# The Synthesis of 5-Ylidenepyrol-2(5H)-ones from Maleimides and from Pyrrol-2-(5H)-ones 

G. Bryon Gill, Gwyn D. James, Karen V. Oates and Gerald Pattenden* Department of Chemistry, The University, Nottingham NG7 2RD, UK

#### Abstract

A series of maleimides 5 have been prepared by reaction of the appropriate maleic anhydrides with either ammonium acetate or methylammonium acetate in boiling acetic acid. The maleimides underwent Wittig-type reactions with stabilised phosphoranes, under moderately forcing conditions, to give 5-ylidenepyrrol-2( $5 H$ )-ones 6. The ease of the reaction and the regiochemistry of the addition to unsymmetrical maleimides depended upon the nature of the 3 -substituent and on the presence or absence of an $N$-alkyl substituent. Thus, 3 -methoxymaleimides reacted exclusively at $\mathrm{C}-2$; the presence of an $N$-methyl substituent required the use of more forcing reaction conditions, but did not alter the preference for $\mathbf{C - 2}$ attack. With 3-methylmaleimides, however, the slight preference for reaction at $\mathbf{C}-2$ in $5 \mathbf{c}$ was overturned by the presence of an $N$-methyl substituent as in $5 \mathbf{d}$. The related reactions of unstabilised phosphoranes or phosphine oxides usually only afforded intractable gums, and with Julia-type reagents only starting materials were recovered. However, the lithium enolate of methyl trimethylsilylacetate (or other Peterson-type reagents) underwent successful addition to $N$-methylmaleimides at $-78^{\circ} \mathrm{C}$; the 5 -ylidenepyrrolone product distributions were similar to those obtained with the stabilised phosphoranes. Variation of the 5 -alkylidene side-chain was achieved through the reactions of $N$-methylmaleimides with alkyl Grignard reagents by dehydrating the first-formed 5-alkyl-5-hydroxypyrrolone. 4-Methoxy-1-methylpyrrol-2(5H)-one could be deprotonated exclusively at the 5 -position under kinetic control (i.e. BuLi, THF, $-78^{\circ} \mathrm{C}$ ), and the anion then quenched with a variety of electrophilic agents to give 5 -substituted pyrrolones. These derivatives proved amenable to dehydration or dehydrogenation, as appropriate, to afford the corresponding 5-alkylidenepyrrolones.

The 5 -ylidenepyrrol- $2(5 \mathrm{H})$-one structural unit 6 is found in a range of biologically important natural products including holomycin $\mathbf{1},{ }^{1}$ pukeleimide A $2,{ }^{2}$ isoampullicin $3,{ }^{3}$ and the bile pigment bilirubin $4 .{ }^{4}$ Although synthetic routes to the corresponding 5 -ylidenefuran- $2(5 \mathrm{H})$-ones and 4 -ylidenetetronic acids are well documented, ${ }^{5}$ apart from holomycin 1 and its relatives, ${ }^{6}$ very few synthetic studies towards 5 -ylidenepyrrol$2(5 H)$-ones have been published. In connection with synthetic studies with the natural products 1,2 and $\mathbf{3}$ we have examined the uses of substituted maleimides 5 and of pyrrolones 7 as starting materials in the elaboration of 5 -ylidenepyrrol-2(5H)ones by appropriate carbanion reactions (Scheme 1). In this paper we summarise the outcome of these investigations, and in the accompanying paper we describe the development of the

Scheme 1
studies in a total synthesis of pukeleimide A 2, a constituent of the blue green alga Lyngbya majuscula.

We began our studies by first examining synthetic routes to a variety of carbon and nitrogen substituted maleimides 5 , and then investigating systematically their reactivity with a range of carbon nucleophiles, particularly those associated with phosphorus (Wittig type), sulfur (Julia reaction), silicon (Peterson) and magnesium (Grignard reaction).

The majority of the methods reported for the synthesis of maleimides are based on the reactions of the corresponding maleic anhydrides 8 with an amine. This affords a half-amide adduct which can be dehydrated and cyclised with, for example, acetic anhydride. ${ }^{7}$ However, we found that a one-step method involving the action of the ammonium acetate 9 on the maleic anhydride 8 in boiling acetic acid, ${ }^{8}$ to be the most convenient and efficient means for effecting the conversion $8 \rightarrow 5$. Product yields were usually of the order $60-80 \%$ except for the cases where $R^{3}=H$, when yields of $20-50 \%$ were obtained.

## Reactions of Maleimides with Carbon Nucleophiles

(1) Phosphoranes.-The reaction of maleic anhydrides with stabilised phosphoranes leading to 5-ylidenefuran-2-ones is well precedented, ${ }^{9,10}$ and has provided the basis for the development of syntheses of the pulvinone, pulvinic acid, and multicolic acid

groups of natural pigments. ${ }^{9}$ The analogous reactions of maleimides have received scant attention despite the fact that the reactions of phosphoranes with both cyclic and acyclic amides are known to give the ylidene derivatives. ${ }^{11}$ This lack of interest may, in part, be due to the apparent need for forcing conditions (e.g. reaction in the melt or in boiling xylene) and in part to the modest product yields (ca. $20-60 \%$ ). Also, maleimide itself 5 $\left(\mathrm{R}^{1}-\mathrm{R}^{3}=\mathrm{H}\right)$ was reported ${ }^{11}$ to react by Michael addition to the $C=C$ (to give a 3-phosphoranyl adduct) rather than by nucleophilic attack at the $\mathrm{C}=\mathrm{O}$ group (to give the 5 ylidenepyrrolone plus $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{O}$ ). However, reaction of 3,4diphenylmaleimide with ethoxycarbonylmethylene(triphenyl)phosphorane (CMTP) did afford the product of 1,2 -or Wittig-type addition $(10 ; 58 \%),{ }^{10 b}$ but the stereochemistry of the olefination was not specified.

We were interested to discover the influence exerted by the substituent groups $R^{1}-R^{3}$ in the maleimide 5 on reactivity, and on the interplay of steric and electronic factors in dictating the regiochemistry of the nucleophilic attack and the stereochemistry of the 5 -ylidene products formed.

The symmetrical maleimides $5 \mathbf{a}$ and $\mathbf{5 b}$ were chosen as suitable substrates for the initial investigations. Both reacted with an excess of CMTP in boiling toluene to afford only products of Wittig addition. From the reaction with 5 a was isolated the $Z$-5-ylidene ester $119(71 \%)$ and only a trace of the $E$-isomer 12a could be detected in chromatographically concentrated tail fractions. In contrast, the reaction of the maleimide 5b gave an inseparable $7: 3$ mixture of $11 b: 12 b$ in only $21 \%$ yield with recovery of $\mathbf{5 b}(55 \%)$. Stereochemical assignments are based on ${ }^{1} \mathrm{H}$ NMR chemical shift data and on the results of NOE signal enhancements from double irradiation experiments. Thus, in 12a the olefinic proton resonates at $\delta_{\mathrm{H}} 6.02$ whereas in 11a the shift is 5.81 ppm (i.e. deshielding by $c i s-N$ of $c a .0 .2 \mathrm{ppm})$. The two vinyl methyl signals in 12a are split by 0.37 ppm , whereas the difference is only 0.09 ppm in 11 a ; i.e. a ca. 0.4 ppm deshielding effect caused by a cis-ester carbonyl group. Irradiation of the vinyl methyl groups in 11a in a NOE double-irradiation experiment caused a $2 \%$ enhancement of the olefinic-H signal (see Table 1 in Experimental section), thereby confirming the $Z$-stereochemistry. Likewise, in the 11b/12b mixture the olefinic-H signals at $\delta_{\mathrm{H}} 5.62$ and 5.48 may be assigned, respectively, to 12b and 11b. The $N$-Me signals at $\delta_{\mathrm{H}} 3.40$ and 3.13 are assigned to 11 b and 12 b , whereas the $\mathrm{C}-4$ vinyl methyl group in $\mathbf{1 2 b}$ suffers deshielding relative to that in $\mathbf{1 1 b}$ by 0.35 ppm .
The unsymmetrical maleimides 5c and 5d were appreciably more reactive towards CMTP than were 5 a and 5 b. Both afforded mixtures of olefination products. The major product from 3-methylmaleimide 5c was the $Z$-ylidenepyrrolone 13a $(30 \%)$ while the minor products were the $Z$ - and $E$ regioisomers, respectively $15 a(13 \%)$ and $16 a(9 \%)$. Compound 14a was not detected among the reaction products. Attack of a phosphorane on the corresponding citraconic anhydride is known to occur predominantly at the less hindered $\mathrm{C}=\mathrm{O}$ group $[C(2): C(5) \text { attack is } 1: 5]^{10 b}$ in a relatively fast, presumably kinetically-controlled process. The reaction with the maleimide

13

14

15

5c requires a six-fold excess of phosphorane and boiling toluene for 21 h to force completion, and it seems likely that these forcing conditions would favour the thermodynamic product (i.e. 13a). The absence of the $E$-isomer 14 a indicates that stereochemistry may be determined by steric factors, and this conclusion is supported by the product distribution in the analogous reaction of 1,3 -dimethylmaleimide 5 d . That reaction was somewhat slower, but all four isomeric ylidenepyrrolones were formed: $13 \mathrm{~b}+14 \mathrm{~b}$ in $4 \%$ yield as a $1: 1$ inseparable mixture, $15 \mathrm{~b}(2 \%)$ and $\mathbf{1 6 b}(29 \%)$. In the major product $\mathbf{1 6 b}$ the ester function is relatively unencumbered being cis to a vinylic-H atom. In all of the other products $\mathbf{1 3 b}, \mathbf{1 4 b}$ and $\mathbf{1 5 b}$ the ester moiety is adjacent to a methyl substituent which presumably disrupts planarity, and therefore conjugation. The $Z$-stereochemistry in 13a and $15 a$ could also be stabilised by the H-bonding interaction $\mathrm{N}-\mathrm{H} \cdot \mathrm{O}=\mathrm{C}-\mathrm{OEt}$; however, this may not be a dominant interaction in view of the fact that 16a is also a significant product. Assignments are again based on ${ }^{1} \mathrm{H}$ NMR shifts and on the results of NOE experiments (see Table 1).

We anticipated that the electronic effect of the 3-methoxy substituent would be particularly marked in the maleimides 5 e and 5 f, and $\mathrm{C}-2$ should be much more susceptible to nucleophilic attack than C-5. Maleimide 5e reacted with CMTP under relatively mild conditions (1 equiv., benzene, reflux, 26 h), and afforded only the ylidenepyrrolone $17 \mathrm{a}(94 \%$ ). The maleimide $5 f$ required more forcing conditions ( 8 equiv., toluene, reflux, 24 h ) and gave only the $Z$-alkylidenepyrrolone $\mathbf{1 7 b}(55 \%)$. A small quantity of the less hindered regio- and stereo-isomer $20 a(2 \%)$ was formed when only 2 equiv. of the phosphorane was employed. This possibly indicates that 20a is the kinetic product.
The analogous Wittig addition of CMTP to 3-methoxy-4methylmaleimide 5 g occurred under relatively mild conditions ( 2 equiv., toluene, reflux, 24 h ). The only ylidenepyrrolone isolated and identified by NOE (Table 1) was the $E$-isomer 22a $(36 \%)$, a result that was contrary to expectation based on steric effects and the possibility of H -bonding (i.e. 21a was the predicted major product). On the other hand, the related addition to 1,4-dimethyl-3-methoxymaleimide 5 h required forcing conditions for completion ( 10 equiv., toluene, reflux, $336 \mathrm{~h})$ and gave $21 \mathrm{~b}(60 \%)$ and $22 \mathrm{~b}(16 \%)$. When the same reaction was repeated, but allowed to run for $552 \mathrm{~h}, \mathbf{2 1 b}$ was again obtained whereas only a trace of 22 b could be detected. It would, therefore, appear that the alkoxycarbonylmethylene

17 a $\mathrm{R}=\mathrm{H} \quad \mathrm{X}=\mathrm{CO}_{2} \mathrm{Et}$
b $\mathrm{R}=\mathrm{Me} \mathrm{X}=\mathrm{CO}_{2} \mathrm{Et}$
c $\mathrm{R}=\mathrm{Me} X=\mathrm{CO}_{2} \mathrm{Me}$
d $R=M e X=S P h$
e $\mathrm{R}=\mathrm{Me} \mathrm{X}=\mathrm{Ph}$
f $\mathrm{R}=\mathrm{Me} \mathrm{X}=\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{OMe-p}$

21 a $R=H \quad X=\mathrm{CO}_{2} E t$
b $\mathrm{R}=\mathrm{Me} \mathrm{X}=\mathrm{CO}_{2} \mathrm{Et}$
c $\mathrm{R}=\mathrm{Me} \mathrm{X}=\mathrm{CO}_{2} \mathrm{Me}$
d $\mathrm{R}=\mathrm{Me} X=\mathrm{CO}_{2} \mathrm{Bu}^{t}$
e $R=M e X=S P h$
group can be stereomutated, and that 21b is the thermodynamically more stable isomer of the two.

A few other phosphoranes were examined as substrates for these reactions. The stabilised phosphorane $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CH}(\mathrm{CO}) \mathrm{SEt}$ reacted ( 3 equiv., toluene, reflux, 243 h ) with the maleimide 5a very sluggishly. Only the thio analogue of 11a $\left[\mathrm{CO}_{2} \mathrm{Et}=\mathrm{C}(\mathrm{O})\right.$ SEt] was obtained ( $21 \%$ ). The maleimide 5e failed to react with this phosphorane. $N$-Benzyl-3-methylmaleimide 5j failed to react with 5 equiv. of CMTP in boiling toluene during 100 h , presumably because of steric hindrance. The reactions of semistabilised phosphoranylides (e.g. $\mathrm{Ph}_{3} \mathrm{P}=\mathrm{CHCH}=\mathrm{CR}^{1} \mathrm{R}^{2} ; \mathrm{R}^{1}=$ $\mathbf{R}^{2}=\mathbf{H}, \mathbf{R}^{1}=\mathbf{R}^{2}=\mathrm{Me}$, or $\mathbf{R}^{1}=\mathbf{H}, \mathbf{R}^{2}=\mathbf{C H M e} 2$ ) with the maleimide $\mathbf{5 d}$ afforded only intractable gums.
(2) Anions from Phosphonates and Phosphine Oxides.Reactions of the phosphonate anion 23a or the phosphine oxide anion 23b with $N$-substituted maleimides afforded highly coloured solutions which, on aqueous work-up, gave only the starting phosphorus species. No starting maleimides or olefination products were ever observed or isolated. Presumably 23a, b are sufficiently basic to deprotonate the maleimide to give a species which is unstable at $0^{\circ} \mathrm{C}$ and decomposes. Reaction of 1,3-dimethylmaleimide 5 d with the phosphine oxide anions 24a or $\mathbf{2 4 b}$ gave only intractable tars; the maleimide $\mathbf{5 h}$, however, failed to react with these reagents and $50-75 \%$ of the starting materials were recovered. However, stabilisation of the anion by sulfur, as in 25, proved to be beneficial. Thus, reaction of $\mathbf{2 5}$ with the maleimide $5 f$ at $-78^{\circ} \mathrm{C}$ gave principally the $Z$ ylidenepyrrolone 17d (7-9\%), a trace of recovered $5 \mathrm{ff}(2 \%)$ and large amounts of starting phosphine oxide ( $71 \%$ ).

(3) $\alpha$-Sulfone Anions (the Julia Reaction).-In order to circumvent the problems encountered with unstabilised phosphoranes and the reagents in (2), above, the reactions of the less basic $\alpha$-sulfone anions were investigated briefly. The addition of 1,3-dimethylmaleimide 5 d or 1,4-dimethyl-3methoxymaleimide 5 h to a solution of the anion 26a afforded only starting material on work-up. Similar results were obtained with the anions 26b or $\mathbf{2 6 c}$ and $\mathbf{5 h}$. Although starting material recovery was only moderate, no evidence for addition products was obtained.
(4) Peterson Reagents.-The reactions of the Peterson reagent 27a, generated from methyl trimethylsilylacetate and lithium diisopropylamide, with $N$-methylmaleimides were more encouraging. Thus, reaction of a slight excess of $27 a$ with the maleimide 5d in THF at $-78^{\circ} \mathrm{C}(2 \mathrm{~h})$ afforded, after a hydrolytic work-up and chromatographic purification, an 11:9 mixture $(18 \%)$ of the $Z$ - and $E$-ylidenepyrrolones 13 c and 14 c plus a $1: 2$ mixture ( $17 \%$ ) of the $Z$ - and $E$-isomers 15 c and 16 c . In the Wittig reaction the $E$-isomer 16 b was the predominant product, whereas in the Peterson olefination (admittedly using a methyl rather than an ethyl ester), the product distribution was much more even over the four isomers. The Peterson reaction is considerably faster (i.e. 2 h at $-78^{\circ} \mathrm{C}$ versus 36 h at $110^{\circ} \mathrm{C}$ ) and is considered to be under kinetic control; the predominance of $\mathbf{1 6 b}$ in the Wittig reaction is a reflection of its greater thermodynamic stability among the isomers $\mathbf{1 3 b} \mathbf{- 1 6 b}$.

