# Furan-2(3H)- and 2(5H)-ones. Part 5. ${ }^{1}$ Photoreactions of 3-Benzylfuran-2(5H)-ones; Cyclisation to Indenofuranones ${ }^{2}$ 

Osamu Muraoka, ${ }^{,{ }^{a} \text { a }}$ Genzoh Tanabe, ${ }^{a}$ Kyohko Sano, ${ }^{a}$ Toshie Minematsu, ${ }^{a}$ and Takefumi Momose ${ }^{*, b}$<br>${ }^{a}$ Faculty of Pharmaceutical Sciences, Kinki University, Kowakae 3-4-1, Higashi-Osaka, Osaka 577, Japan<br>${ }^{\text {b }}$ Faculty of Pharmaceutical Sciences, Toyama Medical and Pharmaceutical University, Sugitani 2630, Toyama 930-01, Japan

The effect of substitution at the 'central methane' on the photoreactivity of 3-benzylfuran-2(5H)ones $5 \mathbf{a - g}$ was investigated. Despite its di- $\pi$-methane structure, photochemical arylation was effected to give substituted indenofuranones 6 in good yields. Only the substitution by phenyl caused the di- $\pi$-methane rearrangement to give a cyclopropanofuranone $\mathbf{1 8 g}$ in moderate yield.

The di- $\pi$-methane rearrangement has proved to be one of the most ubiquitous of photochemical rearrangements, and most typically involves the conversion of a molecule having a di- $\pi$ methane moiety, i.e. having two $\pi$ systems bound to a single $\mathrm{sp}^{3}$ carbon, into a cyclopropane appended with a $\pi$ substituent. ${ }^{3}$ An interesting fact in the di- $\pi$-methane rearrangement of $\beta$ apolignans 1 is the observation that the regiospecific rearrangement of species 1 into tetrahydrocyclopropa[a]indenes 2 is common irrespectively of their ring substituents, and that only the pendant phenyl (the phenyl at the $\alpha$ - and not the $\beta$ butenolidylmethyl system) migrates among the three possible di- $\pi$-methane systems found in the $\beta$-apolignans. ${ }^{4}$

In a previous paper dealing with the selectivity in migration in systems 1 , we examined the photoreactivity of 3,4-dibenzyl-furan- $2(5 H)$-one 3 , a system lacking the stereochemical rigidity of compounds 1 , and found that only the $\beta$-butenolide system migrated to give a cyclopropane $4 .^{1}$ No rearrangement of the 3-benzyl moiety was detected, in contrast with the case of $\beta$ apolignans 1.

In order to inquire into the origin of the selectivity found for compounds 1 , we examined the photoreactivity of the 3- $\alpha-$ substituted benzyl)furan- $2(5 H)$-one system 5 from the viewpoint of examining the spatial factors in the substituted 'central methane' carbon, because Zimmerman et al. had reported the acceleration of the di- $\pi$-methane rearrangement by the introduction of substituents on the 'central methane' carbon in the photoirradiation of the divinylmethane system. ${ }^{5}$ Despite its di- $\pi$-methane structure, introduction of appropriate substitu-
ents on the 'central methane' resulted in characteristic photoarylation, affording functionalised tetrahydroindenofuranones 6 in good yields.

6

## Results

Synthesis of 3-( $\alpha$-Substituted Benzyl)furan-2(5H)-ones 5a-g. -A general procedure starting with 3-benzyltetrahydrofuran-2-ones 7 via sulfenylation/oxidation/elimination by Trost's protocol ${ }^{6}$ worked well with the $\alpha$-substituted benzyl system 7b-g. However, it was found to be unsuccessful with the $\alpha$-non-substituted system 7a, and thus the preparation of 3-benzylfuran-2( $5 H$ )-one 5a was attempted by two other procedures. $\dagger$

Hydrogenation of $\alpha$-benzylidenebutyrolactone $\mathbf{8 a}{ }^{\mathbf{8}}$ and subsequent sulfenylation of the resulting 3-benzyltetrahydrofuran-2-one 7a, ${ }^{8 a, 9}$ according to Trost's method, ${ }^{6}$ gave 3-benzyl-3-(methylsulfanyl)tetrahydrofuran-2-one 9 a in $58 \%$ yield (Scheme 1). The sodium metaperiodate oxidation of 9a in aq. tetrahydrofuran (THF) at $50^{\circ} \mathrm{C}$ followed by heating of the resulting sulfoxide in boiling toluene gave a $1: 1$ mixture of the desired furan-2( $5 H$ )-one 5 a and its regioisomer 8 a in $78 \%$ combined yield. They proved to be difficult to separate, so an alterative route was examined.
$\alpha$-Alkylation, with benzyl bromide, of the dianion derived from a $\beta$-hydroxy ester, methyl ( $S$ )-4-[(1,1-dimethylethyl)-dimethylsiloxy]-3-hydroxybutanoate $\mathbf{1 0}, \ddagger$ proceeded in a highly stereoselective manner§ to give practically a single diastereoisomer, methyl ( $2 R, 3 S$ )-2-benzyl-4-(tert-butyl-dimethylsiloxy)-3-hydroxybutanoate 11, in $43 \%$ yield. Lactonisation of silyl ester 11 with $10 \%$ hydrochloric acid in 1,2dimethoxyethane (DME) at $80^{\circ} \mathrm{C}$ gave cis-3-benzyl-4-

[^0]
$a \mathrm{R}=\mathrm{H} ; \mathrm{b} \mathrm{R}=\mathrm{Me} ; \mathbf{c} \mathrm{R}=\mathrm{Et} ; \mathrm{d} \mathrm{R}=\mathrm{Pr} ;$ e $\mathrm{R}=$ cyclohexyl; f $\mathrm{R}=\mathrm{Pr}$; g $\mathrm{R}=\mathrm{Ph}$
Scheme 1 Reagents and conditions: i, BMS; ii, $10 \% \mathrm{HCl} ; \mathrm{ii}, \mathrm{H}_{2}, \mathrm{Pd}-\mathrm{C} ;$ iv, MeSSMe, $\mathrm{LiPr}^{i}$ cyclohexyl amide; v, $\mathrm{NalO}_{4} ;$ vi, heat; vii, $\mathrm{ClCO}_{2}{\mathrm{Et}, \mathrm{NEt}_{3} \text {; }}$, viii, $\mathrm{NaBH}_{4} ;$ ix, $10 \% \mathrm{H}_{2} \mathrm{SO}_{4} ; \mathrm{x}, \mathrm{BnBr}, \mathrm{LDA} ;$ xi, $\mathrm{POCl}_{3}, \mathrm{Py}$
hydroxytetrahydrofuran-2-one 12,* which was treated with phosphorus trichloride oxide in pyridine ${ }^{12}$ to give the desired furanone 5a in $81 \%$ overall yield from compound 11.

