#### Abstract

Following the method of Foucaud and coworkers, reaction of pentane-2,4-dione with 3-(acetoxyamino) quinazolin-4-one 8 gave the keto amide 9 (15\%). 3-Methylpentane-2,4-dione reacts with compound 8 to give a relatively stable enol 11 (66\%) which can be isolated in a crystalline form. Rotation around the $\mathrm{N}-\mathrm{N}$ bonds in both compounds 9 and 11 is believed to be slow on the real time-scale and hence the $\mathbf{N}-\mathbf{N}$ bonds can be considered as a chiral axes. As a result, protonation of the enol double bond in compound 11 and the creation of an additional chiral centre, gives rise to the separable keto amides 14 and 15; this protonation can be accomplished completely diastereoselectively. Lead tetraacetate acetoxylation of compound 11 to give compound 19 is also completely diastereoselective. Brief heating of the enol effects the elimination of the quinazolinone and the formation of the $N$-acetylimine 16 via an 8 -membered transition state. Base-catalysed elimination of the quinazolinone ring from compound 22 is surprisingly easy: reductive cleavage of this $\mathbf{N}-\mathbf{N}$ bond in compound $\mathbf{2 2}$ is facile by comparison with the 3-(alkylamino)quinazolin-4-ones.

In 1977, Foucaud and coworkers reported ${ }^{1}$ that the oxidation of $N$-aminophthalimide 1 with lead tetraacetate (LTA) in the presence of 1,3-diketones gave rise to $N$-acyl- $N$-phthalimido- $\alpha$ amino ketones 4 (Scheme 1).

As indicated in Scheme 1, the reaction was assumed to occur via the aziridination of the enolic form of the $\beta$-diketone followed by an unusual $\mathrm{C}-\mathrm{C}$ bond cleavage of the intermediate aziridine $\mathbf{2}$ followed by the keto amide $\mathbf{4}$ formation via the enol 3. Although the aziridinating species in Scheme 1 was presumed at the time to be a $N$-nitrene, it is most likely that it is $N$ (acetoxyamino)phthalimide in the light of subsequent work. ${ }^{2}$

Our interest in this work of Foucaud arose initially from the need to bring about $\mathrm{N}-\mathrm{N}$ bond cleavage in compounds of type 5 (Scheme 2). ${ }^{3}$

Some work of Mellor and Smith ${ }^{4}$ suggested that cleavage of the $\mathrm{N}-\mathrm{N}$ bond in compounds similar to compound 5 would be facilitated by the acylation of the exocyclic nitrogen to give compound 6. However, all our attempts to acylate this nitrogen by direct means were unsuccessful. It appeared that an alternative route to compounds resembling the amide ester 6, whose susceptibility to reductive $\mathrm{N}-\mathrm{N}$ bond cleavage could then be tested, was by the aziridination of the enolic form of a $\beta$-keto

Scheme 2
ester using, for example, 3-(acetoxyamino)-2-ethylquinazolin4 -one $\mathbf{8}^{2,5}$ (Scheme 3) in an analogous manner to the reaction described by Foucaud and coworkers in Scheme 1. The aziridination of $\beta$-diketones was initially studied since this class of compounds contain a greater proportion of the enol tautomer than do the $\beta$-keto esters.

Reaction of pentane-2,4-dione with $N$-(acetoxyamino)-2-ethylquinazolin-4-one 8, prepared in solution in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $-20^{\circ} \mathrm{C}$ by oxidation of compound 7 with LTA, gave the keto amide $9(15 \%)$ which was analogous to that isolated by Foucaud and coworkers (Scheme 3). ${ }^{6}$ The major product was the 3 H -quinazolin- 4 -one 10 , the product usually recovered from the aziridination of unreactive alkenes using compound 8 . ${ }^{2}$
A striking feature of the NMR spectrum of the keto amide 9 was the degree of non-equivalence of the two protons in the methylene group adjacent to the ketone carbonyl ( $\delta_{\mathrm{H}} 3.76$ and $4.98,2 \times \mathrm{d}, J 17.3 \mathrm{~Hz}$ ). The chiral element which gives rise to the non-equivalence of the protons in this methylene group (and in that of the quinazolin-4-one 2-ethyl group) is the $\mathrm{N}-\mathrm{N}$ chiral axis. It is known that the barrier to rotation around the $\mathrm{N}-\mathrm{N}$ bond is $>70 \mathrm{~kJ} \mathrm{~mol}^{-1}$ when both nitrogens are acylated. ${ }^{7}$

Scheme 3

The keto amide 9 also contains several minor peaks in its NMR spectrum, including two doublets at $\delta 4.34$ and 5.04 ( $J$ 18.7 Hz ) which, from their resemblance to those above, are assigned to a minor amide rotamer (ratio major : minor 7.6:1). It should be noted that the $\mathrm{N}-\mathrm{N}$ bonds in the analogous keto amides 4 prepared by Foucaud and coworkers are not chiral axes because of the $C_{2}$-symmetry of the phthalimide group.

Although the yield of compound 9 was low, aziridination of 3-methylpentane-2,4-dione (in its enol form) with 3-(acetoxy-amino)-2-ethylquinazolin-4-one 8 gave a crystalline product in $66 \%$ yield when the reaction mixture was worked up with a minimal base wash as soon as the reaction had reached ambient temperature. Spectroscopic data for this compound as well as its chemical properties (vide infra) show that it had the enol amide structure 11 (Scheme 4).

Thus, compound 11 is the enol formed by the homo [1,5]sigmatropic rearrangement and hence the double bond is assigned the $Z$-configuration. In the NMR spectrum, the OH is observed as a singlet at $\delta 9.80$ (exchangeable in $\mathrm{D}_{2} \mathrm{O}$ ) and the methylene protons of the 2 -ethyl substituent on the quinazolin-4-one are non-equivalent ( $\delta 2.80, \mathrm{ABX}_{3} J_{\mathrm{AB}} 16.8$ and $J_{\mathrm{AX}(\mathrm{BX})} 7.3$ Hz ), implying that the chiral $\mathrm{N}-\mathrm{N}$ axis is still operative in this molecule.
Foucaud and coworkers ${ }^{1}$ had previously reported that the oxidative addition of $N$-aminophthalimide to $2,2,6,6$-tetra-methylheptane-3,5-dione gave a mixture of the enol 12 and its tautomeric keto amide 13 (Scheme 5).

We repeated the preparation of compounds 12 and 13 described by Foucaud and coworkers in order to obtain the (previously unreported) ${ }^{13} \mathrm{C}$ NMR spectrum of compound 12 and to compare it with that for compound 11. The $\delta_{\mathrm{C}}$ resonances of the enol double bond carbons $(\mathrm{N}-\mathrm{C}=\mathrm{C}-\mathrm{OH})$ in both compound 11 and compound 12 at $\delta 107.7$ and 100.8 were in reasonable agreement. In neither compound was a $\delta_{\mathrm{C}}$ resonance signal for a ketone carbonyl present, but both compounds gave
the keto forms under mild conditions (see below) in which this signal was present at $\delta_{\mathrm{C}} \sim 200$.

When the reaction mixture from compound 8 and 3-methylpentane-2,4-dione was set aside to stir for 2 h at room temperature before work up, a mixture of the keto amides 14 m.p. $162-163.5^{\circ} \mathrm{C}$ and 15 m. p. $127-129^{\circ} \mathrm{C}$ was obtained, which could be separated by fractional crystallisation. However, it was subsequently found that the enol amide 11 was converted quantitatively into only the keto amide 14 by boiling briefly in ethanol or by stirring in acetic acid overnight. Moreover, setting aside a solution of this keto amide 14 in acetonitrile for three days resulted in the epimerisation and the complete conversion to the keto amide 15.

The relative configurations at the chiral centre and chiral axis in compound 14 and in compound 15 are as yet unknown, but it is clear that the barrier to rotation around their $\mathrm{N}-\mathrm{N}$ bonds must be considerable: no interconversion between them occurred on briefly heating each to $200^{\circ} \mathrm{C}$, as judged from their NMR spectra compared to those obtained for the unheated products.

Thermolysis of the Enol Amide 11.-Heating the enol amide 11 for 1 min in boiling ethyl acetate resulted in the quantitative conversion to the 2-ethylquinazolin-4-one 10 and the $N$ acetylimine $16^{8}$ (Scheme 6); compound 16 was purified by distillation and was isolated as an unstable oil.

Scheme 6

On treatment of compound 16 with reagents that were either acidic (allyltrimethylsilane, $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ ) or basic (ethyl acetoacetate, $\mathrm{Et}_{3} \mathrm{~N}$ ), it was converted into the enamide 17. This crystalline tautomer was also unstable and was therefore characterised by reduction with palladium-charcoal and hydrogen to give 3-acetamidobutan-2-one 18 , which was identical with an authentic sample. ${ }^{9}$

Interestingly, neither of the diastereoisomeric keto amides 14 or 15 were intermediates in the conversion of the enol amide 11 into the $N$-acetylimine 16 (and compound 10 ), since both were recovered unchanged after heating in ethyl acetate. Accordingly, the reaction in Scheme 6 is assumed to proceed via the 8 -membered transition state, as illustrated. Although this
transition state is via an unusual ring-size, the component atoms are contained in two planes and it is this conformational rigidity which lowers the entropy requirement for the elimination.

