# Synthesis and effects on arginase and nitric oxide synthase of two novel analogues of $N^{\omega}$ -hydroxyarginine, $N^{\omega}$ -hydroxyanidinophenylalanine

# Sandrine Vadon, Julien Custot, Jean-Luc Boucher and Daniel Mansuy\*

Laboratoire de Chimie et Biochimie Pharmacologiques et Toxicologiques, URA 400, Université Paris V, 45 rue des Saints-Pères, 75270 Paris Cedex 06, France

Two novel amino acids,  $N^{\infty}$ -hydroxy-D,L-indospicine and p-hydroxyamidino-D,L-phenylalanine, have been synthesized in four steps from *tert*-butoxycarbonylglycine. Both compounds act as good inhibitors of arginase,  $N^{\infty}$ -hydroxyindospicine being one of the best inhibitors of this enzyme known so far (IC<sub>50</sub> = 50  $\mu$ mol dm<sup>-3</sup>). In contrast, with brain NO synthase the two compounds are almost without effect.

L-Arginine is metabolised in cells by two major pathways: arginase catalyses its hydrolysis to L-ornithine and urea in the first step of the urea cycle, whereas NO synthase (NOS) catalyses its five-electron oxidation to L-citrulline and nitric oxide (NO).<sup>2,3</sup> NO thus produced has been found to be a key biological molecule in vasodilation, neurotransmission and cytotoxicity. 4.5 Arginase and NO synthase are metalloenzymes. The former involves a bimetallic Mn<sup>II</sup><sub>2</sub> centre, whereas the latter is a flavo-hemoprotein that requires tetrahydrobiopterin.6 Although arginase and NO synthase share the same substrate, they differ in their affinity for arginine, the  $K_m$  for arginine being 1-10 mmol dm<sup>-3</sup> for arginase 1 and 1-10 µmol dm<sup>-3</sup> for NOS. 3.6 They also have different patterns of inhibition: NOS is inhibited by  $N^{\omega}$ -substituted analogues of arginine, like  $N^{\omega}$ methyl-L-arginine (NMMA) or No-nitro-L-arginine (NNA)  $(K_i = 1-10 \,\mu\text{mol dm}^{-3})$ , whereas the best inhibitors of arginase known until last year were L-valine<sup>8</sup> or L-indospicine ( $K_i = 1$  $mmol dm^{-3}).9$ 

Since the two enzymes can be found in similar tissues and cells, and because their expression may be regulated in response to the same stimuli [cytokines, endotoxines (LPS)] 10 recent studies have been devoted to possible interactions between these two pathways. Several results showed the importance of  $N^{\omega}$ hydroxy-L-arginine (L-NOHA) in that context. L-NOHA, an intermediate in the NOS-dependent oxidation of L-arginine into L-citrulline and NO, was recently reported to act as a very good inhibitor of arginase, in fact the best one reported so far, displaying a K<sub>i</sub> of ca. 100 µmol dm<sup>-3</sup> on bovine and rat liver arginase. 11,12 This phenomenon may be important for the availability of arginine, and could modulate the production of NO and urea. In fact, rat alveolar macrophages exposed to LPS were found to generate up to 37 µmol dm<sup>-3</sup> L-NOHA, suggesting that this compound may be a potent endogenous arginase inhibitor thus increasing the availability of L-arginine for NO biosynthesis. 13,14 The regulation of arginase and NOS by selective inhibitors may have considerable importance in therapy. Because of the dual role of L-NOHA on NOS and arginase, it seems particularly interesting to obtain analogues of this compound that may help to control selectively arginase and/or NOS, and may provide insight on the catalytic site of these two metalloenzymes. So far, only two analogues of L-NOHA have been reported in the literature; both of them are NG-methyl-L-NOHA. 15,16