The furanone 5 a displayed IR absorptions for the enone system at 1756 and $1660 \mathrm{~cm}^{-1}$. The ${ }^{1} \mathrm{H}$ NMR spectrum displayed a one-proton triplet of triplets, at $\delta_{\mathrm{H}} 6.93$, due to the olefinic proton of the butenolide system. Furthermore, the ${ }^{13} \mathrm{C}$ NMR spectrum displayed resonances, at $\delta_{\mathrm{c}} 134.1$ and $\delta_{\mathrm{C}}$ 145.5, due to two olefinic carbons of the butenolide moiety.
Of the 'central methane'-substituted analogues $\mathbf{5 b}-\mathbf{g}$, four ( $\mathbf{5 b}$, $\mathbf{5 e}, \mathbf{5 f}$ and $\mathbf{5 g}$ ) were prepared in the following manner. Selective reduction of the carboxy group in 1-ethyl 4-hydrogen 2alkylidenesuccinates 13b, ${ }^{13 a} 13 \mathrm{e},{ }^{13 b} \mathbf{1 3 f}^{13 \mathrm{c}}$ and $\mathbf{1 3 g}{ }^{13 a}$ with borane-dimethyl sulfide complex (BMS) followed by acidcatalysed lactonisation of the resulting hydroxy esters afforded 3-alkylidenetetrahydrofuran-2-ones $\mathbf{8 b},{ }^{8,8 c}{ }^{8 c} \mathbf{8 e}, \mathbf{8 f}$ and $\mathbf{8 g},{ }^{8 c, 14}$ which were subjected to catalytic hydrogenation over palladium on carbon in glacial acetic acid to give the 3-alkyltetrahy-drofuran-2-ones $\mathbf{7 b}, 7 \mathbf{e}, 7 \mathbf{f}$ and $\mathbf{7 g}$, respectively. Sulfenylation of the furanones, followed by oxidative elimination of the sulfenyl group in the resulting sulfides 9 , in the same manner as described above, afforded the desired furan- $2(5 H)$-ones $5 \mathbf{b b}, 5 \mathbf{e}$, $\mathbf{5 f}$ and 5 g in $53-68 \%$ overall yields from the corresponding precursor 7. The selective formation of compounds 5 comes about as a result of the alkyl substitution at the 'central methane', which causes an anti relationship between the $\alpha$ methylsulfanyl moiety and the adjacent benzyl methine proton; hence syn elimination of the sulfoxide afforded furan-2(5H)ones 5 effectively.

The furanone with an ethyl or propyl appendage, compound 5 c or 5 d , was prepared starting from 1 -ethyl 4 -hydrogen 2 -(1-phenylalk-1-enyl)succinate 14 a or $\mathbf{1 4 b} . \dagger$ The mixed anhydride

[^1]15 obtained by hydrogenation of compound 14 and subsequent treatment with ethyl chloroformate was reduced by sodium borohydride and subsequently subjected to acid-catalysed lactonisation of the reduction product to give compound $\mathbf{7 c}$ or 7d, which was elaborated to the corresponding butenolide 5 by the sequence described for compounds $7 \mathrm{~b}-\mathrm{g}$.
The ${ }^{1} \mathrm{H}$ NMR spectra of these furanones $5 \mathbf{b}, 5 \mathbf{e}, 5 \mathbf{f}$ and 5 g showed one-proton signals, at $\delta_{\mathrm{H}} 6.96-7.25$, due to the olefinic proton of the butenolide system. The one-proton signal centred at $\delta_{\mathrm{H}} 3.88, \delta_{\mathrm{H}} 3.59, \delta_{\mathrm{H}} 3.70, \delta_{\mathrm{H}} 3.45, \delta_{\mathrm{H}} 3.38$ or $\delta_{\mathrm{H}}$ 5.19 was responsible for the methine proton on the 'central methane' carbon in compound $\mathbf{5 b}, \mathbf{5 c}, 5$ d, 5 e, 5 f or $\mathbf{5 g}$, respectively.

Photoirradiation of 3-( $\alpha$-Substituted benzyl)furan-2(5H)-ones.-Photoirradiation of 3-benzylfuran-2(5H)-one 5a in methanol through a Pyrex filter gave mainly a photoreduced product 7a $\ddagger$ and a methanol adduct $16 a \S$ each in $20 \%$ yield. Formation of small amounts of photocyclisation product, 3,3a,8,8a-tetrahydro-1 H -indeno[1,2-c]furan-1-one 6a, $\boldsymbol{9}$ and another methanol adduct $17 \ddagger$ in 8 and $4 \%$ yield, respectively, was detected. No evidence for the formation of a cyclopropanolactone 18a was detected in spite of careful examination of the products. Irradiation of compound 5a in acetone under the same conditions as the run in methanol gave no trace amounts of tricycle 6a but gave compound 7a and an acetone adduct, 3-benzyl-4-(2-hydroxypropan-2-yl)tetrahydro-furan-2-one 19a, in 17 and $53 \%$ yield, respectively. The spectral properties of compound 7 a were identical with those of the authentic specimen obtained by catalytic hydrogenation of compound 8. The IR spectrum of trans adduct 16a showed absorptions due to the hydroxy group and the lactone carbonyl at 3474 and $1764 \mathrm{~cm}^{-1}$, respectively. Its ${ }^{1} \mathrm{H}$ NMR spectrum

[^2]displayed signals, at $\delta 2.77$ and at $\delta 2.47$, due to the methine protons on the $\alpha$ - and $\beta$-carbon of the lactone ring, respectively, and a pair of one-proton doublets of doublets due to the hydroxymethylene protons at $\delta 3.37$ and $\delta 3.47$. Moreover, compound 16a displayed a peak due to the molecular ion at $m / z$ $206(48 \%)$ in the MS spectrum. The relative stereochemistry at $\mathrm{C} \alpha$ and $\mathrm{C} \beta$ on the lactone ring in compound 16a was determined as depicted on the basis of differential nuclear Overhauser effect (NOE) experiments. A marked NOE was detected between one of the benzylic methylene protons and the methine proton on the carbon $\beta$ to the lactone carbonyl, but not between the two methine protons on the lactone ring.

The ${ }^{1} \mathrm{H}$ NMR spectrum of compound 19a displayed a pair of three-proton singlets at $\delta 1.07$ and $\delta 1.15$, due to two methyl groups attached to the $\mathrm{sp}^{3}$ carbon bearing a hydroxy group, instead of the signals ( $\delta 3.37$ and $\delta 3.47$ ) due to the hydroxymethylene protons in compound 16a. Moreover, compound 19a displayed a peak due to the molecular ion at $m / z 234$ ( $27 \%$ ) in the MS spectrum.

The IR spectrum of compound 6a showed an absorption due to its lactone carbonyl at $1768 \mathrm{~cm}^{-1}$ and no olefinic bands. Its ${ }^{1} \mathrm{H}$ NMR spectrum displayed a broad triplet-like signal, at $\delta 4.08$, due to a methine proton on the carbon $\beta$ to the carbonyl, a pair of one-proton doublet of doublets, at $\delta_{\mathrm{H}} 4.52$ and $\delta_{\mathrm{H}} 4.67$, due to the lactonic $\gamma$-methylene moiety, and signals, between $\delta_{\mathrm{H}} 7.22$ and $\delta_{\mathrm{H}} 7.35$, corresponding to four aromatic protons. Its ${ }^{13} \mathrm{C}$ NMR spectrum displayed resonances due to two substituted aromatic carbons at $\delta_{C} 141.6$ and $\delta_{\mathrm{C}}$ 141.9. The MS spectrum displayed a peak due to the molecular ion at $m / z 174(55 \%)$.

Photoirradiation of the 'central methane'-substituted systems 5b-f in methanol through a Pyrex filter afforded mainly the corresponding photocyclisation products 6b-f with concomitant formation of the photoreduced products $\mathbf{7 b - f}$ and methanol adducts 16b-f, respectively. Additionally, a product possessing a cyclobutane structure 20* was obtained as one of the minor products on irradiation of compound 5 e . The product distributions are shown in Table 1.