Asymmetric Induction Mediated by an $N-N$ Chiral Axis.The double bond of the enol amide 11 possesses diastereomeric faces by virtue of the chiral $\mathrm{N}-\mathrm{N}$ axis. In the conversion of the enol amide to the keto amide 14 by briefly boiling in ethanol, the protonation occurs exclusively from only one diastereoisomeric face. It was of interest to examine the diastereoselectivity of the addition of other reagents to this enol double bond, i.e. to determine whether the $\mathrm{N}-\mathrm{N}$ chiral axis could bring about asymmetric induction in other cases.

Oxidation of the enol amide 11 with LTA gave a crystalline product in over $90 \%$ yield, which was assigned structure 19.

19

The presence of a chiral centre as well as a chiral $\mathrm{N}-\mathrm{N}$ axis in compound 19 meant that it should be capable of existing as two diasteroisomers ( $c f$ compounds 14 and 15). However, compound 19 appeared by NMR to be a single diastereoisomer with its four methyl resonances each appearing as singlets. Attempts at the thermal conversion of this single diastereoisomer, at least partially, into the other diastereoisomer were unsuccessful; at $200^{\circ} \mathrm{C}$, the compound partially decomposed, but none of the new resonances in the proton NMR spectrum of the crude mixture could be reasonably assigned to the other diastereoisomer.
$N-N$ Bond Reduction in Ethyl N-Acetyl-N-(2-isopropyl-3,4-dihydro-4-oxoquinazolin-3-yl)-2-aminoacetate 22.-As indicated earlier, our initial interest in the Foucaud reaction was as a means for preparing $3-[(N$-acyl $-N$-alkyl)amino $]$ quinazolin-4one derivatives, to test whether the reductive cleavage was facilitated by the presence of the acyl group on the exocyclic nitrogen.

Attempts to apply the Foucaud reaction to acyclic $\beta$ ketoesters were unsuccessful, presumably because of the poor contribution of the enol tautomer. However, an alternative route to the synthesis of the ester 22 was pursued using the route shown in Scheme 7 [the 2-isopropyl-substituted quinazolin-4one $20\left(Q^{\prime} \mathrm{NH}_{2}\right)$ was used in these experiments].

Scheme 7 Reagents: i, $\mathrm{Ac}_{2} \mathrm{O}$; ii, NaH , DMF; iii, $\mathrm{BrCH}_{2} \mathrm{CO}_{2} \mathrm{Et}$

Our initial attempts to prepare the ester 22 by reaction of the sodium salt of compound 21 with ethyl bromoacetate, led to the mixture of compounds in the isolated yields shown in Scheme 8.

This mixture of products, we believe, arose from the initial product, the amide ester 22, which lost the quinazolin-4-one anion following deprotonation adjacent to the ester (Scheme 9).

Scheme 8 Reagents: i, $\mathrm{NaH}, \mathrm{DMF}$; ii, $\mathrm{BrCH}_{2} \mathrm{CO}_{2} \mathrm{Et}$

The $N$-acetyl imine intermediate 25 (cf compound 16) was re-attacked by the quinazolinone anion $\mathrm{Q}^{\prime-}$ to form the rearranged amide ester 24. Alternatively, the quinazolinone anion could have been alkylated with the ethyl $\alpha$-bromoacetate to give the ester, 23.

When alkylation of the monoanion of the amide 21 was performed by adding this anion slowly to a solution of ethyl bromoacetate at $-20^{\circ} \mathrm{C}$, the required amide ester 22 was isolated in $83 \%$ yield after chromatography. Under these conditions, there is little excess base present which would cause the elimination of the quinazolin-4-one anion, according to Scheme 9 .
An aluminium amalgam reduction of the amide ester 22 furnished the ethyl $N$-acetylglycinate 26 in $74 \%$ yield, identical with an authentic sample.
Since $\mathrm{N}-\mathrm{N}$ bonds in compounds similar to compound 5 , are not reduced under these conditions, acetylation of the exocyclic nitrogen does indeed facilitate the reductive cleavage of the $\mathrm{N}-\mathrm{N}$ bond. However, we subsequently found that, using samarium diiodide, reduction of these type of compounds can be accomplished without the need for an acyl group on the exocyclic nitrogen. ${ }^{10}$

Aziridination of other Acyclic $\beta$-Diketones.--Two additional $\beta$-diketones, 1,3-diphenylpropane-1,3-dione and 1 -phenylbut-ane-1,3-dione were also reacted with 3 -(acetoxyamino)quin-azolin-4-one 28 (Scheme 10). In neither case were the intermediate enol amides, which are analogous to compound 11, ever isolated.

The keto amide 29 exists as a 1.2:1 ratio of amide rotamers on the NMR timescale: the diastereotopic methylene protons are separated by 1.82 ppm in the major rotamer, but by only 0.2 ppm in the minor rotamer (vide infra).

For 1-phenylbutane-1,3-dione (which exists as $91 \%$ in the enol form at $40^{\circ} \mathrm{C}$ in $\mathrm{CDCl}_{3},{ }^{11}$ ), the interconversion between both tautomeric enol forms, can be assumed to be fast by comparison with the rate of aziridination. However, the phenylsubstituted enol would be expected to be the more nucleophilic
Table 1

| 22 (Ester amide) | $\begin{gathered} 3.59 \text { and } 4.98, \\ J 16.9 \end{gathered}$ | $\begin{aligned} & 4.14 \text { and } 4.87, \\ & I 187 \end{aligned}$ | 3.55:1 |

and thus the more reactive towards aziridination. After chromatography of the crude reaction mixture, the keto amides 31 and 30 were obtained $(75 \%)$ in a 3.3:1 ratio, as determined from integration of appropriate resonances in the NMR spectrum of the mixture. Pure samples of these keto amides 31 (m.p. $112-114^{\circ} \mathrm{C}$ ) and $\mathbf{3 0}$ (m.p. $115-117^{\circ} \mathrm{C}$ ) were obtained by fractional crystallisation. Structural assignments to these two isomers were supported by IR spectroscopy: compound 31 $v_{\text {max }} / \mathrm{cm}^{-1}$ at 1732 and 1700 for the ketone and amide carbonyl groups whereas compound 30 has a single peak at $v_{\text {max }} / \mathrm{cm}^{-1}$ 1685, presumably as a result of overlap of the benzoyl and amide carbonyl stretching frequencies. These assignments are supported by the chemical shifts of the ${ }^{13} \mathrm{C}$ carbonyl carbons, with the lowest field peak at $\delta 200.06$ for the acetyl carbonyl in compound 31 compared with $\delta 191.51$ for the benzoyl carbonyl in compound $\mathbf{3 0}$ for their respective major rotamers. Finally, the ratio of the amide rotamers is significantly more disparate in the $N$-acetyl isomer 30 than in the $N$-benzoyl isomer 31, which is consistent with the corresponding ratios between compounds 9 and 29 (vide infra).

Two other products isolated from the reaction of 3-(acetoxyamino)quinazolin-4-one 28 with 1-phenylbutane-1,3dione were 2 -isopropylquinazolin-4-one 27 ( $9 \%$ ) and the diketo amine 32 ( $13 \%$ ) (Scheme 10). It is assumed that this latter product arises by $\mathrm{C}-\mathrm{N}$ bond cleavage of the intermediate aziridine, mediated by the acetic acid present (Scheme 11).

Although compound 32 could also arise by an analogous

Scheme 11
ring-opening of the isomeric aziridine formed from the alternative enol tautomer, the greater stability of the incipient benzyl carbocation $\mathbf{3 3}$ leading to compound $\mathbf{3 2}$ makes it likely that this is the origin of the latter. If this is the case, then the ratio of the attack on the two enolic forms of 1-phenylbutane-1,3-dione could be as high as $4.2: 1$ in favour of the phenyl substituted one.

Stereostructures of the Keto Amides 9, 29, 30 and 31.-The chemical shifts and coupling constants for the methylene $\left(\mathrm{NCH}_{2}\right)$ protons and amide rotamer ratios in the keto amides 9 and 29-31 are summarised in Table 1.

The following generalisations emerge from Table 1: (a) the difference in the chemical shifts for the diastereotopic protons of the methylene groups in the major rotamers are consistently larger than those in the minor rotamers, with a remarkable 1.82 ppm difference in the major diastereoisomer of compound 29; (b) the coupling constants are always larger for the minor rotamer; and (c) the ratio of major:minor rotamers is significantly higher ( $\sim 6-7: 1$ ) for the $N$-acetyl isomers 9 and 30 than for the $N$-benzoyl isomers 29 and 31 .

We interpret the gross difference in chemical shift between the protons of the methylene group in the major rotamers in Table 1 as evidence for a highly preferred conformation in each case, in which one proton is deshielded. At the present time, the identity of this preferred conformation is unknown, but is under investigation.

## Experimental

For general experimental details see ref. 10. Unless otherwise indicated, ${ }^{1} \mathrm{H}$ NMR spectra were run in $\mathrm{CDCl}_{3}$ at 300 MHz and ${ }^{13} \mathrm{C}$ NMR spectra in $\mathrm{CDCl}_{3}$ at 75 MHz , with tetramethylsilane as the internal standard and $J$ values given in Hz . Magnesium sulfate was used as the drying agent and 2,2,6,6-tetramethyl-heptane-3,5-dione and ethyl $N$-acetylglycinate were purchased from Aldrich and used without further purification. 3-Methyl-pentane-2,4-dione (Aldrich), was distilled under reduced pressure before use.

