Novel access to the chiral, $\alpha, \alpha$-disubstituted ketone 2 -hydroxymethyl-2-methylcyclobutanone was developed, leading to an enantioselective total synthesis of ( - )-frontalin, an aggregating pheromone of bark beetles.

The construction of chiral quaternary stereogenic centres ${ }^{1}$ is one of the most important problems in the enantioselective synthesis ${ }^{2}$ of natural products. We report herein a potentially valuable method for the enantioselective construction of quaternary carbons via enantiospecific 1,2 -rearrangements of cyclopropane systems to produce chiral $\alpha, \alpha$-disubstituted cyclobutanones, which lead to an enantioselective total synthesis of ( - )-frontalin 18.

Our preliminary goal in this context relied on an enantioselective construction of the chiral cyclopropyl epoxide 8, followed by its enantiospecific 1,2 -rearrangement. Hence, the ketone 2, prepared in $79 \%$ yield by Swern oxidation of a diastereoisomeric mixture of the optically active alcohol $1,{ }^{3}$ was subjected to Grignard reaction ( MeMgBr ) to give the alcohol 3 $(91 \%)$ as a single product with no detectable amount of the isomeric alcohol 4. This high stereoselectivity could be reasonably explained by applying a cyclic Cram's model, with the magnesium chelating with the ring oxygen and the carbonyl group, followed by attack from the least hindered side of the carbonyl group as mentioned in Eliel's original report. ${ }^{4}$ (The direct 1,2-rearrangement of the alcohol 3 to produce the corresponding cyclobutanone 5 was first examined, and the reaction was found not to be like the case for the secondary alcohol ${ }^{3}$ ). Oxidative solvolysis [ $N$-chlorosuccinimide (NCS), $\mathrm{AgNO}_{3}$ ] of the alcohol 3 afforded the aldehyde 6 , which was reduced $\left(\mathrm{NaBH}_{4}\right)$ to give the diol $7(92 \%$ overall yield from 3$)$. Mesylation [methanesulphonyl chloride ( MsCl ), $\mathrm{Et}_{3} \mathrm{~N}$ ] of the diol 7, followed by base $(\mathrm{NaH})$ treatment of the resulting monomesyl ester, yielded the epoxide 8, which on treatment with silica gel furnished the cyclobutanone $9(99 \%$ overall yield from 7) (Scheme 1).

Confirmation of the absolute configuration and also the enantiomeric purity of this cyclobutanone 9 was achieved by a demonstration of the effective synthesis of ( - )-frontalin 18 starting from ketone 9 as follows.

Protection [ $t$-butylchlorodimethylsilane (TBSCl), $\mathrm{Et}_{3} \mathrm{~N}$ ] of the alcohol 9 afforded the silyl ether $10(74 \%)$, which was then subjected to Baeyer-Villiger oxidation [ $m$-chloroperbenzoic acid (MCPBA)] to give the lactone 11 ( $85 \%$ ). The triol 12, obtained by reduction [lithium aluminium hydride (LAH)] of the lactone 11, was protected [2,2-dimethoxypropane, toluene-$p$-sulphonic acid (PTSA)] to give the acetonide alcohol $\mathbf{1 3}^{4}$ ( $76 \%$ overall yield from 11), which was tosylated [toluene-psulphonyl chloride ( $p$ - TsCl ), pyridine] to afford the tosyl ester $14(64 \%)$. Coupling of this tosate 14 with isopropenylmagnesium bromide was effected in the presence of dilithium tetrachlorocuprate ( $\mathrm{Li}_{2} \mathrm{CuCl}_{4}$ ) to produce the olefin $15(81 \%)$. Osmylation [osmium tetraoxide $\left(\mathrm{OsO}_{4}\right), \quad \mathrm{N}$-methylmorpholine oxide (NMO)] of this olefin 15, followed by oxidative cleavage [sodium metaperiodate $\left(\mathrm{NaIO}_{4}\right)$ ] of the resulting diol 16, yielded the keto acetonide $17(76 \%$ overall yield from the olefin 15). Finally, the keto acetonide 17 was treated with acid (PTSA)

to furnish our target molecule, ( - )-frontalin 18 (Scheme 2), which was identical with an authentic sample ${ }^{5.6}$ in all aspects, including its optical behaviour.
Thus we have developed a novel route to the chiral $\alpha, \alpha-$ disubstituted cyclobutanone 9 and have shown its flexibility by illustrating an effective synthesis of ( - -frontalin 18.

## Experimental

General Methods.-M.p.s were determined on a Yanagimoto MP-22 apparatus and are uncorrected. IR spectra were recorded on a JASCO Report-100 spectrophotometer. ${ }^{1} \mathrm{H}$ NMR spectra were obtained on a JEOL FX-90 spectrometer. Chemical shifts were recorded relative to internal $\mathrm{SiMe}_{4}$, and $J$-values are in Hz . Mass spectra were taken on a JEOL-JMS-01SG-2, JEOL-AX-500, or JEOL-JMS-DX-303 spectrometer. Optical rorations were measured with a JASCO-DIP-340 polarimeter. All reactions were carried out under dry nitrogen. Column chromatography was carried out with silica gel (Wako gel C-200). The phrase 'residue upon work-up' refers to the residue obtained when the organic layer was separated, dried