In contrast, reaction of 3-methoxy-1-methylmaleimide $\mathbf{5 f}$ with 27 a at $-78^{\circ} \mathrm{C}(3 \mathrm{~h})$ afforded a $4: 1$ mixture $(40 \%)$ of the $Z$ - and $E$-alkylidenepyrrolones 17 c and $18 a$. The similar reaction of the maleimide 5 h also afforded a $4: 1$ mixture of $Z$ and $E$-alkylidenepyrrolones 21c and 22c; recrystallisation removed the minor isomer to give pure $21 \mathrm{c}(51 \%)$. On the other hand, reaction of $\mathbf{5 h}$ with the bulky Peterson reagent $\mathbf{2 7 b}$ at $-78^{\circ} \mathrm{C}(1.5 \mathrm{~h})$ afforded only the $Z$-pyrrolone $21 \mathrm{~d}(51 \%)$. Hence, in the case of alkoxy-substituted maleimides, the Peterson reaction gives good regiochemical and stereochemical control.

The reaction of 3 -methoxy-1-methylmaleimide with the anion derived from phenylthiomethyltrimethylsilane 27c, however, appears to occur preferentially at the less electrophilic $\mathrm{C}=0$ group $\mathrm{C}-5$. Thus, reaction of 27 c with 5 f at $-78^{\circ} \mathrm{C}(2 \mathrm{~h})$ afforded three isomers- $19(27 \%)$, 18b as a $1: 1$ mixture $(8 \%)$ with 19 , and $20 b(25 \%$, plus recovery of phenylthiomethyltrimethylsilane ( $31 \%$ ). Structural assignments, which again rely on the results of NOE experiments (Table 1), are somewhat less clear-cut with these particular compounds.

By way of contrast, reaction of the maleimide 5 h with the anion 27c afforded a $1: 1$ mixture of the stereoisomers $21 e$ and 22d in low yield. The regaining of regioselectivity for attack at the $\mathrm{C}=\mathrm{O}$ nearest the OMe group, indicates that in the reaction of $\mathbf{5 f}$ with 27 c steric influences override electronic factors. Under similar conditions, the maleimide 5 d reacted with 27 c only to give gummy products. The 3-phenylthiomaleimide $\mathbf{5 i}$ reacted sluggishly with 27 c ; after 6 h at $-78^{\circ} \mathrm{C}, 82 \%$ of the maleimide was recovered and the olefination products $(2.5 \%)$ consisted of a mixture of three isomers.
(5) Aliphatic Grignard Reagents.-Awad et al., ${ }^{12}$ have studied the action of aromatic Grignard reagents on $N$ arylmaleimides. The product formed (i.e. $\beta$-aroyl- $N$-arylacrylamide ${ }^{12 a}$ or 1,5 -diaryl-5-hydroxypyrrolone) ${ }^{12 b}$ depended upon the substrate and conditions for the Grignard addition. Clearly, if an aliphatic Grignard reagent were to be employed for the addition, then the hydroxypyrrolone could, in principle, be dehydrated to provide a complementary route to alkylidene pyrrolones. We limited our studies to the reactions of the commercially available butylmagnesium chloride ( $2 \mathrm{~mol} \mathrm{dm}^{-3}$ in diethyl ether).

Treatment of 1,3-dimethylmaleimide 5d with a small excess of butylmagnesium chloride at $0^{\circ} \mathrm{C}$ afforded, after hydrolysis and chromatographic purification, the two hydroxypyrrolones 28a $(23 \%)$ and $29(28 \%)$. Consistent with these structural assignments were the observation of spectroscopic absorptions characteristic of the OH group: $v_{\max } 3560$ and $3570 \mathrm{~cm}^{-1}$ and $\delta_{\mathrm{H}}$ (broad singlets, removed by exchange with $\mathrm{D}_{2} \mathrm{O}$ ) at 4.75 and 5.20 ppm , respectively. Dehydration of 28a was achieved under either acidic (pTSA, benzene, reflux) or basic conditions (mesyl chloride, triethylamine) and gave 4:3 mixtures of the $E$ and $Z$-ylidenepyrrolones 30a. Isomer identification was based solely on the olefinic H -shifts in the ${ }^{1} \mathrm{H}$ NMR spectrum. In contrast, elimination of water from 29, by either method, proved to be more selective, affording only one isomer of 5-butylidene-1,3-dimethylpyrrolone 31 ( $62 \%$ ). Steric considerations suggest the $E$-stereochemistry, but no definitive assignment could be made on the basis of the data obtained.

28 a $R=M e$
b $R=O M e$

29

a $R=M e$ b $\mathrm{R}=\mathrm{OMe}$

31

32

Reaction of 3-methoxy-1-methylmaleimide 5 f with 2 equiv. of butylmagnesium chloride (THF, $-78^{\circ} \mathrm{C}$ ) afforded only the hydroxypyrrolone 28b ( $98 \%$ ). Dehydration under the above acidic conditions afforded a mixture of the butylidenepyrrolones $\mathbf{3 0 b}(34 \%$ ) and a yellow oil (ca. $20 \%$ ). The olefinic H -shifts in the ${ }^{1} \mathrm{H}$ NMR spectrum of $\mathbf{3 0 b}$ all occurred in the narrow range $\delta_{\mathrm{H}} 5.05-5.39$; hence, it was not possible to determine the isomer ratio and to assign stereochemistry in this case. The yellow oil was possibly impure 32 since the conversion of enol ethers of the type $\mathbf{3 0 b}$ into pyrrolidine-2,4-diones under acidic conditions is known. ${ }^{13}$
As before, the nucleophilic attack on an alkoxy-substituted maleimide was more selective than with an alkyl-substituted maleimide. The Grignard reaction appears to have potential for the introduction of a variety of side-chains in the preparation of pyrrolones.

Synthesis of 5-Ylidenepyrrolones from the Anions of 5-Unsubstituted Pyrrolones.-The synthesis of 5 -ylidenepyrrolones could, in principle, be achieved by a complementary general strategy to those discussed above. Thus, removal of a proton
from C-5 of a pyrrol-2-one by a suitable base would afford a nucleophile that could be trapped with a carbon electrophile. Depending upon the electrophilic species employed, the 5ylidenepyrrolone should then be accessible through the dehydration or dehydrogenation of the intermediate adducts. In our studies the pyrrolone 33a was chosen as a suitable model system. ${ }^{13,14}$

Deprotonation of 33a under thermodynamic control (1.1 equiv. LDA, THF, $-78^{\circ} \mathrm{C}, 30 \mathrm{~min}$ ), followed by quenching of the anion with deuteriomethanol (MeOD) afforded the deuterio derivative 33b. However, the ${ }^{1} \mathrm{H}$ NMR spectrum indicated contamination (ca. 35\%) with the 3-deuterio isomer. Deprotonation of 33 a under kinetic conditions ( 1.4 equiv. BuLi, THF, $-78^{\circ} \mathrm{C}, 45 \mathrm{~min}$ ), followed by quenching as before, led only to 33b ( $>70 \%$ ). Confirmation that C-5 deprotonation could be carried out selectively was obtained by performing the kinetic deprotonation and then quenching with an excess of methyl iodide. The pyrrolone 33c was obtained exclusively in 77-98\% yield.

Encouraged by these results, the kinetic anion from 33a was allowed to react with methyl bromoacetate. The ester 33d ( $74 \%$ ) and a small amount of starting pyrrolone 33a ( $8 \%$ ) were isolated. Dehydrogenation of 33d with chloranil in boiling benzene afforded an 8:1 mixture of the $Z$ - and $E$-ylidenepyrrolones $17 \mathrm{c}: 18 \mathrm{a}$. Chromatographic purification resulted in a partial separation into $17 \mathrm{c}(29 \%)$ and a $4: 1$ mixture of 17 c : 18 a (54\%).

Reaction of the pyrrolone 33a with aqueous formaldehyde in methanolic sodium hydroxide resulted in condensation and dehydration to give 4-methoxy-1-methyl-5-methylenepyrrolone 18e ( $c a .20 \%$ ); a similar condensation had been observed with the maleimide 5a. ${ }^{15}$ The related reaction of 33a with benzaldehyde gave a mixture of the $Z$ - and $E$-5-benzylidenepyrrolones 17 e and 18 c in variable ( $50-80 \%$ ) yield. It seemed likely that partial hydrolytic ring cleavage occurred under the conditions of the reaction. Pure samples of $17 \mathrm{e}(25 \%)$ and $\mathbf{1 8 c}$ ( $8 \%$ ) were obtained by chromatography. The condensation of tetramic acids with aromatic aldehydes under acidic alcoholic conditions has been reported previously. ${ }^{16}$

Generation of the anion from 33a under aprotic conditions, followed by the addition of aryl aldehyde, affords the intermediate adduct rather than the ylidenepyrrolone. The dehydration must then be accomplished in a separate step. Thus, treatment of 33a first with butyllithium and then with $p$ anisaldehyde gave the salt 34 . Treatment of the salt, without isolation, first with trifluoroacetic anhydride (TFAA) and then with 1,8 -diazabicyclo[5.4.0]undec-7-ene (DBU) effected transformation into a mixture of the ylidenepyrrolones 17 f and 18 d . The isomers were separated by chromatography, and stereochemistry established by ${ }^{1} \mathrm{H}$ NMR double-resonance experiments (Table 1). A similar sequence of reactions involving 33a and 4 -trimethylsilyloxybenzaldehyde (i.e. first BuLi and then TFAA-DBU) gave, after aqueous work-up, the hydroxybenzylidene derivative 35 ( $8 \%$ ). The $E$ - and $Z$-isomers, although

$\begin{array}{rl}37 a & R=H \\ b & R=M e\end{array}$

38a $R=M e$
b $R=H$
separable by HPLC, were only obtained as a mixture since isomerization proceeded with some ease.

The benzylidene derivative 35 was also prepared by an alkylation/dehydrogenation route. Thus, treatment of 33a with BuLi and then 4-methoxybenzyl bromide at $-78^{\circ} \mathrm{C}$ gave the benzyl derivative $33 \mathrm{e}(45 \%)$. On reaction with boron tribromide $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$ solution, $\left.20^{\circ} \mathrm{C}, 24 \mathrm{~h}\right)$, 33e underwent regiospecific demethylation to give the phenol $33 f(50 \%)$ which, on dehydrogenation with 2,3-dichloro-5,6-dicyanobenzoquinone (DDQ) in boiling dioxane ( 22 h ), was converted into the benzylidene derivative 35 ( $86 \%$ ). The dehydrogenation could occur in the 1,2 -sense (to give 35 directly) or the 1,6 -sense to give the quinone methide $\mathbf{3 6 a}$. The conversion $\mathbf{3 6 a} \rightarrow \mathbf{3 5}$ would be expected to occur rapidly through a protonation-deprotonation mechanism, the C-5 hydrogen of the pyrrolone being relatively acidic. We were interested in the generation of quinone methides such as $36 a$ because of the possibility of using these intermediates to promote the ring expansion of pyrrolones (e.g. 36a arrows) to give pyridones (e.g. 37). However, no evidence for pyridone formation was obtained in the dehydrogenation of 33f. Hence, in order to block the 1,2dehydrogenation pathway, 33 e was treated with BuLi at $-78^{\circ} \mathrm{C}$, and the anion quenched with an excess of methyl iodide to give a $2: 1$ mixture $(40 \%)$ of $38 \mathrm{a}: 33 \mathrm{e}$. Treatment of this mixture with boron tribromide in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, as above, and chromatographic purification of the product afforded the phenol 38b in moderate yield. However, dehydrogenation of 38b with DDQ afforded much tarry material plus a small quantity ( $18 \%$ ) of recovered $\mathbf{3 8 b}$. If the quinone methide $\mathbf{3 6 b}$ was formed, we were unable to detect any products, e.g. a pyridone, arising from a 1,2-migration mechanism.

## Experimental

General Procedures.-The majority of the organic solvents employed were distilled before use. Tetrahydrofuran (THF) was distilled freshly from sodium under nitrogen. Light petroleum refers to the fraction b.p. $40-60^{\circ} \mathrm{C}$. Organic solutions were dried over anhydrous magnesium sulfate, unless stated otherwise. Ether refers to diethyl ether.

Chromatographic purification was achieved over silica gel [Fluka Kieselgel G or Merck Kieselgel 60 (9385)], and Camlab plastic-backed UV254 silica gel plates were used for TLC analyses. A Reichert Kofler micro hot stage was used for m.p. determinations, and are uncorrected. IR spectra were recorded in a Perkin-Elmer 710B, Pye-Unicam SP3 100 or a Philips PU9706 spectrometer, and were calibrated using a standard polystyrene film. UV spectra were obtained using a Unicam

SP700 or SP800 or a Philips PU 8720 spectrophotometer and $\varepsilon$ values are expressed in $\mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$. Unless stated otherwise, solutions in deuteriochloroform were used for the determination of NMR spectra. Shifts are expressed in ppm downfield from $\mathrm{Me}_{4} \mathrm{Si}$ as internal standard and $J$ values are expressed in Hz . The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ spectra were recorded on a 90 MHz Perkin-Elmer R32, 90 MHz JEOL FX90Q, 80 MHz Bruker WP80SY, 250 MHz Bruker WM250 or a 400 MHz Bruker AM400 instrument. Signals were singlets unless specified otherwise: i.e. $d=$ doublet, $d d=$ double doublet, ddd $=$ double doublet of doublets; $d t=$ double triplet, $q=$ quartet, $\mathrm{m}=$ multiplet, $\mathrm{br}=$ broad. Assignments in the ${ }^{1} \mathbf{H}$ spectra were consistent with signal intensities and in the ${ }^{13} \mathrm{C}$ spectra with the results of the DEPT pulse sequence. Mass spectra were by electron impact and were recorded with an AEI MS-902 or VG Micromass 7070 E spectrometer. Microanalytical data were obtained on a Perkin-Elmer 240B elemental analyser.

General Procedure for the Preparation of 1H-Pyrrole-2,5diones $5 \mathbf{5 a - i}$. $^{8}$-A solution of the maleic anhydride and 1.25 equiv. of either ammonium acetate $9\left(\mathrm{R}^{3}=\mathrm{H}\right)$ or methylammonium acetate $9\left(\mathrm{R}^{3}=\mathrm{Me}\right)$ in glacial acetic acid (ca. 1 g substrate $/ 10 \mathrm{~cm}^{3}$ ) was heated under reflux for 2 h . The cooled solution was evaporated to dryness, and the residue was then diluted with water and extracted with ethyl acetate. The combined extracts were washed with $2 \mathrm{~mol} \mathrm{dm}^{-3}$ aqueous sodium hydroxide, dried, filtered and the solvent removed under reduced pressure. The residue thus obtained was then purified by chromatography, distillation or recrystallisation.

3,4-Dimethyl-1H-pyrrole-2,5-dione 5a.-The pyrroledione was prepared according to the general procedure and the residue was distilled under reduced pressure (b.p. 122$126^{\circ} \mathrm{C} / 10$ Torr) to give a white solid. Recrystallisation from hexane-benzene gave the maleimide $5 \mathrm{a}(53 \%$ ) as colourless prisms, m.p. $111-113^{\circ} \mathrm{C}$; $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 3250,1770,1710$ and $1670 ; \delta_{\mathrm{H}} 10.55(\mathrm{NH})$ and $1.88(2 \times \mathrm{Me}) ; \delta_{\mathrm{C}} 172.9(\mathrm{CO})$, $138.3(=\mathrm{C}-)$ and $8.6(=\mathrm{CMe})$ (Found: $m / z 125.0476 . \mathrm{C}_{6} \mathrm{H}_{7} \mathrm{NO}_{2}$ requires 125.0477 ).

1,3,4-Trimethyl-1H-pyrrole-2,5-dione 5b.-The pyrroledione was prepared according to the general procedure and the residue was distilled under reduced pressure to give the maleimide $5 \mathrm{~b}(78 \%)$ as a colourless oil, b.p. $55-65^{\circ} \mathrm{C} / 0.08$ Torr; $v_{\max }($ film $) / \mathrm{cm}^{-1} 1770$ and $1710 ; \delta_{\mathrm{H}} 3.03(\mathrm{NMe})$ and 1.99 $(2 \times \mathrm{Me}) ; \delta_{\mathrm{C}} 172.2(\mathrm{CO}), 137.3(=\mathrm{C}-), 23.7(\mathrm{NMe})$ and 8.6 (=CMe) (Found: $\mathrm{C}, 60.3 ; \mathrm{H}, 6.8 ; \mathrm{N}, 10.0 . \mathrm{C}_{7} \mathrm{H}_{9} \mathrm{NO}_{2}$ requires C , $60.4 ; \mathrm{H}, 6.5 ; \mathrm{N}, 10.1 \%$ ).