This paper describes the synthesis of two novel analogues of L-NOHA,  $N^{\omega}$ -hydroxy-D,L-indospicine **4a** (2,7-diamino-7-hydroxyiminoheptanoic acid), in which the  $\delta$ -NH group of L-NOHA has been replaced by a CH<sub>2</sub> group, and p-hydroxyamidino-D,L-phenylalanine **4b**, in which the CH<sub>2</sub>CH<sub>2</sub>NH

moiety of L-NOHA has been replaced by a more rigid aromatic ring. Both compounds are amino acids containing an amidoxime function instead of the N-hydroxyguanidine function of L-NOHA. Such changes of a  $\delta$ -NH group into a CH<sub>2</sub> will modify the p $K_a$  value of the new compounds (ca. 8 for N-hydroxyguanidines to ca. 6 for amidoximes)  $^{17.18}$  and could modify the interactions between the amino acid and the protein (hydrogen bonding, ionic interactions). This paper also reports a preliminary comparison of the effects of these two compounds on arginase and NOS with those of L-NOHA 6 and  $N^{\omega}$ -hydroxy-L-citrulline 8, another analogue bearing a NOH group without basic properties.

## Synthesis of the two analogues of L-NOHA (Scheme 1)

tert-Butoxycarbonylglycine (BOC-glycine) was chosen as starting material, and the nitriles 1a and 1b were prepared in

Scheme 1 Reagents and conditions: i, LDA, BrCH<sub>2</sub>XCN, THF, -40 °C, 3 h; ii, Bu'Br, benzyltriethylammonium chloride, K<sub>2</sub>CO<sub>3</sub>, dimethylacetamide, 55 °C, 22 h; iii, NH<sub>2</sub>OH, EtOH; iv, HCl

moderate yields according to the procedure of De Nicola et al. <sup>19</sup> Protection of the acidic moiety of **1a** and **1b** was then easily achieved (95% yield) using a previously described method. <sup>20</sup> Use of the tert-butyl ester of **1a** (and **1b**) was required in order to avoid further side reaction with NH<sub>2</sub>OH, and this step was also a useful and easier way to purify the nitriles and separate them from residual glycine.

The amidoximes **3a** and **3b** were then prepared by addition of hydroxylamine to an ethanolic solution of the corresponding nitriles **2**. Reaction proceeded readily with **2b**, giving **3b** in 86% yield. However, the aliphatic amidoxime was more difficult to prepare. It is worth noting that, unlike aromatic amidoximes, very few aliphatic ones are described in the literature, and that yields are generally not given. <sup>17</sup> It was found here that the

best yields were obtained when an ethanolic solution of hydroxylamine (free base), prepared from NH<sub>2</sub>OH·HCl and a slight excess of KOH, was used. Protected  $N^{\omega}$ -hydroxy-D,L-indospicine was thus obtained in 34% yield together with 60% of recovered starting material which was recycled. When NH<sub>2</sub>OH·HCl and MeCO<sub>2</sub>Na were used, yields decreased dramatically and a blue by-product was formed, which gave back the nitrile 2a and the amidoxime 3a in basic solution. It is probably a dimeric product according to its mass spectrum (CI, MH<sup>+</sup> = 658).

Hydrolysis of the protecting groups using anhydrous HCl afforded the desired products  $\mathbf{4a}$  and  $\mathbf{4b}$  as dihydrochloride salts. L-NOHA and  $N^{\omega}$ -hydroxy-L-citrulline were synthesized starting from  $N^{\delta}$ -benzyloxycarbonyl-L-ornithine ( $N^{\delta}$ -Z-L-orn, Scheme 2). L-NOHA was prepared by a modification of the

procedure of Wallace et al.,  $^{21}$  in a 46% overall yield.  $N^{\omega}$ -Hydroxy-L-citrulline was prepared from the same intermediate  $N^{z}$ -BOC-L-ornithine tert-butyl ester 5, which was treated with carbonyldiimidazole. A nucleophilic displacement of imidazole with hydroxylamine gave compound 7 (89% yield). The protecting groups were then removed by acidic hydrolysis, affording 8 in 90% yield.

