# Stereospecific Phenylthio Migrations in the Synthesis of Spirocyclic Lactones and Ethers from $\mathbf{N}$-Methyl-4-Piperidone and Quinuclidin-3-one 

lain Coldham $\dagger$ and Stuart Warren*<br>University Chemical Laboratory, Lensfield Road, Cambridge CB2 1EW, UK

#### Abstract

Single diastereoisomers of spirocyclic lactones and ethers have been prepared using intramolecular attack by the oxygen atom of a hydroxy or ester group onto an episulfonium ion. The sulfur group migrates with complete stereospecificity to give the saturated oxygen heterocycle based on the piperidine or quinuclidine ring.

The stereocontrolled synthesis of cyclic and spirocyclic lactones and ethers has been the focus of a great deal of research effort in recent years. ${ }^{1}$ One class of such spirocyclic oxygen heterocycles is based on the piperidine, quinuclidine, and azabicycloheptane ring systems. These amines, for example $1-4$, have been

prepared as potential muscarinic agonists for the treatment of Alzheimer's disease. ${ }^{2}$ In a preliminary communication ${ }^{3}$ we outlined the synthesis of a new series of such compounds based on the $N$-methylpiperidine and quinuclidine skeletons.
We have reported the use of stereoselective aldol reactions followed by phenylthio migration to effect the synthesis of spirocyclic lactones and ethers. ${ }^{4}$ Rearrangement of the $\beta$ hydroxy sulfide $5^{4 a}$ proceeds through the episulfonium ion intermediate 6 which is captured by the hydroxy group to give the spirocyclic ether 7.

We wondered if this route to spirocyclic ethers could be applied to the synthesis of spirocyclic amines, partly because of the value of a general approach to spirocyclic amines and partly because this would allow the preparation of structural analogues of known muscarinic agonists such as 2 and 3.

Following known methodology for the construction of 2 phenylthio aldehydes, ${ }^{5}$ the amines 10 and 13 were prepared from $N$-methyl-4-piperidone 8 and quinuclidin-3-one 11, $\ddagger$ respectively. Unlike the carbocyclic systems, no base was required for the rearrangement of 9 or 12 as these compounds contain a free nitrogen lone pair and so can themselves act as effective bases for the reaction.
The aldehydes can now be used in aldol reactions. Attempts to prepare the syn aldol products with boron enolates of thioethers, as described by Masamune, ${ }^{6}$ were unsuccessful. The

[^0]
reason is probably complexation of the basic nitrogen atom with boron. The anti-selective aldol reactions, however, proceeded with good yields according to the method used by Aggarwal. ${ }^{4}$ The 2,3-anti aldol product 15 was formed in 95:5 ratio as determined by NMR spectroscopy on the crude mixture. Similarly, the aldehyde 13 gave high 2,3-anti selectivity. This is in good agreement with other similar aldol reactions with 2-phenylthio aldehydes and the lithium enolate of 2,6dimethylphenyl propionate $14.8 \S^{4}$

To our surprise, the aldol reaction on the prochiral aldehyde group of 13 giving the ester 16 was also highly selective at the centre bearing the phenylthio group. The major product 16a, isolated in $72 \%$ yield, was proved to have this relative stereochemistry by examination of the X-ray crystal structure of the diol $20 .{ }^{7}$ It is not clear why there should be such a large stereoselective preference for the ester 16a over the ester 16b. If

[^1]we consider the Felkin-Anh model for attack on a carbonyl group then the nucleophile must approach in the direction shown in Fig. 1. We place the phenylthio group perpendicular to the plane of the carbonyl group as this allows maximum $\sigma_{\mathrm{C}-\mathrm{s}}-\pi^{*} \mathrm{c}=\mathrm{O}$ interaction. This assumption is in agreement with molecular mechanics calculations performed on the aldehyde 13 using Macromodel. ${ }^{8}$

The nitrogen atom of quinuclidinone is an excellent lone pair donor, and it would be expected that the nitrogen atom of the aldehyde 13 would be coordinated to one lithium ion in the solution with the lithium enolate. This would increase the bulk size around the nitrogen atom by solvation and favour attack as shown in Fig. 1. If this is the case, a less bulky ester group

13
Fig. 1
would give lower selectivity. Indeed, the aldol reaction with the smaller methyl ester 17 gave poor selectivity (1.4:1) at this chiral centre.

