# Stereoselective Syntheses of the 14-Hydroxy Epimers of Amphotericin B Methyl Ester 

Benjamin J. Costello, Michael J. Driver, William S. MacLachlan* and Andrew W. Taylor SmithKline Beecham Pharmaceuticals, Great Burgh, Yew Tree Bottom Road, Epsom, Surrey KT18 5XQ, UK

(14R)-Hydroxyamphotericin B methyl ester 8 and its (14S)-epimer 12 have been obtained by way of $m$-CPBA oxidation of the enol ethers 5 and 6 respectively.

The polyene macrolide antibiotic ${ }^{1}$ amphotericin B $\mathbf{1}$ is widely used to combat severe systemic fungal infections. ${ }^{2}$ Amphotericin B was first isolated from Streptomyces nodusus ${ }^{3}$ and its structure has been determined by X-ray crystallography. ${ }^{4}$ Previous chemical manipulation includes its partial ${ }^{5}$ and total ${ }^{6}$ synthesis, selective degradation, ${ }^{7}$ functionalisation at $\mathrm{C}-16,{ }^{8,9}$ and derivatisation of its amino function. ${ }^{10}$ Following our identification of the dehydration at $\mathrm{C}-13,14$ of N -acetylamphotericin B methyl ester $2,{ }^{11}$ we now describe two synthetic sequences (Scheme 1) which yield ( $14 R$ )-hydroxyamphotericin B methyl ester 8 and its (14S)-epimer $12 . \dagger$ These stereoselective hydroxylations are the first reported substitution at C-14 of amphotericin B.
$N$-(Fmoc)amphotericin B methyl ester 3 was dehydrated by way of the silylated intermediate 4 to give the 13,14-anhydro derivative $5 \ddagger$ using our published methodology. ${ }^{11}$ Treatment of this ester 5 with $m$-CPBA in THF- $\mathrm{H}_{2} \mathrm{O}$ resulted in the chemoand stereo-selective dihydroxylation of the enol ether, in preference to the conjugated heptaene system, affording the ( $14 R$ )-hydroxy derivative 7 in $54 \%$ yield (after column chromatography). It is postulated that the initial attack of the electrophilic peracid at C -14 is directed by the hydroxy group at C -15, yielding the ( $14 R$ )-epimer as the sole product. In contrast, the pertriethylsilyl derivative 6 obtained by silylation of the anhydro ester 5 , gave solely the ( 145 )-hydroxy derivative 10 in $50 \%$ yield (after column chromatography) when treated with $m$ CPBA in hexane.§ Presumably blocking the directing effect of the C-15 hydroxy group by silylation results in attack on the enol ether from the less hindered $\beta$-face.