## Biological results and discussion

Both  $N^{\omega}$ -hydroxy-d,l-indospicine **4a** and p-hydroxyamidino-d,l-phenylalanine **4b** led to a clear concentration-dependent inhibition of purified bovine liver arginase. Their IC<sub>50</sub> values (50 and 230  $\mu$ mol dm<sup>-3</sup> respectively) were markedly lower than that of L-valine, a classical arginase inhibitor <sup>8</sup> (IC<sub>50</sub> ca. 1 mmol dm<sup>-3</sup>). In fact, preliminary kinetic studies showed that **4a** exhibited a  $K_i$  value of 20  $\mu$ mol dm<sup>-3</sup> which is lower than that recently reported for L-NOHA. <sup>11,12</sup> Thus  $N^{\omega}$ -hydroxy-d,L-indospicine **4a** appears to be the best arginase inhibitor reported so far. Interestingly enough,  $N^{\omega}$ -hydroxy-L-citrulline **8** was a very poor inhibitor of arginase (Table 1). This indicates that the presence of a N-OH function as in L-NOHA, **4a** or **4b**, is not sufficient for a compound to be a good arginase inhibitor. A sufficient electron richness of this N-OH function also appears to be required. <sup>18</sup>

In contrast to their strong effects on arginase, compounds 4a and 4b seemed to exhibit very weak effects on NOS. Preliminary studies showed that 200  $\mu$ mol dm<sup>-3</sup> 4a and 4b failed to inhibit to a significant extent the oxidation of  $\lceil 1^4C \rceil$ -arginine to  $\lceil 1^4C \rceil$ -

**Table 1** Inhibition of bovine liver arginase (BLA) by amino acids <sup>a</sup>

Compound	$IC_{50}$ (µmol dm <sup>-3</sup> )
L-Valine	1000 ± 250
L-NOHA	$100 \pm 30$
N <sup>∞</sup> -Hydroxy-L-citrulline	$5000 \pm 500$

p-Hydroxyamidino-D,L-phenylalanine	$230 \pm 50$

<sup>a</sup> Reaction mixture for bovine liver arginase (about 250 U mg<sup>-1</sup>, Sigma) contained in a final volume of 100 mm<sup>3</sup>: 200 mmol dm<sup>-3</sup> TrisHCl buffer pH 7.4, 20 mmol dm<sup>-3</sup> L-arginine, 0.05 μCi L-[G-<sup>14</sup>C]arginine and the appropriate concentration of inhibitor (from IC<sub>50</sub>/5 to 5 IC<sub>50</sub>). Reaction was initiated by adding about 1 μg of bovine liver arginase. Incubations were carried out at 37 °C for 10 min, and were stopped by the addition of 250 mm<sup>3</sup> of a cold solution of 7 mol dm<sup>-3</sup> urea in 500 mmol dm<sup>-3</sup> acetic acid; 200 mm<sup>3</sup> of a Dowex-H<sup>+</sup> solution (1/1 w/v) were added. After centrifugation, a 200 mm<sup>3</sup> aliquot was submitted to liquid scintillation counting, and the amount of [1<sup>4</sup>C]urea formed was calculated based on the specific activity of the [G-<sup>14</sup>C]arginine used. IC<sub>50</sub> mean values ±SD from 2 to 4 independent experiments.

citrulline <sup>22</sup> by purified brain NOS. <sup>23</sup> Moreover, neither **4a** nor **4b** were able to act as substrates of brain NOS since they failed to produce significant amounts of NO (detected by visible spectroscopy from its reaction with hemoglobin) <sup>24</sup> upon reaction with purified brain NOS and NADPH.

Further studies are necessary to confirm these results and to extend them to other kinds of NOS. However, the aforementioned results showing the very different behaviour of the two analogues of L-NOHA, 4a and 4b, towards arginase and NOS, should be useful for future comparisons of the active sites of the two classes of enzymes that use L-arginine as substrate. Studies are in progress to obtain pure L- or D-amino acids 4a and 4b in order to determine the stereochemical requirements and to elucidate the mechanism by which they interact with arginase.