3-Methyl-1H-pyrrole-2,5-dione 5c.-The pyrroledione was prepared according to the general procedure and the residue was distilled under reduced pressure and the white solid obtained was then recrystallised from benzene to give citraconimide 5c $\left(20 \%\right.$ ), m.p. 103-104 ${ }^{\circ} \mathrm{C}$ (lit., ${ }^{17} 103.5-105.5^{\circ} \mathrm{C}$ ); $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3270,1760,1710$ and $1635 ; \delta_{\mathrm{H}}\left(\left[{ }^{2} \mathrm{H}_{6}\right]-\right.$ DMSO) 9.6-9.2 (NH), $6.60(\mathrm{q}, J 2,=\mathrm{CH}), 2.06\left(\mathrm{~d}, J 2,=\mathrm{CHCH}_{3}\right)$; $\delta_{\mathrm{C}}\left(\left[{ }^{2} \mathrm{H}_{6}\right] \mathrm{DMSO}\right) 173.3(\mathrm{CO}) \quad 172.4(\mathrm{CO}), 146.2(=C \mathrm{Me})$, $128.2(=\mathrm{CH})$ and $10.3(=C M e)(F o u n d: C, 54.1 ; \mathrm{H}, 4.7 ; \mathrm{N}, 12.6 \%$; M, $111.0327 . \mathrm{C}_{5} \mathrm{H}_{5} \mathrm{NO}_{2}$ requires $\mathrm{C}, 54.1 ; \mathrm{H}, 4.5 ; \mathrm{N}, 12.6 \% ; M$, 111.0320).

1,3-Dimethyl-1H-pyrrole-2,5-dione 5d.-The pyrroledione was prepared according to the general procedure and the residue was distilled under reduced pressure to give the maleimide $5 \mathrm{~d}(83 \%)$ as a colourless oil, b.p. $82-84^{\circ} \mathrm{C} / 10$ Torr (lit., ${ }^{18} 84-84.5^{\circ} \mathrm{C} / 10$ Torr); $v_{\max }($ film $) / \mathrm{cm}^{-1} 3100,1775,1710$ and $1640 ; \delta_{\mathrm{H}} 6.49(\mathrm{q}, J 1.8,=\mathrm{CH}), 3.08(\mathrm{NMe}), 2.15(\mathrm{~d}, J 1.8$, $=\mathrm{CMe}) ; \delta_{\mathrm{C}} 171.9(\mathrm{CO}) 170.9(\mathrm{CO}), 145.8(=C \mathrm{Me}), 127.4$
$(=\mathrm{CH}), 23.6\left(\mathrm{NCH}_{3}\right)$ and $10.8(=\mathrm{CMe})$ (Found: C, 57.6; H, 5.9; $\mathrm{N}, 11.2 \% . \mathrm{C}_{6} \mathrm{H}_{7} \mathrm{NO}_{2}$ requires $\mathrm{C}, 57.6 ; \mathrm{H}, 5.6 ; \mathrm{N}, 11.2 \%$ ).

3-Methoxy-1H-pyrrole-2,5-dione 5e.-The pyrroledione was prepared according to the general procedure and the residue was purified by chromatography (light petroleum-ether, 1:1) to give a yellow solid. Recrystallisation from diisopropyl ether gave fine buff crystals of the maleimide 5 e ( $30 \%$ ), m.p. $168.5-169{ }^{\circ} \mathrm{C}$ (lit.,$^{19} 169{ }^{\circ} \mathrm{C}$ ); $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3230,1715$ and $1640 ; \delta_{\mathrm{H}} 9.6-9.2(\mathrm{NH}), 5.69(=\mathrm{CH})$ and 4.02 (OMe); $\delta_{\mathrm{C}}\left(\left[{ }^{2} \mathrm{H}_{6}\right] \mathrm{DMSO}\right) 171.3(\mathrm{CO}), 166.7(\mathrm{CO}), 161.0(=\mathrm{COMe}), 97.7$ $(=\mathrm{CH})$ and 57.1 (OMe) (Found: $m / z$ 127.0273. $\mathrm{C}_{5} \mathrm{H}_{5} \mathrm{NO}_{3}$ requires 127.0269 ).

3-Methoxy-1-methyl-1H-pyrrole-2,5-dione $\mathbf{5 f}$.-The pyrroledione was prepared according to the general procedure and the residue was purified by chromatography (light petroleumether, 1:1) to give a yellow solid. Recrystallisation of this from hexane-benzene afforded soft yellow plates of the maleimide $\mathbf{5 f}$ $(65 \%)$, m.p. $129-130^{\circ} \mathrm{C} ; v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3110,1710$ and 1640 ; $\delta_{\mathrm{H}} 5.48(=\mathrm{CH}), 3.98(\mathrm{OMe})$ and $3.02(\mathrm{NMe}) ; \delta_{\mathrm{C}} 170.2(\mathrm{CO})$, $165.7(\mathrm{CO}), 161.2(=\mathrm{COMe}), 96.4(=\mathrm{CH}), 59.0(\mathrm{OMe})$ and 23.4 (NMe) (Found: C, 51.3; H, 5.1; N, 9.9\%; M, 141. $\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{NO}_{3}$ requires C, $51.1 ; \mathrm{H}, 5.0 ; \mathrm{N}, 9.9 \% ; M, 141$ ).

3-Methoxy-4-methyl-1H-pyrrole-2,5-dione 5g.-The pyrroledione was prepared according to the general procedure and the residue was a light brown solid. Recrystallisation from hexanebenzene gave the maleimide $5 \mathrm{~g}(63 \%)$ as colourless prisms, m.p. $138-139^{\circ} \mathrm{C}$; $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3240,1715$ and $1645 ; \delta_{\mathrm{H}} 8.0-$ 7.5 (br, NH), $4.15(\mathrm{OMe})$ and $1.95(=\mathrm{CMe})$ (Found: $m / z$ 141.0439. $\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{NO}_{3}$ requires 141.0426).

3-Methoxy-1,4-dimethyl-1H-pyrrole-2,5-dione 5 h .-The pyrroledione was prepared according to the general procedure and the residue was purified by chromatography (hexane-ether, 3:2). Recrystallisation from benzene-light petroleum ( $60-$ $80^{\circ} \mathrm{C}$ ) gave pink monoclinic crystals of the maleimide $5 \mathrm{~h}(62 \%)$, m.p. 67-68 ${ }^{\circ} \mathrm{C} ; v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1710$ and 1670; $\lambda_{\text {max }}(\mathrm{EtOH}) /$ nm 233 ; $\delta_{\mathrm{H}} 4.03$ (OMe), 2.85 (NMe), 1.93 ( CMe ); $\delta_{\mathrm{C}}$ 171.9 (CO), 166.7 (CO), 152.7 (=COMe), 109.8 (=CMe), 59.2 (OMe), 23.4 (NMe), 6.8 (=CMe) (Found: C, 54.3; H, 5.8; N, 9.1. $\mathrm{C}_{7} \mathrm{H}_{9} \mathrm{NO}_{3}$ requires $\mathrm{C}, 54.2 ; \mathrm{H}, 5.85 ; \mathrm{N}, 9.0 \%$ ).

1-Methyl-3-phenylthio-1H-pyrrole-2,5-dione 5i.-The pyrroledione was prepared according to the general procedure and the residue was purified by distillation to give the maleimide $5 \mathbf{5}$ $(61 \%)$ as sticky yellow oil, b.p. $165^{\circ} \mathrm{C} / 0.4$ Torr; $v_{\text {max }}{ }^{-}$ $\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3100,1765,1700$ and $1560 ; \delta_{\mathrm{H}} 7.7-7.4$ (m, $5 \times \mathrm{ArH}), 5.70(=\mathrm{CH})$ and $4.03(\mathrm{NMe}) ; \delta_{\mathrm{c}} 169.9(\mathrm{CO}), 167.9$ (CO), 152.5 (quat. C), $134.3(=\mathrm{CH}), 130.4(=\mathrm{CH}), 129.4(=\mathrm{CH})$, $129.0(=\mathrm{CH})$, 127.5 (quat. C), $119.0(=\mathrm{CH})$ and 23.9 (NMe) (Found: C, 60.3; H, 4.2; N, 6.5\%; M, 219.0356. $\mathrm{C}_{11} \mathrm{H}_{9} \mathrm{NO}_{2} \mathrm{~S}$ requires $\mathrm{C}, 60.3 ; \mathrm{H}, 4.1 ; \mathrm{N}, 6.4 \% ; M, 219.0354)$.

Preparation of 1-Benzyl-3-methyl-1 H-pyrrole-2,5-dione 5j.A mixture of citraconimide $5 \mathrm{c}(1.11 \mathrm{~g}, 10 \mathrm{mmol})$ and freshly prepared silver(1) oxide ( $1.16 \mathrm{~g}, 5 \mathrm{mmol}$ ) in dry acetonitrile ( 30 $\mathrm{cm}^{3}$ ) was stirred at room temperature in the dark for 22 h . The grey-brown solid was filtered off and then washed with cold acetonitrile ( $3 \times 10 \mathrm{~cm}^{3}$ ) and dried to leave a grey solid $(1.22 \mathrm{~g}$, $59 \%$ ); this silver salt was used without further purification. A solution of the citraconimide silver salt ( $1.22 \mathrm{~g}, 5.6 \mathrm{mmol}$ ) and benzyl chloride ( $1.43 \mathrm{~g}, 11.3 \mathrm{mmol}$ ) in dry toluene $\left(20 \mathrm{~cm}^{3}\right)$ was heated under reflux for 20 h . The orange solution was evaporated under reduced pressure to leave a residue which was purified by chromatography (light petroleum-ether, $4: 1$ ) to give the maleimide $5 \mathbf{5}$ ( $285 \mathrm{mg}, 24 \%$ ) as a pale yellow oil;
$v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1770,1710$ and $1640 ; \delta_{\mathrm{H}} 7.39(\mathrm{~m}, 5 \times \mathrm{ArH})$, $6.31(\mathrm{q}, J 2,=\mathrm{CH}), 4.75\left(\mathrm{CH}_{2} \mathrm{Ph}\right)$ and $2.02(\mathrm{~d}, J 2,=\mathrm{CMe})$ (Found: $m / z$ 201.0782. $\mathrm{C}_{12} \mathrm{H}_{11} \mathrm{NO}_{2}$ requires 201.0790).

## Reactions with Phosphoranes

(Z)-5-Ethoxycarbonylmethylene-3,4-dimethylpyrrol-2(5H)one 11a.-A solution of 3,4-dimethylmaleimide 5 ( $371 \mathrm{mg}, 2.96$ mmol ) and ethoxycarbonylmethylene(triphenyl)phosphorane ( $5.16 \mathrm{~g}, 14.81 \mathrm{mmol}, 5$ equiv.) in toluene ( $40 \mathrm{~cm}^{3}$ ) was heated under reflux for 112 h . The solution was evaporated to dryness under reduced pressure and the residue was then purified by chromatography (hexane-ether, $4: 1$ ) to give: (i) the title compound $11 \mathrm{a}(414 \mathrm{mg}, 71 \%$ ) which recrystallised from hexane as pale cream crystals, m.p. $79-80^{\circ} \mathrm{C} ; \lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} 275 ;$ $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1790,1715$ and $1660 ; \delta_{\mathrm{H}} 8.95(\mathrm{NH}), 5.81$ $(=\mathrm{CH}), 4.20\left(\mathrm{q}, \mathrm{J} 7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 2.00$ and $1.91(2 \times \mathrm{Me})$ and 1.32 (t, J 7, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: C, 61.9; H, 6.8; N, 7.2. $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires $\mathrm{C}, 61.5 ; \mathrm{H}, 6.7 ; \mathrm{N}, 7.2 \%$ ) and: (ii) a $2: 1$ mixture of the Z- and E-pyrrol-2(5H)-ones 11a and 12a ( 29 mg , $5 \%$ ) as a yellow solid; $\lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} 275 ; \nu_{\max }\left(\mathrm{CHCl}_{3}\right) /$ $\mathrm{cm}^{-1} 1780,1720$ and $1680 ; E$-isomer $\delta_{\mathrm{H}} 6.02(=\mathrm{CH}), 4.26(\mathrm{q}, \mathrm{J}$ $\left.7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 2.39$ and $2.02(2 \times \mathrm{Me})$ and $1.32(\mathrm{t}, J 7$, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: C, 61.7; H, 6.7; N, 7.4. $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires $\mathrm{C}, 61.5 ; \mathrm{H}, 6.7 ; \mathrm{N}, 7.2 \%$ ).
(Z)-5-(Ethylthio) carbonylmethylene-1 H-3,4-dimethylpyrrol$2(5 \mathrm{H})$-one $11 \mathrm{a}\left(\mathrm{CO}_{2} \mathrm{Et}=\mathrm{COSEt}\right)$.-A solution of 3,4-dimethylmaleimide 5 a ( $150 \mathrm{mg}, 1.2 \mathrm{mmol}$ ) and (ethylthio) carbonylmethylene(triphenyl)phosphorane ( $1.32 \mathrm{~g}, 3.62 \mathrm{mmol}, 3$ equiv.) in toluene ( $30 \mathrm{~cm}^{3}$ ) was heated under reflux for 10 days. The solution was evaporated to dryness under reduced pressure, and the residue purified by chromatography (hexane-ether, 4:1) to give the Z -ylidenepyrrol- $2(5 \mathrm{H}$ )-one $11 \mathrm{a}(52 \mathrm{mg}, 21 \%$ ) which recrystallised from benzene-hexane as pale green monoclinic crystals, m.p. $92-93^{\circ} \mathrm{C} ; \lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} 313 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) /$ $\mathrm{cm}^{-1} 3400,1715,1650$ and $1610 ; \delta_{\mathrm{H}} 9.2(\mathrm{NH}), 5.63(=\mathrm{CH}), 2.99$ $\left(\mathrm{q}, \mathrm{J} 6, \mathrm{COSCH}_{2} \mathrm{CH}_{3}\right), 2.00$ and $1.92(2 \times \mathrm{Me})$ and $1.30(\mathrm{t}, J 6$, $\mathrm{COSCH}_{2} \mathrm{CH}_{3}$ ) (Found: C, 56.9; H, 6.3; N, 6.7\%; M, 211.0657 . $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{2} \mathrm{~S}$ requires $\mathrm{C}, 56.9 ; \mathrm{H}, 6.2 ; \mathrm{N}, 6.6 \% ; M, 211.0647$ ).

5-Ethoxycarbonylmethylene-1,3,4-trimethylpyrrol-2(5H)-ones 11b and 12b.-A solution of 1,3,4-trimethylmaleimide 5b (230 $\mathrm{mg}, 1.65 \mathrm{mmol}$ ) and ethoxycarbonylmethylene(triphenyl)phosphorane ( $4.57 \mathrm{~g}, 13.12 \mathrm{mmol}, 8$ equiv.) in toluene ( $40 \mathrm{~cm}^{3}$ ) was heated under reflux for 233 h . The cooled solution was evaporated to dryness under reduced pressure and the residue was then purified by chromatography (hexane-ether, 3:2) to give: (i) starting material ( $126 \mathrm{mg}, 55 \%$ recovery) and (ii) a $7: 3$ mixture of Z- and E-pyrrol-2(5H)-ones 11b and $\mathbf{1 2 b}$ ( 73 mg , $21 \%)$, as a yellow oil; $\lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} 281 ; \nu_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1}$ 1710 and $1625 ; \delta_{\mathrm{H}} 5.62$ and $5.48(=\mathrm{CH}), 4.29(\mathrm{q}, J 7$, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), 3.13 and 3.40 (NMe), 2.30 and 2.04 ( $=\mathrm{CMe}$ ), 1.95 ( $2 \times=\mathrm{CMe}$ ) and 1.33 (t, J 7, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: $\mathrm{m} / \mathrm{z}$ 209.1046. $\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{NO}_{3}$ requires 209.1052).
(Z)-5-Ethoxycarbonylmethylene-1H-4-methylpyrrol-2(5H)one 13a and (Z)-and (E)-5-Ethoxycarbonylmethylene-3-methyl1 H -pyrrol- $2(5 \mathrm{H}$ )-ones 15 a and 16 a . - A solution of citraconimide $5 \mathrm{c}(246 \mathrm{mg}, 2.21 \mathrm{mmol}$ ) and ethoxycarbonylmethylene(triphenyl)phosphorane ( $4.95 \mathrm{~g}, 14.21 \mathrm{mmol}, 6.4$ equiv.) in toluene ( $50 \mathrm{~cm}^{3}$ ) was heated under reflux for 21 h . The cooled solution was evaporated to dryness under reduced pressure and the residue was then purified by chromatography (hexaneether, $1: 1$ ) to give: (i) the (Z)-pyrrol-2(5H)-one 15a ( $55 \mathrm{mg}, 13 \%$ ) which recrystallised from hexane as pale yellow needles, m.p. $76-76.5^{\circ} \mathrm{C} ; \quad \lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} \quad 305 \inf (\varepsilon \quad 12300)$ and 283 (16700); $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3400,1720,1700$ and $1655 ; \delta_{\mathrm{H}}$
$9.22(\mathrm{NH}), 6.77(=\mathrm{CH}), 5.37\left(=\mathrm{CHCO}_{2} \mathrm{Et}\right), 4.30(\mathrm{q}, J 7$, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), 2.04 (d, J 1.5, $=\mathrm{CMe}$ ) and 1.32 (t, J 7, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: C, 59.7; H, 6.2; N, 7.9. $\mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires $\mathrm{C}, 59.7 ; \mathbf{H}, 6.1 ; \mathrm{N}, 7.7 \%$ ), and (ii) a 3.1 mixture of Z and E-pyrrol-2( 5 H )-ones 13a and $16 \mathrm{a}(178 \mathrm{mg}, 39 \%$ ) which recrystallised from hexane-toluene as yellow plates, m.p. 157$161.5^{\circ} \mathrm{C} ; \lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} 315$ infl. and $278 ; \nu_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1}$ $3400,1720,1700$ and $1650 ; \delta_{\mathrm{H}} 9.12$ and $8.55(\mathrm{NH}), 6.12$ and $7.83(=\mathrm{CH}), 5.47$ and $5.65\left(=\mathrm{CHCO}_{2} \mathrm{Et}\right), 4.31$ ( $\mathrm{q}, J 7$, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), 2.14 and $2.06(\mathrm{~d}, J 1.5,=\mathrm{CMe})$ and $1.32(\mathrm{t}, J 7$, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: C, $59.5 ; \mathrm{H}, 6.2 ; \mathrm{N}, 7.8 \% \mathrm{C}_{9} \mathrm{H}_{11} \mathrm{NO}_{3}$ requires $\mathrm{C}, 59.7 ; \mathrm{H}, 6.1 ; \mathrm{N}, 7.7 \%$ ).