The novel hydroxylated derivatives 7 and 10 were con-
$\dagger$ Stereochemical assignments were made by correlation with 2D NMR of the corresponding 13-O-methyl acetals 9 and 13 .
$\ddagger$ Compounds 5-13 were characterised by ${ }^{13} \mathrm{C}$ NMR, ${ }^{1} \mathrm{H}$ NMR, IR, UV and FAB MS.
§ In hexane the peroxyacid adds across the enol ether ${ }^{12}$ introducing the ( $14 S$ )-hydroxy substituent and the axial ${ }^{7 b} 3$-chlorobenzoyloxy group at the anomeric centre. ${ }^{13}$
T/ The stereochemistry at $\mathrm{C}-13$ is evident ${ }^{14}$ from the large trans diaxial vicinal coupling obtained ( ${ }^{3} J_{14-\mathrm{H}, 13-\mathrm{F}}=23.3 \mathrm{~Hz}$ ) from the ${ }^{1} \mathrm{H}$ NMR spectrum of 11: $\delta_{\mathrm{H}}$ [400 $\mathrm{MHz} ; \mathrm{C}_{5} \mathrm{D}_{5} \mathrm{~N} / \mathrm{CD}_{3} \mathrm{OD}, 1: 1$; $\left.\mathrm{Me}_{4} \mathrm{Si}\right] 7.84(2 \mathrm{H}, \mathrm{d}, J 7.5, \mathrm{ArH}), 7.71(2 \mathrm{H}, \mathrm{t}, J 7.8, \mathrm{ArH}), 7.42$ ( 2 $\mathrm{H}, \mathrm{t}, J 7.5, \mathrm{ArH}), 7.30(2 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{ArH}), 6.62-6.33(12 \mathrm{H}$, complex, olefinic), $6.27(1 \mathrm{H}, \mathrm{dd}, J 15.4,8.3,20-\mathrm{H}), 5.56(1 \mathrm{H}, \mathrm{m}, 37-\mathrm{H}), 5.53$ ( 1 H, dd, $J 14.0,9.8,33-\mathrm{H}$ ), 4.77-4.75 (3 H, complex, 1'-H, 17-H, 19$\mathrm{H}), 4.55(1 \mathrm{H}, \mathrm{m}, 11-\mathrm{H}), 4.51-4.46(1 \mathrm{H}$, complex, $3-\mathrm{H}), 4.48(1 \mathrm{H}, \mathrm{t}$, $J$ 9.7, $15-\mathrm{H}), 4.37\left(2 \mathrm{H}, \mathrm{d}, J 9.7, \mathrm{NHCO}_{2} \mathrm{CH}_{2}\right), 4.24-4.21(2 \mathrm{H}$, complex, $2^{\prime}-\mathrm{H}, \mathrm{NHCO}_{2} \mathrm{CH}_{2} \mathrm{CH}$ ), 4.04 ( 1 H, dd, J $10.2,2.9,3^{\prime}-\mathrm{H}$ ), $3.98(1 \mathrm{H}, \mathrm{m}, 5-\mathrm{H}), 3.89(1 \mathrm{H}, \mathrm{m}, 9-\mathrm{H}), 3.80\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{CH}_{3}\right), 3.77$ $\left(1 \mathrm{H}, \mathrm{t}, J 9.9,4^{\prime}-\mathrm{H}\right), 3.58(1 \mathrm{H}$, dd, $J 23.3,9.4,14-\mathrm{H}), 3.57(1 \mathrm{H}, \mathrm{m}$, $\left.5^{\prime}-\mathrm{H}\right), 3.45(1 \mathrm{H}, \mathrm{m}, 8-\mathrm{H}), 3.40(1 \mathrm{H}, \mathrm{m}, 35-\mathrm{H}), 2.91(1 \mathrm{H}, \mathrm{t}, J 10.8$, $16-\mathrm{H}), 2.59-2.45$ ( 3 H , complex), 2.35 ( $1 \mathrm{H}, \mathrm{dd}, J 16.8,2.9,2-\mathrm{H}$ ), 2.27 ( $1 \mathrm{H}, \mathrm{m}, 18-\mathrm{H}$ ), 2.13-1.92 ( 5 H , complex), 1.79-1.51 ( 6 H , complex), $1.48\left(3 \mathrm{H}, \mathrm{d}, J 6.1,6^{\prime}-\mathrm{CH}_{3}\right), 1.35\left(3 \mathrm{H}, \mathrm{d}, J 6.4,38 \mathrm{CH}_{3}\right), 1.24(3 \mathrm{H}$, d, $\left.J 6.4,40-\mathrm{CH}_{3}\right)$ and $1.16\left(3 \mathrm{H}, \mathrm{d}, J 7.2,39-\mathrm{CH}_{3}\right)$.
verted into their corresponding amphotericin $\mathbf{B}$ methyl ester analogues. Treatment of 7 with piperidine ${ }^{8}$ in $\mathrm{DMSO}-\mathrm{MeOH}$ liberated the amine function to give the ( $14 R$ )-hydroxyamphotericin B methyl ester $8(80 \%)$. Desilylation of 10 with HF-pyridine in THF-pyridine resulted in concomitant cleavage of the anomeric benzoyl group to give the fluoride 11 $(32 \%)$. $\|$ Hydrolysis of the fluoride 11 (CSA-THF- $\mathrm{H}_{2} \mathrm{O}$ ) followed by regeneration of the amino group with piperidine in DMSO-MeOH gave ( $14 S$ )-hydroxyamphotericin $B$ methyl ester 12 ( $87 \%$ ).