## **Experimental**

## **General procedures**

<sup>1</sup>H and <sup>13</sup>C NMR spectra were recorded on a Bruker ARX 250 spectrometer operating at 250 MHz. The solvent was used as the internal standard and J values are given in Hz. IR spectra were recorded on a Perkin-Elmer 783 spectrometer. Mass spectra were obtained on a Riber-Mag R10-10 C spectrometer. FAB mass spectra were recorded on a Nermag R10-10 spectrometer using thioglycerol as a matrix. Melting points were determined on a Reichert Thermovar apparatus and are uncorrected. Elemental analyses were performed in the regional microanalytical laboratory of Paris VI University. Analytical thin layer chromatography was carried out on 0.25 mm precoated silica gel plates (Merck 60 F 254) and compounds were visualised using UV fluorescence and ninhydrin spray reagent. Flash chromatography was performed using Merck Kieselgel 60 (70-230 mesh ASTM) silica gel. Chemical reagents were obtained from Aldrich or Sigma, except if otherwise indicated, and were of analytical grade. Dioxane and diethyl ether (called ether) were distilled over sodium-benzophenone just before use.

# Synthesis of $N^{\omega}$ -hydroxy-D,L-indospicine 4a

 $N^{\alpha}$ -tert-Butoxycarbonyl-6-cyano-D,L-norleucine 1a. <sup>19</sup>  $N^{\alpha}$ -tert-Butoxycarbonylglycine (1.1 g, 6.3 mmol) dissolved in THF (15 cm³) was added to a solution of lithium diisopropylamide (LDA; 20 mmol) in THF (10 cm³) at 0 °C under argon. The mixture was stirred at 0 °C for 0.5 h and then cooled to -40 °C and treated with 5-bromopentanenitrile (5-bromovaleronitrile; Lancaster; 2.8 cm³, 24 mmol). After being stirred for 1.5 h at -40 °C, the reaction mixture was diluted with saturated aqueous ammonium chloride (15 cm³) to quench the reaction.

The mixture was acidified to pH 3.5 and extracted with ethyl acetate. The extract was dried (MgSO<sub>4</sub>) and evaporated and the residue was purified on a silica gel column using ethyl acetate-formic acid (100:1) as eluent to yield 1a (1.4 g) contaminated with  $N^{\alpha}$ -BOC-glycine. Compound 1a was used without further purification;  $\nu_{\text{max}}(\text{neat})/\text{cm}^{-1}$  2240 (CN);  $\delta_{\text{H}}(\text{CDCl}_3)$  1.43 (9 H, s, Bu'), 1.6–1.7 (6 H, m, 3 × CH<sub>2</sub>), 2.35 (2 H, t, *J* 6.9, CH<sub>2</sub>CN), 4.31 (1 H, m, CH) and 5.05 (1 H, m, NH).

 $N^{\alpha}$ -tert-Butoxycarbonyl-6-cyano-D,L-norleucine tert-butvl ester 2a.<sup>20</sup> Compound 1a (1.4 g, 4.3 mmol as determined by NMR) was dissolved in dimethylacetamide (45 cm<sup>3</sup>) containing benzyltriethylammonium chloride (1.34 g, 5.9 mmol), K<sub>2</sub>CO<sub>3</sub> (21.2 g, 153 mmol) and tert-butyl bromide (39 g, 285 mmol). The mixture was heated at 55 °C for 22 h after which it was treated with cold hydrochloric acid (0.05 mol dm<sup>-3</sup>; 150 cm<sup>3</sup>) to give a precipitate; this was extracted with ethyl acetate ( $\times$ 3). The combined extracts were washed with brine, dried (MgSO<sub>4</sub>) and concentrated under reduced pressure. Purification of the residue on a silica gel column (ethyl acetate-cyclohexane, 3:7) yielded a white solid (1.27 g; 63% for the two steps; protected glycine 28%) mp 55 °C (Found: C, 61.5; H, 8.7; N, 8.9. Calc. for  $C_{16}H_{28}N_2O_4$ : C, 61.5; H, 9.0; N, 9.0%);  $v_{max}(KBr)/cm^{-1}$  2240 (CN);  $\delta_{H}$ (CDCl<sub>3</sub>) 1.42 (9 H, s, Bu<sup>t</sup>), 1.45 (9 H, s, Bu<sup>t</sup>), 1.6–1.8 (6  $H, m, 3 \times CH_2$ ), 2.33 (2 H, t, J7,  $CH_2CN$ ), 4.14 (1 H, m, CH) and 5.02 (1 H, m, NH);  $\delta_{\rm C}({\rm CDCl_3})$  17.6 (CH<sub>2</sub>CN), 24.2, 24.9  $(2 \times CH_2)$ , 27.1, 28.0  $(2 \times Bu^tCH_3)$ , 32.1  $(CH_2CH)$ , 53.4 (CH), 79.7, 82.1 (2  $\times$  Bu<sup>t</sup>C), 119.3 (C $\equiv$ N), 155.3 (CO BOC) and 171.5 (CO ester); m/z (CI, NH<sub>3</sub>) 313 (MH<sup>+</sup>, 26%), 330 (93,  $M + NH_4^+$ ), 274 (100,  $M - C_4H_8 + NH_4^+$ ) and 257 (35,  $MH^{+} - C_{4}H_{8}$ ).