Reaction of 3-(Acetoxyamino)-2-ethylquinazolin-4(3H)-one 8 with pentane-2,4-dione.-A solution of compound 8 was obtained by the alternate addition of 3-amino-2-ethyl-quinazolin- $4(3 \mathrm{H})$-one ( 1.3 g ) and powdered lead tetraacetate (LTA) ( 2.54 g ), in very small portions over 15 min , to a vigorously stirred solution of dry dichloromethane ( $10 \mathrm{~cm}^{3}$ ) cooled to -20 to $-25^{\circ} \mathrm{C}$. After stirring for an additional 5 min at this temperature, pentane-2,4-dione ( 1.64 g ) was added and the solution allowed to warm to room temperature. The insoluble lead diacetate was separated by filtration, washed with dichloromethane and the combined organic solution washed with sodium hydrogen caerbonate solution followed by water and then dried, after which the solvent was removed under reduced pressure. Trituration of the solid-oil mixture obtained with cold diethyl ether gave 2-ethylquinazolin-4(3H)one $10(0.77 \mathrm{~g}, 75 \%)$ which was identical with an authentic sample. Chromatography of the diethyl ether-soluble fraction over silica with ethyl acetate as the eluent $\left(R_{\mathrm{f}} 0.55\right)$ gave the keto amide 9 ( $0.23 \mathrm{~g} ; 15 \%$ ) as colourless crystals; m.p. $116-118^{\circ} \mathrm{C}$
(from ethanol) (Found: C, 62.7; H, 6.0; N, 14.65. $\mathrm{C}_{15} \mathrm{H}_{17} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires $\mathrm{C}, 62.7 ; \mathrm{H}, 5.95 ; \mathrm{N}, 14.65 \%$ ). This compound exists in $\mathrm{CDCl}_{3}$ solution as a $7.6: 1$ ratio of amide rotamers: $\delta_{\mathrm{H}}$ major rotamer $1.40\left(\mathrm{t}, J 7.3, \mathrm{CH}_{2} \mathrm{Me}\right.$ ), $1.90\left(\mathrm{~s}, \mathrm{CH}_{2} \mathrm{COMe}\right.$ ), 2.24 ( s , $\mathrm{NHCOM} e), 3.05\left(2 \times \mathrm{dq}, J 17.5\right.$ and $\left.7.3, \mathrm{CH}_{2} \mathrm{Me}\right), 3.76$ and $4.98\left(2 \times \mathrm{d}, J 17.3, \mathrm{CH}_{2} \mathrm{~N}\right), 7.48$ (ddd, $J 7.9,7.0$ and 1.3 , Q 6$\mathrm{H}), 7.67-7.83(\mathrm{~m}, \mathrm{Q} 7-$ and $8-\mathrm{H})$ and $8.20(\mathrm{ddd}, J 7.9,1.5$ and $0.4, \mathrm{Q} 5-\mathrm{H}) ; \delta_{\mathrm{C}} 10.43\left(\mathrm{CH}_{2} \mathrm{Me}\right), 19.44\left(\mathrm{CH}_{2} \mathrm{COMe}\right), 26.27$ ( $\mathrm{CH}_{2} \mathrm{Me}$ ), 27.53 ( NCOMe ), $59.21\left(\mathrm{NCH}_{2} \mathrm{CO}\right), 120.39$, ( Q $C \mathrm{CO}), 126.74,126.82,127.46$ and $135.10(4 \times \mathrm{Q} \mathrm{CH}), 146.58$ ( $\mathrm{Q} C \mathrm{~N}=\mathrm{C}$ ), $158.21,159.98$ ( $\mathrm{Q} \mathrm{C}=\mathrm{N}$ and $\mathrm{Q} \mathrm{C}=\mathrm{O}$ ), 172.66 ( $\mathrm{N} C \mathrm{OMe}$ ) and $200.35(C \mathrm{OMe}) ; \delta_{\mathrm{H}}$ minor rotamer (observable peaks) 1.31 ( $\mathrm{t}, J 7.3, \mathrm{CH}_{2} \mathrm{Me}$ ), 2.20 ( $\mathrm{s}, \mathrm{CH}_{2} \mathrm{COMe}$ ), 2.22 ( s , $\mathrm{NCOMe}), 2.95\left(2 \times \mathrm{dq}, J 17.2\right.$ and 7.3, $\left.\mathrm{CH}_{2} \mathrm{Me}\right)$ and 4.34 and $5.04\left(2 \times \mathrm{d}, \mathrm{J} 18.7, \mathrm{CH}_{2} \mathrm{~N}\right) ; \delta_{\mathrm{C}} 10.34\left(\mathrm{CH}_{2} \mathrm{Me}\right) 20.41$ $\left(\mathrm{CH}_{2} \mathrm{COMe}\right), 25.48\left(\mathrm{CH}_{2} \mathrm{Me}\right), 27.03$ ( NCOMe ), 61.44 $\left(\mathrm{NCH}_{2} \mathrm{CO}\right), 126.13,126.47,127.22$ and $134.52(4 \times \mathrm{QCH})$ and $159.00(\mathrm{Q} \mathrm{C}) ; v_{\text {max }} / \mathrm{cm}^{-1} 1738 \mathrm{~m}, 1700 \mathrm{~s}$ and 1603 s .

Reaction of the N -Amino Compound $\mathbf{8}$ with 3-methylpentane-2,4-dione.-The procedure described above was followed using compound $8(1.0 \mathrm{~g})$, LTA ( 2.46 g ) in dichloromethane ( $10 \mathrm{~cm}^{3}$ ) followed by the addition of 3 -methylpentane-2,4-dione ( 1.81 g ). In the work up, the washing with sodium hydrogen carbonate solution ( $2 \mathrm{~mol} \mathrm{dm}^{-3}$ ) was limited (two or three brief shakings of the separating funnel). Trituration of the solid-oil mixture obtained with ice-cold diethyl ether gave a solid which crystallised from chloroform-light petroleum (minimum heating necessary) to give the enol amide 11 as a colourless solid ( $1.05 \mathrm{~g}, 66 \%$ ); m.p. $114^{\circ} \mathrm{C}$ (decomp.) (Found: C, 63.8; H, 6.35; $\mathrm{N}, 14.05 . \mathrm{C}_{16} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires C, $63.75 ; \mathrm{H}, 6.35 ; \mathrm{N}, 13.95 \%$ ); $\delta_{\mathrm{H}} 1.38\left(\mathrm{t}, J 7.3 \mathrm{CH}_{2}\right.$ Me), $1.83(\mathrm{~s}, \mathrm{C}=\mathrm{CMe}), 1.91(\mathrm{~s}, \mathrm{C}=\mathrm{CMe})$, $2.30(\mathrm{~s}, \mathrm{NCOMe}), 2.80\left(2 \times \mathrm{dq}, J 16.8\right.$ and $\left.7.3, \mathrm{CH}_{2} \mathrm{Me}\right), 7.45$ (ddd, $J 8.1,7.2$ and 1.3, Q 6-H), 7.70 (dd, $J 8.2$ and 1.3, Q $8-H$ ), 7.78 (ddd, $J 8.2,7.2$ and $1.5, \mathrm{Q} \mathrm{H}-7$ ), 8.23 (ddd, $J 8.1,1.5$ and 0.5 , Q 5-H) and $9.80\left(\mathrm{~s}, \mathrm{OH}\right.$, exch. $\left.\mathrm{D}_{2} \mathrm{O}\right)$; $\delta_{\mathrm{C}} 10.76\left(\mathrm{CH}_{2} \mathrm{Me}\right)$, 15.28 ( $\mathrm{C}=\mathrm{C} M e$ ), 17.43 ( $\mathrm{C}=\mathrm{C} M e$ ), 19.85 ( NCOMe ), 25.55 $\left(\mathrm{CH}_{2} \mathrm{Me}\right), 107.65(\mathrm{NC}=\mathrm{C}), 120.29(\mathrm{Q} C \mathrm{CO}), 126.28,127.00$, 127.18 and $135.14(4 \times \mathrm{Q} C \mathrm{H}), 146.78(\mathrm{Q} C \mathrm{~N}=\mathrm{C}), 152.27$ $(\mathrm{C}=C-\mathrm{OH}), 157.98,162.35(\mathrm{Q} \mathrm{C}=\mathrm{N}$ and $\mathrm{Q} \mathrm{C}=\mathrm{O})$ and 169.81 $(\mathrm{NCO}) ; v_{\text {max }} / \mathrm{cm}^{-1} 3181 \mathrm{~m}, 1686 \mathrm{~m}$ and 1661 s .

