# Biosynthesis of porphyrins and related macrocycles. Part 44. ${ }^{\mathbf{1 , 2}}$ Synthetic and stereochemical studies on the proposed spiro intermediate for biosynthesis of the natural porphyrins 

Mark A. Cassidy, Nigel Crockett, Finian J. Leeper and Alan R. Battersby*<br>University Chemical Laboratory, Lensfield Road, Cambridge CB2 1EW, UK

#### Abstract

A route is devised for synthesis of both enantiomers of the spiro lactam 4. The enzyme uroporphyrinogen III synthase (cosynthetase), which converts hydroxymethylbilane 1 into uroporphyrinogen III 3 , is competitively inhibited more than twenty times more strongly by one enantiomer of 4 than by the other. This finding adds further strong support to the view that cosynthetase acts by generating the spiro pyrrolenine 2 as an intermediate.

Haem, chlorophyll and vitamin $B_{12}$ are all biosynthesised from the same parent macrocycle, uroporphyrinogen III 3, shortened to uro'gen III. The formation of this macrocycle from the openchain hydroxymethylbilane $\mathbf{1}$ is catalysed by the enzyme cosynthetase (systematically uroporphyrinogen III synthase, E.C. 4.2.1.75). Comparison of structures $\mathbf{1}$ and $\mathbf{3}$ shows why this process has attracted such strong mechanistic interest; intriguingly, ring D of uro'gen III 3 has been inverted relative to its position in the bilane 1. Both the building of the hydroxymethylbilane 1 and the ring-closure catalysed by cosynthetase have been extensively studied and this work has been reviewed. ${ }^{3}$ The key finding relevant to the present paper was that the inversion of ring D occurs by an intramolecular mechanism ${ }^{4}$ which only affects ring $D .{ }^{5}$
These results, based on a series of ${ }^{13} \mathrm{C}$-labelling experiments as indicated by the black spots and triangles in Scheme 1,4.5

Scheme 1 Proposed mechanism for the formation of uro'gen III by cosynthetase
eliminated most of the 20 or so speculative mechanisms proposed for the ring $D$ inversion and left just two. In one, ring D of the hydroxymethylbilane 1 is detached by cleavage of the bond between $\mathrm{C}-15$ and $\mathrm{C}-16$ but is held in the active site of the
enzyme. Ring $D$ is then inverted before rejoining to $\mathrm{C}-15$ and the hydroxymethyl carbon to give 3 ; there is no experimental support for this mechanism. The other, illustrated in Scheme 1, is fundamentally different in that the bond between the hydroxymethyl carbon and $\mathrm{C}-16$ is suggested to be made first, to form the spiro pyrrolenine $\dagger$ 2. This pyrrolenine could then undergo fragmentation-recombination as in Scheme 1 to form uro'gen III 3 and the chemistry involved has been shown to be both feasible and facile. ${ }^{3}$ This second mechanism is based on a suggestion by Mathewson and Corwin ${ }^{6}$ but it is drawn in a simplified form for reasons that have been outlined earlier. ${ }^{7}$

Strong support for the second mechanism has been provided by the synthesis ${ }^{7}$ of the spiro lactam 4 which strongly inhibited

cosynthetase from carrying out its normal conversion of hydroxymethylbilane 1 into uro'gen III 3; the inhibition was competitive. ${ }^{7}$ In addition, other synthetic macrocycles, lacking one or other parts of the five-membered lactam system, were not inhibitory. ${ }^{7}$ This finding was very significant in that the inhibitory spiro lactam 4 is different in structure from both the substrate $\mathbf{1}$ for cosynthetase and the product $\mathbf{3}$ from the enzyme; the inhibitor only resembles the putative spiro pyrrolenine $\mathbf{2}$. It should also be emphasised that the two molecules, 2 and 4 , only differ around the nitrogen atom of the five-membered spiro ring, otherwise they are identical.

The spiro lactam 4 used for the foregoing studies was racemic, but only one enantiomer can accurately match the putative spiro pyrrolenine 2 held in the active site of cosynthetase. Our aim, therefore, was to synthesise both enantiomers of the spiro lactam 4 for testing as inhibitors of cosynthetase. Of the four substituents carried by the chiral centre of the lactam 4, two are extremely similar so a difficult resolution was expected, best carried out early rather than late in the synthesis.

[^0]
## Results and discussion

Trial experiments on the model system 7
Our initial studies were made on the acid 5 , which had been synthesised earlier for elaboration to the spiro lactam 4. ${ }^{7}$ Salts were prepared from 5 using brucine, cinchonine, cinchonidine, quinine and quinidine. Systematic attempts at crystallisation using seven different solvents gave few crystals and no resolution. A totally different approach was needed and we envisaged synthesising the acid 6 so that a variety of chiral auxiliaries could be covalently attached to the carboxy group close to the chiral centre. However, as acid 6 contains a vinylogous malonic acid residue there was concern about its stability. This was checked by synthesising the simpler lactam 7.

The differentially protected pyrrole 9 was needed as starting material and this was initially prepared by having 2 trimethylsilylethanol present during the thallium-catalysed rearrangement ${ }^{8}$ of the ketone 8 (Scheme 2). The aldehyde 10 was a by-product (a reaction previously observed in a related case ${ }^{9}$ ) and the yield of 9 was too poor for this route to be used for the synthesis of 6; however, it yielded enough material for the preparation of the model 7. Scheme 2 also shows the synthetic route from 9 to 7 via 11, 12 and 14, which was mainly based on similar earlier work, ${ }^{7}$ though the iodination step required new conditions (see Experimental section). Removal of the trimethylsilylethyl group from 14 gave the acid 7 which could be handled without decomposition. The synthesis of the dipyrrolic lactam 6 could, therefore, be confidently undertaken but first the attachment of chiral auxiliaries was tested on the model 7. The esters 15 and 16 were prepared from ( $R$ )-1phenylethanol and ( $1 S$ )-( - )-endo-borneol, respectively, using $N, N^{\prime}$-dicyclohexylcarbodiimide (DCC) and 4-dimethylaminopyridine (DMAP). The former ester 15 was shown by NMR to contain two diastereoisomers in the ratio 1:1.25 and the ratio for the latter one 16 was $1: 1.1$. In neither case could the diastereoisomers be separated by TLC or HPLC. Attention therefore turned to the real system 6.