Reduction of the esters 15, 16a and 18 with $\mathrm{LiAlH}_{4}$ gave the corresponding diols 19, 20 and 21, respectively, with no loss of stereochemical purity. On treatment with an excess of toluene-p-sulfonic acid (TsOH), the diols 19 and 20 gave good yields of

the spirocyclic ethers 22 and 23 respectively. The rearrangement is stereospecific, with inversion of stereochemistry taking place at the migration origin and at the migration terminus. This was verified by NOE experiments and means that the anti-diol 19 gives only the anti cyclic ether 22, and that the diol $\mathbf{2 0}$ gives ether 23 as the sole product.

Attempted rearrangement of the diol 21 gave initially the ketone 24 which could be isolated as the hydrochloride salt, but which did not undergo rearrangement with cyclization. The
presence of the $\mathrm{sp}^{2}$ hybridized carbon within the potential ring must be hindering the cyclization, possibly by disfavouring episulfonium ion formation as this would mean the build-up of partial positive charge on the carbon adjacent to the carbonyl group. In addition, the increase in bond angle may be enough to prevent the ring formation which is already an endo-tet cyclization.

The spirocyclic ring system can be obtained by treatment of the diols 19 or 20 with TsOH . This ring system could also be prepared simply from the precursor esters 15 and 16a. Treating these esters with an excess of TsOH gave the spirocyclic

lactones 25 and 26. The nitrogen atom must be protonated during the rearrangement, which proceeds with complete stereospecificity. No prior hydrolysis of the esters to the corresponding carboxylic acids is needed in order to prevent allylic sulfide formation by loss of $\mathrm{H}^{\mathrm{A}}$ from the intermediate 27.

This is probably because the protonated amine slows down episulfonium ion formation and adjacent proton loss, so giving time for hydrolysis of the intermediate 28.

Despite this, the selective preparation of the allylic sulfides is possible by rearrangement of the protected compounds 29 $(\mathrm{R}=\mathrm{COPh})$ and 30 . The choice of protecting group is important as the use of a silyl group ( $\mathrm{R}=\mathrm{SiBu}^{\boldsymbol{t}} \mathrm{Ph}_{2}$ ) gave only a low yield of the allylic sulfide together with a substantial amount of the spirocyclic ether formed presumably by hydrolysis of the silyl group under the reaction conditions. As before,

the phenylthio group rearranges stereospecifically to give exclusively the syn allylic sulfides 31 and 32.

Removal of PhS from the Rearrangement Products.-If desired, the phenylthio group can be removed from the spirocyclic compounds, as already described ${ }^{4 a}$ for the 4methylpiperidone series. These desulfurizations were extended to the spirocyclic lactone 26 and the spirocyclic ether 23. Oxidation of the lactone 26 with sodium perborate ${ }^{9}$ gives a mixture of the sulfoxides which undergo syn-elimination on heating to give the spirocyclic butenolide 34.

Removal of the sulfur group from the ether 23 with Raney nickel gave the spirocyclic ether 35, isolated as the hydrochloride salt. Hence, by using a stereoselective aldol reaction

followed by stereospecific phenylthio migration (with concomitant cyclization) in just four steps the spirocyclic ether 35 with 1,3 -chirally related centres can be prepared. None of these compounds had any significant activity as muscarinic agonists.