The spectral properties of photocyclisation products $\mathbf{6 b - f}$ were similar, and are suggestive of a tetrahydroindenofuranone structure of the same type as 6a. The stereochemistry of compound 6e was assigned on the basis of differential NOE experiments. A marked NOE was detected between the $\alpha$ - and $\beta$-proton on the lactone ring, but not between the $\alpha$-ketonic proton and the benzylic methine proton.

Only the butenolide 5 g led, upon irradiation in methanol, to formation of a moderate amount of the products of the di- $\pi$ methane rearrangement, viz. exo- and endo-1,6-diphenyl-3-oxa-bicyclo[3.1.0]hexan-2-one (exo-18g and endo-18g), along with a photocyclised product 6 g . When compound 5 g was irradiated under the acetone-photosensitised conditions, the efficiency of the di- $\pi$-methane rearrangement was increased, and compounds 18 g were obtained in $64 \%$ combined yield.

The product 18 g showed photointerconversion between exo

* Hydrogen abstraction by the $\beta$-carbon of an enone system to give a spiro compound has been described (ref. 19). A singlet at $\delta_{\mathrm{C}} 53.8$ and three doublets at $\delta_{\mathrm{C}} 42.9,46.1$ and 52.9 in the off-resonance ${ }^{13} \mathrm{C}$ NMR spectrum of compound 20 are evidence for the characteristic spirostructure of compound 20. The relative stereochemistry of compound 20 is evident on the basis of a significant downfield shift, resulting from the deshielding effect of the lactone carbonyl, of a signal, at $\delta_{\mathrm{H}} 3.70$, due to the benzylic methine proton. No NOE was detected between this and the lactonic $\beta$-methylene protons. However, concerning the relative stereochemistry at the other two chiral centres on the cyclobutane, we could not establish the $\alpha$ or $\beta$ orientation of two kinds of methine protons on $\mathrm{C}-1$ and $\mathrm{C}-6$, resonating at $\delta_{\mathrm{H}} 1.95$ and 2.08 , respectively, from its NOESY spectrum or its differential NOE experiment in the present study.

and endo isomers in acetone-photosensitised irradiation. The formation of two diastereoisomeric isomers exo- and endo- $\mathbf{1 8 g}$ is attributed to readily occurring photoisomerisation in the bicyclo[3.1.0]hexane system. ${ }^{20}$

The major cyclopropanolactone exo-18g resulting from compound 5 g showed an IR absorption due to the lactone carbonyl at $1768 \mathrm{~cm}^{-1}$, and a peak due to the molecular ion at $m / z 250(31 \%)$ in the MS spectrum. Its ${ }^{1} \mathrm{H}$ NMR spectrum displayed a one-proton doublet, at $\delta 2.71$, due to a methine proton on C-6. Both the one-proton doublet at $\delta 4.50$ and the one-proton doublet of doublets at $\delta 4.62$ corresponded to the lactonic $\gamma$-methylene moiety. A significant downfield shift of the signal at $\delta 3.09$ due to the methine proton on $\mathrm{C}-5$ is ascribed to the deshielding effect of the phenyl on C-6, indicating that the phenyl ring is of exo orientation. Furthermore, the exo-oriented phenyl ring at C-6 caused the signals due to two aromatic protons at the ortho position in the phenyl on $\mathrm{C}-1$ to shift upfield to $\delta 6.82-6.86$. The observed small vicinal coupling ( $J_{5,6}$ $4.5 \mathrm{~Hz}) \dagger$ between the two cyclopropane protons on $\mathrm{C}-5$ and C-6 suggested their trans relationship, supporting the assigned stereochemistry. Further support was given by the differential NOE experiments. A marked NOE enhancement appeared between one of the lactonic $\gamma$-methylene protons and the methine proton on $\mathrm{C}-6$, but not between the two methine protons on the cyclopropane ring.

The minor isomer endo- $\mathbf{1 8 g}$ showed similar behaviour in its

[^3] correspond to the endo-isomer (ref. 21).

[^4]IR ( $\mathrm{C}=\mathrm{O}$ at $1764 \mathrm{~cm}^{-1}$ ) and MS [ $\left.\mathrm{m} / \mathrm{z} 250(41 \%)\right]$ spectroscopic properties. The endo-oriented phenyl ring was evidenced both by an upfield shift of the signal at $\delta 4.18$ due to one of the lactonic $\gamma$-methylene protons, possibly by the shielding effect of the phenyl ring, and by a downfield shift of the signal at $\delta 3.10$ due to the methine proton on C-6, as compared with that of compound exo-18 ( $\delta 2.71$ ), owing to the anisotropy of the phenyl ring on C-1. Moreover, the vicinal protons on the cyclopropane exhibited a large coupling constant ( $J_{5,6} 8.5 \mathrm{~Hz}$ ). In the differential NOE experiments, irradiation of the signal at $\delta 3.10$ due to the exo-proton on C-6 enhanced the integrals of both aromatic protons at the ortho positions in the phenyl group at position 1 . An additional NOE enhancement appeared between the aromatic protons at C-6 and one of the lactonic $\gamma$-methylene protons.

## Discussion

The predominant photochemical arylation encountered in the irradiation of compounds 5 is attributable to readily occurring radical formation at the $\beta$ position in the enone system. Carbonyl compounds can be expected to acquire an intensified basicity in the triplet excited state and to abstract a proton from a protic solvent, and an increase in the positive charge on the $\beta$-position can also be expected. ${ }^{22}$ Thus, the $\beta$-carbon of compounds 5 must become more electrophilic by excitation to attack the facing benzene ring intramolecularly. The failure of the photocyclisation upon irradiation in aprotic solvents, such as acetone, acetonitrile, and benzene, supported the proposed reaction pathway via the protonated intermediate, ${ }^{22}$ and the latter was evidenced by the experiment where the butenolide $\mathbf{5 f}$ gave the tricycle $6 f$ efficiently upon irradiation in acetonitrile containing acetic acid.*
It is interesting to note that the efficiency of the intramolecular cycloaddition in substrates 5 is increased with increasing bulk of the substituents on the 'central carbon'. The Newman projection of compound $\mathbf{5 f}$ shows that the phenyl and butenolide $\pi$ planes on the 'central methane' are highly

* Irradiation in acetone containing acetic acid also gave compound $6 f$ though in low yield $(23 \%)$ due to the complexity of the reaction.

Table 2 Chemical shifts for olefinic protons in benzylic furan-2(5H)ones 5a-g

| $\mathbf{5 a}$ | $6.93(\mathrm{tt})$ | $\mathbf{5 b}$ | $7.02(\mathrm{dt})$ | $\mathbf{5 c}$ | $7.08(\mathrm{dt})$ |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{5 d}$ | $7.08(\mathrm{dt})$ | $\mathbf{5 e}$ | $7.21-7.23(\mathrm{~m})$ | $\mathbf{5 f}$ | $7.23-7.25(\mathrm{~m})$ |

restricted in free rotation by the isopropyl methyls and are forced to cause easy linkage to afford the indenofuranone system. ${ }^{2 b}$ This speculation is supported by the fact that the butenolide olefinic protons in compounds 5 e and 5 ff were deshielded, possibly by the anisotropy of the phenyl ring, and were shifted downfield in comparison with those of compounds 5a-5d and 5 g (Table 2).
A variety of aryl-vinyl-heterocycles based on the group VI elements or on nitrogen are known to photocyclise (hetero-atom-directed photoarylation) to give aryl-annelated heterocycles. ${ }^{23}$ The present case is a rare example of cycloaddition in the homogeneous di- $\pi$-methane system, and provides us with a new route to the tetrahydroindenofuranone skeleton.
The di- $\pi$-methane rearrangement was effected only in the irradiation of compound $\mathbf{5 g}$. Even upon irradiation of substrates $\mathbf{5 a}, \mathbf{5 b}$ and $\mathbf{5 e}$ in acetone, no sign of the di- $\pi$-methane rearrangement was detected, $\dagger$ and acetone adducts 19a, 19b and 19 e and photoreduced products $7 \mathrm{a}, 7 \mathrm{~b}$ and 7 e were formed as the main products. Presumably, one of the phenyl groups in compound $\mathbf{5 g}$ only would satisfy the stereoelectronic requirements $\ddagger$ for the rearrangement, and readily caused di- $\pi$-methane rearrangement to give compound $\mathbf{1 8 g}$.