## Synthesis of the enantiomeric lactams 40a and 40b

The first requirement was to develop a practical alternative synthesis of the starting pyrrole 9 . This was achieved in good yield ( $16 \%$ over seven steps) on a large scale by the sequence shown in Scheme 3, based mainly on chemistry developed earlier ${ }^{4.10}$ for similar pyrroles. The key step is reductive alkylation ${ }^{11.12}$ of the 4 -iodopyrrole $\mathbf{2 2}$ using glyoxylic acid as the source of the acetate side-chain. Trial experiments involving some of the later chemistry required for construction of the required lactam 33 then showed that the benzyl ester of 9 caused problems. It was therefore conveniently changed at the stage of

Scheme 2 Reagents: i, $\mathrm{Tl}\left(\mathrm{NO}_{3}\right)_{3} \cdot 3 \mathrm{H}_{2} \mathrm{O}, \mathrm{HNO}_{3}, \mathrm{Me}_{3} \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{OH}$; ii, $\mathrm{H}_{2} / \mathrm{Pd}$; iii, $\mathrm{KI}_{3}, \mathrm{NaHCO}_{3}$; iv, $\mathrm{SnCl}_{4}$ then AgOAc , $\mathrm{TsOH}, \mathrm{H}_{2} \mathrm{O}$; v, TBAF; vi, DCC, DMAP, ROH
the next intermediate $\mathbf{2 4}$ to the tert-butyl ester $\mathbf{2 6}$ by the steps shown in Scheme 4. This product was then coupled with the $\alpha-$ free pyrrole 29, prepared from the available tert-butyl ester 27, to yield the dipyrromethane 30 . The lactam 33 was synthesised

Scheme 3 Reagents: i, $\mathrm{PhCH}_{2} \mathrm{OH}$, heat; ii, $\mathrm{NaNO}_{2}, \mathrm{AcOH}$; iii, $\mathrm{MeCOCH} \mathrm{CO}_{2} \mathrm{Bu}^{t}, \mathrm{Zn}, \mathrm{AcOH}$; iv, $\mathrm{CF}_{3} \mathrm{CO}_{2} \mathrm{H} ; \mathrm{v}, \mathrm{KI}_{3}, \mathrm{NaHCO}_{3}$; vi, $\mathrm{OHCCO}_{2} \mathrm{H}, \mathrm{HI}, \mathrm{H}_{3} \mathrm{PO}_{2}, \mathrm{Ac}_{2} \mathrm{O}$; vii, $(\mathrm{COCl})_{2}$ then $\mathrm{Me}_{3} \mathrm{SiCH}_{2} \mathrm{CH}_{2} \mathrm{OH}$; viii, $\mathrm{SO}_{2} \mathrm{Cl}_{2}$ then $\mathrm{NaOAc}, \mathrm{AcOH}$

41

42

43

44
Scheme 4 Reagents: i, $\mathrm{H}_{2} / \mathrm{Pd}$; ii, $\mathrm{Bu}^{t} \mathrm{OH}, \mathrm{DCC}$; iii, $\mathrm{SnCl}_{4}$; iv, $(\mathrm{COCl})_{2}$ then $\mathrm{Br}_{3} \mathrm{CCH}_{2} \mathrm{OH}$; v, TsOH, $\mathrm{H}_{2} \mathrm{O}$; vi, $\mathrm{KI}_{3}, \mathrm{NaHCO}_{3}$; vii, $\mathrm{SnCl}_{4}$ then AgOAc, $\mathrm{TsOH}, \mathrm{H}_{2} \mathrm{O}$; viii, TBAF; ix, $\mathrm{Me}_{2} \mathrm{C}=\mathrm{C}(\mathrm{Cl}) \mathrm{NMe}_{2}$ then the relevant alcohol; $\mathrm{x}, \mathrm{NaOMe}, \mathrm{MeOH}$
by the steps $\mathbf{3 0} \longrightarrow \mathbf{3 1} \longrightarrow \mathbf{3 2} \longrightarrow \mathbf{3 3}$ essentially as earlier for similar systems, ${ }^{3}$ Scheme 4. Removal of the trimethylsilylethyl group by fluoride then afforded the acid 6 ready for esterification with a range of chiral alcohols.

The esters were prepared by reacting the acid 6 with 1 -chloro-1-dimethylamino-2-methylpropene ${ }^{13}$ to give the corresponding acid chloride, which smoothly acylated the various chiral alcohols. Other standard methods for these esterifications failed or gave unacceptable yields. The chosen alcohols were $(R)$-1phenylethanol, ( $1 S$ )-(-)-endo-borneol (as 41), ( $R$ )-( - )-pantolactone $\ddagger$ (as 42), 2,3- $O$-isopropylidine-D- $(+$ )-ribonic acid $\gamma$ lactone ${ }^{14}$ (as 43) and the commercially available 3,4- $O$ -benzylidene-d-( + )-ribonic acid $\delta$-lactone (as 44). In no case could the diastereoisomeric esters 34 to 38 so formed be separated by TLC, but HPLC gave encouraging results for the esters 36 and 38 , derived from pantolactone and the ribonic acid $\delta$-lactone, respectively. However, there were impurities in the former ester which were difficult to separate from the required materials, so the latter ester was selected for further study. HPLC
$\ddagger$ IUPAC name: ( $R$ )-3-hydroxy-4,4-dimethyltetrahydrofuran-2-one.

Fig. 1 HPLC trace for the separation of the diastereoisomers 38a (peak X) and 38b (peak Y) together with 39a (peak P) and 39b (peak Q)
analysis of this ribonolactone ester 38 initially showed three pairs of peaks, the four peaks that appear in Fig. 1 together with another pair, smaller than $P$ and $Q$, having a longer retention time than X and Y. Mass spectrometry and NMR spectroscopy indicated that this slower running pair represented the separated diastereoisomers of material in which the $\mathrm{CH}_{2} \mathrm{CBr}_{3}$ group had been reduced to $\mathrm{CH}_{2} \mathrm{CHBr}_{2}$. Consideration of the earlier chemistry suggested that this reduction was probably due to attack by iodide ion on a bromine atom of the $\mathrm{CBr}_{3}$ group during the preparation of the dipyrromethane $32 ; \mathrm{CBr}_{3}$ group can act as a source of ' $\mathrm{Br}^{+}$'. Accordingly, the conditions for the iodination step $\mathbf{3 1} \longrightarrow \mathbf{3 2}$ were made as mild as possible and when this product was carried forward to the ester 38, the HPLC trace appeared as in Fig. 1, without the slowest running pair of peaks.
Similar analysis of the four remaining peaks in Fig. 1 indicated that peaks X and Y were the desired diastereoisomers 38a and 38b, § respectively, whereas peaks $P$ and $Q$ were the corresponding diastereoisomers 39a and 39b, respectively, which had lost HBr from the tribromoethyl group at some stage during the synthetic transformations. Again efforts were made to avoid the production of the compounds in peaks P and Q ; presumably they are formed by some base-catalysed elimination of hydrogen bromide. Suffice it to say that the various modifications tried either had little effect or they somewhat reduced the yield of the desired compounds in peaks X and Y . Since these by-products were readily separated, the large scale separation was carried out on the mixture as seen in Fig. 1. This effective separation of the diastereoisomers was only possible with very low loading of the column, so automatic HPLC equipment for injection and collection was needed to provide sufficient material for the rest of the synthesis. Analytical HPLC and $400 \mathrm{MHz}{ }^{1} \mathrm{H}$ NMR proved that complete separation of the diastereoisomers had been achieved.
The first task was to confirm that the peaks X and Y in Fig. 1 in fact contained the desired diastereoisomers 38a and 38b. Certainly their ${ }^{1} \mathrm{H}$ NMR, ${ }^{13} \mathrm{C}$ NMR and mass spectra
§ The two configurations at the starred chiral centre of 40, Scheme 4, are not illustrated but are distinguished by $\mathbf{a}$ and $\mathbf{b}$ attached to the number. The same system with $\mathbf{a}$ and $\mathbf{b}$ is used for Scheme 5, where one configuration is illustrated but always the other separate enantiomer is being handled as well.