## Experimental

3-Phenylthio-1-azabicyclo[2.2.2]octane-3-carbaldehyde 13.Butyllithium ( $1.55 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ solution in hexane; $110 \mathrm{~cm}^{3}, 170$ mmol) was slowly added to a solution of methoxymethyl phenyl sulfide ${ }^{5}$ ( $24 \mathrm{~cm}^{3}, 163 \mathrm{mmol}$ ) in dry tetrahydrofuran (THF) (200 $\mathrm{cm}^{3}$ ) under argon at $-30^{\circ} \mathrm{C}$. After 30 min , a solution of quinuclidin-3-one ( $18.5 \mathrm{~g}, 148 \mathrm{mmol}$ ) in dry THF $\left(100 \mathrm{~cm}^{3}\right)$ was added. After a further 20 min at $-30^{\circ} \mathrm{C}$, the solution was poured into saturated aq. ammonium chloride ( $300 \mathrm{~cm}^{3}$ ), acidified with $\mathrm{HCl}\left(3 \mathrm{~mol} \mathrm{dm}{ }^{-3} ; 100 \mathrm{~cm}^{3}\right)$, and the organic layer was removed. The aqueous layer was basified $(\mathrm{NaOH})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(4 \times 200 \mathrm{~cm}^{3}\right)$. The combined extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and evaporated to give the alcohol 12. Thionyl chloride ( $31 \mathrm{~cm}^{3}, 430 \mathrm{mmol}$ ) was added to a solution of the alcohol 12 in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(250 \mathrm{~cm}^{3}\right)$ under argon at $0^{\circ} \mathrm{C}$. After 2 h saturated aqueous potassium carbonate ( $200 \mathrm{~cm}^{3}$ ) was added and the solution was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 200$ $\mathrm{cm}^{3}$ ). The combined extracts were dried, evaporated, and purified by column chromatography on silica gel ( 500 g ), eluting with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{EtOH}-\mathrm{NH}_{3}(150: 8: 1)$ to give the aldehyde 13 $(19.9 \mathrm{~g}, 54 \%)$ as needles, m.p. $69-71^{\circ} \mathrm{C} ; \quad R_{\mathrm{f}}\left[\mathrm{CH}_{2} \mathrm{Cl}_{2}-\right.$ $\left.\mathrm{EtOH}-\mathrm{NH}_{3}(120: 8: 1)\right] 0.46 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1700(\mathrm{C}=\mathrm{O})$ and $1580(\mathrm{Ph}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 7.39-7.27(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 3.48(1 \mathrm{H}, \mathrm{dd}$, $J 14.4$ and $\left.2.2, \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{N}\right), 3.06-2.91\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right), 2.82$ ( 1 H , dd, $J 14.4$ and $2.4, \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{N}$ ), 2.39-2.31 (1 H, m, $\left.\mathrm{NCH}_{2} \mathrm{CH}\right), 2.06\left(1 \mathrm{H}\right.$, qn, $\left.J 3.1, \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}\right)$ and $1.64-1.50$ ( $3 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2}$ and $\mathrm{NCH}_{2} \mathrm{CH}$ ); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right)$ 194.27, 135.82, $129.27,128.99,128.88,60.03,52.62,47.45,45.45,45.91,25.35$, 24.31 and 21.76 (Found: $\mathrm{M}^{+}, 247.1022 . \mathrm{C}_{14} \mathrm{H}_{17} \mathrm{NOS}$ requires $M, 247.1031) ; m / z 247\left(100 \%, \mathrm{M}^{+}\right), 218(91, \mathrm{M}-\mathrm{CHO})$ and 110 (52, PhSH).
