# Synthesis of the key component for preparation of 6-ketoprostaglandins by a two-component coupling process: synthesis of 6-keto-prostaglandin $E_{1}$, ornoprostil and $\Delta^{2}$-trans-6-ketoprostaglandin $\mathbf{E}_{1}$

Starting with commercially available (3S,4R)-3-(methoxymethyloxy)-2-methylidene-4siloxycyclopentanone 2, useful 6-keto-prostaglandin intermediates 1 have been prepared in good yields by a sequence of reactions which includes treatment with NaBr in the presence of $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}, \mathrm{Pd}$-catalysed coupling of the resulting 2-bromomethyl-4-siloxycyclopent-2-enone 3 with the alkenylborane 4 or 9 and conversion of the alkenyl moiety into an epoxy and then into a keto group. The synthesis of 6-keto-PGE ${ }_{1}$, ornoprostil and $\Delta^{2}$-trans-6-keto-PGE ${ }_{1}$ by using 1 is also described.

Naturally occurring 6-keto-prostaglandin $\mathrm{E}_{1}\left(6-\mathrm{PGE}_{1}\right)$ has attracted substantial interest, because it plays an important role in human physiology. ${ }^{1}$ Artificial 6-keto-prostaglandins have also attracted much interest as being useful therapeutic agents, ${ }^{2}$ and, since only chemical synthesis can supply sufficient quantities, ${ }^{3}$ much effort has been expended in this area.

In connection with our interest in establishing a twocomponent coupling synthesis of PGs as an efficient and industrially viable process, ${ }^{4}$ we were interested in the development of a practical and general method for synthesis of 6 -keto-PGs by this methodology. Herein reported is an efficient synthetic method for preparation of endo-enones 1 which have 6 -keto $\alpha$-side chains from readily available starting material $2 \dagger^{4 a}$ and synthesis of 6 -keto-PGs by 1,4 -addition of $\omega$ sidechain units to 1 (Scheme 1).

## Results and discussion

The synthetic procedure of $\mathbf{1}$ from $\mathbf{2}$ is summarized in Scheme 2. The reaction of 2 with NaBr in the presence of $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$ provided 2-bromomethyl-4-siloxycyclopent-2-enone 3 in $89 \%$ yield. Coupling of $\mathbf{3}$ with the alkenylborane $\mathbf{4}$, synthesized in situ by the hydroboration of the corresponding alkyne with

[^0]

Scheme 2
$\mathrm{BH}\left(\text { cyclo- } \mathrm{C}_{6} \mathrm{H}_{11}\right)_{2},{ }^{5}$ in the presence of $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\right]$ afforded 5 in $81 \%$ yield. ${ }^{6}$ The conversion of 5 into $1\left(\mathrm{R}=\mathrm{CH}_{2} \mathrm{CH}_{2}\right)$ was carried out in $73 \%$ overall yield by regiospecific epoxidation with $m$-chloroperbenzoic acid followed by treatment of the resulting crude compound 6 with $\mathrm{BF}_{3} \cdot \mathrm{OEt}_{2}$. ${ }^{7}$
With compound $1\left(\mathrm{R}=\mathrm{CH}_{2} \mathrm{CH}_{2}\right)$ in hand, it was possible to synthesize 6 -keto-PGs having a variety of $\omega$ side-chain units by 1,4 -addition. Reported next is the synthesis of naturally occuring 6 -keto- $\mathrm{PGE}_{1}$ and ornoprostil which is currently marketed as an anti-ulcer agent (Scheme 3). Thus, the reaction of $1\left(\mathrm{R}=\mathrm{CH}_{2} \mathrm{CH}_{2}\right)$ with the alkenylcopper compound 7 a provided the bis-silyl ether of 6 -keto- $\mathrm{PGE}_{1}$ methyl ester 8 a in $74 \%$ yield. Similarly, ornoprostil was prepared by the reaction of $1\left(\mathrm{R}=\mathrm{CH}_{2} \mathrm{CH}_{2}\right)$ with the alkenylcopper compound 7b ( $74 \%$ ) and the following protodesilylation using HF-pyridine in acetonitrile ( $93 \%$ ).
The present methodology also allows the synthesis of PGs having various 6 -keto $\alpha$ side-chains other than natural ones by changing the alkenylboranes used for the coupling with $\mathbf{3}$ in Scheme 2. Although PGs having a trans-double bond at the 2 position ( $\Delta^{2}$-trans-PGs) have attracted much pharmaceutical interest, ${ }^{8} \Delta^{2}$-trans-6-keto-PGE ${ }_{1}$ has not been developed. Thus, we were interested in synthesizing $\Delta^{2}$-trans- 6 -keto- PGE $_{1}$ by using the present methodology. The enone $1[\mathrm{R}=(E)$ -

Scheme 3
$\mathrm{CH}=\mathrm{CH}]$ was prepared by using the alkenylborane 9 , generated in situ by the hydroboration of the corresponding alkyne with $\mathrm{BH}\left(\text { cyclo- } \mathrm{C}_{6} \mathrm{H}_{11}\right)_{2}$, instead of $\mathbf{4}$ in the coupling step with $\mathbf{3}$ in Scheme $2(48 \%$ overall yield from 3$)$. The reaction of $1[R=$ ( $E$ ) $-\mathrm{CH}=\mathrm{CH}$ ] with the organocopper compound 7a afforded 10 in $71 \%$ yield which, in turn, was converted into $\Delta^{2}$-trans- 6 -keto-PGE ${ }_{1}$ by successive treatment with HF-pyridine ( $95 \%$ ) and porcine liver esterase ( $84 \%$ ).

In summary, a highly efficient method for the synthesis of 1, the key intermediate for the preparation of 6 -keto-PGs, has been developed, which involves (i) the preparation of 2-bromomethyl-4-siloxycyclopent-2-enone $\mathbf{3}$ from commercially available 2, (ii) the Suzuki-Miyaura coupling reaction of $\mathbf{3}$ with alkenylboranes and (iii) the conversion of the vinylsilane moiety of the coupling product into the keto group.

IR spectra were determined using a JASCO A-100 spectrophotometer. ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were determined in $\mathrm{CDCl}_{3}$ ( $\mathrm{SiMe}_{4}$ or residual $\mathrm{CHCl}_{3}$ as internal reference) using a Varian Gemini-300 spectrometer operating at 300 MHz for ${ }^{1} \mathrm{H}$ NMR or at 75 MHz for ${ }^{13} \mathrm{C}$ NMR. The $J$ values are in Hz . $[\alpha]_{\mathrm{D}}$ Values were determined using a JASCO DIP-370 polarimeter. Mass spectra (FAB-HRMS) were measured with a JEOL JMX-102 spectrometer. Column chromatography was carried out with Wako Silica gel C-200 (100-200 mesh) and TLC was carried out with Merck Kieselgel $60 \mathrm{~F}_{254}$.