Keto Amides 14 and 15.-Repetition of the above experiment using compound $8(0.46 \mathrm{~g})$, LTA $(1.21 \mathrm{~g})$ and dichloromethane ( $5 \mathrm{~cm}^{3}$ ) with the addition of 3-methylpentane-2,4-dione ( 1.19 g ) gave, after allowing to stir for 2 h before work up, a solid-oil mixture which was triturated with ice-cold diethyl ether to give 2-ethylquinazolin-4-one 10 ( $211 \mathrm{mg}, 46 \%$ ). Removal of the diethyl ether and crystallisation of the residue twice from ethanol gave the keto amide $14(84 \mathrm{mg}, 12 \%)$; m.p. $162-163.5^{\circ} \mathrm{C}$ (Found: C, 63.7; H, 6.35; N, 13.95. $\mathrm{C}_{16} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires C, $63.75 ; \mathrm{H}, 6.35 ; \mathrm{N}, 13.95 \%$ ); $\delta_{\mathrm{H}} 1.33(\mathrm{~d}, J 7.2, \mathrm{NCHMe}$ ), 1.43 (t, J $7.3 \mathrm{CH}_{2} \mathrm{Me}$ ), 1.94 (s, COMe), 2.39 (s, NCOMe), $2.80\left(\mathrm{ABX}_{3}\right.$, $\mathrm{CH}_{2} \mathrm{Me}$ ), 4.45 (q, $J 7.2$, NCH Me), 7.52 (ddd, $J 8.4,8.0$ and 1.5, Q 6-H), 7.74 (d, $J 7.4, \mathrm{Q} 8-\mathrm{H}), 7.83$ (ddd, J 8.4, 7.4 and 1.3, Q 7$\mathrm{H})$ and $8.26(\mathrm{dd}, J 8.0$ and $1.3, \mathrm{Q} 5-\mathrm{H}) ; \delta_{\mathrm{C}} 10.42\left(\mathrm{CH}_{2} \mathrm{Me}\right), 13.60$ (Me), $20.43(M e), 26.24\left(\mathrm{CH}_{2} \mathrm{Me}\right) 63.97(\mathrm{NCH}), 120.54(\mathrm{Q}$ $C \mathrm{CO}), 127.15,127.17,127.56$ and $135.24(4 \times \mathrm{Q} \mathrm{CH}), 146.33$ ( $\mathrm{Q} C \mathrm{CN}$ ), $157.84,160.72(\mathrm{Q} \mathrm{C}=\mathrm{N}$ and $\mathrm{Q} \mathrm{C}=\mathrm{O}), 171.57$ ( NCOMe ) and 203.90 ( $\mathrm{CH} C \mathrm{OMe}$ ); $\nu_{\text {max }} / \mathrm{cm}^{-1} 1690 \mathrm{~s}$ and 1606s; $m / z(\%) 258\left(14, \mathrm{M}^{+}-43\right), 216(90), 174$ (97) and 173 (100).

Further crystallisation from ethanol after removal of compound 14 gave keto amide 15 ( $76 \mathrm{mg}, 10 \%$ ); m.p. 127$129{ }^{\circ} \mathrm{C}$ (Found: $\mathrm{C}, 63.7 ; \mathrm{H}, 6.45 ; \mathrm{N}, 13.85 . \mathrm{C}_{16} \mathrm{H}_{19} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires $\mathrm{C}, 63.75 ; \mathrm{H}, 6.35 ; \mathrm{N}, 13.95 \%$ ); $\delta_{\mathrm{H}} 0.97$ (d, $J 7.4, \mathrm{NCHMe}$ ), 1.42 ( t , J7.3, $\mathrm{CH}_{2}$ Me), 1.89 (s, COMe), 2.38 (s, NCOMe), $3.20(2 \times \mathrm{dq}$, $J 17.8$ and $\left.7.3, \mathrm{CH}_{2} \mathrm{Me}\right), 4.88(\mathrm{q}, J 7.4, \mathrm{NCHMe}), 7.51$ (ddd, $J$ 8.0, 7.1 and 1.3, Q 6-H), 7.75 (dd, J7.0 and 1.3, Q 8-H), 7.82 (ddd,
$J 8.0,7.0$ and $1.5, \mathrm{Q} 7-\mathrm{H}$ ) and 8.25 (ddd, $J 8.0,1.5$ and $0.4, \mathrm{Q} 5-$ $\mathrm{H}) ; \delta_{\mathrm{C}} 10.55\left(\mathrm{CH}_{2} \mathrm{Me}\right), 13.01(\mathrm{Me}), 20.25(\mathrm{Me}), 26.56\left(\mathrm{CH}_{2} \mathrm{Me}\right)$, 27.52 (Me), $61.52(\mathrm{CH}), 120.11$ (Q CCO), 127.11, 127.14, 127.73 and $135.44(4 \times \mathrm{Q} C H) 146.99(\mathrm{Q} \mathrm{CN}=\mathrm{C}), 159.54$ and 160.95 ( $\mathrm{Q} \mathrm{C}=\mathrm{N}$ and $\mathrm{Q} \mathrm{C}=\mathrm{O}$ ), 173.14 ( NCOMe ) and 204.74 ( COMe ); $v_{\text {max }} / \mathrm{cm}^{-1} 1699 \mathrm{~s}$ and $1606 \mathrm{~m} ; m / z(\%) 301\left(\mathrm{M}^{+} 11\right), 258(18), 216$ (100), 174 (24) and 173 (18).

Conversion of the Enol 11 into the Keto Amide 14.-The enol
 acid $\left(5 \mathrm{~cm}^{3}\right)$ without warming and stirred overnight at room temp. Removal of the acetic acid under reduced pressure and examination of the residue by NMR spectroscopy showed only the keto amide 14 present. The same quantitative conversion was effected when the enol amide ( 0.25 g ) was dissolved in boiling ethanol ( $3 \mathrm{~cm}^{3}$ ) and heated under reflux for approx. 1 min.

Conversion of the Keto Amide 14 into the Diastereoisomer 15.-The keto amide $14(0.05 \mathrm{~g})$ was dissolved in acetonitrile ( 1 $\mathrm{cm}^{3}$ ) and the solution set aside at ambient temperature for 3 days. Removal of the solvent and examination of the residue by NMR showed only the keto amide $\mathbf{1 5}$ was present.

Reaction of N -Aminophthalimide with LTA in the presence of 2,2,6,6-Tetramethylheptane-3,5-dione.-This reaction was carried out according to the procedure of Foucaud and coworkers ${ }^{1}$ and the enol amide 12 was isolated ( $17 \%$ ); m.p. $107-110^{\circ} \mathrm{C}$ (from ethanol) (lit., ${ }^{1}$ m.p. $120^{\circ} \mathrm{C}$ ); $\delta_{\mathrm{H}} 1.16$ (s, CMe), 1.35 ( $\mathrm{s}, \mathrm{NCOCMe}_{3}$ ), $5.80(\mathrm{~s}, \mathrm{CH}=), 7.78$ and $7.87(2 \times \mathrm{dd}, J 5.5$ and $3.2,4 \times$ phthal H ) and $8.06(\mathrm{~s}, \mathrm{OH})$ lit., ${ }^{1} 1.15(\mathrm{~s}, 9 \mathrm{H}), 1.34$ (s, 9 H ) and $5.72(\mathrm{~s}, 1 \mathrm{H}) ; \delta_{\mathrm{c}} 27.05\left(\mathrm{CMe}_{3}\right), 27.28\left(\mathrm{CMe} \mathrm{e}_{3}\right), 34.65$ $\left(\mathrm{CMe}_{3}\right), 39.09\left(\mathrm{CMe}_{3}\right), 100.82(\mathrm{CHN}), 124.11(2 \times$ phthal C), $129.94(2 \times$ phthal $C \mathrm{C}=\mathrm{O}), 134.79(2 \times$ phthal C), 165.45 and $166.69(\mathrm{C}=\mathrm{O}$ and $\mathrm{C}-\mathrm{OH})$ and $177.52(\mathrm{C}=\mathrm{O})$.

Thermolysis of the Enol Amide 11.-The enol amide $11(0.1 \mathrm{~g})$ was heated under reflux for $\sim 1 \mathrm{~min}$ in ethyl acetate $\left(2 \mathrm{~cm}^{3}\right)$. Cooling the solution in ice-water and separation of the solid formed gave 2-ethylquinazolin-4-one $10(0.05 \mathrm{~g}, 86 \%)$. The residue was evaporated under reduced pressure and then distilled b.p. $50^{\circ} \mathrm{C} / 0.1 \mathrm{mmHg}$ (Kugelrohr, bath temp.) to give the $N$-acetylimine $16(0.04 \mathrm{~g}, 95 \%)$ as an unstable oil; $\delta_{\mathrm{H}} 1.95$ (s, $\mathrm{MeC}=\mathrm{N}), 2.12(\mathrm{MeCO})$ and $2.27(\mathrm{MeCO}) ; \delta_{\mathrm{c}} 15.66(\mathrm{MeC}=\mathrm{N})$, 24.29 (Me), 24.44 (Me) 161.1 (C=N), 185.18 ( MeCON ) and $198.55(\mathrm{MeCO}) ; v_{\text {max }} / \mathrm{cm}^{-1} 1706 \mathrm{~s}, 1673 \mathrm{~s}$ and 1650 s .