Fig. 2 Circular dichroism spectra of the enantiomers 40a derived from peak X (Fig. 1) and 40b derived from peak Y
supported that view. Rigorous proof was obtained by treating each diastereoisomer with sodium methoxide in methanol to effect transesterification with loss of the ribonic lactone residue. As had been planned, the benzyl and tribromoethyl esters did not undergo transesterification under the mild conditions used, because they are vinylogous urethanes and thus much less reactive. That the two products, 40a and 40b, were enantiomers was shown by their identical HPLC retention times and ${ }^{1} \mathrm{H}$ NMR and mass spectra; importantly, their circular dichroism (CD) spectra were mirror images with a common crossover point on the zero line (Fig. 2).

Synthesis of the enantiomeric spiro lactams 54a and 54b
The racemic form $\mathbf{4 0}$ of the foregoing final products 40 a and $\mathbf{4 0 b}$ was the key intermediate for the earlier synthesis ${ }^{7}$ of the racemic spiro lactam $\mathbf{5 4 a}, \mathbf{b}$. Now that the pure enantiomers of this intermediate were in hand, each could be carried through the same remaining steps of the synthesis, $\mathbf{4 0} \longrightarrow \mathbf{4 5} \longrightarrow$ $\mathbf{4 6} \longrightarrow \mathbf{4 7} \longrightarrow \mathbf{4 8} \longrightarrow \mathbf{4 9} \mathbf{5 0} \longrightarrow \mathbf{5 1} \longrightarrow \mathbf{5 4}$, shown in Scheme 5. These conversions were carried out as for the racemic series ${ }^{7}$ and were successfully completed for both enantiomers, but there was one surprise, probably due to small differences in reaction conditions used by different workers. This appeared when the first enantiomer of the acid to be used 48b was decarboxylated by iodination and removal of the iodine by hydrogenation (expected steps $\mathbf{4 8 b} \longrightarrow 49 \mathrm{~b} \longrightarrow$ $\mathbf{5 0 b}$ ). The major product was the bis( $\alpha$-free pyrrole) 53b, not 50b. Evidently both decarboxylation and deformylation had occurred in the iodination step to yield the di-iodo derivative 52b, which on hydrogenation afforded the observed product 53b. Modification of the conditions for the iodination overcame this problem to allow the original steps via 50b (Scheme 5) to be used to build the spiro lactam 54b. In addition the bis( $\alpha$-free) system 53b was successfully converted in modest yield into the final spiro lactam 54b by acid-catalysed condensation with formaldehyde. The sum of all this synthetic effort, starting from the two enantiomers of the dipyrrolic lactam 40a and 40b, afforded ample quantities of the enantiomeric spiro lactams 54a and $\mathbf{5 4 b}$ for the necessary enzymic experiments. The last ringclosure step, $\mathbf{5 1 a}$ or $\mathbf{b} \longrightarrow \mathbf{5 4 a}$ or $\mathbf{b}$ (Scheme 5) again yielded small amounts of the macrocyclic dimer 55, readily separable from the monomer, which had been fully characterised in the racemic series; ${ }^{7}$ these enantiomeric dimers are not further examined here.

## Enzymic studies: inhibition of cosynthetase

The two enantiomers of the spiro lactam 54a and 54b were each treated with aqueous methanolic potassium hydroxide under conditions known to hydrolyse only the ester groups ${ }^{7}$ to afford the enantiomeric octa-acids $\mathbf{4 a}$ and $\mathbf{4 b}$. Cosynthetase isolated from Euglena gracilis, ${ }^{15}$ was used in standard assays of the enzyme's activity ${ }^{15}$ for catalysing the conversion of hydroxymethylbilane 1 into uro'gen III 3. These assays were carried out as for the earlier ones in the racemic series ${ }^{7}$ and were run in the presence of varying amounts of each enantiomer of the spiro lactam octa-acids $\mathbf{4 a}$ and $\mathbf{4 b}$; kinetic runs using the racemic octa-acid ${ }^{7} 4$ were also included to act as a standard. The $K_{M}$ value for hydroxymethylbilane 1 was determined at the same time by standard assays ${ }^{15}$ at a range of substrate concentrations in the absence of any inhibitor, the $K_{\mathrm{M}}$ value being determined from a Hanes plot. ${ }^{16}$

Dixon plots of the kinetic data from the experiments with the enantiomeric spiro lactams $\mathbf{4 a}$ and $\mathbf{4 b}$ are shown in Fig. 3, from which the inhibition constants $K_{\mathrm{i}}$ shown in Table 1 were derived. They show a striking difference in the effectiveness of the two enantiomers as inhibitors of cosynthetase, with the spiro lactam 4 a derived from peak X in Fig. 1 being ca. 20 times more inhibitory than its enantiomer $\mathbf{4 b}$ derived from peak $\mathbf{Y}$. Also, the $K_{\mathrm{i}}$ for the strongly inhibiting enantiomer is more than an order of magnitude lower than the $K_{\mathrm{M}}$ for the substrate (hydroxymethylbilane 1) of cosynthetase.