When the reaction was repeated with 6 equiv. of the phosphorane in boiling chloroform for 5 days, the isomer ratios were altered to the following: (i) starting material $5 \mathrm{c}(12 \%)$ and $15 a(13 \%)$ and (ii) $13 a(41 \%)$ and $16 a(11 \%)$.
(Z)- and (E)-5-Ethoxycarbonylmethylene-1,4-dimethylpyrrol$2(5 \mathrm{H})$-ones 13b and 14b and (Z)- and (E)-5-Ethoxycarbonyl-methylene-1,3-dimethylpyrrol-2(5H)-ones 15b and 16b.-A solution of 1,3 -dimethylmaleimide 5 d ( $240 \mathrm{mg}, 1.92 \mathrm{mmol}$ ) and ethoxycarbonylmethylene(triphenyl)phosphorane ( $3.3 \mathrm{~g}, 9.47$ $\mathrm{mmol}, 5$ equiv.) in toluene ( $40 \mathrm{~cm}^{3}$ ) was heated under reflux for 36 h . The solution was concentrated and the residue was then purified by chromatography (hexane-ether, $4: 1$ ) to give: (i) (Z)-5-ethoxycarbonylmethylene-1,3-dimethylpyrrol-2(5H)-one 15b $(8 \mathrm{mg}, 2 \%)$ as a yellow oil; $\lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} \mathrm{282;} \nu_{\max }-$ $\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} \quad 1710$ and $1635 ; \delta_{\mathrm{H}} 6.61 \quad(=\mathrm{CH}), 5.34$ $\left(=\mathrm{CHCO}_{2} \mathrm{Et}\right), 4.32\left(\mathrm{q}, J 7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 3.44(\mathrm{NMe}), 2.00$ ( $=\mathrm{CMe}$ ) and $1.32\left(\mathrm{t}, J 7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right.$ ); $\delta_{\mathrm{C}} 172.7(\mathrm{CO}), 164.8$ $\left(\mathrm{CO}_{2}\right), 148.0$ (quat. C), 135.5 (quat. C), $134.8(=\mathrm{CH}$ ), 100.0 $(=\mathrm{CH}), 60.6\left(\mathrm{OCH}_{2}\right), 30.0(\mathrm{NMe}), 14.3(\mathrm{Me})$ and $10.8(\mathrm{Me})$ (Found: C, 61.6; H, 7.0; N, $7.0 \%$, M, 195.0885. $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires $\mathrm{C}, 61.5 ; \mathrm{H}, 6.7 ; \mathrm{N}, 7.2 \%$; $M$, 195.0895); (ii) (E)-5-ethoxycarbonylmethylene-1,3-dimethylpyrrol-2(5H)-one 16b ( $108 \mathrm{mg}, 29 \%$ ) which was recrystallised from benzene to give light green needles, m.p. $93-94^{\circ} \mathrm{C} ; \lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} 280(\varepsilon$ 18500 ) and 322 (5800); $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1710,1670$ and $1640 ; \delta_{\mathrm{H}} 7.82(=\mathrm{CH}), 5.51\left(=\mathrm{CHCO}_{2} \mathrm{Et}\right), 4.34(\mathrm{q}, J 7$, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}, 3.10(\mathrm{NMe}), 2.02(=\mathrm{CMe})$ and $1.34(\mathrm{t}, \mathrm{J} 7$, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}} 170.7(\mathrm{CO}), 165.9\left(\mathrm{CO}_{2}\right), 151.6$ (quat. C), 137.4 (quat. C), $129.2(=\mathrm{CH}), 97.4(=\mathrm{CH}), 60.4\left(\mathrm{OCH}_{2}\right), 25.7$ (NMe), 14.3 (Me) and 11.1 (Me) (Found: C, 61.6; H, 6.8; N, $7.1 \%$; M, 195.0898. $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires C, $61.5 ; \mathrm{H}, 6.7 ; \mathrm{N}$, $7.2 \%$; $M$, 195.0895), and (iii) a $3: 2$ mixture of Z- and E-pyrrol$2(5 \mathrm{H})$-ones 13 b and 14 b ( $16 \mathrm{mg}, 4 \%$ ) which was recrystallised from hexane to give an off-white solid, m.p. $67-73^{\circ} \mathrm{C}$; $\lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm}$ 326infl. and 272; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1710$ and $1630 ; \delta_{\mathrm{H}}(E$ - and $Z$-, respectively) 6.15 and $6.09(=\mathrm{CH})$, 5.60 and $5.50\left(=\mathrm{CHCO}_{2} \mathrm{Et}\right), 4.33$ (q, J 7, $\left.\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right)$, 3.10 and $3.37(\mathrm{NMe}), 2.39$ and $2.14(=\mathrm{CMe})$ and $1.32(\mathrm{t}, J$ $7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: $\mathrm{C}, 61.2 ; \mathrm{H}, 6.7 ; \mathrm{N}, 7.1 \% ; \mathrm{M}$, 195.0889. $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires $\mathrm{C}, 61.5 ; \mathrm{H}, 6.7 ; \mathrm{N}, 7.2 \% ; M$, 195.0895).

Similar results were obtained using boiling chlorobenzene as solvent and 1 equiv. of the phosphorane ( 24 h ).
(Z)-5-Ethoxycarbonylmethylene-1 H-4-methoxypyrrol-2(5H)one 17a.-A solution of 3-methoxy-1 $H$-pyrrole-2,5-dione 5e (91 $\mathrm{mg}, 0.716 \mathrm{mmol}$ ) and ethoxycarbonylmethylene(triphenyl)phosphorane ( $249 \mathrm{mg}, 0.715 \mathrm{mmol}, 1$ equiv.) in dry benzene ( 20 $\mathrm{cm}^{3}$ ) was heated under reflux for 26 h . The cooled solution was concentrated, and the residue was then purified by chromatography (light petroleum-ether, 1:1) to give the Z-ylidenepyrrol$2(5 \mathrm{H})$-one $17 \mathrm{a}\left(133 \mathrm{mg}, 94 \%\right.$ ) as a white solid, m.p. $120-125^{\circ} \mathrm{C}$; $\lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} 282$ and $262 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3300,1715$, 1660 and $1610 ; \delta_{\mathrm{H}} 8.7(\mathrm{NH}), 5.59\left(=\mathrm{CHCO}{ }_{2} \mathrm{Et}\right), 5.28(=\mathrm{CH})$, 4.29 (q, J 7, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), 3.95 (OMe) and 1.32 ( $\mathrm{t}, J 7$,

$\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: C, 54.6; H, 5.7; N, 7.3\%; M, 197.0694. $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{NO}_{4}$ requires C, $54.8 ; \mathrm{H}, 5.6 ; \mathrm{N}, 7.1 \% ; M, 197.0688$ ).
(Z)-5-Ethoxycarbonylmethylene-4-methoxy-1-methylpyrrol$2(5 \mathrm{H})$-one 17 b .-A solution of 3 -methoxy-1-methylmaleimide 5 ( $177 \mathrm{mg}, 1.25 \mathrm{mmol}$ ) and ethoxycarbonylmethylene(triphenyl)phosphorane ( $3.5 \mathrm{~g}, 10.05 \mathrm{mmol}, 8$ equiv.) in toluene ( 40 $\mathrm{cm}^{3}$ ) was heated under reflux for 24 h . The solution was evaporated to dryness under reduced pressure and the residue was purified by column chromatography (hexane-ether, 3:2) to give the Z-ylidenepyrrol-2(5H)-one 17 b ( $146 \mathrm{mg}, 55 \%$ ), which recrystallised from ether as colourless needles, m.p. $133-134^{\circ} \mathrm{C}$; $\lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} \quad 280 ; \quad v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} \quad 1720, \quad 1635$ and $1620 ; \delta_{\mathrm{H}} 5.68\left(=\mathrm{CHCO}_{2} \mathrm{Et}\right), 5.23(=\mathrm{CH}), 4.25(\mathrm{q}, J 7$, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ), 3.91 ( OMe ), 3.37 (NMe) and 1.30 ( $\mathrm{t}, J 7$, $\mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: C, 56.7; H, 6.2; N, 6.8\%; M, 211.0881. $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{4}$ requires C, $56.9 ; \mathrm{H}, 6.2 ; \mathrm{N}, 6.6 \% ; M, 211.0844$ ).

When the reaction was repeated with 2 equiv. of the stabilised phosphorane in refluxing toluene for 48 h , the reaction products were altered to give: (i) (E)-5-ethoxycarbonylmethylene-3-meth-oxy-1-methylpyrrol- $2(5 \mathrm{H}$ )-one 20a ( $2 \%$ ) which recrystallised from hexane as pale yellow needles, m.p. $96-98^{\circ} \mathrm{C} ; \lambda_{\max }(\mathrm{EtOH}) /$ $\mathrm{nm} 293 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1735,1705$ and $1635 ; \delta_{\mathrm{H}} 7.00$ ( $=\mathrm{CH}$ ), $5.50\left(=\mathrm{CHCO}_{2} \mathrm{Et}\right.$ ), $4.35\left(\mathrm{q}, \mathrm{J} 7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 3.92$ (OMe), 3.12 (NMe) and 1.38 (t, $J 7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: C, $56.8 ; \mathrm{H}, 6.1 ; \mathrm{N}, 6.5 \% ; \mathrm{M}, 211.0850 . \mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{4}$ requires C, 56.9; $\mathrm{H}, 6.2 ; \mathrm{N}, 6.6 \% ; M, 211.0844$ ); (ii) the Z-ylidenepyrrol-2(5H)-one 17b ( $47 \%$ ), and (iii) recovered starting material 5 ( $4 \%$ ).
(E)-5-Ethoxycarbonylmethylene-1H-4-methoxy-3-methyl-. pyrrol-2(5H)-one 22a.-A solution of 3-methoxy-4-methyl-1 $H$-pyrrole-2,5-dione $5 \mathrm{~g}(0.211 \mathrm{~g}, 1.5 \mathrm{mmol})$ and ethoxycarbonylmethylene(triphenyl)phosphorane ( $1.39 \mathrm{~g}, 3.99$ $\mathrm{mmol}, 2.66$ equiv.) in toluene ( $35 \mathrm{~cm}^{3}$ ) was heated under reflux for 24 h . The toluene was evaporated under reduced pressure
and the residue was then purified by chromatography (hexaneether, 3:1) to give the E-alkylidenepyrrol-2(5H)-one 22a ( 75 mg , $36 \%$ ) as a white solid which was recrystallised from benzenehexane to give fine white crystals, m.p. $89-90^{\circ} \mathrm{C}$; $\lambda_{\max }(\mathrm{MeO}-$ $\mathrm{H}) / \mathrm{nm} 288$ and $325 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3410,1720,1693,1660$ and $1640 ; \delta_{\mathrm{H}} 8.6(\mathrm{NH})$, $5.5(=\mathrm{CH}), 4.2\left(\mathrm{q}, J 7, \mathrm{OCH}_{2}\right), 4.1$ $\left(\mathrm{OCH}_{3}\right), 2.1\left(=\mathrm{CCH}_{3}\right)$ and $1.3\left(\mathrm{t}, J 7, \mathrm{CH}_{3}\right)$; for NOE data see Table $1 ; \delta_{\mathrm{C}} 171.86(\mathrm{CO}), 167.25\left(\mathrm{CO}_{2}\right), 158.08(=\mathrm{COMe}), 146.37$ (quat. C), 105.06 (quat. C), $92.22(=\mathrm{CH}), 60.55\left(\mathrm{OCH}_{2}\right), 58.96$ (OMe), 14.29 (Me) and 8.04 (Me) (Found: C, 56.4; H, 6.2; $\mathrm{N}, 6.4 \% ; \mathrm{M}, 211.0860 . \mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires C, $56.8 ; \mathrm{H}, 6.2 ; \mathrm{N}$, $6.6 \% ; M, 211.0844$ ).
(Z)- and (E)-5-Ethoxycarbonylmethylene-4-methoxy-1,3-di-methylpyrrol- $2(5 \mathrm{H})$-ones 21 b and $\mathbf{2 2 b}$.- A solution of 3-meth-oxy-1,4-dimethylmaleimide $5 \mathrm{~h}(120 \mathrm{mg}, 0.77 \mathrm{mmol})$ and ethoxycarbonylmethylene(triphenyl)phosphorane ( $2.7 \mathrm{~g}, 7.75$ $\mathrm{mmol}, 10$ equiv.) in toluene ( $35 \mathrm{~cm}^{3}$ ) was heated under reflux for 336 h . The cooled solution was concentrated and the residue was then purified by chromatography (hexane-ether, $3: 1$ ) give: (i) the Z-pyrrol-2(5H)-one $21 \mathrm{~b}(116 \mathrm{mg}, 60 \%)$ as a yellow oil which solidified, m.p. $47-48^{\circ} \mathrm{C}$ (ether-hexane); $\lambda_{\max }(\mathrm{EtOH}) /$ $\mathrm{nm} 285 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1705,1665$ and $1625 ; \delta_{\mathrm{H}} 5.63$ $(=\mathrm{CH}), 4.23\left(\mathrm{q}, \mathrm{J} 7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 4.13(\mathrm{OMe}), 3.36(\mathrm{NMe})$, $2.07(=\mathrm{CMe})$ and $1.32\left(\mathrm{t}, \mathrm{J} 7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}} 171.7(\mathrm{CO})$, $164.0\left(\mathrm{CO}_{2}\right), 157.2(=\mathrm{COMe}), 143.6$ (quat. C ), 101.4 (quat. C ), $93.3(=\mathrm{CH}), 59.4\left(\mathrm{OCH}_{2}\right), 58.1(\mathrm{OMe}), 28.4(\mathrm{NMe}), 13.2(\mathrm{Me})$ and 7.2 (Me) (Found: C, 58.4; H, 6.9\%; M, 225.0989. $\mathrm{C}_{11} \mathrm{H}_{15} \mathrm{NO}_{4}$ requires $\mathrm{C}, 58.7 ; \mathrm{H}, 6.7 \% ; M, 225.1001$ ) and (ii) the E-pyrrol-2( 5 H )-one 22b ( $27 \mathrm{mg}, 15 \%$ ) as a yellow oil; $\lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} 285 ; \nu_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1710,1665$ and $1630 ; \delta_{\mathrm{H}}$ $5.45(=\mathrm{CH}), 4.24\left(\mathrm{q}, J 7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 4.05$ (OMe), 3.13 (NMe), $2.03(=\mathrm{CMe})$ and $1.32\left(\mathrm{t}, \mathrm{J} 7, \mathrm{CO}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right)$ (Found: $m / z 225.0982 . \mathrm{C}_{11} \mathrm{H}_{15} \mathrm{NO}_{4}$ requires 225.1001).

## Reactions with the Anions from Phosphonates and Phosphine Oxides

(Z)-4-Methoxy-1-methyl-5-phenylthiomethylenepyrrol-2(5H)one 17 d .-A $1.6 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of butyllithium in hexanes ( $0.66 \mathrm{~cm}^{3}, 1.06 \mathrm{mmol}$ ) was added dropwise over 2 min to a stirred solution of diphenyl(phenylthiomethyl)phosphine oxide ${ }^{20}$ ( $343 \mathrm{mg}, 1.06 \mathrm{mmol}$ ) in dry THF $\left(15 \mathrm{~cm}^{3}\right)$ at $-78{ }^{\circ} \mathrm{C}$. A yellow colour rapidly developed and after the solution had been stirred for 20 min at $-78^{\circ} \mathrm{C}$, 3-methoxy-1-methylmaleimide $5 \mathrm{f}(149 \mathrm{mg}, 1.06 \mathrm{mmol})$ in THF $\left(2 \mathrm{~cm}^{3}\right)$ was added all at once. The solution was stirred at $-78^{\circ} \mathrm{C}$ for 1 h and then poured into saturated aqueous ammonium chloride. The mixture was extracted with chloroform and then purified by chromatography (ether) to give: (i) impure $Z$-ylidenepyrrol$2(5 \mathrm{H})$-one $17 \mathrm{~d}(23 \mathrm{mg}, 9 \%)$ as a yellow solid, and (ii) the starting phosphine oxide ( $243 \mathrm{mg}, 71 \%$ ).

