Samarium(II) diiodide-promoted regioselective fragmentation of the $\gamma$-halogeno esters 12 and 13 afforded the olefins 14 and 20, respectively, which were converted into the necic acid components, crobarbatic acid and a known advanced intermediate of integerrinecic acid lactone, of macropyrrolizidine alkaloids.

## Introduction

Pyrrolizidine alkaloids, ${ }^{1}$ a large class of natural products, exhibit interesting biological properties such as hepatotoxic and carcinogenic activities. ${ }^{2}$ Much effort involving White's extensive work has, therefore, been devoted to developing new methods and strategies for their synthesis. ${ }^{3}$ Some of these alkaloids occur in nature as macrocyclic compounds having 11-, 12-, 13- and 14-membered rings through the diester linkage between the necine base and necic acid.

## Results and discussion

In our continuing work on the synthesis of pyrrolizidine alkaloids, ${ }^{4}$ we were interested in the chiral synthesis of $(+)$ crobarbatic acid and ( + )-integerrinecic acid lactone, the necic acid components of the 11- and 12-membered pyrrolizidine alkaloids, crobarbatine and integerrimine, respectively. A challenging feature in the synthesis of the necic acid components is the construction of two stereogenic vicinal methyls and a tertiary hydroxy group. This was achieved using the cyclic ketone 5, easily prepared from ( - -carvone, as a starting material.
The synthesis of crobarbatic acid was established as follows. (see Schemes 1 and 2).
Reaction of the cyclopentanone $\mathbf{2},{ }^{5}$ prepared from the acid $1,{ }^{6}$ with methyllithium afforded the tertiary alcohols 3 and $\mathbf{4}$ in $86 \%$ yield. No stereoselectivity of the products was observed. However, the use of methyl $\gamma$-chloro ester 6 gave the tertiary alcohols 8 and 9 in 62 and $20 \%$ yield, respectively. Methylation of the corresponding benzyl ester 7 further improved this stereoselectivity. After conversion of the adducts $\mathbf{1 0}$ and $\mathbf{1 1}$ into the methyl esters in two steps the ratio of the alcohols 8 and 9 increased to $\sim 5: 1$ in $69 \%$ yield. The stereochemistry of the products was determined on the basis of their NMR spectra. The signals for the secondary methyl group of compound 3 appeared at $\delta 0.97$ and at $\delta_{\mathrm{C}} 10.80$ in the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra, respectively, whereas the signals for the corresponding methyl group of compound $\mathbf{4}$ were shifted downfield to $\delta 1.04$ in ${ }^{1} \mathrm{H}$ and at $\delta_{\mathrm{C}} 16.39$ in ${ }^{13} \mathrm{C}$ NMR spectra due to the presence of the cis-hydroxy group. Also, the signals of the secondary methyl

group of compounds $\mathbf{8}$ and $\mathbf{9}$ appeared at $\delta 0.97$ and 1.04 in their ${ }^{1} \mathrm{H}$ NMR spectra, respectively. These results supported the view that the major adduct $\mathbf{8}$ has two methyl groups in a cis configuration.
The tertiary hydroxy group of the major product 8 was protected as the triethylsilyl (TES) ether 12 in $96 \%$ yield. Previously we developed ${ }^{7}$ the samarium(II) diiodide-promoted carbon-carbon bond cleavage of $\gamma$-halogeno carbonyl compounds to give the regioselective fragmentation to olefinic carbonyl compounds. The samarium(II) diiodide-promoted