(2RS,3SR)-2,6-Dimethylphenyl 3-Hydroxy-2-methyl-3-(3'-phenylthio-1'-azabicyclo[2.2.2]octan- $\left.3^{\prime}-y l\right)$ propionoate 16.-A
solution of 2,6 -dimethylphenyl propionate $(8.74 \mathrm{~g}, 49.1 \mathrm{mmol}$ ) in THF ( $90 \mathrm{~cm}^{3}$ ) was added dropwise to a solution of lithium diisopropylamide (LDA) ( 55 mmol ) in THF ( $200 \mathrm{~cm}^{3}$ ) under argon at $-78^{\circ} \mathrm{C}$. After 1 h , a solution of aldehyde $13(11.55 \mathrm{~g}$, 46.8 mmol ) in THF ( $50 \mathrm{~cm}^{3}$ ) was added and the mixture was stirred for 15 min before being poured into saturated aq. sodium hydrogen carbonate ( $300 \mathrm{~cm}^{3}$ ). The organic layer was separated, and the aqueous layer was basified $(\mathrm{NaOH})$ and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(3 \times 200 \mathrm{~cm}^{3}\right)$. The combined extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and evaporated to give the mixture of esters $16 a$ and $16 b$. The residue was recrystallized from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane to give the ester $16 \mathrm{a}(14.24 \mathrm{~g}, 72 \%$ ) as prisms, m.p. $165-166^{\circ} \mathrm{C} ; R_{\mathrm{f}}\left[\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{EtOH}-\mathrm{NH}_{3}(120: 8: 1)\right] 0.28$; $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3560(\mathrm{OH}), 1735(\mathrm{C}=\mathrm{O})$ and $1580(\mathrm{Ph})$; $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 7.73-7.69(2 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 7.32-7.29(3 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 7.04$ ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OAr}$ ), $4.16(1 \mathrm{H}, \mathrm{t}, J 7.8, \mathrm{CHOH}), 3.68(1 \mathrm{H}, \mathrm{qn}, J 7.3$, $\mathrm{CHMe}), 3.01-2.80\left[6 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{3}\right], 2.68(1 \mathrm{H}, \mathrm{d}, J 8.1$, $\mathrm{CHOH}), 2.50-2.39\left(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}\right), 2.38(1 \mathrm{H}, \mathrm{qn}, J 3.0$, $\left.\left.\mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}\right), 2.31(6 \mathrm{H}, \mathrm{s}, \operatorname{ArMe})_{2}\right), 1.91-1.87(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{NCH}_{2} \mathrm{CH}\right), 1.62-1.44\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right)$ and $1.52(3 \mathrm{H}, \mathrm{d}, J$ 7.2, CHMe ); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right) 174.22,147.81,135.11,132.65,130.21$, 128.87, 128.58, 128.25, 79.45, 60.24, 57.70, 46.77, 46.50, 45.68, 26.47, 24.39, 23.34, 16.44 and 16.31 (Found: $\mathrm{M}^{+}, 425.2024$. $\mathrm{C}_{25} \mathrm{H}_{31} \mathrm{NO}_{3} \mathrm{~S}$ requires $\left.M, 425.2025\right)$; $m / z 425\left(10 \%, \mathrm{M}^{+}\right), 248$ ( $72, \mathrm{C}_{14} \mathrm{H}_{18} \mathrm{NOS}$ ) and 122 ( $100, \mathrm{Me}_{2} \mathrm{C}_{6} \mathrm{H}_{3} \mathrm{OH}$ ) (Found: C , 69.9; $\mathrm{H}, 7.6 ; \mathrm{N}, 3.3 . \mathrm{C}_{25} \mathrm{H}_{31} \mathrm{NO}_{3} \mathrm{~S}$ requires $\mathrm{C}, 70.55 ; \mathrm{H}, 7.34 ; \mathrm{N}$, $3.29 \%$ ).