Further studies on migratory selectivity in compounds 1 from the viewpoint of stereoelectronic requirements are in progress.

## Experimental

M.p.s. (Yanagimoto MP-S3 micro melting point apparatus) and b.p.s points are uncorrected. IR spectra were measured on
$\dagger$ The increased efficiency of the di- $\pi$-methane rearrangement of 4-benzylfuran-2 $(5 \mathrm{H})$-ones under aceton-photosensitised conditions has been described (ref.24).
$\ddagger$ The stereoelectronic requirements for the di- $\pi$-methane rearrangement have been proposed by Zimmerman and co-workers: see ref. $3 a$.
a Shimadzu IR-435 grating infrared spectrophotometer. NMR spectra were recorded on either a JEOL JNM-GSX 270 (270 $\mathrm{MHz}{ }^{1} \mathrm{H}, 67.5 \mathrm{MHz}{ }^{13} \mathrm{C}$ ) or a JEOL JNM-GSX $500(500 \mathrm{MHz}$ $\left.{ }^{1} \mathrm{H}, 125 \mathrm{MHz}{ }^{13} \mathrm{C}\right)$ spectrometer. Chemical shifts and coupling constants ( $J$ ) are given in $\delta$-values (ppm) and in hertz (Hz), respectively, and following abbreviations are used; sext $=$ sextet, sept $=$ septet. All the NMR spectra were taken for $\mathrm{CDCl}_{3}$ solutions with tetramethylsilane as internal standard. Low-resolution mass and high-resolution mass spectra (electron impact) were recorded on either a Shimadzu QP 1000EX spectrometer or a JEOL JMS-HX 100 spectrometer. Column chromatography was effected over either Merck Kieselgel 60 (230-400 mesh) with a pump (FMI model RP) or Merck Kieselgel 60 ( $70-230$ mesh). Photochemical reactions were carried out in an immersion apparatus fitted with an Ishii UV-HT 200 W high-pressure mercury lamp. All the organic extracts were dried over anhydrous magnesium sulfate prior to evaporation. Petroleum spirit refers to the fraction boiling in the range $30-70^{\circ} \mathrm{C}$.

3-Benzyltetrahydrofuran-2-one 7a.-A suspension of 5\% palladium on carbon ( 300 mg ) in acetic acid ( $20 \mathrm{~cm}^{3}$ ) was preequilibrated with hydrogen. A solution of 3-benzylidenetetrahy-drofuran-2-one ${ }^{8}(\mathbf{8 a} ; 2.0 \mathrm{~g}, 11.5 \mathrm{mmol})$ in acetic acid $\left(10 \mathrm{~cm}^{3}\right)$ was added, and the mixture was hydrogenated at $50^{\circ} \mathrm{C}$ and atmospheric pressure until the uptake of hydrogen ceased. The catalyst was filtered off, and the filtrate was evaporated to give an oil $(2.08 \mathrm{~g})$ which, on distillation at reduced pressure, gave compound $7 \mathrm{a}\left(2.0 \mathrm{~g}, 99 \%\right.$ ) as an oil, b.p. $122-124^{\circ} \mathrm{C} / 2 \mathrm{mmHg}$ (lit., ${ }^{8 a} 123-129{ }^{\circ} \mathrm{C} / 0.2-0.5 \mathrm{mmHg}$ ) (Found: $\mathrm{C}, 74.8 ; \mathrm{H}, 6.8 \%$; $\mathrm{M}^{+}, 176.0830 . \mathrm{C}_{11} \mathrm{H}_{12} \mathrm{O}_{2}$ requires $\mathrm{C}, 74.98 ; \mathrm{H}, 6.86 \% ; \mathrm{M}$, 176.0837).

## 3-Benzyl-3-(methylsulfanyl)tetrahydrofuran-2-one 9a.-

Under argon, a $1.6 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ solution of butyllithium in hexane ( $5.3 \mathrm{~cm}^{3}, 8.48 \mathrm{mmol}$ ) was added dropwise to a solution of $N$-isopropylcyclohexylamine ( $1.4 \mathrm{~cm}^{3}, 8.53 \mathrm{mmol}$ ) in THF ( 5 $\mathrm{cm}^{3}$ ) at $0^{\circ} \mathrm{C}$, and the mixture was stirred at $0^{\circ} \mathrm{C}$ for 10 min . A solution of compound $7 \mathrm{a}(1.0 \mathrm{~g}, 5.68 \mathrm{mmol})$ in THF $\left(10 \mathrm{~cm}^{3}\right)$ was added to the mixture, which was stirred for another 30 min . The lithium enolate thus prepared was added dropwise to a solution of dimethyl disulfide ( $1.5 \mathrm{~cm}^{3}, 17.0 \mathrm{mmol}$ ) in THF ( 5 $\mathrm{cm}^{3}$ ) at $0^{\circ} \mathrm{C}$. After being stirred at $0^{\circ} \mathrm{C}$ for 1 h , the reaction mixture was poured into brine ( $20 \mathrm{~cm}^{3}$ ), and extracted with benzene. The extract was washed with brine, and evaporated to give an orange oil ( 1.1 g ) which, on column chromatography (hexane-acetone, 20:1), gave the starting material 7a ( 208 mg , $21 \%$ recovery) and title sulfide $9 \mathbf{9}(726 \mathrm{mg}, 58 \%$ ) as prisms, m.p. $94-95^{\circ} \mathrm{C}$ (from EtOH ) (Found: C, $64.7 ; \mathrm{H}, 6.35 \%$; $\mathrm{M}^{+}$, 222.0701. $\mathrm{C}_{12} \mathrm{H}_{14} \mathrm{O}_{2} \mathrm{~S}$ requires $\mathrm{C}, 64.84 ; \mathrm{H}, 6.35 \% ; \mathrm{M}$, $222.0715)$; $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1758 ; \delta_{\mathrm{H}} 1.90(1 \mathrm{H}, \mathrm{ddd}, J 13.5,5.1$ and 1.5), $2.26(3 \mathrm{H}, \mathrm{s}), 2.44(1 \mathrm{H}$, ddd, $J 13.5,10.7$ and 9.0$), 3.04$ ( $1 \mathrm{H}, \mathrm{d}, J 14.0$ ), $3.35(1 \mathrm{H}, \mathrm{d}, J 14.0), 4.08(1 \mathrm{H}, \mathrm{ddd}, J 9.0,9.0$ and 1.5), $4.34(1 \mathrm{H}$, ddd, $J 10.7,9.0$ and 5.1$)$ and $7.20-7.33(5 \mathrm{H}$, $\mathrm{m}) ; \delta_{\mathrm{C}} 11.9(\mathrm{q}), 33.3(\mathrm{t}), 39.6(\mathrm{t}), 49.5(\mathrm{~s}), 65.0(\mathrm{t}), 127.1(\mathrm{~d}), 128.4$ (d), 130.2 (d), 135.6 (s) and $175.0(\mathrm{~s}) ; m / z 222\left(\mathrm{M}^{+}, 15 \%\right), 176$ (93), 131 (89) and 91 (100).