The fact that one of the two enantiomers of the spiro lactam 4 is a weak inhibitor, rather than having no effect at all, can be understood by setting the lactam ring of these enantiomers in the same orientation, see Fig. 4. This is reasonable since it is the chemistry around ring D of hydroxymethylbilane 1 , correspond-
ing to the pyrrolenine ring of the putative spiro intermediate 2 , that lies at the core of the action of cosynthetase. The three pyrrole rings of the macrocycle will have the same conformation in the two systems and inspection of Fig. 4 shows the only difference between the two systems is that the acetate $(\mathrm{A})$ and propionate $(\mathrm{P})$ side-chains on each pyrrole ring are interchanged. It follows that, whereas the side-chains on the pyrrolic rings of the strongly inhibitory enantiomer presumably fit well into the enzymic active site, the same side-chains of the other enantiomer, though all acidic, are of slightly the wrong size (A for P and P for A ). The observed weak inhibition by this enantiomer, rather than a complete lack of inhibition, fits the foregoing analysis.

These experiments with the two enantiomers of the spiro lactam, $\mathbf{4 a}$ and $\mathbf{4 b}$, add further powerful support to the view that the conversion of hydroxymethylbilane 1 into uro'gen III 3, catalysed by cosynthetase, goes via the spiro pyrrolenine 2. In addition, determination of the absolute configuration of the strongly inhibiting enantiomer will allow the absolute configuration of the spiro pyrrolenine 2 to be deduced. The following paper ${ }^{17}$ describes the way in which that stereochemical problem has been solved.

## Experimental

## General directions

Most general directions are given in Part 34 of this series. ${ }^{18}$ In addition, CD spectra were recorded on Jasco J-40CS or J-600 spectrometers, with a 1 cm pathlength in strain-free cuvettes. HPLC was carried out on Spherisorb S5W silica columns or Spherisorb S5CN nitrile columns with a Waters 6000A pump connected to a Cecil CE272 detector. Solvents for HPLC were filtered through a $0.5 \mu \mathrm{~m}$ sieve. Evaporation was carried out at $c a .15 \mathrm{mmHg}$ on a Büchi rotatory evaporator and residual solvent was removed at high vacuum using an oil pump.

Methyl 2-benzyloxycarbonyl-5-methyl-4-(2-trimethylsilyl-ethoxycarbonylmethyl)pyrrole-3-propionate 9 and methyl 2-benzyloxycarbonyl-5-formyl-4-(2-trimethylsilylethoxy-carbonylmethyl)pyrrole-3-propionate 10
A solution of acetylpyrrole $8^{19}(1 \mathrm{~g}, 2.92 \mathrm{mmol})$ in dimethoxyethane $\left(6 \mathrm{~cm}^{3}\right)$ and 2-trimethylsilylethanol ( 1.38 g , 11.67 mmol ) was treated with a suspension of thallium(III) nitrate trihydrate ( $2.59 \mathrm{~g}, 5.83 \mathrm{mmol}$ ) in dimethoxyethane ( 11 $\mathrm{cm}^{3}$ ) and concentrated nitric acid ( $0.2 \mathrm{~cm}^{3}$ ). The resulting mixture was stirred at room temperature for 28 h and then filtered through Celite. The filtrate was neutralised with $10 \%$ aqueous sodium carbonate, mixed with water ( $10 \mathrm{~cm}^{3}$ ) and extracted with dichloromethane ( $3 \times 30 \mathrm{~cm}^{3}$ ). The combined extracts were dried and evaporated under reduced pressure. The residual oil was purified by flash silica chromatography, eluting with dichloromethane-ethyl acetate (24:1), followed by preparative TLC, eluting with dichloromethane-ethyl acetate ( $4: 1$ ), to give the pyrrole ester $9\left(88.6 \mathrm{mg}, 7 \%\right.$ ), mp $56-57^{\circ} \mathrm{C}$ (from hexane) (see later for spectroscopic data) and the formyl pyrrole 10 ( $117.5 \mathrm{mg}, \quad 11.7 \%$ ), mp $63-64^{\circ} \mathrm{C}$ (from dichloromethane-diethyl ether-hexane)(Found: $\mathrm{M}^{+}, 473.1867$. $\mathrm{C}_{24} \mathrm{H}_{31} \mathrm{NO}_{7}$ Si requires $M, 473.1870$ ); $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 302$ and 232; $v_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3395,2935,1720,1650,1190,1165$ and $835 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right)-0.01\left(9 \mathrm{H}, \mathrm{s}, \mathrm{SiMe}_{3}\right), 0.96(2 \mathrm{H}, \mathrm{t}, J 9$, $\mathrm{CH}_{2} \mathrm{Si}$ ), 2.54 and 3.01 (each $2 \mathrm{H}, \mathrm{t}, \mathrm{J} 8, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), $3.60(3 \mathrm{H}$, s , OMe), 3.78 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), $4.15\left(2 \mathrm{H}, \mathrm{t}, J 9, \mathrm{OCH} \mathrm{CH}_{2} \mathrm{Si}\right)$, $5.31\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 7.30-7.40(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 9.73(1 \mathrm{H}, \mathrm{s}, \mathrm{CHO})$ and $10.01(1 \mathrm{H}$, br s, NH$) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) 1.61,17.25$, 19.66, 29.51, 34.29, 51.53, 63.75, 67.02, 123.89, 125.54, 128.65, $130.60,135.01,159.92,170.61,173.21$ and $179.60 ; m / z(\mathrm{FD}) 473$.

## 3-(2-Methoxycarbonylethyl)-5-methyl-4-(2-trimethylsilyl-

 ethox ycarbonylmethyl)pyrrole-2-carboxylic acid 11To a solution of the pyrrole ester $9(100 \mathrm{mg}, 0.22 \mathrm{mmol})$ in
tetrahydrofuran ( $2 \mathrm{~cm}^{3}$ ) was added $10 \%$ palladium-oncharcoal ( 10 mg ). The mixture was hydrogenated at room temperature for 2.5 h , filtered through Celite and evaporated. The residue was recrystallised from diethyl ether-hexane to give the pyrrole acid $11\left(79 \mathrm{mg}, 98 \%\right.$ ), mp 105.5-106.5 ${ }^{\circ} \mathrm{C}$ (Found: $\mathrm{M}^{+}, 369.1602 . \mathrm{C}_{17} \mathrm{H}_{27} \mathrm{NO}_{6} \mathrm{Si}$ requires $\left.M, 369.1608\right) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right.$, $400 \mathrm{MHz}) 0.01\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Me}_{3} \mathrm{Si}\right), 0.92\left(2 \mathrm{H}, \mathrm{t}, J 9, \mathrm{CH}_{2} \mathrm{Si}\right), 2.23(3$ $\mathrm{H}, \mathrm{s}, \mathrm{CMe}$ ), 2.62 and 3.03 (each $2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.41 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), $3.65(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.15(2 \mathrm{H}, \mathrm{t}, J 9$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right)$ and $9.22(1 \mathrm{H}, \mathrm{br} s, \mathrm{NH}) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ $-1.55\left(\mathrm{Me}_{3} \mathrm{Si}\right), 11.72(\mathrm{CMe}), 17.33\left(\mathrm{CH}_{2} \mathrm{Si}\right), 20.56,30.13$ and $34.66\left(3 \times \mathrm{CH}_{2}\right), 51.49(\mathrm{OMe}), 63.12\left(\mathrm{OCH}_{2}\right), 115.12$, $116.08,132.61$ and $132.95(4 \times$ pyrrole-C $), 165.65\left(\mathrm{CO}_{2} \mathrm{H}\right)$ and 171.89 and $173.91\left(2 \times \mathrm{CO}_{2} \mathrm{Me}\right) ; m / z(\mathrm{FD}) 369\left(\mathrm{M}^{+}, 100 \%\right)$.