## Reactions with Peterson Reagents

Reaction between 1,3-Dimethyl-1H-pyrrole-2,5-dione and Methyl Trimethylsilylacetate; Formation of 13c-16c.-A solution of methyl trimethylsilylacetate ( $433 \mathrm{mg}, 2.96 \mathrm{mmol}$ ) in dry THF ( $1 \mathrm{~cm}^{3}$ ) was added dropwise over 2 min to a stirred solution of LDA ( 3.11 mmol , 1.05 equiv.) in dry THF ( $15 \mathrm{~cm}^{3}$ ) at $-78^{\circ} \mathrm{C}$. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 40 min , and then a solution of 1,3 -dimethylmaleimide $5 \mathrm{~d}(363 \mathrm{mg}, 2.90$ mmol ) in dry THF ( $1 \mathrm{~cm}^{3}$ ) was added over 10 min . The solution was stirred at $-78^{\circ} \mathrm{C}$ for 2 h , and then allowed to warm up to room temperature, when it was quenched with water ( $20 \mathrm{~cm}^{3}$ ) and extracted with chloroform ( $3 \times 15 \mathrm{~cm}^{3}$ ). The combined extracts were dried and concentrated under reduced pressure to leave an orange oil which was then purified by chromatography
(hexane-ether, 4:1) to give: (i) a $1: 2$ mixture of ( Z )- and ( E )-5-ethoxycarbonylmethylene-1,3-dimethylpyrrol-2-(5H)-ones 15c and $16 c(88 \mathrm{mg}, 17 \%$ ) which recrystallised from hexane as white needles, m.p. $87-92^{\circ} \mathrm{C} ; \lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm}$ 314infl. and 279 ; $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1715,1700,1635$ and $1620 ; \delta_{\mathrm{H}} 7.81$ and $6.62(\mathrm{q}, J 1.5,=\mathrm{CH}), 5.52$ and $5.31\left(=\mathrm{CHCO}_{2} \mathrm{Me}\right), 3.83(\mathrm{OMe})$, 3.14 and 3.44 (NMe) and $2.04(=\mathrm{CMe}$ ) (Found: C, 59.7; H, 6.3; $\mathrm{N}, 8.0 \% ; \mathrm{M}, 181.0757 . \mathrm{C}_{9} \mathrm{H}_{11} \mathrm{NO}_{3}$ requires C, $59.7 ; \mathrm{H}, 6.1 ; \mathrm{N}$, $7.7 \%, M, 181.0793$ ) and (ii) an $11: 9$ mixture of (Z)- and (E)-5-ethoxycarbonylmethylene-1,4-dimethylpyrrol-2(5H)-ones 13 c and $14 \mathrm{c}\left(97 \mathrm{mg}, 18 \%\right.$ ) as a colourless oil; $\lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm}$ 314infl. and 275; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1715,1705,1635$ and $1615 ; \delta_{\mathrm{H}} 6.12$ and $6.07(\mathrm{q}, J 1.5,=\mathrm{CH}), 5.62$ and 5.47 $\left(=\mathrm{CHCO}_{2} \mathrm{Me}\right), 3.80(\mathrm{OMe}), 3.08$ and $3.35(\mathrm{NMe}), 2.37$ and 2.12 (d, $J$ 1.5, $=$ CMe) (Found: $m / z$ 181.0751. $\mathrm{C}_{9} \mathrm{H}_{11} \mathrm{NO}_{3}$ requires 181.0739).
(Z)- and (E)-4-Methoxy-5-methoxycarbonylmethylene-1-methylpyrrol-2(5H)-ones 17 c and 18a.-A solution of methyl trimethylsilylacetate ( $127 \mathrm{mg}, 0.87 \mathrm{mmol}$ ) in dry THF $\left(1 \mathrm{~cm}^{3}\right)$ was added dropwise over 2 min to a stirred solution of LDA $(0.87 \mathrm{mmol})$ in dry THF $\left(15 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 35 min , and then 3-methoxy-1methylmaleimide $\mathbf{5 f}(123 \mathrm{mg}, 0.87 \mathrm{mmol})$ was added to it and the solution was stirred at $-78^{\circ} \mathrm{C}$ for 3 h . The vivid pink solution was quenched with water and then thoroughly extracted with chloroform ( $4 \times 15 \mathrm{~cm}^{3}$ ). The combined extracts were dried and evaporated under reduced pressure to leave a 4:1 mixture of the $Z$ - and $E$-ylidenepyrrol-2( 5 H )-ones 17 c and 18a ( $69 \mathrm{mg}, 40 \%$ ); $\delta_{\mathrm{H}} 5.70$ and $5.57\left(=\mathrm{CHCO}_{2} \mathrm{Et}\right), 5.27$ and $5.33(=\mathrm{CH})$ and 3.95 and $3.81\left(\mathrm{OMe}+\mathrm{CO}_{2} \mathrm{Me}\right)$. Recrystallisation from benzene-hexane gave the Z-ylidenepyrrol- $2(5 \mathrm{H}$ )-
 $\lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} 280 ; v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1720,1650$ and 1620 (Found: C, $55.0 ; \mathrm{H}, 5.8 ; \mathrm{N}, 7.2 \% \mathrm{C}_{9} \mathrm{H}_{11} \mathrm{NO}_{4}$ requires C, 54.8; H, 5.6; N, 7.1\%).
(Z)- and (E)-3-Methoxy-1-methyl-5-phenylthiomethylenepyr-rol-2(5H)-ones 19 and 20b and (E)-4-Methoxy-1-methyl-5-phenylthiomethylenepyrrol- $2\left(5 \mathrm{H}\right.$ )-one $\mathbf{1 8 b} .-\mathrm{A} 1.6 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of butyllithium in hexanes ( $0.58 \mathrm{~cm}^{3}, 0.9 \mathrm{mmol}$ ) was added dropwise over 3 min to a stirred solution of phenylthiomethyltrimethylsilane ( $164 \mathrm{mg}, 0.84 \mathrm{mmol}$ ) in dry THF ( 5 $\mathrm{cm}^{3}$ ) at $0^{\circ} \mathrm{C}$. The solution was stirred at $0^{\circ} \mathrm{C}$ for 0.5 h , and then cooled to $-78^{\circ} \mathrm{C}$ when a solution of 3 -methoxy-1methylmaleimide 5 ( $114 \mathrm{mg}, 0.810 \mathrm{mmol}$ ) in dry THF ( $1 \mathrm{~cm}^{3}$ ) was added dropwise to it while the temperature was maintained $<-75^{\circ} \mathrm{C}$. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 2 h , and then allowed to warm to room temperature during 1 h . Water ( 30 $\mathrm{cm}^{3}$ ) was added to the mixture which was then extracted with ether ( $4 \times 20 \mathrm{~cm}^{3}$ ). The combined extracts were washed with saturated brine ( $20 \mathrm{~cm}^{3}$ ), dried, filtered and evaporated under reduced pressure to leave a brown oil. Purification of this chromatography (light petroleum-ether, $1: 2 \rightarrow 1: 3$ ) gave: (i) recovered phenylthiomethyl(trimethyl)silane ( $50 \mathrm{mg}, 31 \%$ ); (ii) the E-pyrrol-2(5H)-one $\mathbf{2 0 b}$ ( $51 \mathrm{mg}, 25 \%$ ) as a colourless oil; $\lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm}$ 343, 196sh; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} \quad 1703$ and $1645 ; \delta_{\mathrm{H}} 7.44-7.20(\mathrm{~m}, 5 \times \mathrm{ArH}), 6.31(4-\mathrm{H}), 5.95(=\mathrm{CHSPh})$, 3.87 ( OMe ) and $3.20(\mathrm{NMe})$; for NOE data see Table $1 ; \delta_{\mathrm{C}}$ 153.0 (quat. C), 142.1 (quat. C), 136.7 (quat. C), 136.2 (quat. C), $129.2(2 \times \mathrm{CH}), 128.2(2 \times=\mathrm{CH}), 126.6(=\mathrm{CH})$, $101.0(=\mathrm{CH})$, $98.7(=\mathrm{CH}), 57.9$ (OMe) and 25.9 (NMe) (Found: $m / z 247.0659$. $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{NO}_{2} \mathrm{~S}$ requires 247.0667); (iii) the pyrrol-2-( 5 H )-one $19(55 \mathrm{mg}, 27 \%)$ as a colourless oil which solidified, m.p. $105-$ $107^{\circ} \mathrm{C}$ (from ethyl acetate-light petroleum); $\lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm}$ 335 and 266sh; $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1670,1600$ and $1350 ; \delta_{\mathrm{H}}$ $7.48-7.31(\mathrm{~m}, 5 \times \mathrm{ArH}), 6.25(=\mathrm{CHSPh}), 5.12(4-\mathrm{H}), 3.81$ (OMe) and 3.42 (NMe); for NOE data see Table $1 ; \delta_{\mathrm{C}} 170.2$
(CO), 164.2 (quat. C), 135.0 (quat. C), 133.2 (quat. C), 129.8 $(2 \times=\mathrm{CH}), 129.4(2 \times \mathrm{CH}), 127.7(=\mathrm{CH}), 105.5(=\mathrm{CH}), 90.9$ $(=\mathrm{CH}), 58.0(\mathrm{OMe})$ and $27.8(\mathrm{NMe})$ (Found: C, 63.1; H, 5.6; N, $5.4 \% ; \mathrm{M}, 247.0683 . \mathrm{C}_{13} \mathrm{H}_{13} \mathrm{NO}_{2} \mathrm{~S}$ requires $\mathrm{C}, 63.1 ; \mathrm{H}, 5.3 ; \mathrm{N}$, $5.7 \% ; M, 247.0667$ ) and (iv) a mixture ( $16 \mathrm{mg}, 8 \%$ ), as an oil, of 19; (data as above) and the E-pyrrol-2(5H)-one 18b; $\lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} 200 ; \nu_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1710 \mathrm{sh}, 1670$ and 1635 ; $\delta_{\mathrm{H}} 7.45-7.30(\mathrm{~m}, 5 \times \mathrm{ArH}), 6.05(\mathrm{~d}, J 1.2,=\mathrm{CHSPh}), 5.21(\mathrm{~d}, J$ $1.2,3-\mathrm{H}$ ), 3.92 (OMe) and 3.06 (NMe) (Found: $m / z 247.0656$. $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{NO}_{2} \mathrm{~S}$ requires 247.0667).
(Z)- and (E)-4-Methoxy-5-methoxycarbonylmethylene-1,3-di-methylpyrrol-2(5H)-ones 21c and 22c.-A solution of methyl trimethylsilylacetate $(0.12 \mathrm{~g}, 0.82 \mathrm{mmol})$ in dry THF $\left(1 \mathrm{~cm}^{3}\right)$ was added dropwise over 3 min to a stirred solution of lithium diisopropylamide $(0.82 \mathrm{mmol})$ in THF at $-70^{\circ} \mathrm{C}$. The solution was stirred at $-70^{\circ} \mathrm{C}$ for 15 min after which a solution of 3-methoxy-1,4-dimethylpyrrole-2,5-dione $5 \mathrm{~h}(0.127 \mathrm{~g}, 0.82 \mathrm{mmol})$ in THF ( $2 \mathrm{~cm}^{3}$ ) was added dropwise to it over 10 min . The resulting yellow solution was stirred at $-70^{\circ} \mathrm{C}$ for 1 h , and then at room temperature for 1 h . The solution was quenched with water $\left(10 \mathrm{~cm}^{3}\right)$ and then acidified with $2 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid $\left(5 \mathrm{~cm}^{3}\right)$ and extracted with ether. The combined organic extracts were washed with water, dried, filtered and evaporated under reduced pressure. The residue was purified by chromatography (ether-hexane, $1: 3$ ) to give a $4: 1$ mixture of the pyrrolones 21c and 22c; crystallisation from ether afforded the Z-ylidenepyrrol-2( 5 H )-one $\mathbf{2 1 c}$ ( $89 \mathrm{mg}, 51 \%$ ) as a white solid, m.p. $64-66{ }^{\circ} \mathrm{C}$; $\lambda_{\max }(\mathrm{MeOH}) / \mathrm{nm} 196,286 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1}$ 1718, 1705, 1660, 1640 and $1630 ; \delta_{\mathrm{H}} 5.58(=\mathrm{CH}), 4.07$ ( OMe , ester), $3.74(\mathrm{OMe}), 3.33(\mathrm{NMe})$ and $2.05(=\mathrm{CMe}) ; \delta_{\mathrm{C}} 172.7(\mathrm{CO})$, $165.5\left(\mathrm{CO}_{2}\right), 158.8(=\mathrm{COMe}), 145.0$ (quat. C), 103.5 (quat. C), $93.9(=\mathrm{CH}), 59.3(\mathrm{OMe}), 51.6(\mathrm{OMe}), 29.4(\mathrm{NMe})$ and $8.3(\mathrm{Me})$ (Found: C, 57.3; H, 6.6; N, 6.2\%; M, 211.0857. $\mathrm{C}_{10} \mathrm{H}_{13} \mathrm{NO}_{4}$ requires $\mathrm{C}, 56.9 ; \mathrm{H}, 6.2 ; \mathrm{N}, 6.6 \% ; M, 211.0845$ ).
(Z)-5-tert-Butoxycarbonylmethylene-4-methoxy-1,3-dimethyl-pyrrol-2(5H)-one 21d.-A solution of tert-butyl trimethylsilylacetate ( $0.376 \mathrm{~g}, 2 \mathrm{mmol}$ ) in dry THF ( $2 \mathrm{~cm}^{3}$ ) was added dropwise over 2 min to a stirred solution of lithium diisopropylamide ( 2.1 $\mathrm{mmol})$ in THF $\left(6 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$. The solution was stirred at $78^{\circ} \mathrm{C}$ for 20 min , after which a solution of 1,4 -dimethyl-3-methoxy- 1 H -pyrrole-2,5-dione $5 \mathrm{~h}(0.310 \mathrm{~g}, 2 \mathrm{mmol})$ in tetrahydrofuran $\left(2 \mathrm{~cm}^{3}\right)$ was added dropwise to it over 10 min . The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 1.5 h and then allowed to warm to room temperature over 1 h . The mixture was quenched with $10 \%$ aq. ammonium chloride ( $25 \mathrm{~cm}^{3}$ ), the organic phase separated, and the aqueous layer extracted with dichloromethane. The combined organic extracts were then washed with water, dried, filtered and evaporated under reduced pressure to give a dark brown oil. The oil was purified by flash chromatography (methanol-dichloromethane, 3:97) to give the Z-ylidenepyrrolone 21d ( $0.258 \mathrm{~g}, 51 \%$ ) as a brown oil; $\lambda_{\text {max }}(\mathrm{MeOH}) / \mathrm{nm} 282 ; v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 2980,1715,1665$ and $1635 ; \delta_{\mathrm{H}} 5.40(=\mathrm{CH}), 3.93(\mathrm{OMe}), 3.16(\mathrm{NMe})$ and $1.91(=\mathrm{CMe})$; $\delta_{\mathrm{C}} 172.2(\mathrm{CO}), 164.2\left(\mathrm{CO}_{2}\right), 158.5$ (quat. C), 143.1 (quat. C), 102.8 (quat. C), $96.3(=\mathrm{CH}), 88.4\left(\mathrm{OCMe}_{3}\right), 58.8$ (OMe), 28.9 (NMe), $27.9(3 \times \mathrm{Me}$ ) and 7.9 ( $=\mathrm{CMe}$ ) (Found: C, 60.3; H, 7.6; $\mathrm{N}, 5.8 \% ; \mathrm{M}, 253.1317 . \mathrm{C}_{13} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires $\mathrm{C}, 60.2 ; \mathrm{H}, 7.2 ; \mathrm{N}$, $5.9 \% ; M, 253.1314$ ).
(Z)- and ( E )-4-Methoxy-1,3-dimethyl-5-phenylthiomethylene-pyrrol- $2(5 \mathrm{H})$-ones 21 e and $22 \mathrm{~d} .-\mathrm{A} 1.6 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ solution of butyllithium in hexanes ( $0.62 \mathrm{~cm}^{3}, 1 \mathrm{mmol}$ ) was added all at once to a solution of phenylthiomethyl(trimethyl)silane $(0.196 \mathrm{~g}, 1 \mathrm{mmol})$ in dry THF $\left(3 \mathrm{~cm}^{3}\right)$ at $-60^{\circ} \mathrm{C}$. The solution was stirred at $-60^{\circ} \mathrm{C}$ for 15 min after which a solution of 3-methoxy-1,4-dimethylpyrrole-2,5-dione $3 \mathrm{~h}(155 \mathrm{mg}, 1 \mathrm{mmol})$ in

THF ( $2 \mathrm{~cm}^{3}$ ) was added dropwise to it over 10 min . The orange solution was stirred at $-60^{\circ} \mathrm{C}$ for 1 h and then warmed to room temperature overnight. The dark orange-brown solution was quenched with water ( $10 \mathrm{~cm}^{3}$ ) and then extracted with ether. The combined organic extracts were washed with water, dried, filtered and evaporated under reduced pressure. The residue was purified by chromatography (ethyl acetate-light petroleum, $3: 7$ ) to give the pyrrolone ( $21 \mathrm{mg}, 8 \%$ ); recrystallisation from ether-ethyl acetate gave a cream solid which was found to be a 1:1 mixture of the $Z$ - and $E$-isomers 21e and 22d, m.p. 118$127^{\circ} \mathrm{C} ; \lambda_{\max }(\mathrm{MeOH}) / \mathrm{nm} 234,265$ sh and $329 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) /$ $\mathrm{cm}^{-1} 1710,1675$ and 1590; $\delta_{\mathrm{H}} Z$-isomer 21e: 7.49-7.27 (m, $5 \times \mathrm{ArH}), 6.10(=\mathrm{CH}), 4.02(\mathrm{OMe}), 3.42(\mathrm{NMe})$ and 2.06 ( $=\mathrm{CMe}$ ); $E$-isomer 22d: 7.49-7.27 (m, $5 \times \mathrm{ArH}$ ), 5.98 (=CH), 4.13 ( OMe ), $3.06(\mathrm{NMe})$ and 2.04 ( $=\mathrm{CMe}$ ); $\delta_{\mathrm{c}}$ ( $E / Z$-mixture) 190.8 (CO), 171.5 (quat. C), 157.0 (quat. C), 136.0 ( $=\mathrm{CH}$ ), 135.5 (quat. C), $129.8(=\mathrm{CH}), 129.2(=\mathrm{CH}), 129.0(=\mathrm{CH}), 128.6(=\mathrm{CH})$, $127.2(=\mathrm{CH}), 127.0(=\mathrm{CH}), 107.7(=\mathrm{CH}), 104.8(=\mathrm{CH}), 103.1$ ( $=\mathrm{CH}$ ), 58.8 ( OMe ), 58.6 ( OMe ), 27.9 ( NMe ), 25.4 ( NMe ), 7.8 ( $=\mathrm{CMe}$ ) and $7.6(=\mathrm{CMe}$ ) (Found: C, $64.5 ; \mathrm{H}, 5.8 \%$, M, 261.0813. $\mathrm{C}_{14} \mathrm{H}_{15} \mathrm{NO}_{2} \mathrm{~S}$ requires C, $64.3 ; \mathrm{H}, 5.8 \% ; M, 261.0824$ ).