Sodium Metaperiodate Oxidation of Sulfide 9a.-A mixture of sulfide 9a ( $500 \mathrm{mg}, 2.25 \mathrm{mmol}$ ), sodium metaperiodate ( 1.0 g , $4.67 \mathrm{mmol})$, THF ( $13 \mathrm{~cm}^{3}$ ), and water ( $8 \mathrm{~cm}^{3}$ ) was stirred at room temperature for 12 h . The resulting precipitates were filtered off, and the filtrate was poured into water $\left(10 \mathrm{~cm}^{3}\right)$ and extracted with chloroform. The extract was washed with brine, and evaporated to give a pale yellow oil ( 485 mg ), which was heated in toluene $\left(10 \mathrm{~cm}^{3}\right)$ under reflux for 10 min . The mixture was washed with aq. sodium thiosulfate-sodium hydrogen carbonate, and evaporated to give a pale brown oil ( 447 mg )
which, on column chromatography (hexane-acetone, 10:1), gave a $1: 1$ mixture $\ddagger$ of 3-benzylfuran-2( $5 H$ )-one 5 a and its regioisomer 8a as an oil ( $306 \mathrm{mg}, 78 \%$ ).

Methyl 3-Benzyl-4-(tert-butyldimethylsiloxy)-3-hydroxybutanoate 11.-Under argon, a $1.6 \mathrm{~mol} \mathrm{dm}{ }^{-3}$ solution of butyllithium in hexane $\left(11.2 \mathrm{~cm}^{3}, 17.9 \mathrm{mmol}\right)$ was added dropwise to a solution of diisopropylamine ( $2.5 \mathrm{~cm}^{3}, 17.9 \mathrm{mmol}$ ) in THF ( 20 $\mathrm{cm}^{3}$ ) at $0^{\circ} \mathrm{C}$, and the mixture was stirred at $0^{\circ} \mathrm{C}$ for 10 min . The mixture was cooled to $-50^{\circ} \mathrm{C}$, and hexamethylphosphoric triamide (HMPA) $\left(4.2 \mathrm{~cm}^{3}, 24.2 \mathrm{mmol}\right)$ was added. To the mixture was added a solution of methyl 4-(tert-butyldimethyl-siloxy)-3-hydroxybutanoate ${ }^{10} 10(2.0 \mathrm{~g}, 8.1 \mathrm{mmol})$ in THF ( 10 $\mathrm{cm}^{3}$ ) at -60 to $-50^{\circ} \mathrm{C}$, and the resulting mixture was stirred at that temperature for 30 min . After addition of a solution of benzyl bromide ( $1.2 \mathrm{~cm}^{3}, 10 \mathrm{mmol}$ ) in THF $\left(5 \mathrm{~cm}^{3}\right)$ followed by stirring of the mixture at $-20^{\circ} \mathrm{C}$ for 1 h , the mixture was poured into ice-water ( $100 \mathrm{~cm}^{3}$ ) and extracted with dichloromethane. The extract was washed with brine and evaporated to give an orange oil ( 6.8 g ), which, on column chromatography $\left(\mathrm{CHCl}_{3}\right)$, gave compound $11(1.16 \mathrm{~g}, 43 \%$ ) as an oil, b.p. $128-$ $130^{\circ} \mathrm{C} / 0.008 \mathrm{mmHg}$ (Found: $\mathrm{M}^{+}$, 338.1896. $\mathrm{C}_{18} \mathrm{H}_{30} \mathrm{O}_{4} \mathrm{Si}$ requires $\mathrm{M}, 338.1913$ ); $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3541$ and $1729 ; \delta_{\mathrm{H}}$ $0.04(3 \mathrm{H}, \mathrm{s}), 0.05(3 \mathrm{H}, \mathrm{s}), 0.89(9 \mathrm{H}, \mathrm{s}), 2.85-3.02$ $(3 \mathrm{H}, \mathrm{m}), 3.04\left(1 \mathrm{H}, \mathrm{d}, J 8.0\right.$, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right), 3.59(3 \mathrm{H}$, s), $3.64(1 \mathrm{H}$, dd, $J 11.0$ and 5.0$), 3.66(1 \mathrm{H}$, dd, $J 11.0$ and 5.0$)$, $3.75(1 \mathrm{H}, \mathrm{m})$ and $7.16-7.31(5 \mathrm{H}, \mathrm{m}) ; \delta_{\mathrm{C}}-5.6(\mathrm{q}), 18.2(\mathrm{~s}), 25.7$ (q), 35.2 (t), 49.5 (d), 51.4 (q), 65.2 (t), 71.8 (d), 126.4 (d), 128.2 (d), $128.8(\mathrm{~d}), 138.5(\mathrm{~s})$ and $174.7(\mathrm{~s}) ; m / z 338\left(\mathrm{M}^{+}, 0.3 \%\right), 281$ (67), 249 (57), 117 (100) and 91 (41).
cis-3-Benzyl-4-hydroxytetrahydrofuran-2-one 12.-A mixture of siloxy ester $11(850 \mathrm{mg}, 2.5 \mathrm{mmol}), 10 \%$ hydrochloric acid ( 5 $\mathrm{cm}^{3}$ ), and DME ( $8 \mathrm{~cm}^{3}$ ) was heated at $80^{\circ} \mathrm{C}$ for 30 min . After removal of the solvent, the residue was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extract was washed with brine, and evaporated to give a solid ( 490 mg ) which, on column chromatography $\left(\mathrm{CHCl}_{3}\right)$, gave lactone 12 ( $411 \mathrm{mg}, 85 \%$ ) as prisms, m.p. $63-65^{\circ} \mathrm{C}$ (from cyclohexane) (Found: $\mathrm{C}, 68.7 ; \mathrm{H}, 6.3 \% ; \mathrm{M}^{+}, 192.0762$. $\mathrm{C}_{11} \mathrm{H}_{12} \mathrm{O}_{3}$ requires $\mathrm{C}, 68.73 ; \mathrm{H}, 6.29 \% ; \mathrm{M}, 192.0786$ ); $v_{\text {max }}{ }^{-}$ $\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3420$ and $1776 ; \delta_{\mathrm{H}} 2.30(1 \mathrm{H}$, br s, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right), 2.83(1 \mathrm{H}$, ddd, $J 11.5,4.0$ and 4.0$), 2.98(1 \mathrm{H}, \mathrm{dd}, J$ 14.5 and 11.5 ), $3.21(1 \mathrm{H}, \mathrm{dd}, J 14.5$ and 4.0$) 4.27(1 \mathrm{H}, \mathrm{dd}, J 10.0$ and 3.0$), 4.29(1 \mathrm{H}, \mathrm{d}, J 10.0), 4.41(1 \mathrm{H}, \mathrm{dd}, J 4.0$ and 3.0$)$ and $7.22-7.35$ ( $5 \mathrm{H}, \mathrm{m}$ ); $\delta_{\mathrm{C}} 29.3$ (t), 47.3 (d), 68.7 (t), 74.4 (d), 126.7 (d), 128.6 (d), 128.8 (d), 138.8 (s) and 177.1 (s); $m / z 192\left(\mathrm{M}^{+}\right.$, $72 \%$ ), 148 (96), 131 (69) and 91 (100).