Methyl 3-Hydroxy-2,2-dimethoxy-3-(3'-phenylthio-1'-aza-bicyclo[2.2.2]octan-3'-yl) propionate 18.-In the same way as for the ester 16, methyl dimethoxyacetate ( $4.95 \mathrm{ml}, 40.5 \mathrm{mmol}$ ) and the aldehyde $13(5.0 \mathrm{~g}, 20.2 \mathrm{mmol})$ gave the ester $18(4.83 \mathrm{~g}$, $63 \%, 1.4: 1$ mixture of diastereoisomers), purified by column chromatography on silica gel ( 200 g ) eluting with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-$ $\mathrm{EtOH}-\mathrm{NH}_{3}(100: 8: 1)$, as an oil, $\mathrm{R}_{\mathrm{f}}\left[\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{EtOH}-\mathrm{NH}_{3}\right.$ (100:8:1)] 0.38; $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1740(\mathrm{C}=\mathrm{O})$ and $1580(\mathrm{Ph})$; $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 7.65-7.61(2 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 7.55-7.51(2 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 7.32-$ $7.22(3 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 4.34(1 \mathrm{H}, \mathrm{d}, J 5.8, \mathrm{CHOH}), 4.18(1 \mathrm{H}, \mathrm{d}, J 8.9$, $\mathrm{CHOH}), 3.83(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.72(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.53(1 \mathrm{H}, \mathrm{d}, J 7.0$, $\mathrm{CHOH}), 3.22(1 \mathrm{H}, \mathrm{d}, J 8.9, \mathrm{CHOH}), 3.47(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.45(3 \mathrm{H}$, $\mathrm{s}, \mathrm{OMe}), 3.42(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.37(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 2.97-2.57[6 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{N}\left(\mathrm{CH}_{2}\right)_{3}\right], 2.57\left(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}\right)$ and $2.42-1.25[4 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2}\right] ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right) 168.88,168.22,137.26,134.50,133.88$, 131.56, 128.79, 128.56, 128.48, 127.27, 102.26, 101.87,77.90, 77.14, $59.51,58.05,57.22,56.26,52.66,51.37,51.30,50.16,49.67,47.01$, 46.76, 46.34, 28.79, 27.54, 24.83, 24.46, 24.05, 23.77 and 18.36 (Found: $\mathrm{M}^{+}, 381.1605 . \mathrm{C}_{19} \mathrm{H}_{27} \mathrm{NO}_{5} \mathrm{~S}$ requires $M, 381.1610$ ); $m / z$ $381\left(6 \%, \mathrm{M}^{+}\right), 248\left(100, \mathrm{C}_{14} \mathrm{H}_{18} \mathrm{NOS}\right)$ and $218\left(48, \mathrm{C}_{13} \mathrm{H}_{16} \mathrm{NS}\right)$.
(2RS,3RS,3'SR)-2-Methyl-3-(3'-phenylthio-1'-azabicyclo-[2.2.2]octan- $3^{\prime}$-yl)propane-1,3-diol 20.-Lithium aluminium hydride ( $190 \mathrm{mg}, 5.0 \mathrm{mmol}$ ) was added to a solution of the ester $16 a(988 \mathrm{mg}, 2.32 \mathrm{mmol})$ in dry THF ( $20 \mathrm{~cm}^{3}$ ) under argon at $0^{\circ} \mathrm{C}$. After 4 h , the mixture was quenched with dilute NaOH ( $0.01 \mathrm{~mol} \mathrm{dm}^{-3} ; 10 \mathrm{~cm}^{3}$ ), diluted with sodium potassium tartrate ( $0.1 \mathrm{~mol} \mathrm{dm}^{-3} ; 100 \mathrm{~cm}^{3}$ ), and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(3 \times 50$ $\mathrm{cm}^{3}$ ). 393.1820); $m / z 393\left(4 \%, M^{+}\right), 284(30, M-\mathrm{PhS})$ and 105 ( $100, \mathrm{PhCO}$ ).