 $N^{\alpha}$ -tert-Butoxycarbonyl- $N^{\omega}$ -hydroxy-D,L-indospicine butyl ester 3a. Compound 2a (1 g, 3.2 mmol) was mixed with ethanolic hydroxylamine (50 cm<sup>3</sup>, 4 equiv.) and heated under reflux for 6 h. The mixture was then evaporated to remove the ethanol, diluted with ethyl acetate and thrice extracted with water acidified to pH 4.5 (acetic acid). The combined aqueous extracts were then basified to pH 11 by addition of ammonium hydroxide and extracted with ethyl acetate ( $\times$ 3). The combined extracts were dried (MgSO<sub>4</sub>) and concentrated, and the residue was purified by flash chromatography (silica) using ethyl acetate-acetic acid (100:1) to afford compound 3a as an oily compound (375 mg, 1.09 mmol, 34%) (Found: M<sup>+</sup>, 345.226 37.  $C_{16}H_{31}N_3O_5$  requires M 345.226 43);  $\delta_H(CDCl_3)$  1.42 (9 H, s, Bu'), 1.44 (9 H, s, Bu'), 1.6–1.8 (6 H, m, 3 ×  $CH_2$ ), 2.14 (2 H, t, J 7.5, CH<sub>2</sub>CN), 4.14 (1 H, m, CH), 4.60 (2 H, br s, NH<sub>2</sub>) and 5.10 (1 H, m, NH);  $\delta_{\rm C}({\rm CDCl_3})$  24.5, 25.9, 30.8, 32.4 (4 × CH<sub>2</sub>), 27.9, 28.3 (2 ×  $Bu^tCH_3$ ), 53.6 (CH), 79.7, 81.9 (2 ×  $Bu^tC$ ), 153.6 (CO BOC), 155.5 (C=N) and 171.9 (CO ester); m/z (CI,  $NH_3$ ) 346 (MH<sup>+</sup>, 100%) and 330 (7, MH<sup>+</sup> – 16).

Elution of the first organic layer (ethyl acetate-cyclohexane, 1:1) yielded starting material **2a** (600 mg, 60 %) which could be recycled.

 $N^{\omega}$ -Hydroxy-D,L-indospicine 4a. A solution of HCl in anhydrous dioxane (4 mol dm<sup>-3</sup>; 3 cm<sup>3</sup>) was added to 3a (140 mg, 0.4 mmol) in dioxane (2 cm<sup>3</sup>). The mixture was stirred at room temperature for 24 h and then diluted with dry ether to afford a precipitate which was collected by vacuum filtration. This was washed with acetone and dried *in vacuo* to give 4a as a white solid (52 mg, 50%),  $R_F$  0.37 (PriOH-acetone-H<sub>2</sub>O-AcOH, 2:2:2:1);  $\delta_H$ (D<sub>2</sub>O) 1.54 (2 H, m, 4-H<sub>2</sub>), 1.78 (2 H, m, 5-H<sub>2</sub>), 1.98 (2 H, m, 3-H<sub>2</sub>), 2.53 (2 H, t, *J* 7.5, 6-H<sub>2</sub>) and 3.97 (1 H, t, *J* 6, 2-H);  $\delta_C$ (CD<sub>3</sub>OD) 25.2, 27.3, 30.0, 31.1 (4 × CH<sub>2</sub>), 54.7 (CH), 166.2 (C=N) and 174.0 (CO); m/z (FAB) 190 (MH<sup>+</sup>, 100%), 174 (25, MH<sup>+</sup> - 16) and 111 [98, H<sub>2</sub>N<sup>+</sup> = CH - (CH<sub>2</sub>)<sub>4</sub>CN]. An elemental analysis is not reported for 4a because of its highly hygroscopic nature.