3-Benzylfuran-2(5H)-one 5a.-Phosphorus trichloride oxide $\left(0.7 \mathrm{~cm}^{3}, 7.5 \mathrm{mmol}\right)$ was added to a stirred solution of the alcohol $12(300 \mathrm{mg}, 1.56 \mathrm{mmol})$ in pyridine $\left(5 \mathrm{~cm}^{3}\right)$ at $0^{\circ} \mathrm{C}$. After being stirred at $0^{\circ} \mathrm{C}$ for 1 h , the reaction mixture was poured into ice-water $\left(30 \mathrm{~cm}^{3}\right)$, acidified with $10 \%$ sulfuric acid, and extracted with diethyl ether. The extract was washed with brine and evaporated to give an oil ( 278 mg ) which, on column chromatography (hexane-acetone, 1:1), gave compound 5a ( $257 \mathrm{mg}, 95 \%$ ) as an oil, b.p. $141-143^{\circ} \mathrm{C} / 0.01 \mathrm{mmHg}$ (lit., ${ }^{7 c}$ $114^{\circ} \mathrm{C} / 0.2 \mathrm{mmHg}$ ) (Found: C, $75.6 ; \mathrm{H}, 5.8 \% ; \mathrm{M}^{+}, 174.0682$. $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{O}_{2}$ requires $\mathrm{C}, 75.84 ; \mathrm{H}, 5.79 \% ; \mathrm{M}, 174.0681$ ).

Stobbe Condensation of Diethyl Succinate with Ketones.-1Ethyl 4-hydrogen 2-(1-phenylethylidene)succinate 13b. A mixture of acetophenone $(18.0 \mathrm{~g}, 150 \mathrm{mmol})$, diethyl succinate $(40.0$ $\mathrm{g}, 230 \mathrm{mmol}$ ), and benzene ( $50 \mathrm{~cm}^{3}$ ) was added dropwise to a

[^5]suspension of sodium hydride $(6.0 \mathrm{~g}, 150 \mathrm{mmol} ; 60 \%$ in liquid paraffin; washed twice with benzene) in benzene ( $100 \mathrm{~cm}^{3}$ ) at $0^{\circ} \mathrm{C}$, and to the resulting mixture was added dropwise absolute ethanol $\left(2 \mathrm{~cm}^{3}\right)$ at that temperature. After being stirred at room temperature for 1 h , the reaction mixture was poured into icecooled water ( $300 \mathrm{~cm}^{3}$ ), and washed with diethyl ether. The aqueous layer was acidified with $10 \%$ sulfuric acid, and extracted with diethyl ether, and the extract was re-extracted with aq. sodium hydrogen carbonate. The aqueous extract was acidified with $10 \%$ sulfuric acid, and extracted with diethyl ether. This extract was washed with brine and evaporated to give a $1: 1$ isomeric mixture $\ddagger$ of $(E)$ - and $(Z)-13 \mathrm{~b}(34.5 \mathrm{~g})$ as a pale yellow semi-solid, which was used in the next step without purification. An analytical sample of compound ( $Z$ )-13b was obtained as prisms by trituration of the semi-solid with a mixture of diethyl ether and petroleum spirit followed by recrystallisation from benzene-petroleum spirit.
(Z)-13b: m.p. $108-109^{\circ} \mathrm{C}$ (lit., ${ }^{13 a} 111-112^{\circ} \mathrm{C}$ ) (Found: C , $67.6 ; \mathrm{H}, 6.5 . \mathrm{C}_{14} \mathrm{H}_{16} \mathrm{O}_{4}$ requires $\mathrm{C}, 67.73 ; \mathrm{H}, 6.50 \%$ ); $v_{\max }-$ $\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 2620$ and $1710 ; \delta_{\mathrm{H}} 0.79(3 \mathrm{H}, \mathrm{t}, J 7.0), 2.16(3 \mathrm{H}, \mathrm{s})$, $3.57(2 \mathrm{H}, \mathrm{s}), 3.86(2 \mathrm{H}, \mathrm{q}, J 7.0), 7.12-7.16(2 \mathrm{H}, \mathrm{m}), 7.26-7.43$ (3 $\mathrm{H}, \mathrm{m})$ and $9.0-10.5(1 \mathrm{H}, \mathrm{br}) ; \delta_{\mathrm{c}} 13.3(\mathrm{q}), 22.9(\mathrm{q}), 35.9(\mathrm{t})$, 60.6 (t), 122.6 (s), 126.6 (d), 127.3 (d), 127.9 (d), 143.5 (s), 149.6 (s), 169.6 (s) and 176.1 (s). The $Z$ configuration was assigned on the basis of difference NOE experiments in the present study.*

The other half-ester $[(E)-13 b]$ proved to be difficultly separable, so small amount of the crude mixture was treated with an ethereal solution of diazomethane to give a $1: 1$ mixture $\ddagger$ of $(E)$ - and ( $Z$ )-1-ethyl 4-methyl 2-(1-phenylethylidene)succinate (13b Methyl ester), which was separated on column chromatography (hexane-ethyl acetate, $30: 1$ ).

Preparation of 3-( $\alpha$-Substituted Benzylidene)tetrahydrofuran-2-ones8.-3-(1-Phenylethylidene)tetrahydrofuran-2-one 8b. A 10 $\mathrm{mol} \mathrm{dm}{ }^{-3}$ solution of BMS $\left(7.0 \mathrm{~cm}^{3}, 70 \mathrm{mmol}\right)$ in THF was injected slowly into a stirred solution of half-ester $13 \mathrm{~b}(8.7 \mathrm{~g}$, 35.1 mmol ) in THF $\left(40 \mathrm{~cm}^{3}\right)$ at $0^{\circ} \mathrm{C}$, and the resulting mixture was stirred at $0^{\circ} \mathrm{C}$ for 3 h . To the mixture were added
$\ddagger$ See footnote on p. 1837.
§ See footnote on p. 1838.
successively dropwise water $\left(25 \mathrm{~cm}^{3}\right)$ and saturated aq. sodium hydrogen carbonate ( $25 \mathrm{~cm}^{3}$ ), and the mixture was extracted with chloroform. The extract was washed with brine and evaporated to give an orange oil ( 8.25 g ), which was used in the next step without purification.