cleavage of the tertiary silyl ether $\mathbf{1 2}$ gave the desired product 14 in $94 \%$ yield (Scheme 2). Removal of the silyl group of ester compound $\mathbf{1 4}$ with tetrabutylammonium fluoride (TBAF) in tetrahydrofuran (THF) and consequential lactonization gave the $\gamma$-lactone $\mathbf{1 5}$ in quantitative yield. Ozonolysis of the lactone 15 in ethanol, followed by reduction with sodium boranuide, afforded the alcohol 16 in $97 \%$ yield. Dehydration of the alcohol 16 to alkene 18 proved to be problematic. However, oxidative elimination of the selenide 17 derived from the alcohol 16 according to Grieco's procedure, ${ }^{8}$ with $m$ chloroperbenzoic acid (MCPBA) furnished the olefin 18 in $87 \%$ yield after two steps. Finally, treatment of the olefin 18 with ruthenium tetraoxide under Sharpless's condition ${ }^{9}$ provided the crobarbatic acid $19, \mathrm{mp} 182-184.5^{\circ} \mathrm{C}\left[\right.$ lit., $\left.{ }^{10} 181.5-183^{\circ} \mathrm{C}\right]$, in $96 \%$ yield, whose spectroscopic data including its specific optical rotation, $[x]_{\mathrm{D}}+3.45\left(\mathrm{H}_{2} \mathrm{O}\right)\left\{\right.$ lit., $\left.{ }^{11}[\alpha]_{\mathrm{D}}+3.93\left(\mathrm{H}_{2} \mathrm{O}\right)\right\}$, were identical with those reported. ${ }^{11}$
We next examined the synthesis of integerrinecic acid lactone starting from the tertiary alcohol 9 by adapting the above synthetic route. Samarium(II) diiodide-promoted fragmentation of the silylether $\mathbf{1 3}$ followed by deprotection of the OH group of the ester $\mathbf{2 0}$ gave the $\gamma$-lactone 21, in $79 \%$ yield, which was further converted into the olefin 24 via the alcohol 22 and the selenide 23, in $79 \%$ overall yield from compound 21. Diisobutylaluminium hydride (DIBAH) reduction of lactone 24 in THF gave the lactol 25, which on treatment with 2-lithio-2-trimethylsilyl-1,3-dithiane and subsequent acid hydrolysis with toluene- $p$-sulfonic acid (PTSA) in dichloromethane furnished the $\delta$-lactone 26 in $69 \%$ yield, whose spectroscopic data including its specific optical rotation, $\left\{[\alpha]_{\mathrm{D}}+17.7\left(\mathrm{CHCl}_{3}\right)\right.$; lit., $\left.{ }^{11}[\alpha]_{\mathrm{D}}+17.7\left(\mathrm{CHCl}_{3}\right)\right\}$, were identical with those reported. ${ }^{11}$ This lactone has previously been converted into integerrinecic acid lactone 27 by White et al. ${ }^{11}$ Therefore the above constitutes a formal synthesis of integerrinecic acid lactone (see Scheme 3).
In conclusion, we have developed a new synthetic pathway to crobarbatic acid and integerrinecic acid lactone which should be applicable to the synthesis of other necic acids.

## Conversion of the benzyl ester 10 into the methyl ester 8

A solution of the benzyl ester $10(0.52 \mathrm{~g}, 1.60 \mathrm{mmol})$ in ethanol ( $50 \mathrm{~cm}^{3}$ ) in the presence of $10 \%$ palladium on carbon ( 70 mg ) was stirred under hydrogen at ambient temperature for 12 h . An insoluble material was filtered off and the filtrate was concentrated to give a residue, which was taken up with DMF $\left(50 \mathrm{~cm}^{3}\right)$. To this solution were added potassium carbonate (440 $\mathrm{mg}, 3.19 \mathrm{mmol})$ and iodomethane $\left(0.20 \mathrm{~cm}^{3}, 3.19 \mathrm{mmol}\right)$ and the resulting mixture was stirred at room temperature for a further 2 h . After treatment with saturated aq. ammonium chloride, the mixture was extracted with ethyl acetate and the extract was washed with water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated to leave a residue, which was subjected to column chromatography on silica gel. Elution with hexaneethyl acetate ( $4: 1, \mathrm{v} / \mathrm{v}$ ) gave the methyl ester 8 ( $379 \mathrm{mg}, 95 \%$ ) which was identical with the authentic sample obtained above. Conversion of benzyl ester 11 into methyl ester 9 was also carried out in $96 \%$ yield by using the same procedure as above.