Attempted Allylation of the N -Acetylimine 16.-To a solution of the $N$-acetylimine $\mathbf{1 6}(0.147 \mathrm{~g})$, prepared above, in dry THF $\left(10 \mathrm{~cm}^{3}\right)$, was added allyltrimethylsilane ( 0.132 g ) and boron trifluoride-diethyl ether ( 0.16 g ). After stirring for 2 h , followed by standing overnight, the volatile solvents were removed under reduced pressure, the residue dissolved in ethyl acetate and this solution washed with sodium hydrogen carbonate solution and then water, dried and finally evaporated under reduced pressure. The residue was crystallised from ethyl acetate-light petroleum to give the unstable $\alpha, \beta$-unsaturated ketone 17 as a colourless solid; m.p. $47-48^{\circ} \mathrm{C} ; \delta_{\mathrm{H}}(90 \mathrm{MHz}) 2.13$ (s, $\mathrm{C}=\mathrm{CCOMe}), 2.41(\mathrm{NCOMe}), 5.75(\mathrm{~s}, \mathrm{CH}=$ trans to NH ), 6.87 ( s , $\mathrm{CH}=$ cis to NH ), $7.70-8.52$ ( s , br NH). This compound was characterised in its reduced form, obtained when compound 17 $(0.11 \mathrm{~g})$, dissolved in dry ethanol $\left(10 \mathrm{~cm}^{3}\right)$ containing palladium on charcoal ( 0.11 g ), was hydrogenated for $\sim 7 \mathrm{~h}$. Removal of the catalyst followed by evaporation of the solvent and distillation of the residue [b.p. $150^{\circ} \mathrm{C} / 0.15 \mathrm{mmHg}$ (Kugelrohr, bath temp.)] gave the 3 -(acetamido)-butan-3-one 18 as a colourless oil ( $0.1 \mathrm{~g}, 89 \%$ ), which was identical with an authentic sample prepared by the method of Wiley and Borum. ${ }^{9}$

Reaction of the Enol Amide 11 with LTA.-To a stirred solution of the enol amide 11 in dichloromethane ( $3 \mathrm{~cm}^{3}$ ) was added LTA $(0.75 \mathrm{~g})$ continually, and in very small portions, over a period of 15 min . After addition, stirring was continued for a further 10 min before the lead diacetate was separated, washed with dichloromethane and the organic layer washed with sodium hydrogen carbonate solution, dried and evaporated under reduced pressure. Chromatography of the residual solid over silica with ethyl acetate-light petroleum as the eluent ( $R_{\mathrm{f}}$ 0.71 ) gave the $\alpha$-acetoxy keto amide 19 as a colourless solid $(0.269 \mathrm{~g}, 97 \%)$; m.p. $149-149.5^{\circ} \mathrm{C}$ (from ethanol) (Found: C, $60.1 ; \mathrm{H}, 5.95 ; \mathrm{N}, 11.65 . \mathrm{C}_{18} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{5}$ requires $\mathrm{C}, 60.15 ; \mathrm{H}, 5.9$; $\mathrm{N}, 11.7 \%) ; \delta_{\mathrm{H}} 1.41\left(\mathrm{t}, J 7.4, \mathrm{CH}_{2} \mathrm{Me}\right), 1.92(\mathrm{~s}, \mathrm{Me}), 1.94(\mathrm{~s}, \mathrm{Me})$, $1.99(\mathrm{~s}, \mathrm{MeCON}), 2.58\left(\mathrm{MeCO}_{2}\right), 3.21(2 \times \mathrm{dq}, J 17.5$ and 7.4 , $\mathrm{CH}_{2} \mathrm{Me}$ ), 7.52 (ddd, $J 8.0,7.2$ and $\left.1.2, \mathrm{Q} 6-\mathrm{H}\right), 7.76$ (dd, $J 8.1$ and $0.6, \mathrm{Q} 8-\mathrm{H}), 7.84$ (ddd, $J 8.1,7.2$ and 1.1, Q 7-H) and 8.27 (dd, $J 8.0$ and $1.1, \mathrm{Q} 5-\mathrm{H}) ; \delta_{\mathrm{C}} 10.93\left(\mathrm{CH}_{2} \mathrm{Me}\right), 20.35(\mathrm{Me}), 20.67$ (Me), $20.78(\mathrm{Me}), 26.42\left(\mathrm{CH}_{2} \mathrm{Me}\right), 26.99\left(\mathrm{MeCO}_{2}\right), 94.70$ $(\mathrm{AcOCN}), 120.68(\mathrm{Q} C \mathrm{CO}), 127.04,127.29,127.62$ and 135.45 $(4 \times \mathrm{Q} C H), 146.55(\mathrm{Q} C \mathrm{~N}=\mathrm{C}), 160.31$ and $161.11(\mathrm{Q} \mathrm{C}=\mathrm{N}$ and Q C=O), $167.48(\mathrm{NCOMe}), 171.41(\mathrm{MeCOO})$ and 199.63 (CCOMe); $v_{\text {max }} / \mathrm{cm}^{-1} 1760 \mathrm{~s}, 1725 \mathrm{~s}, 1693 \mathrm{~s}$ and 1609 s .

3-Amino-2-isopropylquinazolin-4-one 20.-To methyl anthranilate ( 255 g ) was added isobutyric anhydride ( 267 g ) and the stirred mixture heated at $100^{\circ} \mathrm{C}$ for 2.5 h with the exclusion of moisture. After cooling, the mixture was dissolved in diethyl ether ( $600 \mathrm{~cm}^{3}$ ), washed with sodium hydrogen carbonate solution ( $4 \times 500 \mathrm{~cm}^{3}$ ) and then with water. The organic layer was dried, evaporated under reduced pressure and the residue crystallised from light petroleum to give methyl N -(isopropanoyl)anthranilate ( $231 \mathrm{~g}, 78 \%$ ) as a white solid; m.p. 51$52^{\circ} \mathrm{C}$ (Found: C, $65.2 ; \mathrm{H}, 6.85 ; \mathrm{N}, 6.35 . \mathrm{C}_{12} \mathrm{H}_{15} \mathrm{NO}_{3}$ requires C , $65.15 ; \mathrm{H}, 6.85 ; \mathrm{N}, 6.35 \%) ; \delta_{\mathrm{H}} 1.30\left(\mathrm{~d}, J 6.9, M e_{2} \mathrm{CH}\right), 2.62$ (hept, $J 6.9, \mathrm{Me}_{2} \mathrm{CH}$ ), 3.91 (s, OMe), 7.04 (ddd, $J 8.5,7.4$ and $1.2, \mathrm{ArH}$ $p$ - to $\mathrm{CO}_{2} \mathrm{Me}$ ), 7.51 (ddd, $J 8.0,7.4$ and 1.4, ArH p- to N), 8.00 (dd, $J 8.0$ and 1.2, ArH $o$ - to $\mathrm{CO}_{2} \mathrm{Me}$ ), 8.75 (dd, $J 8.5$ and 1.4 , $\operatorname{ArH} o-$ to N ) and $11.13(\mathrm{~s}, \mathrm{br}, \mathrm{NH}) ; v_{\text {max }} / \mathrm{cm}^{-1} 3262 \mathrm{w}, 1682 \mathrm{~s}$ and 1606 m .

The amide above ( 231 g ) and hydrazine hydrate ( 325 g ) were heated under reflux in ethanol ( $650 \mathrm{~cm}^{3}$ ) for 16 h under nitrogen. After standing overnight, the title 3 -aminoquinazolinone 20 was separated. The ethanol filtrate was evaporated under reduced pressure, the residue dissolved in dichloromethane ( $500 \mathrm{~cm}^{3}$ ), and the organic layer washed twice with water, dried and evaporated to yield more product 20. Crystallisation of the combined solids from ethanol gave the product 20 ( $272 \mathrm{~g}, 92 \%$ ); m.p. $101-102^{\circ} \mathrm{C}$ (Found: C, $65.05 ; \mathrm{H}$, $6.5 ; \mathrm{N}, 20.65 . \mathrm{C}_{11} \mathrm{H}_{13} \mathrm{~N}_{3} \mathrm{O}$ requires $\mathrm{C}, 65.0 ; \mathrm{H}, 6.45 ; \mathrm{N}, 20.70 \%$ ); $\delta_{\mathrm{H}} 1.35\left(\mathrm{~d}, J 6.8, M e_{2} \mathrm{CH}\right), 3.72$ (hept, $\left.J 6.8, \mathrm{Me}_{2} \mathrm{CH}\right), 4.93$ (s, $\left.\mathrm{NH}_{2}\right), 7.36\left(\mathrm{dd}, J 8.0\right.$ and $\left.2.2 \mathrm{Q}^{\prime} 6-\mathrm{H}\right), 7.64\left(\mathrm{~m}, \mathrm{Q}^{\prime} 7-\mathrm{H}\right.$ and $\left.8-\mathrm{H}\right)$ and 8.14 (ddd, J 8.0, 1.5 and $\left.0.7 \mathrm{Q}^{\prime} 5-\mathrm{H}\right) ; \delta_{\mathrm{C}} 20.35\left(\mathrm{Me}_{2} \mathrm{CH}\right)$, $30.88\left(\mathrm{Me}_{2} C \mathrm{H}\right), 119.73\left(\mathrm{Q}^{\prime} \mathrm{CCO}\right), 125.85,126.08,127.17$ and $133.77\left(4 \times \mathrm{Q}^{\prime} \mathrm{CH}\right), 146.90\left(\mathrm{Q}^{\prime} C \mathrm{NC}\right)$ and 161.80 and 161.93 ( $\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{N}$ and $\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{O}$ ); $v_{\text {max }} / \mathrm{cm}^{-1} 3304 \mathrm{w}, 3192 \mathrm{~m}, 1666 \mathrm{~m}$ and 1640s.