## Experimental

(14R)-N-(9-Fluorenylmethoxycarbonyl)-14-hydroxyamphotericin B Methyl Ester 7.-To a solution of the polyene $5(0.372 \mathrm{~g}$, $0.37 \mathrm{mmol})$ in $\mathrm{THF}-\mathrm{H}_{2} \mathrm{O}\left(6: 1 ; 3 \mathrm{~cm}^{3}\right)$, at $0^{\circ} \mathrm{C}$ was added solid $m$-CPBA ( $0.067 \mathrm{~g}, 0.39 \mathrm{mmol}$ ). The coolant was removed and the reaction mixture was stirred at room temperature for 1 h and then diluted with ethyl acetate. The organic solution was washed sequentially with aqueous sodium metabisulfite, aqueous sodium hydrogen carbonate and water, dried $\left(\mathbf{M g S O}_{4}\right)$ and evaporated. The residue was purified by flash column chromatography on silica gel with the separated lower phase of chloroform-methanol-ammonium hydroxide (d 0.88 ) (5:1:1) mixture as eluent to give the polyene $7(0.207 \mathrm{~g}, 54 \%)$ as a yellow amorphous solid; $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 3427,3013,2972,2934$, $1717,1636,1514,1450,1376,1323,1190,1071,1010,905,882$, 848, 760, 742, 651 and 540; $\lambda_{\max }(\mathrm{MeOH}) / \mathrm{nm} 405,382,363$ and 344; $\delta_{\mathrm{H}}\left[400 \mathrm{MHz} ; \mathrm{C}_{5} \mathrm{D}_{5} \mathrm{~N}-\mathrm{CD}_{3} \mathrm{OD}, 1: 1 ; \mathrm{Me}_{4} \mathrm{Si}\right] 7.84(2 \mathrm{H}$, $\mathrm{d}, J 7.5, \mathrm{ArH}), 7.71(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.41(2 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{ArH}), 7.30(2$ $\mathrm{H}, \mathrm{t}, J 7.3, \mathrm{ArH}), 6.66-6.32$ ( 13 H , complex, olefinic), $5.63(1 \mathrm{H}$, $\mathrm{m}, 37-\mathrm{H}), 5.49(1 \mathrm{H}, \mathrm{dd}, J 14.7,10.2,33-\mathrm{H}), 4.88(1 \mathrm{H}, \mathrm{m}, 17-\mathrm{H})$, 4.77-4.67 (4 H, complex, 1'-H, 11-H, 15-H, 19-H), $4.46(1 \mathrm{H}, \mathrm{m}$, 3-H), $4.37\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NHCO}_{2} \mathrm{CH}_{2}\right), 4.24-4.20(2 \mathrm{H}$, complex, $\left.\mathrm{NHCO}_{2} \mathrm{CH}_{2} \mathrm{CH}, 2^{\prime}-\mathrm{H}\right), 4.07\left(1 \mathrm{H}, \mathrm{dd}, J 10.1,2.6,3^{\prime}-\mathrm{H}\right), 3.95$ ( 1 $\mathrm{H}, \mathrm{m}, 5-\mathrm{H}), 3.87(1 \mathrm{H}, \mathrm{d}, J 2.8,14-\mathrm{H}), 3.85(1 \mathrm{H}$, complex, $9-\mathrm{H})$, $3.80\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CO}_{2} \mathrm{CH}_{3}\right), 3.77\left(1 \mathrm{H}, \mathrm{t}, J 9.9,4^{\prime}-\mathrm{H}\right), 3.59\left(1 \mathrm{H}, \mathrm{m}, 5^{\prime}-\right.$ H), 3.47-3.36 ( 2 H , complex, $8-\mathrm{H}, 35-\mathrm{H}), 3.14(1 \mathrm{H}, \mathrm{t}, J 10.8,16-$ H), $2.56(1 \mathrm{H}$, complex $), 2.49(1 \mathrm{H}, \mathrm{dd}, J 16.9,9.7,2-\mathrm{H}), 2.40-2.27$ ( 3 H , complex), 2.13-1.92 ( 4 H , complex), 1.81-1.45 ( 7 H , complex), $1.49\left(3 \mathrm{H}, \mathrm{d}, J 5.8,6^{\prime}-\mathrm{CH}_{3}\right), 1.35(3 \mathrm{H}, \mathrm{d}, J 6.4,38-$ $\left.\mathrm{CH}_{3}\right), 1.24\left(3 \mathrm{H}, \mathrm{d}, J 6.4,40-\mathrm{CH}_{3}\right)$ and $1.17(3 \mathrm{H}, \mathrm{d}, J 7.1,39-$ $\mathrm{CH}_{3}$ ) ; $\delta_{\mathrm{c}}\left[100.6 \mathrm{MHz} ; \mathrm{C}_{5} \mathrm{D}_{5} \mathrm{~N}-\mathrm{CD}_{3} \mathrm{OD}, 1: 1 ; \mathrm{Me}_{4} \mathrm{Si}\right] 174.8$, 172.3, 158.1, 145.1, 145.0, 142.1, 137.5, 134.9, 134.8, 134.3, 134.2, $133.9,133.8,133.7,133.6,133.5,133.0,130.5,128.5,127.9,126.14$, $126.10,120.7,100.4,98.7,79.1,77.1,76.4,75.3,75.0,72.8,72.3$, $71.8,71.4,70.5,70.3,69.3,68.7,67.4,66.6,58.5,52.3,52.2,48.2$, $44.9,44.0,43.3,42.9,41.3,41.1,38.5,36.4,31.6,19.1,18.6,17.3$ and 12.6; m/z (FAB-thiodiethanol, sodium matrix) 1199 $\left(\mathrm{MNa}^{+}\right)$.
