \mathrm{s}), 4.85$
$(1 \mathrm{H}, \mathrm{t}, J 10.5), 2.18(3 \mathrm{H}, \mathrm{s}), 1.08$ and $1.04(3 \mathrm{H}, \mathrm{d}, J 7), 0.80(9 \mathrm{H}$, s) and $0.03(6 \mathrm{H}, \mathrm{s})$.

The enolate prepared using $\mathrm{LiN}\left(\mathrm{SiMe}_{3}\right)_{2}$ gave the same two products with the ratio reversed.