## 9-Benzyloxycarbonyl-2,7-bis(2-methoxycarbonylethyl)-8-methoxycarbonylmethyl-4-methyl-3-(2-trimethylsilylethoxy-carbonylmethyl)-4,5-dihydrodipyrrin-1(10H)-one 14

A solution of pyrrole acid $11(2.0 \mathrm{~g}, 5.42 \mathrm{mmol})$ in dichloromethane ( $30 \mathrm{~cm}^{3}$ ) was stirred vigorously with a solution of sodium hydrogen carbonate $(1.35 \mathrm{~g}, 16.07 \mathrm{mmol})$ in water ( $25 \mathrm{~cm}^{3}$ ) under argon. An aqueous solution $\left(60 \mathrm{~cm}^{3}\right)$ of iodine ( $0.1 \mathrm{~mol} \mathrm{dm}^{-3}$ ) and potassium iodide $\left(0.2 \mathrm{~mol} \mathrm{dm}^{-3}\right)$ was added over 5 min and the resulting mixture was stirred for a further 2 min before addition of solid sodium metabisulfite to destroy the excess iodine. The organic layer was separated and the aqueous layer extracted with dichloromethane ( $3 \times 30$ $\mathrm{cm}^{3}$ ). The combined organic layers were dried and evaporated. Flash chromatography on silica, eluting with diethyl etherhexane ( $1: 1$ ), gave the $\alpha$-iodopyrrole $\mathbf{1 2}$ as an oil which was used directly in the next step.

A stirred solution of the iodopyrrole 12 and acetoxymethylpyrrole $13^{8}(2.28 \mathrm{~g}, 5.41 \mathrm{mmol})$ in anhydrous dichloromethane ( $50 \mathrm{~cm}^{3}$ ) was cooled to $0^{\circ} \mathrm{C}$ under argon. Stannic chloride ( 698 $\mathrm{mm}^{3}, 5.96 \mathrm{mmol}$ ) was added dropwise. After 30 min saturated aqueous sodium hydrogen carbonate ( $25 \mathrm{~cm}^{3}$ ) was added and the mixture was stirred for a further 10 min . The organic layer was separated and the aqueous layer extracted with dichloromethane ( $5 \times 25 \mathrm{~cm}^{3}$ ). The combined organic layers were dried and evaporated. The residual oil was dissolved in tetrahydrofuran $\left(100 \mathrm{~cm}^{3}\right)$ and water $\left(10 \mathrm{~cm}^{3}\right)$ and treated with toluene- $p$-sulfonic acid ( $1.5 \mathrm{~g}, 8.7 \mathrm{mmol}$ ) and silver acetate ( 250 $\mathrm{mg}, 1.5 \mathrm{mmol}$ ). The mixture was stirred under argon for 13 h , then mixed with water ( $400 \mathrm{~cm}^{3}$ ) and extracted with dichloromethane ( $4 \times 150 \mathrm{~cm}^{3}$ ). The combined extracts were dried and evaporated and the residue was purified by flash chromatography on silica, eluting with diethyl ether followed by diethyl ether-ethyl acetate ( $1: 1$ ), to give the lactam 14 as an oil ( $1.43 \mathrm{~g}, 37 \%$ ) (Found: $\mathrm{M}^{+}, 712.3028 . \mathrm{C}_{36} \mathrm{H}_{48} \mathrm{~N}_{2} \mathrm{O}_{11}$ Si requires $M, 712.3027$ ); $\lambda_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} \mathrm{280;} v_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3685$, $2940,1720,1690,1600$ and $1165 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 0.02(9 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{Me}_{3} \mathrm{Si}\right), 0.99\left(2 \mathrm{H}, \mathrm{t}, J 9, \mathrm{CH}_{2} \mathrm{Si}\right), 1.32(3 \mathrm{H}, \mathrm{s}, \mathrm{CMe}), 2.40-2.70$ $\left(8 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.74$ and $3.04\left(2 \mathrm{H}, \mathrm{ABq}, J 15,5-\mathrm{H}_{2}\right)$, 3.32 and $3.49\left(2 \mathrm{H}, \mathrm{ABq}, J 17, \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.51,3.58$ and 3.63 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), 3.62 and $3.84\left(2 \mathrm{H}, \mathrm{ABq}, J 17, \mathrm{CH}_{2} \mathrm{CO}_{2}\right.$ ), $4.18\left(2 \mathrm{H}, \mathrm{t}, J 9, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 5.13$ and $5.23(2 \mathrm{H}, \mathrm{ABq}, J 12$, $\left.\mathrm{CH}_{2} \mathrm{Ph}\right), 7.19(1 \mathrm{H}, \mathrm{s}$, lactam-NH), $7.23-7.34(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 10.18$ $\left(1 \mathrm{H}, \mathrm{s}\right.$, pyrrole-NH); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)-1.54\left(\mathrm{Me}_{3} \mathrm{Si}\right)$, $17.36\left(\mathrm{CH}_{2} \mathrm{Si}\right), 19.26$ and $19.67\left(2 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 23.77$ (CMe), 30.86, 31.15, 31.39, 33.36, $34.76\left(2 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right.$, $\left.2 \times \mathrm{CH}_{2} \mathrm{CO}_{2}, \mathrm{C}-5\right), 51.48(\mathrm{OMe}), 51.77(2 \times \mathrm{OMe}), 63.39$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 64.31,65.67$ (C-4 and $\left.\mathrm{CH}_{2} \mathrm{Ph}\right), 119.16,121.91$, $122.22,127.95,128.19,128.35,128.70,135.30,136.29$ and 151.53 $(\mathrm{C}=\mathrm{C}), 160.67\left(\alpha-\mathrm{CO}_{2}\right)$ and $170.22,171.84,171.04,173.47$ and $173.96\left(4 \times \mathrm{CO}_{2}\right.$ and CONH ); $m / z(\mathrm{FD}) 712\left(\mathrm{M}^{+}, 100 \%\right)$.