## Synthesis of *p*-hydroxyamidino-D,L-phenylalanine 4b

 $N^{\alpha}$ -tert-Butoxycarbonyl-p-cyano-D,L-phenylalanine 1b. 19 Compound 1b was prepared as described for 1a except for the

following modifications: the mixture of BOC-glycine and LDA was added at  $-70\,^{\circ}\text{C}$  to a pre-cooled solution of 4-(bromomethyl)benzonitrile (2 equiv.) in THF. The temperature was allowed to reach  $-50\,^{\circ}\text{C}$  in 3 h, and the reaction was then quenched by addition of saturated aqueous ammonium chloride (50 cm³) to the mixture. After extraction and work-up, the residue was chromatographed on silica gel and eluted with ethyl acetate–cyclohexane–acetic acid (50:50:1) followed by ethyl acetate–formic acid (100:1) to give material (850 mg) which contained 70% of the desired product (as determined by  $^{1}\text{H}$  NMR) and was used without further purification;  $\nu_{\text{max}}(\text{neat})/\text{cm}^{-1}$  2220 (CN);  $\delta_{\text{H}}(\text{CDCl}_3)$  1.39 (9 H, s, Bu¹), 3.10 (1 H, m, CH<sub>2</sub>), 3.27 (1 H, m, CH<sub>2</sub>), 4.59 (1 H, m, CH), 5.04 (1 H, m, NH), 7.33 (2 H, d, J 8, ArH) and 7.62 (2 H, d, J 8, ArH).

 $N^{\alpha}$ -tert-Butoxycarbonyl-p-cyano-D,L-phenylalanine tert-butyl ester 2b. <sup>20</sup> Compound 2b was prepared and purified from 1b as described for 2a to yield a white solid (450 mg, 17% for the two steps; protected glycine 35%), mp 100 °C;  $\nu_{\rm max}({\rm KBr})/{\rm cm}^{-1}$  2240 (CN);  $\delta_{\rm H}([^2{\rm H}_6]{\rm acetone})$  1.35 (9 H, s, Bu'), 1.40 (9 H, s, Bu'), 3.05 (1 H, dd, *J* 9 and 13.5, 3-H), 3.20 (1 H, dd, *J* 5.6 and 13.5, 3-H), 4.31 (1 H, m, 2-H), 6.13 (1 H, d, *J* 7, NH), 7.49 (2 H, d, *J* 8, ArH) and 7.69 (2 H, d, *J* 8, ArH);  $\delta_{\rm C}({\rm CDCl}_3)$  27.9, 28.2 (2 × Bu'CH<sub>3</sub>), 39.0 (CH<sub>2</sub>), 54.5 (CH), 80.0, 83.0 (2 × Bu'C), 111.0 (p-C), 119.0 (C≡N), 130.0 (o-C), 132 (m-C), 142.0 (C<sub>q</sub>), 155.0 (CO BOC) and 170.3 (CO ester); m/z (CI, NH<sub>3</sub>) 347 (MH<sup>+</sup>, 100%).