Attempted Preparation of 5-Phenylthiomethylene-3/4-phenyl-thio-1-methylpyrrol- $2(5 \mathrm{H})$-one.-A $1.26 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of butylithium in hexane ( $0.7 \mathrm{~cm}^{3}, 0.88 \mathrm{mmol}$ ) was added dropwise over 2 min to a stirred solution of phenylthiomethyl(trimethyl)silane ( $173 \mathrm{mg}, 0.88 \mathrm{mmol}$ ) in dry THF at $-3^{\circ} \mathrm{C}$, and the mixture then stirred at $-3^{\circ} \mathrm{C}$ for 20 min . The solution was cooled to $-78^{\circ} \mathrm{C}$ and then added over 30 min by way of a double-ended needle under a positive nitrogen pressure to a stirred solution of 1-methyl-3-phenylthiomaleimide $5 \mathbf{j}$ ( 193 mg , $0.88 \mathrm{mmol})$ in THF $\left(10 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 6 h and then allowed to warm to room temperature overnight. Saturated brine ( $30 \mathrm{~cm}^{3}$ ) was added to the mixture which was then extracted with ether $\left(3 \times 10 \mathrm{~cm}^{3}\right)$. The combined extracts were washed with water $\left(2 \times 20 \mathrm{~cm}^{3}\right)$, dried, filtered and evaporated under reduced pressure to leave a black oil $(0.20 \mathrm{~g})$. The oil was purified by chromatography (light petroleum-ether, $3: 1$ ) to give: (i) the starting sulfide ( 145 mg , $82 \%$ recovery) and (ii) 1-methyl-5-phenylthiomethylene-3/4-phenylthiopyrrol-2( 5 H )-one $(6.7 \mathrm{mg}, 2.5 \%$ ) as a yellow oil; $\lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} 363$ and $267 ; v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1740,1690$ and $1640 ; \delta_{\mathrm{H}} 7.7-7.2(\mathrm{~m}, 10 \times \mathrm{ArH}), 6.65,6.40,6.19,5.96$ and $5.61(=\mathrm{CH})$ and $3.52,3.49,3.20$ and 3.12 (NMe)-indicating that it was a mixture of at least three of the possible isomers (Found: $m / z 325.0520 . \mathrm{C}_{18} \mathrm{H}_{15} \mathrm{NOS}_{2}$ requires 325.0595).

## Reactions with Aliphatic Grignard Reagents

5-Butyl-5-hydroxy-1,4-dimethylpyrrol-2(5H)-one and 5-Butyl-5-hydroxy-1,3-dimethylpyrrol-2(5H)-one 28a and 29.-A 1.9 mol $\mathrm{dm}^{-3}$ solution of butylmagnesium chloride in ether $\left(5.8 \mathrm{~cm}^{3}\right.$, $11.02 \mathrm{mmol}, 1.3$ equiv.) was added dropwise over 15 min to a stirred solution of 1,3 -dimethylmaleimide $5 \mathrm{~d}(1.05 \mathrm{~g}, 8.39 \mathrm{mmol})$ in dry THF ( $25 \mathrm{~cm}^{3}$ ) at $0^{\circ} \mathrm{C}$ (a large exotherm was observed). The cooling bath was removed and the solution was then stirred at room temperature for 1.5 h . Water ( $30 \mathrm{~cm}^{3}$ ) and $2 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid $\left(10 \mathrm{~cm}^{3}\right)$ were added to the mixture which was then extracted with ethyl acetate ( $3 \times 20 \mathrm{~cm}^{3}$ ). The combined extracts were dried, filtered and evaporated under reduced pressure to leave a yellow oil which was purified by chromatography (ether) to give: (i) the pyrrolone 29 ( 429 mg , $28 \%$ ) as a yellow oil; $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3570,3350,1685$ and $1655 ; \delta_{\mathrm{H}} 6.57(\mathrm{~m},=\mathrm{CH}), 5.2(\mathrm{OH}), 2.79(\mathrm{NMe}), 2.0-0.8(\mathrm{~m}$, $\mathrm{C}_{4} \mathrm{H}_{9}$ ) and $1.82(\mathrm{~d}, J 2,=\mathrm{CMe}) ; \delta_{\mathrm{C}} 170.3(\mathrm{CO}), 142.4(=\mathrm{CH})$, $134.6(=C \mathrm{Me}), 90.1(\mathrm{OCN}), 35.0\left(\mathrm{CH}_{2}\right), 25.8\left(\mathrm{CH}_{2}\right), 23.2(\mathrm{NMe})$, $22.7\left(\mathrm{CH}_{2}\right), 14.0(\mathrm{Me})$ and $10.7(\mathrm{Me})$ (Found: $m / z 183.1246$. $\mathrm{C}_{10} \mathrm{H}_{17} \mathrm{NO}_{2}$ requires 183.1233) and (ii) the pyrrolone 28a (356
$\mathrm{mg}, 23 \%$ ) as a yellow oil; $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3560,3350,1690$ and $1675 ; \delta_{\mathrm{H}} 5.69(=\mathrm{CH}), 4.75(\mathrm{OH}), 2.78(\mathrm{NMe}), 2.0-0.8(\mathrm{~m}$, $\mathrm{C}_{4} \mathrm{H}_{9}$ ) and $1.87(\mathrm{~d}, J 2,=\mathrm{CMe}) ; \delta_{\mathrm{C}} 170.2(\mathrm{CO}), 160.4(=C \mathrm{Me})$, $121.9(=\mathrm{CH}), 92.7(\mathrm{OCN}), 32.7\left(\mathrm{CH}_{2}\right), 24.9\left(\mathrm{CH}_{2}\right), 23.3(\mathrm{NMe})$, $22.4\left(\mathrm{CH}_{2}\right), 13.9(\mathrm{Me})$ and 12.1 (Me) (Found: $m / z 183.1259$. $\mathrm{C}_{10} \mathrm{H}_{17} \mathrm{NO}_{2}$ requires 183.1233).
(Z)- and (E)-5-Butylidene-1,4-dimethylpyrrol-2(5H)-one 30a.-A solution of the hydroxypyrrolone 28 ( $108 \mathrm{mg}, 0.59$ mmol), methanesulfonyl chloride ( $123 \mathrm{mg}, 0.71 \mathrm{mmol}, 1.2$ equiv.) and pyridine ( $0.16 \mathrm{~cm}^{3}, 3.3$ equiv) in dichloromethane $\left(5 \mathrm{~cm}^{3}\right)$ was stirred at room temperature for 39 h . The solution was evaporated to dryness under reduced pressure and the residue was then purified by chromatography (light petroleumether) to give: (i) the Z-pyrrol-2(5H)-one Z-30a ( $24 \mathrm{mg}, 25 \%$ ), as a yellow oil; $\lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} 268 ; v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1690$, 1670 and $1655 ; \delta_{\mathrm{H}} 5.92(\mathrm{~m},=\mathrm{CH}), 5.27\left(\mathrm{t}, J 8,=\mathrm{CHC}_{3} \mathrm{H}_{7}\right), 3.37$ ( NMe ), $2.55\left(\mathrm{q}, J 8,=\mathrm{CHCH}_{2} \mathrm{C}_{2} \mathrm{H}_{5}\right), 2.07(\mathrm{~d}, J 1.5,=\mathrm{CMe})$ and 1.6-1.0 (m, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ) (Found: $m / z 165.1144 . \mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO}$ requires 165.1153 ) and (ii) the E-pyrrol-2(5H)-one $\mathrm{E}-30 \mathrm{a}(32 \mathrm{mg}$, $33 \%$ ), as a yellow oil; $\lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} 269 ; v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1}$ 1685,$1670 ; \delta_{\mathrm{H}} 5.96(\mathrm{~m},=\mathrm{CH}), 5.37\left(\mathrm{t}, \mathrm{J} 8,={ }_{=} \mathrm{CHC}_{3} \mathrm{H}_{7}\right), 3.35$ (NMe), $2.45\left(\mathrm{q}, \mathrm{J} 8,=\mathrm{CHCH}_{2} \mathrm{C}_{2} \mathrm{H}_{5}\right), 2.26(=\mathrm{CMe})$ and $1.6-0.96$ $\left(\mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right.$ ) (Found: $m / z$ 165.1136. $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO}$ requires 165.1153).

The hydroxypyrrolone 28a was also dehydrated using toluene-p-sulfonic acid in benzene under reflux leading to a similar isomeric ratio, i.e. $Z: E=23: 32$.

5-Butylidene-1,3-dimethylpyrrol-2(5H)-one 31.—A solution of the hydroxypyrrolone $29(198 \mathrm{mg}, 1.08 \mathrm{mmol})$, methanesulfonyl chloride ( $207 \mathrm{mg}, 1.19 \mathrm{mmol}, 1.1$ equiv.) and pyridine ( $0.30 \mathrm{~cm}^{3}$, 3.4 equiv.) in dichloromethane ( $7 \mathrm{~cm}^{3}$ ) was stirred at room temperature for 48 h . The solution was evaporated to dryness under reduced pressure and the residue was then purified by chromatography (light petroleum-ether, 1:1) to give the butylidenepyrrol- $2(5 \mathrm{H})$-one $31(111 \mathrm{mg}, 62 \%$ ) as a yellow oil; $\lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} \quad 272 ; \quad v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1750, \quad 1655 ; \quad \delta_{\mathrm{H}}$ $6.98(=\mathrm{CH}), 5.33\left(\mathrm{t}, J 8,=\mathrm{CHC}_{3} \mathrm{H}_{7}\right), 3.12(\mathrm{NMe}), 2.30(\mathrm{q}, J 8$, $=\mathrm{CHCH}_{2} \mathrm{C}_{2} \mathrm{H}_{5}$ ), $2.00(\mathrm{~d}, \mathrm{~J} 1.5,=\mathrm{CMe})$ and $1.6-0.94(\mathrm{~m}$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}} 170.5(\mathrm{CO}), 139.8$ (quat. C), 133.8 (quat. C), $126.4(=\mathrm{CH}), 112.0(=\mathrm{CH}), 29.4\left(\mathrm{CH}_{2}\right), 25.5(\mathrm{NMe}), 23.5$ $\left(\mathrm{CH}_{2}\right), 13.6(\mathrm{Me})$ and $11.0(\mathrm{Me})$ (Found: $m / z \quad 165.1163$. $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO}$ requires 165.1153 ).

A solution of the hydroxypyrrolone $29(198 \mathrm{mg}, 1.08 \mathrm{mmol})$ in benzene ( $40 \mathrm{~cm}^{3}$ ) was heated under reflux in the presence of toluene- $p$-sulfonic acid ( 10 mg ) in a Dean and Stark apparatus for 3 h . The solution was concentrated under reduced pressure and the residue was then purified by chromatography as indicated above to give the butylidenepyrrolone 31 ( 118 mg , $66 \%$ ).

## 5-Butyl-5-hydroxy-4-methoxy-1-methylpyrrol-2(5H)-one

$\mathbf{2 8 b}$.-A $1.9 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of butylmagnesium chloride in ether ( $1.06 \mathrm{~cm}^{3}, 2.01 \mathrm{mmol}, 2.0$ equiv.) was added dropwise over 2 min to a stirred solution of 3-methoxy-1-methylmaleimide $\mathbf{5 f}$ ( $143 \mathrm{mg}, 1.01 \mathrm{mmol}$ ) in dry THF $\left(15 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$ after which the solution was allowed slowly to warm to $25^{\circ} \mathrm{C}$ over 2 h . The excess of reagent was quenched by the addition of water ( 15 $\mathrm{cm}^{3}$ ) and the mixture was then extracted with ethyl acetate $\left(4 \times 15 \mathrm{~cm}^{3}\right)$. The combined organic extracts were dried, filtered and evaporated under reduced pressure to leave a solid residue. The residue was purified by chromatography (ether) to give the hydroxypyrrol- $2(5 \mathrm{H})$-one $\mathbf{2 8 b}(197 \mathrm{mg}, 98 \%)$ as a white solid, m.p. $110.5-111^{\circ} \mathrm{C} ; \lambda_{\max }(\mathrm{EtOH}) / \mathrm{nm} 258$ and 209; $v_{\max }-$ $\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3400$ and $1660 ; \delta_{\mathrm{H}} 5.37(\mathrm{OH}), 4.95(=\mathrm{CH}), 3.90$ (OMe), $2.77(\mathrm{NMe})$ and $2.0-0.7\left(\mathrm{~m}, \mathrm{C}_{4} \mathrm{H}_{9}\right)$ (Found: $\mathrm{C}, 60.6 ; \mathrm{H}$, $8.3 ; \mathrm{N}, 6.8 \% . \mathrm{C}_{10} \mathrm{H}_{17} \mathrm{NO}_{3}$ requires $\mathrm{C}, 60.3 ; \mathrm{H}, 8.6 ; \mathrm{N}, 7.0 \%$ ).

5-Butylidene-4-methoxy-1-methylpyrrol-2(5H)-one 30b.-A solution of the hydroxypyrrolone $\mathbf{2 8 b}(190 \mathrm{mg}, 0.95 \mathrm{mmol})$ in toluene ( $30 \mathrm{~cm}^{3}$ ) was heated under reflux in the presence of toluene-p-sulfonic acid ( 10 mg ) in a Dean and Stark apparatus for 6 h . The solution was evaporated to dryness under reduced pressure and the residue was then purified by chromatography (light petroleum-ether, $3: 7$ ) to give: (i) a mixture of E - and Z -pyrrol- $2(5 \mathrm{H})$-ones $\mathbf{3 0 b}\left(59 \mathrm{mg}, 34 \%\right.$ ) as a yellow oil; $\lambda_{\text {max }}{ }^{-}$ $(\mathrm{EtOH}) / \mathrm{nm} 267 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1670$ and $1605 ; \delta_{\mathrm{H}} 5.5-$ $5.1(\mathrm{~m}, 2 \times=\mathrm{CH}), 3.87(\mathrm{OMe}), 3.30$ and $3.04(\mathrm{NMe}), 2.7-2.3(\mathrm{~m}$, $=\mathrm{CHCH}_{2} \mathrm{C}_{2} \mathrm{H}_{5}$ ) and $1.7-0.8\left(\mathrm{~m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{3}\right.$ ) (Found: $m / z$ 181.1118. $\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{NO}_{2}$ requires 181.1102 ) and (ii) an unidentified yellow oil ( $30 \mathrm{mg}, \sim 20 \%$ ); $\lambda_{\text {max }}(\mathrm{EtOH}) 300$ and 275 ; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3600-2800,1705$ and $1640 ; \delta_{\mathrm{H}} 5.25(\mathrm{t}, J 8$, $=\mathrm{CH}), 3.09(\mathrm{NMe}), 2.68(c a . \mathrm{q}, J 7, \sim 2 \mathrm{H}), 1.52(\mathrm{~m}, \sim 2 \mathrm{H})$ and $0.96(\mathrm{t}, \mathrm{J} 7, \sim 3 \mathrm{H})$.