## 9-Benzyloxycarbonyl-3-carboxymethyl-2,7-bis(2-methoxy-carbonylethyl)-8-methoxycarbonylmethyl-4-methyl-4,5-dihydro-dipyrrin-1-( $\mathbf{1 0 H}$ )-one 7

Tetrabutylammonium fluoride trihydrate ( $118 \mathrm{mg}, 0.37 \mathrm{mmol}$ )
was added to a solution of the lactam $14(88.7 \mathrm{mg}, 0.12 \mathrm{mmol})$ in tetrahydrofuran $\left(1 \mathrm{~cm}^{3}\right)$ and the solution was stirred under argon at room temperature for 40 min . Water ( $6 \mathrm{~cm}^{3}$ ) was added and the pH of the solution adjusted to $3.0-3.5$ with dilute sulfuric acid. The solution was extracted with dichloromethane ( $2 \times 5 \mathrm{~cm}^{3}$ ) and the combined organic extracts were dried and evaporated. The residue was recrystallised from dichloromethane to give the acid $7(46.8 \mathrm{mg}, 61 \%), \mathrm{mp} 159-161^{\circ} \mathrm{C}$ (Found: $\mathrm{MH}^{+}$, 613.2361. $\mathrm{C}_{31} \mathrm{H}_{36} \mathrm{~N}_{2} \mathrm{O}_{11}$ requires $M H, 613.2397$ ); $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 1.34(3 \mathrm{H}, \mathrm{s}, \mathrm{CMe}), 2.34-2.64(8 \mathrm{H}, \mathrm{m}$, $\left.2 \times \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.83$ and $3.13\left(2 \mathrm{H}, \mathrm{ABq}, J 15,5-\mathrm{H}_{2}\right), 3.32$ and $3.53\left(2 \mathrm{H}, \mathrm{ABq}, J 17, \mathrm{CH}_{2} \mathrm{CO}_{2}\right.$ ), 3.49, 3.56, 3.57 (each 3 H , s, OMe), 3.60 and $3.80\left(2 \mathrm{H}, \mathrm{ABq}, J 17, \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 5.19(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{2} \mathrm{Ph}\right), 7.25-7.39(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 7.51(1 \mathrm{H}$, br s, lactam-NH) and $10.20\left(1 \mathrm{H}\right.$, br s, pyrrole-NH); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) 19.16$ and $19.74\left(2 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 23.66(\mathrm{CMe}), 30.91,30.97$, 31.11, 32.75 and $34.86\left(2 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}, 2 \times \mathrm{CH}_{2} \mathrm{CO}_{2}, \mathrm{C}-5\right.$ ), 51.53, 51.69 and $51.82(3 \times \mathrm{OMe}), 64.44$ and $65.84(\mathrm{C}-4$ and $\left.\mathrm{CH}_{2} \mathrm{Ph}\right), 118.95,121.95,122.36,127.94,128.05,128.49,128.89$, 134.93, 136.16 and $152.48(\mathrm{C}=\mathrm{C}), 161.07\left(\alpha-\mathrm{CO}_{2}\right)$ and 172.36, $172.68,173.43$ and $173.74\left(4 \times \mathrm{CO}_{2}\right.$ and CONH ); $m / z(\mathrm{FD})$ $612\left(\mathrm{M}^{+}, 100 \%\right)$.

## 9-Benzyloxycarbonyl-2,7-bis(2-methoxycarbonylethyl)-8-methoxycarbonylmethyl-4-methyl-3-(1- phenylethoxy-carbonylmethyl)-4,5-dihydrodipyrrin- $1(10 \mathrm{H})$-one 15

$N, N^{\prime}$-Dicyclohexylcarbodiimide ( $7.6 \mathrm{mg}, 37 \mu \mathrm{~mol}$ ) and 4 dimethylaminopyridine ( $0.7 \mathrm{mg}, 6 \mu \mathrm{~mol}$ ) were added to a solution of the acid $7(15 \mathrm{mg}, 25 \mu \mathrm{~mol})$ in dichloromethane ( 1.5 $\mathrm{cm}^{3}$ ) and ( $S$ )-(-)-1-phenylethanol ( $30 \mathrm{mg}, 245 \mu \mathrm{~mol}$ ) and the mixture was stirred under argon at room temperature for 20 min . ## Methyl 2-(benzyloxycarbonyl)-4-(tert-butoxycarbonyl)-5-methylpyrrole-3-propionate 20

A solution of sodium nitrite ( $17.46 \mathrm{~g}, 253 \mathrm{mmol}$ ) in water ( 31 $\mathrm{cm}^{3}$ ) was added dropwise to a stirred mixture of 1-benzyl 6 -methyl 3 -oxohexanedioate $18(64.25 \mathrm{~g}, 243 \mathrm{mmol})$ (made from 17 by the method in ref. 19) in acetic acid ( $100 \mathrm{~cm}^{3}$ ) at such a rate that the temperature did not exceed $25^{\circ} \mathrm{C}$. After being stirred overnight at room temperature, the mixture, containing the oxime 19, was added dropwise to a stirred mixture of tert-butyl acetoacetate ( $45.37 \mathrm{~g}, 287 \mathrm{mmol}$ ) in acetic acid ( $100 \mathrm{~cm}^{3}$ ). At the same time a mixture of zinc dust ( 50 g ) and ammonium acetate ( 50 g ) was added at such a rate that it was always in excess and the temperature remained between 50 and $70^{\circ} \mathrm{C}$. The resulting mixture was stirred for 30 min , then diluted with ice-water $\left(750 \mathrm{~cm}^{3}\right)$, stirred for a further 30 min and filtered. The residue was washed with water $\left(200 \mathrm{~cm}^{3}\right)$ and dissolved in dichloromethane ( $250 \mathrm{~cm}^{3}$ ). The organic solution was washed with water ( $250 \mathrm{~cm}^{3}$ ) and then with $5 \%$ aqueous sodium carbonate, dried and evaporated. The residue was recrystallised from diethyl ether to give the pyrrole ester 20 ( 35.3 g, $36 \%$ ), mp $95-98{ }^{\circ} \mathrm{C}$ (Found: $\mathrm{M}^{+}, 401.1829 . \mathrm{C}_{22} \mathrm{H}_{27} \mathrm{NO}_{6}$ requires $M, 401.1838) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 1.54(9 \mathrm{H}, \mathrm{s}$, $\mathrm{Bu}^{\mathrm{t}}$ ), $2.46(3 \mathrm{H}, \mathrm{s}, 5-\mathrm{Me}), 2.53$ and 3.35 (each $2 \mathrm{H}, \mathrm{t}, J 8$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.61 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), 5.29 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}$ ), $7.30-$ $7.40(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph})$ and $9.15(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{NH})$; $m / z(\mathrm{FD}) 401\left(\mathrm{M}^{+}\right.$, $100 \%$ ).