Acetylation of 3-Amino-2-isopropylquinazolin-4-one 20.-3-Amino-2-isopropylquinazolinone 20 ( 20.82 g ) was dissolved in acetic anhydride $\left(100 \mathrm{~cm}^{3}\right)$ and stirred at room temp. for 48 h . The solution was poured into water ( $1 \mathrm{dm}^{3}$ ) and the solid obtained separated, dried and crystallised from chloroformlight petroleum to give 3-(acetylamino)-2-isopropylquinazolin-4one as a hydrate $21\left(16.6 \mathrm{~g}, 66 \%\right.$ ), m.p. $74-76^{\circ} \mathrm{C}$ (Found: C , 59.05; $\mathrm{H}, 6.5 ; \mathrm{N}, 15.9 . \mathrm{C}_{13} \mathrm{H}_{15} \mathrm{~N}_{3} \mathrm{O}_{2} \cdot \mathrm{H}_{2} \mathrm{O}$ requires $\mathrm{C}, 59.30 ; \mathrm{H}$, $6.5 ; \mathrm{N}, 15.95 \%) ; \delta_{\mathrm{H}}\left(\left[{ }^{2} \mathrm{H}_{6}\right] \mathrm{DMSO}\right) 1.22\left(2 \times \mathrm{d}, J 6.7, \mathrm{Me}_{2} \mathrm{CH}\right)$, 2.12 (s, NCOMe), 3.13 (hept, $J 6.7, \mathrm{Me}_{2} \mathrm{CH}$ ), 3.32 (s, br, $\mathrm{H}_{2} \mathrm{O}$ of crystallisation), 7.53 (dd, $J 8.0$ and $\left.1.0, \mathrm{Q}^{\prime} 6-\mathrm{H}\right), 7.67\left(\mathrm{~d}, J 8.1, \mathrm{Q}^{\prime}\right.$
$8-\mathrm{H}), 7.85\left(\mathrm{ddd}, J 8.1,7.3\right.$ and $\left.1.6, \mathrm{Q}^{\prime} 7-\mathrm{H}\right), 8.10(\mathrm{dd}, J 8.0$ and 1.6, $\mathrm{Q}^{\prime} 5-\mathrm{H}$ ) and 10.95 ( $\mathrm{s}, \mathrm{br}, \mathrm{NH} ; \mathrm{D}_{2} \mathrm{O}$ exch.); $v_{\max } / \mathrm{cm}^{-1} 3420 \mathrm{~s}$, $3420 \mathrm{br} \mathrm{s}, 3180 \mathrm{~m}, 1700 \mathrm{~s}$ and 1677 s .

Alkylation of N -Acetylamino-2-isopropylquinazolinone 21 with Ethyl $\alpha$-Bromoacetate.-To dry dimethylformamide ( 15 $\mathrm{cm}^{3}$ ) was added sodium hydride ( 0.21 g ) followed by the $N$ -(acetylamino)-2-isopropylquinazolin-4-one 21 (1.14 g). The mixture was stirred at room temp. until effervescence ceased and then cooled to $-20^{\circ} \mathrm{C}$. Ethyl $\alpha$-bromoacetate $(2.34 \mathrm{~g})$ was added in one portion and the solution stirred at this temperature for 3 h , then allowed to warm to room temp. and then stirred overnight. Addition of dry diethyl ether and ethyl acetate ( $1: 1$ ) precipitated the bulk of the sodium bromide which was separated, washed with diethyl ether, and the combined filtrates evaporated under reduced pressure. Chromatography of the residue over silica, with ethyl acetate-light petroleum ( $1: 1$ ) as the eluent ( $R_{f} 0.68$ ), gave the amide ester 22 as colourless crystals $(0.2 \mathrm{~g}, 12 \%) ;$ m.p. $102-103{ }^{\circ} \mathrm{C}$ (from ethanol) (Found: $\mathrm{C}, 61.6 ; \mathrm{H}, 6.4 ; \mathrm{N}, 12.7 . \mathrm{C}_{17} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{4}$ requires $\mathrm{C}, 61.6 ; \mathrm{H}, 6.4 ; \mathrm{N}, 12.7 \%$ ). This compound exists in $\mathrm{CDCl}_{3}$ solution as a 3.55:1 ratio of amide rotamers: $\delta_{\mathbf{H}}$ major rotamer: $1.31\left(\mathrm{t}, J 7.1, \mathrm{CH}_{2} M e\right), 1.31$ and $1.41\left(2 \times \mathrm{d}, J 6.6, M e_{2} \mathrm{CH}\right)$, 1.91 (s, NCOMe), 3.89 (hept, $J 6.6, \mathrm{Me}_{2} \mathrm{CH}$ ), 3.59 and 4.98 $\left(2 \times \mathrm{d}, J 16.9, \mathrm{CH}_{2} \mathrm{~N}\right), 4.26\left(\mathrm{ABX}_{3}, \mathrm{CH}_{2} \mathrm{Me}\right), 7.48$ (ddd, $J 8.0$, 7.0 and $\left.1.3, Q^{\prime} 6-H\right), 7.71\left(\mathrm{dd}, J 7.6\right.$ and $\left.0.7, \mathrm{Q}^{\prime} 8-\mathrm{H}\right), 7.80$ (ddd, $J 7.6,7.0$ and $1.5, \mathrm{Q}^{\prime} 7-\mathrm{H}$ ) and 8.23 (ddd, $J 8.0,1.5$ and $0.7, \mathrm{Q}^{\prime} 5-$ $\mathrm{H}) ; \delta_{\mathrm{C}} 14.09$ and $19.83\left(\mathrm{Me}_{2} \mathrm{CH}\right), 21.34\left(\mathrm{CH}_{2} \mathrm{Me}\right), 22.22$ ( NCOMe ), $29.94\left(\mathrm{Me}_{2} \mathrm{CH}\right), 52.99\left(\mathrm{NCH}_{2}\right), 61.45\left(\mathrm{OCH}_{2} \mathrm{Me}\right)$, $120.55\left(\mathrm{Q}^{\prime} C \mathrm{CO}\right), 126.97,127.03,127.70$ and $135.27\left(4 \times \mathrm{Q}^{\prime}\right.$ $\mathrm{CH}), 146.95\left(\mathrm{Q}^{\prime} C \mathrm{~N}=\mathrm{C}\right), 160.31$ and $162.45\left(\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{N}\right.$ and $\mathrm{Q}^{\prime}$ $\mathrm{C}=\mathrm{O}), 167.35(\mathrm{NCOMe})$ and $173.16\left(\mathrm{CO}_{2} \mathrm{Et}\right)$; minor rotamer (observable peaks): 2.35 (s, NCOMe), 4.14 and $4.87(2 \times \mathrm{d}, J$ $18.7, \mathrm{CH}_{2} \mathrm{~N}$ ), 7.41 (ddd, $J 8.0,7.0$ and $\left.1.3, \mathrm{Q}^{\prime} 6-\mathrm{H}\right), 7.65(\mathrm{dd}, J$ 7.6 and $\left.0.7, \mathrm{Q}^{\prime} 8-\mathrm{H}\right), 8.18\left(\mathrm{dd}, J 8.0\right.$ and $\left.0.7, \mathrm{Q}^{\prime} 5-\mathrm{H}\right) ; \delta_{\mathrm{C}}$ (observable peaks) 20.90 ( MeCHMe ); $21.50\left(\mathrm{CH}_{2} \mathrm{Me}\right), 22.05$ ( NCOMe ), $30.07\left(\mathrm{Me}_{2} \mathrm{CH}\right), 54.23\left(\mathrm{OCH}_{2} \mathrm{Me}\right) 62.03\left(\mathrm{CH}_{2} \mathrm{~N}\right)$, 126.27, 126.82, 127.42 and $134.70\left(4 \times \mathrm{Q}^{\prime} \mathrm{CH}\right)$ and $147.30\left(\mathrm{Q}^{\prime}\right.$ $C \mathrm{~N}=\mathrm{C}) ; v_{\text {max }} / \mathrm{cm}^{1} 1739 \mathrm{~s}, 1698 \mathrm{~s}$ and 1600 s .

Further elution gave the ester $23\left(R_{\mathrm{f}} 0.6\right)$ as colourless crystals $(0.225 \mathrm{~g}, 18 \%)$, m.p. $81-82^{\circ} \mathrm{C}$ (from ethyl acetate-light petroleum) (Found: $\mathrm{C}, 65.7 ; \mathrm{H}, 6.7 ; \mathrm{N}, 9.95 . \mathrm{C}_{15} \mathrm{H}_{18} \mathrm{~N}_{2} \mathrm{O}_{3}$ requires $\mathrm{C}, 65.65 ; \mathrm{H}, 6.6 ; \mathrm{N}, 10.2 \%) ; \delta_{\mathrm{H}} 1.29\left(\mathrm{t}, J 7.2, \mathrm{CH}_{2} \mathrm{Me}\right)$, $1.37\left(\mathrm{~d}, J 6.6, M e_{2} \mathrm{CH}\right), 2.91$ (hept, $\left.J 6.6, \mathrm{Me}_{2} \mathrm{CH}\right), 4.25(\mathrm{q}, J 7.2$, $\left.\mathrm{CH}_{2} \mathrm{Me}\right), 4.92\left(\mathrm{~s}, \mathrm{CH}_{2} \mathrm{~N}\right), 7.42\left(\mathrm{ddd}, J 7.9,6.9\right.$ and $\left.1.5, \mathrm{Q}^{\prime} 6-\mathrm{H}\right)$, 7.66 (ddd, $J 7.6,1.5$ and $\left.0.4, \mathrm{Q}^{\prime} 8-\mathrm{H}\right), 7.72$ (ddd, $J 7.6,6.9$ and $1.5, \mathrm{Q}^{\prime} 7-\mathrm{H}$ ) and 8.23 (ddd, $J 7.9,1.5$ and $0.4, \mathrm{Q}^{\prime} 5-\mathrm{H}$ ).