The oil ( 8.25 g ) was dissolved in a mixture of $10 \%$ hydrochloric acid-DME $\left(60 \mathrm{~cm}^{3} ; 1: 5\right)$, and the resulting mixture was heated under reflux for 1 h , and concentrated under reduced pressure. The residue was extracted with diethyl ether, and the extract was washed with brine, and evaporated to give an orange oil ( 6.45 g ) which, on column chromatography $\left(\mathrm{CHCl}_{3}\right)$, gave a $1: 1$ mixture $\ddagger$ of compounds $(E)-\mathbf{8 b}$ and $(Z)-8 \mathrm{~b}(4.35 \mathrm{~g}, 66 \%)$ as a pale yellow oil, b.p. $145-148^{\circ} \mathrm{C} / 2$ mmHg (lit., ${ }^{8 b} \quad 120^{\circ} \mathrm{C} / 0.2 \mathrm{mmHg}$; lit., ${ }^{8 \mathrm{c}}{ }^{\mathrm{c}} 130-135^{\circ} \mathrm{C} / 0.1$ mmHg ) (Found: $\mathrm{M}^{+}, 188.0830 . \mathrm{C}_{12} \mathrm{H}_{12} \mathrm{O}_{2}$ requires M , 188.0837).
(E)-3-( $\alpha$-Cyclohexylphenylmethylene)tetrahydrofuran-2-one (E)-8e $[2.8 \mathrm{~g}, 69 \%$ yield from $(E)-13 \mathrm{e}(5.0 \mathrm{~g}, 15.8 \mathrm{mmol})]:$ needles, m.p. 105-106 ${ }^{\circ} \mathrm{C}$ (from hexane) (Found: C, 79.45 ; H, $7.9 \% ; \mathrm{M}^{+}, 256.1441 . \mathrm{C}_{17} \mathrm{H}_{20} \mathrm{O}_{2}$ requires C, $79.65 ; \mathrm{H}, 7.86 \%$; $\mathrm{M}, 256.1463) ; v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1743$ and $1640 ; \delta_{\mathrm{H}} 0.98(1 \mathrm{H}$, ddddd, $J$ 13.0, 13.0, 13.0, 3.5 and 3.5), 1.07 ( 2 H , dddd, $J 13.0$, 13.0, 13.0 and 3.0), 1.41 ( 2 H , ddddd, $J 13.0,13.0,13.0,3.0$ and 3.0), $1.57-1.72$ ( $5 \mathrm{H}, \mathrm{m}$ ), $2.50(2 \mathrm{H}, \mathrm{t}, J 7.5), 4.10(1 \mathrm{H}$, dddd, $J$ 13.0, 13.0, 3.0 and 3.0), $4.20(2 \mathrm{H}, \mathrm{t}, J 7.5), 6.99-7.03(2 \mathrm{H}, \mathrm{m})$, 7.29-7.34 (1 H, m) and 7.36-7.40(2 H, m); $\delta_{\mathrm{c}} 25.8(\mathrm{t}), 26.1(\mathrm{t})$, 29.0 (t), 31.1 (t), 38.5 (d), 64.7 (t), 120.1 (s), 126.7 (d), 127.8 (d), 128.4 (d), 139.7 (s), 162.0 (s) and 170.0 (s); $m / \mathrm{z} 256\left(\mathrm{M}^{+}, 57 \%\right.$ ), 174 (43), 129 (100), 115 (16) and 91 (15).

Preparation of 3-( $\alpha$-Substituted Benzyl)tetrahydrofuran-2ones 7c and 7d.-3-(1-Phenylpropyl)tetrahydrofuran-2-one 7c. Following a method similar to that used for the preparation of compound 7a, a mixture of compounds 13 c and $14 \mathrm{a}(3.0 \mathrm{~g}, 11.5$ $\mathrm{mmol})$ was hydrogenated to give a pale yellow oil ( 3.1 g ). To a mixture of the oil ( 3.1 g ), triethylamine ( $1.7 \mathrm{~cm}^{3}, 12.2 \mathrm{mmol}$ ), and THF ( $50 \mathrm{~cm}^{3}$ ) was added a solution of ethyl chloroformate ( $1.63 \mathrm{~cm}^{3}, 17.1 \mathrm{mmol}$ ) in THF $\left(5 \mathrm{~cm}^{3}\right)$ at $0^{\circ} \mathrm{C}$, and the mixture was stirred at $0^{\circ} \mathrm{C}$ for 30 min . The resulting precipitates were filtered off, and washed with THF ( $10 \mathrm{~cm}^{3}$ ). The combined filtrate and washings were added to a solution of sodium borohydride ( $1.3 \mathrm{~g}, 34.4 \mathrm{mmol}$ ) in water $\left(20 \mathrm{~cm}^{3}\right)$ at $0^{\circ} \mathrm{C}$, and the mixture was stirred for 2 h . The reaction mixture was acidified with $10 \%$ sulfuric acid, heated under reflux for 3 h , and concentrated under reduced pressure. The residue was extracted with diethyl ether, and the extract was washed with brine. The combined extract was evaporated to give a pale yellow oil (2.4 g), which, on distillation at reduced pressure, gave a $2: 1$ diastereoisomeric mixture $\ddagger$ of compound $7 \mathrm{c}(2.0 \mathrm{~g}, 86 \%)$ as an oil, b.p. $141-143{ }^{\circ} \mathrm{C} / 0.006 \mathrm{mmHg}$ (Found: $\mathrm{M}^{+}$, 204.1143. $\mathrm{C}_{13} \mathrm{H}_{16} \mathrm{O}_{2}$ requires $\mathrm{M}, 204.1150$ ); $v_{\max }\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 1762 ; \delta_{\mathrm{H}}$ $0.83(1 \mathrm{H}, \mathrm{t}, J 7.0), 0.84(2 \mathrm{H}, \mathrm{t}, J 7.0), 1.72-1.96(2 \mathrm{H}, \mathrm{m}), 2.06-$ $2.24(2 \mathrm{H}, \mathrm{m}), 2.79-2.86(1 \mathrm{H}, \mathrm{m}), 2.97-3.06(1 \mathrm{H}, \mathrm{m}), 3.90(0.66$

Photolysis of Compound 5e in Acetone.-A mixture of compound 5e ( $100 \mathrm{mg}, 0.39 \mathrm{mmol}$ ), DABCO ( $40 \mathrm{mg}, 0.35$ mmol ), and acetone ( $200 \mathrm{~cm}^{3}$ ) was irradiated for 11 h to give a brown oil ( 280 mg ), which, on column chromatography (hexane-acetone, 10:1), gave 3-( $\alpha$-cyclohexylphenylmethyl)-4-(2-hydroxypropan-2-yl)tetrahydrofuran-2-one 19e ( 23.1 mg , $19 \%$ ) as practically a single diastereoisomeric isomer 20 (10.5 $\mathrm{mg}, 11 \%$ ), compound 7 e ( $9.4 \mathrm{mg}, 9 \%$ ), and the starting material $(14.2 \mathrm{mg}, 14 \%$ recovery). The physical and spectral properties of compound 7 e were completely in accord with those of the specimen obtained by catalytic hydrogenation of compound 8 e .

The hydroxypropan-2-yltetrahydrofuranone 19e: oil, b.p. 152$155^{\circ} \mathrm{C} / 0.008 \mathrm{mmHg}$ (Found: $\mathrm{M}^{+}, 316.2016 . \mathrm{C}_{20} \mathrm{H}_{28} \mathrm{O}_{3}$ requires M, 316.2037); $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3479$ and $1758 ; \delta_{\mathrm{H}} 0.78-$ $1.90(11 \mathrm{H}, \mathrm{m}), 1.14(3 \mathrm{H}, \mathrm{s}), 1.16(3 \mathrm{H}, \mathrm{s}), 1.97(1 \mathrm{H}, \mathrm{m}), 2.17(1 \mathrm{H}$, ddd, $J 7.0,1.5$ and 1.5 ), $2.89(1 \mathrm{H}, \mathrm{dd}, J 8.5$ and 6.0$), 3.02(1 \mathrm{H}$, dd, $J 6.0$ and 1.5 ), 3.35 ( 1 H , dd, $J 9.5$ and 7.0 ), $4.06(1 \mathrm{H}, \mathrm{dd}, J 9.5$ and 1.5$)$ and $7.18-7.30(5 \mathrm{H}, \mathrm{m}) ; \delta_{\mathrm{C}} 26.20(\mathrm{t}), 26.26(\mathrm{t}), 26.32(\mathrm{t})$, 26.8 (q), 27.1 (q), 37.8 (d), 44.5 (d), 48.9 (d), 52.6 (d), 68.5 (t), 71.5 (s), 127.0 (d), 128.3 (d), 129.4 (d), 139.1 (s) and 179.8 (s); $m / z 316$ $\left(\mathrm{M}^{+}, 1 \%\right), 234(30), 172(38), 144$ (97) and 91 (100).