## Methyl 2-benzyloxycarbonyl-4-iodo-5-methylpyrrole-3propionate 22

A solution of pyrrole ester $20(19.8 \mathrm{~g}, 49.3 \mathrm{mmol})$ in $1,2-$ dichloroethane ( $65 \mathrm{~cm}^{3}$ ) was treated with trifluoroacetic acid $\left(4.94 \mathrm{~cm}^{3}\right)$, heated under reflux with stirring for 75 min and then cooled to room temperature. Water ( $42 \mathrm{~cm}^{3}$ ) was added and after 10 min the acid 21 was collected by filtration, washed with dichloromethane then water and dried in vacuo for use directly in the next step.

The acid 21 was added to a stirred solution of sodium hydrogen carbonate ( $12.4 \mathrm{~g}, 148 \mathrm{mmol}$ ) in water $\left(82 \mathrm{~cm}^{3}\right)$. When foaming began, 1,2 -dichloroethane $\left(82 \mathrm{~cm}^{3}\right)$ was added and the mixture was heated gently at reflux to dissolve the pyrrole. A solution of iodine ( $13.8 \mathrm{~g}, 109 \mathrm{mmol}$ ) and potassium iodide ( $16.4 \mathrm{~g}, 99 \mathrm{mmol}$ ) in water ( $82 \mathrm{~cm}^{3}$ ) was added over 5 min and the resulting mixture was heated under reflux with stirring for 30 min . Solid sodium metabisulfite was added to destroy excess iodine and the organic layer was separated. The aqueous layer was extracted with dichloromethane ( 60 $\mathrm{cm}^{3}$ ) and the combined organic layers were dried and evaporated to give the pale yellow iodopyrrole $22(16.65 \mathrm{~g}$, $79 \%$ ) mp $130-131^{\circ} \mathrm{C}$ (from diethyl ether) (Found: $\mathrm{M}^{+}$, 427.0241. $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{NO}_{4} \mathrm{I}$ requires $M, 427.0239$ ); $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400\right.$ $\mathrm{MHz}) 2.26(3 \mathrm{H}, \mathrm{s}, 5-\mathrm{Me}), 2.47$ and 3.02 (each $2 \mathrm{H}, \mathrm{t}, J 8$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.63 ( $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), $5.28\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 7.30-$ $7.39(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph})$ and $9.35(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{NH})$; $m / z(\mathrm{FD}) 427\left(\mathrm{M}^{+}\right.$, $100 \%$ ).

## 5-Benzyloxycarbonyl-4-(2-methoxycarbonylethyl)-2-methyl-

 pyrrole-3-acetic acid 23To a stirred solution of $57 \%$ aqueous hydriodic acid $\left(125 \mathrm{~cm}^{3}\right)$ at $0^{\circ} \mathrm{C}$ was slowly added acetic anhydride $\left(125 \mathrm{~cm}^{3}\right)$ followed by $50 \%$ aqueous hypophosphorous acid ( $24.5 \mathrm{~cm}^{3}$ ). To this cooled solution was added finely powdered iodopyrrole 22 (21.4 $\mathrm{g}, 50 \mathrm{mmol})$. The resulting mixture was stirred for 5 min and then glyoxylic acid monohydrate ( $13.81 \mathrm{~g}, 150 \mathrm{mmol}$ ) was added in 3 portions over 15 min . After a further 20 min at $0^{\circ} \mathrm{C}$, dichloromethane ( $425 \mathrm{~cm}^{3}$ ) was added and the solution was washed with water $\left(500 \mathrm{~cm}^{3}\right)$. The organic layer was separated and the aqueous layer was extracted with dichloromethane ( $3 \times 330 \mathrm{~cm}^{3}$ ). The combined organic layers were washed with $5 \%$ aqueous sodium hydrogen sulfite ( $250 \mathrm{~cm}^{3}$ ) and then water ( $250 \mathrm{~cm}^{3}$ ), dried and evaporated. Crystallisation from dichloromethane-hexane gave the acid 23 ( $17.53 \mathrm{~g}, 97 \%$ ), mp $145-146^{\circ} \mathrm{C}$ (Found: $\mathrm{MH}^{+}$, 360.1454. $\mathrm{C}_{19} \mathrm{H}_{21} \mathrm{NO}_{6}$ requires $M+H, 360.1447) ; \lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 278 ; \nu_{\text {max }}(\mathrm{Nujol}) / \mathrm{cm}^{1}$ $3700-3000,3300,2993,1735,1705,1665$ and $1465 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right.$, $400 \mathrm{MHz}) 2.20(3 \mathrm{H}, \mathrm{s}, \mathrm{CMe}), 2.52$ and 2.99 (each $2 \mathrm{H}, \mathrm{t}, J 8$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), $3.45\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.58(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe})$, $5.27\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 7.33(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph})$ and $9.26(1 \mathrm{H}$, br s, $\mathrm{NH}) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) 11.60(\mathrm{CMe}), 20.64,29.66,34.82$ $\left(3 \times \mathrm{CH}_{2}\right), 51.48(\mathrm{OMe}), 60.06\left(\mathrm{CH}_{2} \mathrm{Ph}\right), 113.94,116.72$, $128.25,128.37(2 \mathrm{C}), 128.59(2 \mathrm{C}), 130.94,132.06$ and 135.05 $(\mathrm{C}=\mathrm{C})$ and $161.04,173.74$ and $177.01(3 \times \mathrm{C}=\mathrm{O}) ; m / z(\mathrm{FD}) 359$ $\left(\mathrm{M}^{+}, 100 \%\right)$.