Further elution gave the ester amide $24\left(R_{\mathrm{f}} 0.39\right)$ as colourless crystals $(0.193 \mathrm{~g}, 12 \%)$, m.p. $160-162^{\circ} \mathrm{C}$ (from ethanol) (Found: $\mathrm{C}, 61.5 ; \mathrm{H}, 6.4 ; \mathrm{N}, 12.55 . \mathrm{C}_{17} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{4}$ requires $\mathrm{C}, 61.6 ; \mathrm{H}, 6.4$; $\mathrm{N}, 12.7 \%) ; \delta_{\mathrm{H}} 1.21\left(\mathrm{t}, J 7.1, \mathrm{CH}_{2} M e\right), 1.43\left(2 \times \mathrm{d}, J 6.6, M e_{2} \mathrm{CH}\right)$, 2.08 (s, NCOMe), 3.75 (hept, $J 6.6, \mathrm{Me}_{2} \mathrm{CH}$ ), $4.25\left(\mathrm{ABX}_{3}\right.$, $\left.\mathrm{CH}_{2} \mathrm{Me}\right), 6.85(\mathrm{~d}, J 9.1, \mathrm{NHCH}), 7.43$ (ddd, $J 8.0,6.8$ and $1.6, \mathrm{Q}^{\prime}$ $6-\mathrm{H}), 7.63(\mathrm{~d}, J 9.1, \mathrm{~N} H \mathrm{CH}), 7.67-7.77\left(\mathrm{~m}, \mathrm{Q}^{\prime} 7-\right.$ and $\left.8-\mathrm{H}\right)$ and 8.15 (ddd, $J 8.0,1.3$ and $\left.0.5, \mathrm{Q}^{\prime} 5-\mathrm{H}\right)$; proton decoupling at $\delta$ $6.85(\mathrm{~d}, \mathrm{NHCH})$ collapses $7.63(\mathrm{~d}, \mathrm{~N} H \mathrm{CH})$ to a singlet; $\delta_{\mathrm{C}}$ $(75 \mathrm{MHz}) 13.95,20.71\left(\mathrm{Me}_{2} \mathrm{CH}\right), 21.70\left(\mathrm{OCH}_{2} \mathrm{Me}\right), 22.89$ ( NCOMe ), $31.49\left(\mathrm{Me}_{2} \mathrm{CH}\right), 60.72(\mathrm{NHCH}), 62.78\left(\mathrm{OCH}_{2} \mathrm{Me}\right)$, $120.09\left(\mathrm{Q}^{\prime} C \mathrm{C}=\mathrm{O}\right), 126.22,126.53,127.50$ and $134.76\left(4 \times \mathrm{Q}^{\prime}\right.$ $\mathrm{CH}), 147.58\left(\mathrm{Q}^{\prime} C \mathrm{~N}=\mathrm{C}\right), 160.07$ and $163.22\left(\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{N}\right.$ and $\mathrm{Q}^{\prime}$ $\mathrm{C}=\mathrm{O}), 166.66(\mathrm{NCOMe})$ and $170.29\left(\mathrm{CO}_{2} \mathrm{Et}\right) ; v_{\text {max }} / \mathrm{cm}^{-1}$ $3311 \mathrm{~m}, 1755 \mathrm{~s}, 1690 \mathrm{~s}$ and 1658 s .

[^0]dropwise over 30 min to a vigorously stirred solution of ethyl $\alpha$-bromoacetate ( 2.38 g ) in dry dimethylformamide held at $-20^{\circ} \mathrm{C}$. The resulting mixture was stirred for 2.5 h at this temperature and then allowed to stand overnight at room temp. The reaction mixture was worked up as described above and the ester 22 isolated by chromatography ( $1.49 \mathrm{~g}, 83 \%$ ), identical to the material described above.

Aluminium Amalgam Reduction of the Ester 22.-The ester amide $22(0.296 \mathrm{~g})$ was dissolved in dry methanol $\left(30 \mathrm{~cm}^{3}\right)$, aluminium amalgam [prepared from aluminium turnings ( 2 g )] was added and the solution stirred under a nitrogen atmosphere in a flask immersed in water at ambient temperature for 48 h . The solution was centrifuged, the methanol decanted, the solid re-suspended in methanol ( $\sim 20 \mathrm{~cm}^{3}$ ), again centrifuged and the methanol separated. Evaporation of the combined methanol extracts under reduced pressure and chromatography of the residue over silica, eluting with ethyl acetate, gave impure 2-isopropylquinazolin-4-one 27. Further elution with methanolethyl acetate (1:1) ( $R_{\mathrm{f}} 0.16$ ) gave ethyl $N$-acetylglycinate 26 ( $0.096 \mathrm{~g}, 74 \%$ ) ( $R_{\mathrm{f}} 0.16$ ) after distillation (Kugelrohr). The NMR spectrum of this material was identical with that of an authentic sample (Aldrich): $\delta_{\mathrm{H}}(90 \mathrm{MHz}) 1.25\left(\mathrm{t}, \mathrm{J} 7.5, \mathrm{CH}_{2} \mathrm{Me}\right)$, 2.00 (s, NCOMe), 3.97 (d, $J 5.4, \mathrm{NHCH}_{2}$ ), 4.21 (q, J 7.5, $\mathrm{CH}_{2} \mathrm{Me}$ ) and 6.29 (s, br, NH).

Reaction of 3-(Acetoxyamino)-2-isopropylquinazolin-4-one 28 with 1,3-Diphenylpropane-1,3-dione.-The procedure given earlier for the reaction of compound 7 with pentane-2,4-dione was followed, this time using compound 20 ( $3.45 \mathrm{~g}, 17 \mathrm{mmol}$ ), LTA ( $7.92 \mathrm{~g}, 18 \mathrm{mmol}$ ) and 1,3-diphenylpropane-1,3-dione ( $11.44 \mathrm{~g}, 50 \mathrm{mmol}$ ) in dry dichloromethane ( $35 \mathrm{~cm}^{3}$ ). After the same work up as before, an oil was obtained from which the bulk of the excess 1,3-diphenylpropane-1,3-dione crystallised on standing. After separation, the residual oil was chromatographed on silica with ethyl acetate-light petroleum (1:4) $\left(R_{\mathrm{f}}\right.$ 0.21 ) as the eluent and the keto amide 29 was obtained as colourless crystals ( $2.97 \mathrm{~g}, 48 \%$ ); m.p. $154-155^{\circ} \mathrm{C}$ (from ethanol) (Found: C, 73.35; H, 5.5; N, 9.85. $\mathrm{C}_{26} \mathrm{H}_{23} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires $\mathrm{C}, 73.4, \mathrm{H}, 5.45 ; \mathrm{N}, 9.9 \%$ ). In $\mathrm{CDCl}_{3}$ solution, this compound was present as a $1.2: 1$ ratio of amide rotamers; major rotamer $\delta_{\mathrm{H}} 1.34\left(2 \times \mathrm{d}, J 6.8, \mathrm{Me}_{2} \mathrm{CH}\right), 4.23-4.35(\mathrm{~m}$, $\left.\mathrm{Me}_{2} \mathrm{CH}\right), 4.29$ and $6.11\left(2 \times \mathrm{d}, J 17.5, \mathrm{CH}_{2}\right), 7.16-7.78(11 \mathrm{H}$, $\mathrm{m}, \mathrm{Q}^{\prime} 6-, 7-, 8-\mathrm{H}$ and $\left.8 \times \mathrm{PhH}\right), 8.03(\mathrm{~m}, 2 \times \mathrm{PhH})$ and 8.10 (ddd, $J 8.3,1.5$ and $0.3, \mathrm{Q}^{\prime} 5-\mathrm{H}$ ); minor rotamer $\delta_{\mathrm{H}}$ (observable peaks) $1.18,1.52\left(2 \times \mathrm{d}, J 6.5, M e_{2} \mathrm{CH}\right), 5.22$ and $5.42(2 \times \mathrm{d}, J$ $19.3, \mathrm{CH}_{2}$ ) and $8.24\left(\mathrm{~d}, J 8.1, \mathrm{Q}^{\prime} 5-\mathrm{H}\right) ; v_{\max } / \mathrm{cm}^{-1} 1700 \mathrm{~s}, 1673 \mathrm{~s}$ and $1598 \mathrm{~s} ; m / z(\%) 188(100), 187(94), 173$ (100), 166 (72), 119 (63), 106 (93) and 105 (100). Further elution gave 2-isopropylquinazolin-4-one 27 ( $4 \%$ ).