N<sup>α</sup>-tert-Butoxycarbonyl-p-hydroxyamidino-D,L-phenylalanine tert-butyl ester 3b. NH<sub>2</sub>OH·HCl (1.16 g, 16.6 mmol) and Na<sub>2</sub>CO<sub>3</sub> (880 mg, 8.3 mmol) were added to a solution of compound **2b** (1.15 g, 3.34 mmol) in ethanol (40 cm<sup>3</sup>) and the mixture was refluxed for 2 h, stirred for 2 h at room temperature and then concentrated. The residue was dissolved in ethyl acetate and water, and the mixture was extracted with ethyl acetate ( $\times$ 3). The combined extracts were dried (MgSO<sub>4</sub>) and concentrated under reduced pressure to give a crude solid which was recrystallised from ethanol (1.08 g, 86%), mp 184 °C (Found: C, 60.1; H, 7.7; N, 11.0. Calc. for C<sub>19</sub>H<sub>29</sub>N<sub>3</sub>O<sub>5</sub>: C, 60.1; H, 7.7; N, 11.1%);  $\nu_{\text{max}}(\text{KBr})/\text{cm}^{-1}$  1640 (C=N);  $\delta_{\text{H}}(\text{[$^2$H}_6\text{]}$ acetone) 1.36 (9 H, s, Bu<sup>t</sup>), 1.40 (9 H, s, Bu<sup>t</sup>), 2.99 (1 H, dd, J 8.4 and 13.5, 3-H), 3.10 (1 H, dd, J 5.9 and 13.5, 3-H), 4.27 (1 H, m, 2-H), 5.42 (2 H, br s, NH<sub>2</sub>), 5.97 (1 H, d, J 8, NH), 7.25 (2 H, d, J 8, ArH), 7.64 (2 H, d, J 8, ArH) and 8.82 (br s, OH);  $\delta_{\rm C}({\rm CDCl_3})$  27.7, 28.0 (2 × Bu<sup>t</sup>CH<sub>3</sub>), 37.9 (CH<sub>2</sub>), 54.6 (CH), 79.8, 82.3 (2 × Bu<sup>t</sup>C), 125.8, 129.5 (o-C and m-C), 131.0 (p-C), 138.3 (C<sub>Ar</sub>), 153.0 (C=N) 155.2 (CO BOC) and 170.8 (CO ester); m/z (CI, NH<sub>3</sub>) 380 (MH<sup>+</sup>, 100%) and 397 (4, M + NH<sub>4</sub><sup>+</sup>).

*p*-Hydroxyamidino-D,L-phenylalanine 4b. A solution of compound 3b (200 mg, 0.53 mmol) in hydrochloric acid (5 mol dm<sup>-3</sup>, 3 cm<sup>3</sup>) was stirred at room temperature for 24 h and then evaporated under reduced pressure to yield a white solid, which was washed with acetone and ether (150 mg, 95%),  $R_F$  0.45 (Pr<sup>i</sup>OH-NH<sub>3</sub>, 7:3);  $δ_H$ (D<sub>2</sub>O) 3.37 (1 H, dd, *J* 7.2 and 14.5, 3-H), 3.47 (1 H, dd, *J* 6 and 14.5, 3-H), 4.40 (1 H, t, *J* 6.8, 2-H), 7.57 (2 H, d, *J* 8.4, ArH) and 7.75 (2 H, d, *J* 8.4, ArH);  $δ_C$ (CD<sub>3</sub>OD) 37.0 (CH<sub>2</sub>), 54.7 (CH), 125.9 (*p*-C), 129.4, 131.8 (*o*-C and *m*-C), 142.3 ( $C_{Ar}$ ), 162.3 (C=N), 170.7 (CO); m/z (FAB) 224 (MH<sup>+</sup>, 65%), 208 (20, MH<sup>+</sup> – 16) and 109 (100). An elemental analysis is not reported for 4b because of its highly hygroscopic nature.

#### $N^{\omega}$ -Hydroxy-L-arginine 6

Compound 6 was prepared in 6 steps starting from  $N^6$ -Z-L-ornithine by a modification of literature procedures.  $^{21,25}$   $N^{\alpha}$ -BOC-L-ornithine tert-butyl ester 5 was prepared in three steps starting from  $N^6$ -Z-ornithine by a modification of a literature method:  $N^6$ -Z-L-Orn was converted into  $N^{\alpha}$ -BOC- $N^6$ -Z-L-Orn as previously described  $^{25}$  and subsequently transformed into  $N^{\alpha}$ -BOC- $N^6$ -Z-L-Orn-CO<sub>2</sub>Bu<sup>t</sup> as described for 2a.  $^{20}$  This compound was then hydrogenated  $^{25}$  to give 5 in a 97% overall yield.