## Synthesis of 5-Ylidenepyrrol-2(5H)-ones from 33a

4-Methoxy-1-methylpyrrol-2(5H)-one 33a. ${ }^{13,14}$ _A solution of ethyl 4-bromo-3-methoxybut-2-enoate ( $5.2 \mathrm{~g}, 24.64 \mathrm{mmol}$ ) in $40 \%$ aq. methylamine ( $50 \mathrm{~cm}^{3}, 581 \mathrm{mmol}$ ) was stirred vigorously at room temperature for 12 h . The solution was extracted with chloroform ( $4 \times 30 \mathrm{~cm}^{3}$ ) and the combined extracts were dried, filtered and evaporated under reduced pressure to leave a brown solid. Distillation of this gave the pyrrolone $33 \mathrm{a}(2.31 \mathrm{~g}, 79 \%$ ) as a yellow solid, b.p. $190^{\circ} \mathrm{C} / 1.5$ Torr, which was recrystallised from benzene-hexane to give colourless prisms, m.p. $86-87^{\circ} \mathrm{C}$; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} \quad 1670$ and $1635 ; \delta_{\mathrm{H}} \quad 5.19(=\mathrm{CH}), 3.88$ $\left(\mathrm{CH}_{2}+\mathrm{OMe}\right)$ and $2.98(\mathrm{NMe}) ; \delta_{\mathrm{C}} 173.2(\mathrm{CO}), 172.5(=\mathrm{CO})$, $94.4(=\mathrm{CH}), 58.1(\mathrm{OMe}), 52.5\left(\mathrm{CH}_{2}\right)$ and $28.5(\mathrm{NMe})$ (Found: $\mathrm{C}, 56.6 ; \mathrm{H}, 7.4 ; \mathrm{N}, 11.1 \% ; \mathrm{M}, 127.0626 . \mathrm{C}_{6} \mathrm{H}_{9} \mathrm{NO}_{2}$ requires C , $56.7 ; \mathrm{H}, 7.1 ; \mathrm{N}, 11.0 \% ; M, 127.0619)$.

4-Methoxy-1-methyl[ $\left.5-^{2} \mathrm{H}\right]$ pyrrol-2(5H)-one 33b.—Method (a). A solution of the pyrrol-2( $5 H$ )-one $33 \mathrm{a}(110 \mathrm{mg}, 0.865 \mathrm{mmol})$ in dry THF $\left(2 \mathrm{~cm}^{3}\right)$ was added dropwise over 5 min to a stirred solution of LDA $(0.952 \mathrm{mmol})$ in dry THF $\left(10 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$, after which the solution was stirred at $-78^{\circ} \mathrm{C}$ for 0.5 h . Methan $\left[{ }^{2} \mathrm{H}\right] \mathrm{ol}\left(0.5 \mathrm{ml}^{3}, 12.3 \mathrm{mmol}\right)$ was added to the solution which was then allowed to warm to room temperature. The solution was poured into $2 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ hydrochloric acid ( 20 $\mathrm{cm}^{3}$ ), and the mixture was then extracted with chloroform ( $2 \times 20 \mathrm{~cm}^{3}$ ). The combined extracts were dried, filtered and evaporated under reduced pressure to leave a yellow solid (103 $\mathrm{mg}, 92 \%$ ). Comparison of ${ }^{1} \mathrm{H}$ NMR signals indicated that complete deuteriation had occurred at $\mathrm{C}-5$ and partial deuteriation ( $\sim 35 \%$ ) at $\mathrm{C}-3 ; \delta_{\mathrm{H}} 5.20(0.65 \mathrm{H}$, i.e. $35 \% \mathrm{D},=\mathrm{CH}), 3.95$ (CHD + OMe) (Found: $m / z$ 128.0667. $\mathrm{C}_{6} \mathrm{H}_{8} \mathrm{NO}_{2} \mathrm{D}$ requires 128.0661).

Method (b). A $1.6 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of butyllithium in hexanes ( $0.49 \mathrm{~cm}^{3}, 0.78 \mathrm{mmol}$ ) was added dropwise over 2 min to a stirred solution of the pyrrol-2( 5 H )-one 33 a ( $79 \mathrm{mg}, 0.62$ $\mathrm{mmol})$ in dry THF $\left(10 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$ for 45 min . Methan $\left[{ }^{2} \mathrm{H}\right] \mathrm{ol}\left(0.5 \mathrm{~cm}^{3}, 12.3 \mathrm{mmol}\right)$ was added to the solution which was then allowed to warm to room temperature. The mixture was worked up in the usual manner to give a yellow solid 33 b ( $68 \mathrm{mg}, 86 \%$ ). Inspection of the ${ }^{1} \mathrm{H}$ NMR spectrum showed that $70 \%$ deuteriation had occurred at C-5; $\delta_{\mathrm{H}} 5.13$ $(=\mathrm{CH}), 3.87(\mathrm{~m}, \mathrm{CHD}+\mathrm{OMe})$ and $2.98(\mathrm{NMe})$.

4-Methoxy-1,5-dimethylpyrrol-2(5H)-one 33c.-A 1.6 mol $\mathrm{dm}^{-3}$ solution of butyllithium in hexanes $\left(1.58 \mathrm{~cm}^{3}, 2.53 \mathrm{mmol}\right)$ was added dropwise over 5 min to a stirred solution of the pyrrol-2 $5 H$ )-one $33 \mathrm{a}(300 \mathrm{mg}, 2.36 \mathrm{mmol})$ in dry THF $\left(15 \mathrm{~cm}^{3}\right)$ at $-80^{\circ} \mathrm{C}$ and the solution was stirred at $-80^{\circ} \mathrm{C}$ for 45 min . Iodomethane ( $0.6 \mathrm{~cm}^{3}, 9 \mathrm{mmol}$ ) was added dropwise over 10 min to the solution, which was stirred for a further 30 min and
then allowed to warm to room temperature over 2 h . Water ( 25 $\mathrm{cm}^{3}$ ) was added to the mixture which was then extracted with dichloromethane $\left(2 \times 15 \mathrm{~cm}^{3}\right)$. The combined extracts were dried, filtered and evaporated under reduced pressure to leave a residue which was purified by chromatography over silica gel (dichloromethane-methanol, $98: 2$ ) to give the pyrrol- $2(5 \mathrm{H})$ one $33 \mathrm{c}\left(290 \mathrm{mg}, 98 \%\right.$ ) as an oil; $v_{\max }$ (film) $/ \mathrm{cm}^{-1} 1772$ and 1631 ; $\delta_{\mathrm{H}} 4.94(=\mathrm{CH}), 3.87\left(\mathrm{q}, \mathrm{J} 7, \mathrm{CHCH}_{3}\right), 3.76(\mathrm{OMe}), 2.84(\mathrm{NMe})$ and $1.31\left(\mathrm{~d}, \mathrm{~J} 7, \mathrm{CHCH}_{3}\right) ; \delta_{\mathrm{C}} 177.7(\mathrm{CO}), 171.7(=\mathrm{CO}), 93.2$ $(=\mathrm{CH}), 58.3(\mathrm{OMe}), 58.0(\mathrm{NCH}), 26.3(\mathrm{NMe})$ and $19.4(\mathrm{Me})$ (Found: $m / z 141.0778 . \mathrm{C}_{7} \mathrm{H}_{11} \mathrm{NO}_{2}$ requires 141.0790).

5-Methoxycarbonylmethyl-4-methoxy-1-methylpyrrol-2(5H)one 33d.-A $1.6 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of butyllithium in hexanes $\left(0.74 \mathrm{~cm}^{3}, 1.184 \mathrm{mmol}\right)$ was added dropwise over 3 min to a stirred solution of the pyrrolin- $2(5 \mathrm{H})$-one $33 \mathrm{a}(130 \mathrm{mg}, 1.022$ mmol) in dry THF ( $15 \mathrm{~cm}^{3}$ ) at $-78^{\circ} \mathrm{C}$ and the solution was stirred for $-78^{\circ} \mathrm{C}$ for 45 min . Methyl bromoacetate ( 313 mg , 2.046 mmol ) was added over 10 min to the solution which was stirred at $-78^{\circ} \mathrm{C}$ for 30 min and then allowed to warm to room temperature. Water $\left(15 \mathrm{~cm}^{3}\right)$ was added to the mixture which was then extracted with chloroform $\left(4 \times 15 \mathrm{~cm}^{3}\right)$. The combined extracts were dried, filtered and evaporated under reduced pressure to leave a residue which was purified by chromatography (chloroform-methanol, $99: 1$ ) to give: (i) the pyrrolone ester 33d ( $150 \mathrm{mg}, 74 \%$ ) as a yellow oil; $v_{\max }{ }^{-}$ $\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1735,1670$ and $1630 ; \delta_{\mathrm{H}} 5.11(=\mathrm{CH}), 4.35(\mathrm{t}, J 6$, $\mathrm{NCHCH} 2), 3.87$ and $3.78\left(\mathrm{OMe}+\mathrm{CO}_{2} \mathrm{Me}\right), 2.93(\mathrm{NMe})$ and $2.76\left(\mathrm{~m}, \mathrm{NCHCH}_{2}\right)$ (Found: $m / z 199.0836 . \mathrm{C}_{9} \mathrm{H}_{13} \mathrm{NO}_{4}$ requires 199.0845) and (ii) recovered starting material ( $10 \mathrm{mg}, 8 \%$ ).

Dehydrogenation of the Pyrrol-2(5H)-one 33d to give (Z)- and (E)-5-Methoxycarbonylmethylene-4-methoxy-1-methylpyrrol$2(5 \mathrm{H})$-one 17 c and 18a.-A solution of the pyrrol-2(5H)-one $33 \mathrm{~d}(98 \mathrm{mg}, 0.492 \mathrm{mmol})$ and $p$-chloranil ( $260 \mathrm{mg}, 1.057 \mathrm{mmol}$ ) in benzene $\left(10 \mathrm{~cm}^{3}\right)$ was heated under reflux for 24 h . The cooled solution was diluted with ether $\left(20 \mathrm{~cm}^{3}\right)$ and then washed successively with $0.5 \mathrm{~mol} \mathrm{dm}^{-3}$ aqueous sodium hydroxide, water and saturated brine. The organic layer was dried, filtered and evaporated under reduced pressure to leave a residue which was purified by chromatography (chloroformmethanol, 49:1) to give: (i) the Z-pyrrol-2(5H)-one $17 \mathrm{c}(23 \mathrm{mg}$, $29 \%$ ) as a white solid, m.p. $134-137^{\circ} \mathrm{C}$ and (ii) a $4: 1$ mixture of the Z- and E-ylidenepyrrol-2(5H)-ones 17 c and $18 \mathrm{a}(44 \mathrm{mg}$, $54 \%$ ) as a white powder, m.p. $124-128^{\circ} \mathrm{C}$. The spectral data were identical with those recorded earlier.

Condensation of the Pyrrolone 33a with Benzaldehyde; Formation of $(\mathrm{Z})$ and (E)-4Methoxy-1-methyl-5-phenylmethyl-enepyrrol- $2(5 \mathrm{H})$-one 17 e and $18 \mathrm{c} .-4 \mathrm{~mol} \mathrm{dm}^{-3}$ Aqueous sodium hydroxide $\left(60 \mathrm{~cm}^{3}\right)$ was added to a solution of the pyrrol-2( 5 H$)$ one $33 \mathrm{a}(1.0 \mathrm{~g}, 7.87 \mathrm{mmol})$ in methanol $\left(10 \mathrm{~cm}^{3}\right)$. After 15 min this solution was added to a solution of benzaldehyde $(1.0 \mathrm{~g}$, $9.42 \mathrm{mmol})$ in methanol $\left(10 \mathrm{~cm}^{3}\right)$. The mixture heated to $100^{\circ} \mathrm{C}$ for 10 min and then cooled with ice-water $\left(10 \mathrm{~cm}^{3}\right)$. The mixture was extracted with chloroform ( $3 \times 10 \mathrm{~cm}^{3}$ ), the combined organic layers were dried, filtered and evaporated under reduced pressure. The residue was purified by column chromatography (ethyl acetate-light petroleum, 3:1) to give: (i) the Z-ylidenepyrrol- $2(5 \mathrm{H})$-one $17 \mathrm{e}(0.42 \mathrm{~g}, 25 \%)$ as a cream solid which on recrystallisation from light petroleum-ether gave material of m.p. $130-132^{\circ} \mathrm{C}$; $\lambda_{\max }(\mathrm{MeOH}) / \mathrm{nm} \mathrm{303;} v_{\max }{ }^{-}$ $\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3400,1681,1655$ and $1610 ; \delta_{\mathrm{H}} 7.4-7.2(\mathrm{~m}$, $5 \times \mathrm{ArH}), 6.50($ exo $=\mathrm{CH}), 5.18(\mathrm{~d}, J 0.4,3-\mathrm{H}), 3.89(\mathrm{OMe})$ and 2.83 (NMe); $\delta_{\mathrm{C}} 171.9(\mathrm{CO}), 166.7(=\mathrm{COMe}), 135.3(=\mathrm{CN})$, $134.1(=\mathrm{CH}), 129.6(=\mathrm{CH}), 128.0(=\mathrm{CH}), 127.5(=\mathrm{CH}), 107.9$ $(=\mathrm{CH}), 91.9(=\mathrm{CH}), 58.1(\mathrm{OMe})$ and $29.4(\mathrm{NMe})$ (Found: C, 67.0; $\mathrm{H}, 6.6 \% ; \mathrm{M}, 215.0946 . \mathrm{C}_{13} \mathrm{H}_{13} \mathrm{NO}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ requires $\mathrm{C}, 66.9 ; \mathrm{H}$,
$6.5 \% ; \mathrm{C}_{13} \mathrm{H}_{13} \mathrm{NO}_{2}$ requires $M, 215.0946$ ) and (ii) the E-isomer $18 \mathrm{c}(0.14 \mathrm{~g}, 8 \%)$ as a brown oil; $\lambda_{\max }(\mathrm{MeOH}) / \mathrm{nm} \mathrm{301;}$ $v_{\max }($ film $) / \mathrm{cm}^{-1} 3420,1680,1655$ sh and $1611 ; \delta_{\mathrm{H}} 7.5-7.2$ (m, $5 \times \mathrm{ArH}), 6.28($ exo $=\mathrm{CH}), 5.24(\mathrm{~d}, J 1.2,3-\mathrm{H}), 3.72(\mathrm{OMe})$ and 3.15 (NMe) (Found: $m / z$ 215.0918. $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{NO}_{2}$ requires 215.0946 ).