After being stirred for 15 h at room temperature the reaction mixture was treated with saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}$ and extracted with diethyl ether. The extract was washed with saturated aq. NaCl . The residue upon work-up was chromatographed with pentane-diethyl ether ( $98: 2$ ) to give the olefin $15\left(27.7 \mathrm{mg}, 81 \%\right.$ ) as an oil, $[\alpha]_{\mathrm{D}}^{21}-$ $3.60^{\circ}$ (c $1.35, \mathrm{CHCl}_{3}$ ) [Found: $\left(\mathrm{M}^{+}-15\right)$, 183.1379. $\mathrm{C}_{11} \mathrm{H}_{19} \mathrm{O}_{2}$ requires $m / z, \quad 183.1384]$; $\quad v_{\text {max }}($ neat $) / \mathrm{cm}^{-1} \quad 1627 \quad(\mathrm{C}=\mathrm{C})$; $\delta_{\mathbf{H}}\left(\mathrm{CDCl}_{3}\right) 1.31(3 \mathrm{H}, \mathrm{s}, 4-\mathrm{Me}), 1.41\left(6 \mathrm{H}, \mathrm{s}, \mathrm{CMe}_{2}\right), 1.45-1.62$ ( $4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 1.73 ( $3 \mathrm{H}, \mathrm{s}, 4^{\prime}$-Me), $1.86-2.17$ ( $2 \mathrm{H}, \mathrm{m}, 3^{\prime}-$ $\left.\mathrm{H}_{2}\right), 3.68$ and $3.80\left(2 \mathrm{H}\right.$, each d, $\left.J 9,5-\mathrm{H}_{2}\right)$ and $4.70(2 \mathrm{H}$, br s, $\left.\mathrm{C}=\mathrm{CH}_{2}\right) ; m / z 183\left(\mathrm{M}^{+}-15\right)$.
(S)-5-(2,2,4-Trimethyl-1,3-dioxolan-4-yl)pentan-2-one 17.To a stirred solution of the olefin $15(27.7 \mathrm{mg}, 0.14 \mathrm{mmol})$ in water-acetone ( $5: 2,7 \mathrm{~cm}^{3}$ ) at room temperature was added NMO ( $18.0 \mathrm{~g}, 0.15 \mathrm{mmol}$ ) followed by a catalytic amount of $\mathrm{OsO}_{4}$. After being stirred for 30 min at the same temperature, the reaction mixture was treated with $\mathrm{NaIO}_{4}(59.8 \mathrm{mg}, 0.28$ mmol ) and stirred for a further 30 min at the same temperature; it was then evaporated to leave a residue, which was extracted with diethyl ether. The extract was washed successively with $10 \%$ aq. HCl , saturated aq. $\mathrm{NaHCO}_{3}$, and aq. NaCl . The residue upon work-up was chromatographed with pentanediethyl ether $(7: 3)$ to give the ketone $17(21.3 \mathrm{mg}, 76 \%$ overall yield from 15) as an oil, $[\alpha]_{\mathrm{D}}^{20}-9.45^{\circ}(c 1.06, \mathrm{MeOH})$ [Found: $\left(\mathrm{M}^{+}-15\right), \quad 159.1021 . \mathrm{C}_{8} \mathrm{H}_{15} \mathrm{O}_{3}$ requires $\mathrm{m} / \mathrm{z}, 159.1020$ ]; $v_{\text {max }}($ neat $) / \mathrm{cm}^{-1} 1719(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 1.24(3 \mathrm{H}, \mathrm{s}, \mathrm{Me}), 1.35$ $\left(6 \mathrm{H}, \mathrm{s}, \mathrm{CMe}_{2}\right), 1.44-1.72\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.10(3 \mathrm{H}, \mathrm{s}$, $\mathrm{O}=\mathrm{CMe}), 2.24-2.61\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{C}=\mathrm{O}\right)$ and 3.68 and $3.81(2 \mathrm{H}$, each d, $\left.J 9, \mathrm{CH}_{2} \mathrm{OH}\right) ; m / z 159\left(\mathrm{M}^{+}-15\right)$.
(S)-(-)-Frontalin 18.-A stirred mixture of the ketone 17 $(31.7 \mathrm{mg}, 0.16 \mathrm{mmol})$, a catalytic amount of PTSA $(0.5 \mathrm{mg})$, water $\left(0.1 \mathrm{~cm}^{3}\right)$ and diethyl ether $\left(3.0 \mathrm{~cm}^{3}\right)$ was refluxed for 2 h . After the mixture had been basified with powdered $\mathrm{K}_{2} \mathrm{CO}_{3}$, it was evaporated to leave a residue, which was chromatographed with pentane-diethyl ether $(9: 1)$ to give $(S)$-( - )-frontalin 18 $(6.7 \mathrm{mg}, 30 \%$ ) as an oil, which was identical with an authentic sample in all aspects, including ${ }^{1} \mathrm{H}$ NMR, IR and optical rotation data: $[\alpha]_{\mathrm{D}}^{19}-53.73^{\circ}\left(c 0.67, \mathrm{Et}_{2} \mathrm{O}\right)\left(\right.$ lit., ${ }^{5}-52.0^{\circ}$; lit., ${ }^{6}$ $-56.7^{\circ}$ ).