Compound 5 was converted into  $N^{\alpha}$ -BOC- $N^{\omega}$ -hydroxy-Larginine *tert*-butyl ester as described by Wallace *et al.*;<sup>21</sup> this crude compound was purified on a silica gel column by elution with ethyl acetate–ethanol–acetic acid (70:30:1), and deprotected as described by Feldman.<sup>25</sup> This yielded  $N^{\omega}$ -hydroxy-Larginine in a 46% overall yield. This compound displayed physicochemical characteristics identical with those previously published.<sup>21,25</sup>

#### Synthesis of No-hydroxy-L-citrulline 8

 $N^{\alpha}$ -tert-butoxycarbonyl- $N^{\omega}$ -hydroxy-L-citrulline tert-butyl ester 7. Carbonyldiimidazole (350 mg, 1.8 mmol) in chloroform (3 cm<sup>3</sup>) was added to a solution of  $N^{\alpha}$ -tert-butoxycarbonyl-Lornithine tert-butyl ester 5 (400 mg, 1.4 mmol) in CHCl<sub>3</sub> (5 cm<sup>3</sup>) at 0 °C. A further equivalent of carbonyldiimidazole was added after 2 h to the mixture which was then stirred for 2 h at room temperature. The mixture was washed with water, dried (MgSO<sub>4</sub>) and concentrated, and the residue was rapidly purified by flash chromatography (silica gel). Elution with ethyl acetate provided the protected N<sup>δ</sup>-carbonylimidazoyl-Lornithine (530 mg, 99%) which, dissolved in methanol (2 cm<sup>3</sup>) was treated with ethanolic hydroxylamine (10 cm<sup>3</sup>, 5 equiv.). The mixture was stirred at room temperature for 48 h, after which the ethanol was removed by evaporation and the residue diluted with water and extracted with ethyl acetate ( $\times$ 3). The combined extracts were dried (MgSO<sub>4</sub>) and concentrated under reduced pressure, and the residue was purified on a silica gel column (elution with ethyl acetate) to yield 7 as an oily compound (420 mg, 89%);  $\delta_{H}(CDCl_{3})$  1.38 (9 H, s, Bu<sup>t</sup>), 1.40 (9 H, s, Bu'), 1.5–1.8 (4 H, m, 2 × CH<sub>2</sub>), 3.20 (2 H, m, CH<sub>2</sub>N), 4.10 (1 H, m, CH), 5.28 (1 H, d, J 7.8, NHCH), 6.1 (1 H, br s, NHCH<sub>2</sub>), 7.3 (1 H, s, NHOH) and 8.40 (br s, OH);  $\delta_c$ (CDCl<sub>3</sub>)  $25.9, 29.9 (2 \times CH_2), 27.9, 28.2 (2 \times Bu^tCH_3), 39.0 (CH_2NH),$ 53.8 (CH), 79.8, 82.0 (2 × Bu<sup>t</sup>C), 155.6 (CO BOC), 162.4 (CONHOH) and 171.9 (CO ester); m/z (CI, NH<sub>3</sub>) 348 (MH<sup>+</sup>, 75%), 365 (8, M + NH<sub>4</sub><sup>+</sup>), 332 (32, MH<sup>+</sup> – 16) and 315 (32, M - NHOH).

*N*°-Hydroxy-L-citrulline 8. Compound 8 was obtained as an hygroscopic precipitate from 7 as described for 4a (210 mg, 90%),  $R_{\rm F}$  0.60 (Pr<sup>i</sup>OH-acetone-H<sub>2</sub>O-AcOH 2:2:2:1);<sup>26</sup>  $\delta_{\rm H}({\rm D_2O})$  1.73 (2 H, m, CH<sub>2</sub>), 2.10 (2 H, m, CH<sub>2</sub>), 3.30 (2 H, t, *J* 6.8, C*H*<sub>2</sub>NH) and 4.13 (1 H, t, *J* 6, CH);  $\delta_{\rm C}({\rm CD_3OD})$  26.6, 28.6 (2 × CH<sub>2</sub>), 40.1 (CH<sub>2</sub>NH), 53.5 (CH), 163.8 (CO) and 171.6 (CO<sub>2</sub>).

## Acknowledgements

We are grateful to the CNRS for a grant to S. V. We thank Marie-Agnès Sari and Squire Booker for the preparation and purification of the NOS and Catherine Guédès for helpful discussions.