4'-Methyl-(1-azabicyclo[2.2.2]octane)-3-spiro-2'-(furan)-5'one 34.-Sodium perborate $(143 \mathrm{mg}, 0.93 \mathrm{mmol})$ was added to a solution of the lactone $26(300 \mathrm{mg}, 0.88 \mathrm{mmol})$ in glacial acetic acid ( $3 \mathrm{~cm}^{3}$ ) under nitrogen at room temperature. After 5 h , water $\left(30 \mathrm{~cm}^{3}\right)$ and $\mathrm{NaOH}\left(2 \mathrm{~mol} \mathrm{dm}{ }^{-3} ; 25 \mathrm{~cm}^{3}\right)$ were added and the solution was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(4 \times 20$ $\mathrm{cm}^{3}$ ). The combined extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and evaporated to give the sulfoxide, which was heated to $110^{\circ} \mathrm{C}$ in dimethyl sulfoxide (DMSO) ( $1 \mathrm{~cm}^{3}$ ) for 30 min . Aqueous potassium carbonate $\left(10 \mathrm{~cm}^{3}\right)$ was added and the aqueous layer was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(5 \times 20 \mathrm{~cm}^{3}\right)$. The combined extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, evaporated, and purified by column chromatography on silica gel ( 25 g ), eluting with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{EtOH}-\mathrm{NH}_{3}(100: 8: 1)$ gave the butenolide 34 ( 46 mg , $27 \%$ ) as needles, m.p. $90-91^{\circ} \mathrm{C}$; $R_{\mathrm{f}}\left[\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{EtOH}-\mathrm{NH}_{3}\right.$ $(100: 8: 1)] \quad 0.28 ; \quad v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1740 \quad(\mathrm{C}=\mathrm{O})$ and 1650 $(\mathrm{C}=\mathrm{C}) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 7.18(1 \mathrm{H}, \mathrm{q}, J 1.5, \mathrm{HC}=\mathrm{C}), 3.03(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{NCH}_{2} \mathrm{CO}\right), 3.00-2.82\left[4 \mathrm{H}, \mathrm{m}, \mathrm{N}\left(\mathrm{CH}_{2}\right)_{2}\right], 2.16-2.02(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{NCH}_{2} \mathrm{CH}\right), 2.80(3 \mathrm{H}, \mathrm{d}, J 1.5, \mathrm{Me}), 1.82-1.77(1 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}\right), 1.74-1.66\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2}\right)$ and $1.55-1.42$ ( $1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}$ ); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right) 173.62,150.91,129.03,86.34$, 57.02, 46.40, 46.27, 31.04, 23.19, 21.19 and 10.46 (Found: $\mathbf{M}^{+}$, 193.1105. $\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{NO}_{2}$ requires $M, 193.1103$ ); $m / z 193(100 \%$, $\mathrm{M}^{+}$) and 96 (97, $\mathrm{M}-\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{O}_{2}$ ) (Found: $\mathrm{C}, 68.1 ; \mathrm{H}, 7.8 ; \mathrm{N}, 6.9$. $\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{NO}_{2}$ requires $\mathrm{C}, 68.37 ; \mathrm{H}, 7.82 ; \mathrm{N}, 7.25 \%$ ).
(2RS,4SR)-4'-Methyl-(1-azabicyclo[2.2.2]octane)-3-spiro-2'(tetrahydrofuran) 35.-Raney nickel ( $50 \%$ slurry in water; 1 g ) was added to a solution of the sulfide $23(75 \mathrm{mg}, 0.26 \mathrm{mmol})$ in ethanol ( $2 \mathrm{~cm}^{3}$ ) and the mixture was heated under reflux under nitrogen for 30 min . The suspension was filtered, washed with ethanol, and evaporated to give an oil to which ethereal $\mathrm{HCl}(2$ $\mathrm{cm}^{3}$ ) was added. The solvent was then evaporated off to give the tetrahydrofuran hydrochloride $35(24 \mathrm{mg}, 43 \%)$ as a foam, $\boldsymbol{R}_{\mathrm{f}}$ $\left[\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{EtOH}-\mathrm{NH}_{3}(100: 8: 1)\right] 0.20 ; v_{\max }\left(\mathrm{CHBr}_{3}\right) / \mathrm{cm}^{-1} 3420$
$\left(\mathrm{OH}_{2}\right) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 12.26\left(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}^{+}\right), 3.92(1 \mathrm{H}, \mathrm{t}, J 7.6$, $\left.\mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{O}\right), 3.37\left(1 \mathrm{H}, \mathrm{t}, J 7.6, \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{O}\right), 3.39-3.07[6 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{N}\left(\mathrm{CH}_{2}\right)_{3}\right], 2.38-2.28\left(3 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CO}\right.$ and CHMe$), 2.06-1.59$ [ $5 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2} \mathrm{CH}_{2} \mathrm{CH}$ and $\mathrm{N}\left(\mathrm{CH}_{2} \mathrm{CH}_{2}\right)_{2}$ ] and $1.04(3 \mathrm{H}, \mathrm{d}, J$ 6.3, CHMe ) (Found: $\mathrm{M}^{+}, 181.1467 . \mathrm{C}_{11} \mathrm{H}_{19} \mathrm{NO}$ requires $M$, 181.1466); $m / z 181\left(4 \%, \mathrm{M}^{+}\right), 96\left(90, \mathrm{C}_{6} \mathrm{H}_{10} \mathrm{~N}\right)$ and 84 ( 87 , $\mathrm{C}_{5} \mathrm{H}_{8} \mathrm{O}$ ).