Reaction of compound 28 with 1-Phenylbutane-1,3-dione.The reaction was performed as described above using compound $20(3.2 \mathrm{~g})$, LTA ( 7.38 g ) and 1-phenylbutane-1,3dione ( 6.3 g ) in dry dichloromethane ( $32 \mathrm{~cm}^{3}$ ). The solid-oil mixture obtained was triturated with ice-cold diethyl ether to give 2 -isopropylquinazolin-4-one 27 ( $9 \%$ ). Chromatography of the residue over silica with ethyl acetate-light petroleum ( $1: 4$ ) ( $R_{\mathrm{f}} 0.30$ ) gave the diketo amine 32 as colourless crystals (from ethanol) ( $0.74 \mathrm{~g}, 13 \%$ ), m.p. $125-127^{\circ} \mathrm{C}$ (decomp.) (Found: C, 69.3; $\mathrm{H}, 5.95 ; \mathrm{N}, 11.7$. $\mathrm{C}_{21} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires C, 69.4; $\mathrm{H}, 5.85$; $\mathrm{N}, 11.55 \%$ ); $\delta_{\mathrm{H}} 1.22\left(2 \times \mathrm{d}, J 6.7, \mathrm{Me}_{2} \mathrm{CH}\right), 2.28(\mathrm{~s}, \mathrm{MeCO})$, 3.38 (hept, $J 6.7, \mathrm{Me}_{2} \mathrm{C} H$ ), 5.02 (d, $J 2.9, \mathrm{CHNH}$ ), 6.71 (d, $J$ $2.9, \mathrm{NH}$ ), 7.37 (ddd, $J 8.1,6.7$ and $\left.1.6, \mathrm{Q}^{\prime} 6-\mathrm{H}\right), 7.46$ (dd, $J 7.4$ and $1.6,2 \times \mathrm{PhH}), 7.65\left(2 \mathrm{H}, \mathrm{m}, \mathrm{Q}^{\prime} 7-\mathrm{and} 8-\mathrm{H}\right), 8.00(\mathrm{~m}$, $3 \times \mathrm{ArH}$ ) and $8.11\left(\mathrm{dd}, J 8.1\right.$ and $\left.1.1, \mathrm{Q}^{\prime} 5-\mathrm{H}\right) ; \delta_{\mathrm{C}} 20.68$ and 20.92 ( $\mathrm{Me}_{2} \mathrm{CH}$ ), 26.19 (MeCO), $30.81\left(\mathrm{Me}_{2} \mathrm{CH}\right), 77.80$ (CHNH), 120.56 (Q' CCO), 126.29, 126.39, 127.42, 128.89 and
$129.34(5 \times \mathrm{ArCH}), 134.06(\mathrm{CCO}), 134.39$ and 134.45 $(2 \times \mathrm{ArCH}), 147.0\left(\mathrm{Q}^{\prime} \mathrm{CN}=\mathrm{C}\right), 162.06$ and $162.95\left(\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{N}\right.$ and $\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{O}$ ), 193.11 ( PhCO ) and 201.42 ( MeCO ); $v_{\text {max }} / \mathrm{cm}^{-1}$ $3174 \mathrm{~m}, \mathrm{br}, 1700 \mathrm{~s}, 1620 \mathrm{~s}$ and 1600 s .

Further elution gave a mixture of keto amides 30 and $31\left(R_{\mathrm{f}}\right.$ $0.21)(4.31 \mathrm{~g}, 75 \%)$ in a $1: 3.3$ ratio. Crystallisation from ethanol ( $3 \times$ ) gave the keto amide 31 ( $0.245 \mathrm{~g}, 4 \%$ ) as colourless crystals, m.p. $112-114{ }^{\circ} \mathrm{C}$ (Found: M $363.1583 . \mathrm{C}_{21} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires $M$ 363.1583). In $\mathrm{CDCl}_{3}$ solution, this compound is present as a 1.6:1 ratio of rotamers; major rotamer $\delta_{\mathrm{H}} 1.21$ and $1.28(2 \times \mathrm{d}$, $J 6.5, \mathrm{Me}_{2} \mathrm{CH}$ ), 2.34 (s, MeCO), 3.99 (hept, $J 6.5, \mathrm{Me}_{2} \mathrm{CH}$ ), 3.83 and $5.15\left(2 \times \mathrm{d}, J 17.2, \mathrm{CH}_{2}\right), 7.20-7.77\left(8 \mathrm{H}, \mathrm{m}, \mathrm{Q}^{\prime} 6-, 7-, 8-\mathrm{H}\right.$ and $5 \times \mathrm{PhH})$ and $8.09\left(\mathrm{~d}, \mathrm{Q}^{\prime} 5-\mathrm{H}\right) ; \delta_{\mathrm{C}} 20.50$ and 22.91 $\left(\mathrm{Me}_{2} \mathrm{CH}\right), 27.62(\mathrm{MeCO}), 29.97\left(\mathrm{Me}_{2} \mathrm{CH}\right), 60.82\left(\mathrm{CH}_{2}\right), 120.20$ ( $\mathrm{Q}^{\prime} \mathrm{CCO}$ ), 126.29, 126.68, 126.77, 126.84, 127.36, 127.44, 128.13 and $130.92(8 \times \mathrm{ArCH}), 132.44(\mathrm{PhCCO}), 135.02\left(\mathrm{Q}^{\prime} \mathrm{CH}\right)$, $146.60\left(\mathrm{Q}^{\prime} C \mathrm{~N}=\mathrm{C}\right), 160.66$ and 162.24 ( $\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{N}$ and $\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{O}$ ), $172.52(\mathrm{NCOPh})$, and 200.06 ( $C \mathrm{OMe}$ ); minor rotamer (observable peaks) 1.47 (d, J6.5, Me ${ }_{2} \mathrm{CH}$ ), 1.96 (s, COMe), 4.14 (hept, $\left.J 6.5, \mathrm{Me}_{2} \mathrm{CH}\right), 4.54$ and $4.82\left(2 \times \mathrm{d}, J 19.6, \mathrm{CH}_{2}\right)$ and 8.22 (d, J 7.7, $\mathrm{Q}^{\prime} 5-\mathrm{H}$ ); $\delta_{\mathrm{C}}$ (observable peaks) 21.72 and 22.15 $\left(\mathrm{Me}_{2} \mathrm{CH}\right), 27.11(\mathrm{COMe}), 30.36\left(\mathrm{Me}_{2} \mathrm{CH}\right), 61.80\left(\mathrm{CH}_{2}\right)$, 121.05 ( $\mathrm{Q}^{\prime}$ CCO), 126.29, 126.77, 126.84, 127.36, 127.44, 130.92 and $131.66(7 \times \mathrm{ArCH}), 132.94(\mathrm{PhCCO}), 134.75\left(\mathrm{Q}^{\prime}\right.$ $\mathrm{CH}), 147.24\left(\mathrm{Q}^{\prime} \mathrm{CN}=\mathrm{C}\right), 159.63$ and $163.75\left(\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{N}\right.$ and $\mathrm{Q}^{\prime}$ $\mathrm{C}=0), 171.41(\mathrm{NCOPh})$ and $201.62(\mathrm{COMe}) ; v_{\text {max }} / \mathrm{cm}^{-1}$ 1732s, 1700s and $1601 ; m / z(\%) 188(38), 173$ (72) and 105 (100).

Further crystallisation of the mixture of compounds $\mathbf{3 0}$ and 31 from chloroform-light petroleum gave the keto amide 30 as a colourless solid ( $0.148 \mathrm{~g}, 2 \%$ ) m.p. $115-117^{\circ} \mathrm{C}$ (Found: M 363.1583. $\mathrm{C}_{21} \mathrm{H}_{21} \mathrm{~N}_{3} \mathrm{O}_{3}$ requires $M$ 363.1583). In $\mathrm{CDCl}_{3}$ solution this compound exists as a 5.8:1 ratio of rotamers; major rotamer $\delta_{\mathrm{H}} 1.25$ and $1.44\left(2 \times \mathrm{d}, J 6.6, \mathrm{Me} e_{2} \mathrm{CH}\right), 1.95$ (COMe), 4.03 (hept, $\left.J 6.6, \mathrm{Me}_{2} \mathrm{CH}\right), 4.15$ and $5.88(2 \times \mathrm{d}, J$ $17.4, \mathrm{CH}_{2}$ ), $7.38-7.83\left(6 \mathrm{H}, \mathrm{m}, \mathrm{Q}^{\prime} 6-, 7-, 8-\mathrm{H}\right.$ and $3 \times \mathrm{PhH}$ ), $7.95-8.00(\mathrm{~m}, 2 \times \mathrm{PhH})$ and $8.25\left(\mathrm{dd}, J 8.0\right.$ and $\left.1.2, \mathrm{Q}^{\prime} 5-\mathrm{H}\right) ; \delta_{\mathrm{C}}$ 19.90 and 21.34 ( $\mathrm{Me}_{2} \mathrm{CH}$ ), 22.25 (COMe), 29.82 ( $\mathrm{Me}_{2} \mathrm{CH}$ ), $57.12\left(\mathrm{CH}_{2}\right), 120.52\left(\mathrm{Q}^{\prime} \mathrm{CCO}=\mathrm{O}\right), 126.94,127.69,128.08,128.74$ (2 peaks) and $133.71(6 \times \mathrm{ArCH}), 134.82(\mathrm{PhCCO}), 135.28\left(\mathrm{Q}^{\prime}\right.$ CH ), $147.01\left(\mathrm{Q}^{\prime} C \mathrm{~N}=\mathrm{C}\right), 160.63$ and $162.76\left(\mathrm{Q}^{\prime} \mathrm{C}=\mathrm{N}\right.$ and $\mathrm{Q}^{\prime}$ $\mathrm{C}=0$ ), 173.07 ( NCOMe ) and 191.51 ( COPh ); minor rotamer (observable peaks) $\delta_{\mathrm{H}} 1.19$ and $1.37\left(2 \times \mathrm{d}, J 6.7, \mathrm{Me}_{2} \mathrm{CH}\right), 2.27$ (s, COMe), 3.76 (hept, $J 6.7, \mathrm{Me}_{2} \mathrm{CH}$ ), 4.90 and $5.67(2 \times \mathrm{d}, J$ 19.4, $\mathrm{CH}_{2}$ ) and 8.19 (dd, $J 8.1$ and 1.1, Q' $5-\mathrm{H}$ ); $\delta_{\mathrm{C}}$ (observable peaks) 20.82 ( MeCHMe ), $29.94\left(\mathrm{Me}_{2} \mathrm{CH}\right) 59.11\left(\mathrm{CH}_{2}\right), 126.24$, 126.72, 127.44, 127.91, 129.07, 134.45 and $134.72(7 \times \mathrm{ArCH})$ and $192.30(\mathrm{COPh}) ; v_{\text {max }} / \mathrm{cm}^{-1}, 1685 \mathrm{~s}$ and $1596 \mathrm{~s} ; m / z(\%) 188$ (50), 173 (100) and 105 (63).