## ( $4 R, 5 S$ )-4,5-Dimethyl-5-vinyltetrahydrofuran-2-ol 25

To a stirrred solution of the lactone $24(241 \mathrm{mg}, 1.72 \mathrm{mmol})$ in dry THF $\left(9.8 \mathrm{~cm}^{3}\right)$ was added dropwise a $0.91 \mathrm{~mol} \mathrm{dm}^{-3}$ hexane solution of DIBAH ( $4.0 \mathrm{~cm}^{3}, 3.72 \mathrm{mmol}$ ) at $-78^{\circ} \mathrm{C}$ and the resulting mixture was stirred for a further 40 min . After treatment with saturated aq. ammonium chloride, the mixture was extracted with ethyl acetate and the extract was washed with water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated to leave a
residue, which was subjected to column chromatography on silica gel. Elution with hexane-ethyl acetate ( $3: 1, \mathrm{v} / \mathrm{v}$ ) gave a diastereoisomeric mixture of the lactol 25 ( $244 \mathrm{mg}, 99 \%$ ) as an oil; $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{1} 3410,2930$ and $1610 ; \delta 0.94$ and 0.97 (each 1.5 H , each d, $J 6.7, \mathrm{Me}$ ), 1.30 and 1.46 (each 1.5 H , each s, $\mathrm{Me}), 1.50-2.43\left(3 \mathrm{H}, \mathrm{m}, 3-\mathrm{H}_{2}\right.$ and $\left.4-\mathrm{H}\right), 3.50$ and 3.95 (each 0.5 H , each $\mathrm{m}, 2-\mathrm{H}$ ), 5.10 and 5.30 (each 1 H , each m, $\mathrm{CH}=\mathrm{CH}_{2}$ ), $5.69\left(0.5 \mathrm{H}\right.$, dd, $J 10.4$ and 17.1, $\left.\mathrm{CH}=\mathrm{CH}_{2}\right)$ and $5.95(0.5 \mathrm{H}$, dd, $J 10.4$ and 17.1, $\mathrm{CH}=\mathrm{CH}_{2}$ ) [Found: $m / z, 124.0885 . \mathrm{C}_{8} \mathrm{H}_{12} \mathrm{O}$ $\left(\mathrm{M}^{+}-18\right)$ requires $\left.m / z, 124.0905\right]$.

## (5R,6S)-5,6-Dimethyl-6-vinyl-3,4,5,6-tetrahydro-2H-pyran-2-

 one 26To a stirred solution of 2-trimethylsilyl-1,3-dithiane $\left(2.37 \mathrm{~cm}^{3}\right.$, 11.41 mmol ) in THF ( $11.2 \mathrm{~cm}^{3}$ ) was added a $1.64 \mathrm{~mol} \mathrm{dm}^{-3}$ hexane solution of butyllithium ( $6.30 \mathrm{~cm}^{3}, 9.78 \mathrm{mmol}$ ) at $-15^{\circ} \mathrm{C}$ under argon. After the mixture had been stirred for 30 min at the same temperature, a solution of the lactol 25 ( 232 mg , 1.63 mmol ) in THF ( $3.4 \mathrm{~cm}^{3}$ ) was added dropwise and the mixture was stirred for a further 20 min . The mixture was treated with saturated aq. ammonium chloride and extracted with ethyl acetate. The extract was washed with water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated to leave a residue, which was taken up with dichloromethane $\left(20 \mathrm{~cm}^{3}\right)$. A catalytic amount of PTSA was added to the solution and the mixture was stirred for 1 h at room temperature. The solution was basified with saturated aq. sodium hydrogen carbonate and extracted with dichloromethane. The extract was washed with water, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated to leave a residue, which was subjected to column chromatography on silica gel. Elution with hexane-dichloromethane ( $4: 1, \mathrm{v} / \mathrm{v}$ ) gave the $\delta$-lactone 26 $(174 \mathrm{mg}, 69 \%)$ as an oil; $[\alpha]_{\mathrm{D}}+17.70$ (c 0.7, $\mathrm{CHCl}_{3}$ ) $v_{\text {max }}\left(\mathrm{CHCl}_{3}\right) / \mathrm{cm}^{-1} 2900$, and $1735 ; \delta 1.04(3 \mathrm{H}, \mathrm{d}, J 7.3$, Me), $1.47(3 \mathrm{H}, \mathrm{s}, \mathrm{Me}), 1.86-2.23\left(3 \mathrm{H}, \mathrm{m}, 3-\mathrm{H}_{2}\right.$ and $\left.5-\mathrm{H}\right), 2.44-2.60$ $\left(2 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}_{2}\right), 5.16-5.32\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}=\mathrm{CH}_{2}\right)$ and $5.88(1 \mathrm{H}, \mathrm{dd}$, $J 10.4$ and 17.1, $\mathrm{CH}=\mathrm{CH}_{2}$ ) (Found: $\mathrm{M}^{+}, 154.0982$. Calc. for $\mathrm{C}_{9} \mathrm{H}_{14} \mathrm{O}_{2}: \mathrm{M}, 154.0992$ ).