Photolysis of Compound 5g in Acetone.-A mixture of compound 5 g ( $100 \mathrm{mg}, 0.40 \mathrm{mmol}$ ), DABCO ( $40 \mathrm{mg}, 0.35$ mmol ), and acetone ( $200 \mathrm{~cm}^{3}$ ) was irradiated for 6 h to give a brown oil ( 275 mg ), which, on column chromatography (hexane-acetone, $20: 1$ ), gave bicycle exo- $18 \mathrm{~g}(46.8 \mathrm{mg}, 47 \%)$, its diastereoisomer endo-18g ( $17.4 \mathrm{mg}, 17 \%$ ), 3-benzhydryl-4-(2-hydroxypropan-2-yl)tetrahydrofuran-2-one 19 g ( $19.2 \mathrm{mg}, 15 \%$ ) as an oil, and the starting material ( $14.2 \mathrm{mg}, 14 \%$ recovery). Formation of a small amount of compound 7 g was detected by GC-MS analysis.

The hydroxypropan-2-yltetrahydrofuranone 19g: oil, b.p. 154$155^{\circ} \mathrm{C} / 0.005 \mathrm{mmHg}$ (Found: $\mathrm{M}^{+}, 310.1567 . \mathrm{C}_{20} \mathrm{H}_{22} \mathrm{O}_{3}$ requires M, 310.1569); $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 3500$ and $1760 ; \delta_{\mathrm{H}} 1.18$ $(3 \mathrm{H}, \mathrm{s}), 1.19(3 \mathrm{H}, \mathrm{s}), 1.35\left(1 \mathrm{H}, \mathrm{br} \mathrm{s}\right.$, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right)$, 2.31 ( 1 H , ddd, $J 8.0,2.5$ and 2.5 ), 3.42 ( $1 \mathrm{H}, \mathrm{dd}, J 8.0$ and 2.5 ), 3.90 ( $1 \mathrm{H}, \mathrm{dd}, J 10.0$ and 8.0 ), 4.21 ( 1 H , dd, $J 10.0$ and 2.5 ), 4.28 ( $1 \mathrm{H}, \mathrm{d}, J 8.0$ ) and $7.20-7.44(10 \mathrm{H}, \mathrm{m}) ; \delta_{\mathrm{c}} 26.7(\mathrm{q}), 27.3(\mathrm{q}), 46.4$ (d), 50.3 (d), 53.3 (d), 67.7 (t), 71.6 (s), 127.0 (d), 127.2 (d), 128.4 (d), 128.5 (d), 128.6 (d), 129.0 (d), 140.5 (s), 141.4 (s) and 177.5 (s); $m / z 310\left(\mathrm{M}^{+}, 7 \%\right), 292(6), 224(24), 167$ (100) and $152(8)$.

Photolysis of Compound $5 \mathbf{5}$ in Acetonitrile.-A mixture of compound $5 f(100 \mathrm{mg}, 0.46 \mathrm{mmol})$, DABCO ( $40 \mathrm{mg}, 0.35$ mmol ), and acetonitrile ( $200 \mathrm{~cm}^{3}$ ) was irradiated for 12 h . Removal of the solvent resulted in complete recovery of the starting material.

Photolysis of Compound 5f in Acetonitrile in the Presence of Acetic Acid.-A mixture of compound $\mathbf{5 f}(\mathbf{1 0 0} \mathrm{mg}, 0.46 \mathrm{mmol})$, DABCO ( $40 \mathrm{mg}, 0.35 \mathrm{mmol}$ ), acetic acid $\left(20 \mathrm{~cm}^{3}\right)$, and acetonitrile ( $200 \mathrm{~cm}^{3}$ ) was irradiated for 27 h . Removal of the solvent left a $2: 1$ mixture $\ddagger$ of compound $\mathbf{6 f}$ and the starting material (total 125 mg ).

Photolysis of Compound 5f in Benzene.-A mixture of compound 5f ( $100 \mathrm{mg}, 0.46 \mathrm{mmol}$ ), DABCO ( $40 \mathrm{mg}, 0.35$ mmol ), and benzene ( $200 \mathrm{~cm}^{3}$ ) was irradiated for 8 h . Removal of the solvent resulted in complete recovery of the starting material.

Photoisomerisation of Bicycle exo-18g.-Under argon, a mixture of bicycle exo $-18 \mathrm{~g}(10 \mathrm{mg}, 0.04 \mathrm{mmol})$ and degassed acetone ( $1 \mathrm{~cm}^{3}$ ) in a Pyrex test tube was irradiated for 5 h . Removal of the solvent left a $10: 1$ diastereoisomeric mixture $\ddagger$ of bicycles exo-18g and endo-18g (total 10 mg ).

Photoisomerisation of Compound endo-18g.-Compound endo $-18 \mathrm{~g}(10 \mathrm{mg}, 0.04 \mathrm{mmol})$ was irradiated for 5 h under the same conditions as those described for the photoirradiation of its diastereoisomer exo-18g, to give a $1: 5.5$ mixture $\ddagger$ of exo- $\mathbf{1 8 g}$ and endo-18g (complete recovery by mass).

[^0]:    $\dagger$ Several methods are known for the preparation of the furanone 5 a. ${ }^{7}$ However, we synthesised compound 5a via an independent route in the present work.
    $\ddagger$ Derived from dimethyl (S)-(-)-malate using $\mathrm{BH}_{3} \cdot \mathrm{SMe}_{2}-\mathrm{NaBH}_{4}(c f$. ref. 10a) followed by monoprotection of the primary hydroxy group (ref. $10 b, c$ ).
    § The stereoselectivity in the alkylation of a $\beta$-hydroxy ester has been discussed (ref. 11).

[^1]:    * The cis stereochemistry for compound 12 was determined on the basis of the NOE enhancement between the $\alpha$ and $\beta$ protons on the lactone ring.
    $\dagger$ Compounds 14a and 14b were prepared in a manner similar to that for the preparation of compound 13. Predominant formation of compound 14a via the Stobbe condensation of diethyl succinate with propiophenone has been reported (ref. 15).

[^2]:    $\ddagger$ Reduction or $\alpha$-addition of the solvent on irradiation of an $\alpha, \beta$-unsaturated ester in methanol has been described (ref. 16).
    § Photochemical conjugate addition of methanol to $\alpha$-enones has been reported (ref. 17).

    - Compound 6a has appeared in the literature, but without spectral data (ref. 18).

[^3]:    $\dagger$ The one with a large coupling constant was usually found to

[^4]:    ${ }^{b}$ Results in acetone.

[^5]:    $\ddagger$ The ratio of the products was determined on the basis of the ${ }^{1} \mathrm{H}$ NMR spectrum.

[^6]:    $\ddagger$ See footnote on p. 1837.
    ${ }^{*}$ The configuration of compound $(Z)-13 \mathrm{~b}$ was determined on the basis of the ${ }^{1} \mathrm{H}$ NMR spectrum of the corresponding methyl ester which was obtained by treatment with an ethereal solution of diazomethane.

[^7]:    $\ddagger$ See footnote on p. 1837.

[^8]:    * All the irradiations except those in a Pyrex test tube were carried out under a stream of dry, oxygen-free nitrogen through a Pyrex filter at $25^{\circ} \mathrm{C}$.
    $\dagger$ Although oxygen in the nitrogen gas was supposed to have been washed out by passing the gas through an alkaline solution of pyrogallol, DABCO was added in order to avoid the influence of singlet oxygen (cf. ref. 25) which might be generated from any remaining oxygen.