4-Methoxy-1-methyl-5-methylenepyrrol-2(5H)-one 18e.-A $40 \%$ aqueous solution of formaldehyde $\left(3 \mathrm{~cm}^{3}, 10 \mathrm{mmol}\right)$ was added to a solution of the pyrrol- $2(5 H)$-one 33 a ( $380 \mathrm{mg}, 3$ mmol ) in $2 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ aq. sodium hydroxide ( $1.5 \mathrm{~cm}^{3}, 3 \mathrm{mmol}$ ). The mixture was stirred at room temperature for 3.5 h , after which time it was acidified with $2 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid to pH 7 . The aqueous solution was extracted with dichloromethane and the organic extracts were dried, filtered and evaporated under reduced pressure to give a pale cream solid ( $160 \mathrm{mg}, 38.5 \%$ ). This solid was purified by chromatography (methanol-dichloromethane, 1:24) to give the alkene 18e (85 $\mathrm{mg}, 20 \%$ ) as a white solid. Recrystallisation from ether-hexane afforded material of m.p. $86-88^{\circ} \mathrm{C} ; \lambda_{\max }(\mathrm{MeOH}) / \mathrm{nm} \mathrm{194}$, and 297; $\lambda_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3480,1690,1655$ and $1610 ; \delta_{\mathrm{H}}$ $5.11(\mathrm{~d}, J 1.5,=\mathrm{CH} H), 4.94(\mathrm{~d}, J 1.5,3-\mathrm{H}), 4.64(\mathrm{t}, J 1.5,=\mathrm{CHH})$, $3.84(\mathrm{OMe})$ and $3.03(\mathrm{NMe}) ; \delta_{\mathrm{C}} 169.8(\mathrm{CO}), 165.2(=\mathrm{COMe})$, $142.2(=\mathrm{CN}), 92.8(=\mathrm{CH}), 89.9\left(=\mathrm{CH}_{2}\right), 58.0(\mathrm{OMe})$ and 24.9 (NMe) (Found: C, $60.5 ; \mathrm{H}, 6.8 ; \mathrm{N}, 9.9 \% ; \mathrm{M}, 139.0638 . \mathrm{C}_{7} \mathrm{H}_{9} \mathrm{NO}_{2}$ requires $\mathrm{C}, 60.4 ; \mathrm{H}, 6.5 ; \mathrm{N}, 10.1 \% ; M, 139.0633$ ).
(Z)- and (E)-4-Methoxy-1-methyl-5-(4'-methoxybenzylidene)-pyrrol-2(5H)-one 17 f and 18 d .-A solution of the pyrrol-2( 5 H$)$ one 33 a ( $127 \mathrm{mg}, 1 \mathrm{mmol}$ ) in dry THF ( $1 \mathrm{~cm}^{3}$ ) was added to a $1.6 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ solution of butyllithium in hexanes $\left(0.625 \mathrm{~cm}^{3}, 1\right.$ $\mathrm{mmol})$ in THF $\left(5 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$. The solution was stirred for 20 min and then $p$-anisaldehyde ( $136 \mathrm{mg}, 1 \mathrm{mmol}$ ) was added in one portion. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 45 min , and then allowed to warm to room temperature during 1.5 h . Trifluoroacetic anhydride ( 6 drops) was added to the mixture which was stirred for 5 min and then 1,8-diazabicyclo-[5.4.0]undec-7-ene (DBU, 6 drops) was also added to it. The mixture was then stirred for a further 10 min after which it was diluted with water $\left(10 \mathrm{~cm}^{3}\right)$ and extracted with ether. The combined ether extracts were dried, filtered and evaporated under reduced pressure to give a brown oil, purification of which by flash chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ gave: (i) the E-isomer $18 \mathrm{~d}\left(11 \mathrm{mg}, 5 \%\right.$ ) as an orange oil; $\lambda_{\max }(\mathrm{MeOH}) / \mathrm{nm} \mathrm{198}, \mathrm{228sh}$, 304sh and $332 ; v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3400 \mathrm{br}, 1705,1682,1670$, 1635 and $1601 ; \delta_{\mathrm{H}} 7.20(\mathrm{dd}, 4 \times \mathrm{ArH}), 6.24($ exo $=\mathrm{CH}), 5.24$ (d, J 1.2, 3-H), $3.84(\mathrm{OMe}), 3.76(\mathrm{OMe})$ and $3.14(\mathrm{NMe})$; for NOE data see Table 1 (Found: $m / z$ 245.1047. $\mathrm{C}_{14} \mathrm{H}_{15} \mathrm{NO}_{3}$ requires 245.1052 ) and (ii) the Z -isomer $17 \mathrm{f}(23 \mathrm{mg}, 10 \%$ ) as a yellow oil; $\lambda_{\text {max }}(\mathrm{MeOH}) / \mathrm{nm} 198,228$ sh and $329 ; \nu_{\max }\left(\mathrm{CHCl}_{3}\right)$ / $\mathrm{cm}^{-1} 3450,1710,1685,1675,1640$ and $1601 ; \delta_{\mathrm{H}} 7.10(\mathrm{~d}, J 8.8$, $2 \times \mathrm{ArH}), 6.80(\mathrm{~d}, J 8.8,2 \times \mathrm{ArH}), 6.37(e x o=\mathrm{CH}), 5.09(3-\mathrm{H})$, 3.79 (OMe), 3.75 (OMe) and 2.79 (NMe); for NOE data see Table 1; $\delta_{\mathrm{C}} 171.9$ (CO), 166.7 (quat. C), 159.2 (quat. C), 134.5 (quat. C), $130.8(=\mathrm{CH}), 126.2$ (quat. C), $113.6(=\mathrm{CH}), 107.9$ $(=\mathrm{CH}), 91.6(=\mathrm{CH}), 57.9(\mathrm{OMe}), 55.2$ (OMe) and 29.4 (NMe) (Found: $m / z 245.1045 . \mathrm{C}_{14} \mathrm{H}_{15} \mathrm{NO}_{3}$ requires 245.1052).
(E)- and (Z)-5-(4'-Hydroxybenzylidene)-4-methoxy-1-methyl-pyrrol-2( 5 H )-one 35 .-A $1.63 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of butyllithium in hexanes $\left(0.5 \mathrm{~cm}^{3}, 0.815 \mathrm{mmol}\right)$ was added to a cooled solution of the pyrrol-2( 5 H )-one $33 \mathrm{a}(118 \mathrm{mg}, 0.928 \mathrm{mmol})$ in dry THF $\left(5 \mathrm{~cm}^{3}\right.$ ) at $-70^{\circ} \mathrm{C}$, and the mixture was stirred for 15 min . A solution of 4-trimethylsilyloxybenzaldehyde ( $176 \mathrm{mg}, 0.90$ mmol ) in THF ( $0.5 \mathrm{~cm}^{3}$ ) was then added to it in one portion. The mixture was stirred at $-70^{\circ} \mathrm{C}$ for 1.5 h and then allowed to warm to room temperature overnight. Trifluoroacetic anhydride ( 8 drops) followed by DBU ( 8 drops) were added to
the mixture which was stirred for 10 min and then diluted with water ( $5 \mathrm{~cm}^{3}$ ) followed by $2 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ hydrochloric acid ( 10 $\mathrm{cm}^{3}$ ). The solution was extracted with ether and the combined extracts were dried, filtered and evaporated under reduced pressure to give an oil. This was purified by flash chromatography (light petroleum-ethyl acetate, 1:1) which afforded a $1: 1$ mixture of the E - and Z-olefins $35(16 \mathrm{mg}, 8 \%)$ as a colourless oil; $\lambda_{\max }(\mathrm{MeOH}) / \mathrm{nm} 196,245,341$ and 479 ; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3275,1671$ and 1604; $\delta_{\mathrm{H}} 7.37$ and $7.15(\mathrm{~d}, J$ $8.4,4 \times \mathrm{ArH}), 6.80(\mathrm{~m}, 4 \times \mathrm{ArH}), 6.47$ and $6.26($ exo $=\mathrm{CH})$, 5.18 and $5.26(3-\mathrm{H}), 3.87$ and $3.75(\mathrm{OMe})$ and 2.88 and 3.15 (NMe), respectively, for $E-35$ and $Z-35$; (Found: $m / z 231.0879$. $\mathrm{C}_{13} \mathrm{H}_{13} \mathrm{NO}_{3}$ requires 231.0895).

4-Methoxy-5-(4'-methoxybenzyl)-1-methylpyrrol-2(5H)-one 33e.-A $1.6 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of butyllithium in hexanes $(0.64$ $\mathrm{cm}^{3}, 1.02 \mathrm{mmol}$ ) was added in a dropwise manner over 5 min to a solution of the pyrrol-2( 5 H )-one $33 \mathrm{a}(127 \mathrm{mg}, 1 \mathrm{mmol})$ in dry THF $\left(2 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$. The solution was stirred at $-78^{\circ} \mathrm{C}$ for 15 min after which a solution of 4-methoxybenzyl bromide ( $201 \mathrm{mg}, 1 \mathrm{mmol}$ ) in THF $\left(1 \mathrm{~cm}^{3}\right)$ was added to it over 10 min . The mixture was stirred at $-78^{\circ} \mathrm{C}$ for a further 3 h and then at room temperature for 16 h . Water $\left(5 \mathrm{~cm}^{3}\right)$ was then added to it and the organic layer separated. The aqueous layer was extracted with ether and the combined extracts were dried, filtered and evaporated under reduced pressure. The residue was purified by chromatography (dichloromethane-methanol, 97:3) to give a white solid. Recrystallisation of this from hexane-ethyl acetate afforded the pyrrolone $33 \mathrm{e}(222 \mathrm{mg}, 45 \%$ ), m.p. $\quad 141-143^{\circ} \mathrm{C} ; \quad v_{\max }(\mathrm{MeOH}) / \mathrm{nm} 200,213 \mathrm{sh}$ and 225 ; $\nu_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1678,1665$ and 1630; $\delta_{\mathrm{H}} 6.97$ (dd, J 1.3, $8.5,3^{\prime}-\mathrm{H}$ and $5^{\prime}-\mathrm{H}$ ), 6.77 (dd, $J 1.5,8.5,2^{\prime}-\mathrm{H}$ and $\left.6^{\prime}-\mathrm{H}\right), 4.86$ (3-H), 4.06 (dd, J 4.5, 4.5, 5-H), 3.77 (OMe), 3.76 (OMe), 3.08 (dd, J 4.5, 14.4, CHH), 2.92 (dd, J 4.5, 14.4, CHH) and 2.89 (NMe); $\delta_{\mathrm{C}} 174.7$ (CO), 172.0 (quat. C), 158.5 (quat. C), 130.2 (=CH), 127.2 (quat. C), $113.7(=\mathrm{CH}), 94.7(=\mathrm{CH}), 63.0(\mathrm{NCH})$, $57.8(\mathrm{OMe})$, $55.2(\mathrm{OMe}), 34.5\left(\mathrm{CH}_{2}\right)$ and 27.4 (NMe) (Found: $m / z 247.1220 . \mathrm{C}_{14} \mathrm{H}_{17} \mathrm{NO}_{3}$ requires 247.1208).

5-(4'-Hydroxybenzyl)-4-methoxy-1-pyrrol-2(5H)-one 33f.A $1 \%(\mathrm{w} / \mathrm{v})$ solution of boron tribromide in dichloromethane $\left(1.3 \mathrm{~cm}^{3}, 0.52 \mathrm{mmol}\right)$ was added to a solution of the pyrrol$2(5 \mathrm{H})$-one 33 e ( $61 \mathrm{mg}, 0.25 \mathrm{mmol}$ ) in dichloromethane ( $1 \mathrm{~cm}^{3}$ ) at room temperature. The reaction mixture was stirred for 24 h and then water $\left(2 \mathrm{~cm}^{3}\right)$ was added to it. The organic layer was separated and the aqueous layer extracted with ether. The combined organic layers were dried, filtered and evaporated under reduced pressure. The residue was purified by chromatography (dichloromethane-methanol, 97:3) to give the phenol $33 \mathrm{f}\left(29 \mathrm{mg}, 50 \%\right.$ ) as a colourless oil; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1}$ 3250,1665 and $1630 ; \delta_{\mathrm{H}} 6.75$ (d, $J 8.5,3^{\prime}-\mathrm{H}$ and $\left.5^{\prime}-\mathrm{H}\right), 6.65$ (d, $J$ $8.5,2^{\prime}-\mathrm{H}^{\prime}$ and $\left.6^{\prime}-\mathrm{H}\right), 4.80(3-\mathrm{H}), 4.03(\mathrm{dd}, J 3.9,3.9,5-\mathrm{H}), 3.62$ ( OMe ), $2.98\left(\mathrm{~m}, \mathrm{CH}_{2}\right.$ ) and 2.90 (NMe) (Found: $m / z$ 233.1059. $\mathrm{C}_{13} \mathrm{H}_{15} \mathrm{NO}_{3}$ requires 233.1052).
(E)- and (Z)-5-(4'-Hydroxybenzylidene)-4-methoxy-1-methyl-pyrrol-2(5H)-one 35 by the Dehydrogenation of 33 f .-A solution of 2,3-dichloro-5,6-dicyano-1,4-benzoquinone (DDQ; 15 mg , 0.07 mmol ) and the pyrrol-2( 5 H )-one $33 \mathrm{f}(14 \mathrm{mg}, 0.06 \mathrm{mmol})$ in dry dioxane ( $5 \mathrm{~cm}^{3}$ ) was boiled under reflux under a nitrogen atmosphere for 22 h and then allowed to cool. Then $2 \mathrm{~mol} \mathrm{dm}^{-3}$ hydrochloric acid ( $5 \mathrm{~cm}^{3}$ ) was added to it and the organic layer separated. The aqueous layer was extracted with ether and then with dichloromethane. The combined organic phases were dried, filtered and evaporated under reduced pressure to give an oil. Purification of this by chromatography (dichloromethanemethanol, $9: 1$ ) afforded a colourless oil ( $12 \mathrm{mg}, 86 \%$ ) which proved to be identical in all respects with the hydroxybenzylidene compound 35 obtained earlier (see above).

4-Methoxy-5-(4'-methoxybenzyl)-1,5-dimethylpyrrol-2(5H)one 38a.-A $1.6 \mathrm{~mol} \mathrm{dm}^{-3}$ solution of butyllithium in hexanes ( $0.24 \mathrm{~cm}^{3}, 0.38 \mathrm{mmol}$ ) was added, in a dropwise manner during 5 min , to a solution of the pyrrol-2( 5 H )-one $33 \mathrm{e}(74 \mathrm{mg}, 0.3$ mmol ) in dry THF $\left(5 \mathrm{~cm}^{3}\right)$ at $-70^{\circ} \mathrm{C}$. The solution was stirred at $-70^{\circ} \mathrm{C}$ for 15 min and then methyl iodide $\left(20 \mathrm{~mm}^{3}, 0.3\right.$ mmol ) was added to it. The reaction mixture was stirred for a further 1 h at $-70^{\circ} \mathrm{C}$, and then allowed to regain room temperature during 16 h . The mixture was poured into water ( $5 \mathrm{~cm}^{3}$ ) and extracted with ether. The combined organic phases were then dried, filtered and evaporated under reduced pressure. The residue was then filtered through a bed of flash silica gel (dichloromethane-methanol, 19:1) to remove polar impurities. Evaporation of the filtrate afforded an oil which comprised a $1: 2$ mixture of the starting pyrrolone 33 e and the product 38a ( $33 \mathrm{mg}, 40 \%$ ). This mixture was employed in the next stage without further purification: $\delta_{\mathrm{H}} 6.71(\mathrm{~d}, J 8.6,2 \times \mathrm{ArH}), 6.59$ (d, $J 8.6,2 \times \mathrm{ArH}), 4.72(\mathrm{OMe}), 3.66(\mathrm{OMe}), 2.99(\mathrm{NMe}), 2.86$ (d, J15, CHH), $2.83(\mathrm{~d}, J 15, \mathrm{CH} H$ ) and $1.40(\mathrm{Me})$ (Found: $m / z$ 261.1348. $\mathrm{C}_{15} \mathrm{H}_{19} \mathrm{NO}_{3}$ requires 261.1365).

5-(4'-Hydroxybenzyl)-4-methoxy-1,5-dimethylpyrrol-2(5H)one 38b.-A $1 \%(\mathrm{w} / \mathrm{v})$ solution of boron tribromide in dichloromethane ( $0.35 \mathrm{~cm}^{3}, 0.035 \mathrm{mmol}$ ) was added to a solution of the above mixture of $33 \mathrm{e}+38 \mathrm{a}(20 \mathrm{mg}, 0.08 \mathrm{mmol})$ in dichloromethane ( $1 \mathrm{~cm}^{3}$ ) at room temperature. The mixture was stirred for 1 h and then quenched by the careful addition of water ( $2 \mathrm{~cm}^{3}$ ). The organic phase was separated and the aqueous phase extracted with dichloromethane. The combined organic phases were dried, filtered and evaporated under reduced pressure. The residue was purified by chromatography (dichloromethane-methanol, 19:1), and the solid thus obtained was then recrystallised from hexane-ethyl acetate to give a buff solid, m.p. $148-150^{\circ} \mathrm{C}$, consisting largely of the phenol 38b ( $10 \mathrm{mg}, 76 \%$ ); $\lambda_{\max }(\mathrm{MeOH}) / \mathrm{nm} 220,226$ and $277 \mathrm{sh} ; \nu_{\text {max }}-$ $\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3300 \mathrm{br}, 1650,1630 \mathrm{sh}$ and $1615 \mathrm{sh} ; \delta_{\mathrm{H}} 8.9$ (br, $\mathrm{OH}), 6.68(\mathrm{~d}, J 8.7,2 \times \mathrm{ArH}), 6.60(\mathrm{~d}, J 8.7,2 \times \mathrm{ArH}), 4.72$ (3-H), 3.66 (OMe), 2.99 (NMe), 2.85 (d, $J 15, \mathrm{CH}$ ), 2.82 (d, J $15, \mathrm{CHH}$ ) and 1.40 (CMe) (Found: $m / z 247.1184 \mathrm{C}_{14} \mathrm{H}_{17} \mathrm{NO}_{3}$ requires 247.1208 ).

Attempted Dehydrogenation of the Pyrrol-2(5H)-one 38b with $D D Q$.-A solution of $\operatorname{DDQ}(51 \mathrm{mg}, 0.23 \mathrm{mmol})$ and $38 \mathrm{~b}(56 \mathrm{mg}$, 0.23 mmol ) in benzene ( $5 \mathrm{~cm}^{3}$ ) was boiled under reflux under a nitrogen atmosphere for 46 h and then allowed to cool. Hydrochloric acid ( $2 \mathrm{~mol} \mathrm{dm}{ }^{-3} ; 5 \mathrm{~cm}^{3}$ ) was added to it and the organic layer separated. The aqueous layer was extracted with dichloromethane and the combined organic phases were dried, filtered and evaporated under reduced pressure. The oily residue was purified by chromatography (dichloromethane-methanol, $9: 1)$ to give two fractions: (i) recovered starting material 38b ( $10 \mathrm{mg}, 18 \%$ ) and an unidentified $\operatorname{tar}(30 \mathrm{mg})$. No evidence could be found for the formation of the pyridone $\mathbf{3 7 b}$.

## Acknowledgements

We thank the SERC for studentships (to G. D. J. and K. V. O.). We also thank ICI Pharmaceuticals, which is part of Zeneca Ltd. (CASE award to G. D. J.) and Pfizer Central Research for financial support, and Dr S. D. Mills (ICI Pharmaceuticals) for his interest.