## Methyl 2-benzyloxycarbonyl-5-methyl-4-(2-trimethylsilyl-ethoxycarbonylmethyl)pyrrole-3-propionate 9

To a solution of the acid $23(3.25 \mathrm{~g}, 9.05 \mathrm{mmol})$ in anhydrous dichloromethane ( $30 \mathrm{~cm}^{3}$ ) was added oxalyl chloride ( 3.16 $\mathrm{cm}^{3}, 4.60 \mathrm{~g}, 36.24 \mathrm{mmol}$ ) dropwise, followed by 3 drops of anhydrous $N, N$-dimethylformamide. Vigorous effervescence ensued and the red solution was stirred at room temperature under argon for 30 min and then evaporated. A solution of the residue in anhydrous dichloromethane ( $10 \mathrm{~cm}^{3}$ ) was stirred with 2-(trimethylsilyl)ethanol ( $2.68 \mathrm{~g}, 22.66 \mathrm{mmol}$ ) and 4dimethylaminopyridine ( $1.33 \mathrm{~g}, 10.89 \mathrm{mmol}$ ) under argon for 20 min at room temperature and then evaporated. The residue was purified by flash chromatography on silica, eluting with hexane-diethyl ether ( $9: 1$ ) followed by dichloromethane-ethyl acetate ( $95: 5$ ), and crystallisation from hexane to give pyrrole ester 9 ( $3.85 \mathrm{~g}, 93 \%$ ), mp $56-57^{\circ} \mathrm{C}$ (Found: $\mathrm{M}^{+}, 459.2076$. $\mathrm{C}_{24} \mathrm{H}_{33} \mathrm{NO}_{6} \mathrm{Si}$ requires $M, 459.2077$ ); $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 278$; $v_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3425,2925,1760-1640 \mathrm{~s}, 1165,1065$ and $835 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 0.01\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Me}_{3} \mathrm{Si}\right), 0.96(2 \mathrm{H}, \mathrm{t}, J 9$, $\left.\mathrm{CH}_{2} \mathrm{Si}\right), 2.20(3 \mathrm{H}, \mathrm{s}, \mathrm{CMe}), 2.53$ and 3.00 (each $2 \mathrm{H}, \mathrm{t}, J 8$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), $3.39\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.60(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.13$ ( $2 \mathrm{H}, \mathrm{t}, \mathrm{J} 9, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}$ ), 5.27 ( $2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}$ ), 7.36 ( $5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}$ ) and $8.99(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{NH}) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)-1.54\left(\mathrm{Me}_{3} \mathrm{Si}\right)$, $11.66(\mathrm{CMe}), 17.34\left(\mathrm{CH}_{2} \mathrm{Si}\right), 20.68\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 30.12$ $\left(\mathrm{CH}_{2} \mathrm{CO}_{2}\right), 34.86\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 51.39(\mathrm{OMe}), 63.05$ and $65.83\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right.$ and $\left.\mathrm{CH}_{2} \mathrm{Ph}\right), 114.59,116.68,128.18,128.30$ ( 2 C ), $128.57(2 \mathrm{C}), 130.84,131.54,136.23$ (C=C), 160.76 (2$\mathrm{CO}_{2}$ ) and 171.87 and $173.62\left(2 \times \mathrm{CO}_{2} \mathrm{Me}\right) ; m / z(\mathrm{FD}) 459\left(\mathrm{M}^{+}\right.$, $100 \%$ ).

## Methyl 5-acetoxymethyl-2-benzyloxycarbonyl-4-(2-trimethyl-silylethoxycarbonylmethyl)pyrrole-3-propionate 24

A solution of sulfuryl chloride ( $559 \mathrm{mg}, 335 \mathrm{~mm}^{3}, 4.14 \mathrm{mmol}$ ) in anhydrous dichloromethane ( $4 \mathrm{~cm}^{3}$ ) was added dropwise over 1 min to a stirred solution of the methyl pyrrole $9(2 \mathrm{~g}, 4.36$ mmol ) in anhydrous dichloromethane ( $16 \mathrm{~cm}^{3}$ ) under argon at $0^{\circ} \mathrm{C}$. After 1 h at $0^{\circ} \mathrm{C}$, the solution was evaporated and a solution of the residue in acetic acid $\left(20 \mathrm{~cm}^{3}\right)$ was stirred with sodium acetate ( $1.18 \mathrm{~g}, 14.38 \mathrm{mmol}$ ) under argon at $60^{\circ} \mathrm{C}$ for 90 min, then diluted with water ( $80 \mathrm{~cm}^{3}$ ) and extracted with dichloromethane ( $3 \times 20 \mathrm{~cm}^{3}$ ). The combined organic extracts were washed with saturated aqueous sodium hydrogen
carbonate $\left(2 \times 50 \mathrm{~cm}^{3}\right)$ and then with water $\left(30 \mathrm{~cm}^{3}\right)$, dried and evaporated to give the acetoxymethylpyrrole 24 as fine needles ( $2.12 \mathrm{~g}, 94 \%$ ), $\mathrm{mp} 64.5-65.5^{\circ} \mathrm{C}$ (from diethyl etherhexane) (Found: $\mathrm{M}^{+}, 517.2121 . \mathrm{C}_{26} \mathrm{H}_{35} \mathrm{NO}_{8} \mathrm{Si}$ requires $M$, 517.2132); $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 269 ; v_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3420$, $2940,1760-1650 \mathrm{~s}, 1200,1170,1070$ and $835 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400\right.$ $\mathrm{MHz}) 0.00\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Me}_{3} \mathrm{Si}\right), 0.95\left(2 \mathrm{H}, \mathrm{t}, J 9, \mathrm{CH}_{2} \mathrm{Si}\right), 2.04(3 \mathrm{H}, \mathrm{s}$, Ac), 2.52 and 2.99 (each $\left.2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.49(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.60(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.12\left(2 \mathrm{H}, \mathrm{t}, J 9, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right)$, $5.03\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{OAc}\right), 5.28\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{Ph}\right), 7.35(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph})$ and $9.18(1 \mathrm{H}$, br s, NH $) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)-1.56\left(\mathrm{Me}_{3} \mathrm{Si}\right)$, $17.33\left(\mathrm{CH}_{2} \mathrm{Si}\right), 20.40\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 20.85(\mathrm{COMe}), 29.81$ $\left(\mathrm{CH}_{2} \mathrm{CO}_{2}\right), \quad 34.70 \quad\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), \quad 51.44 \quad(\mathrm{OMe}), 56.91$ $\left(\mathrm{CH}_{2} \mathrm{OAc}\right), 63.28$ and $66.14\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right.$ and $\left.\mathrm{CH}_{2} \mathrm{Ph}\right), 117.17$, $119.08,128.30,128.39$ (2 C), 128.61 (2 C), 128.79, 129.97 and $135.93(\mathrm{C}=\mathrm{C})$ and $160.43,171.45,171.51$ and $173.49(4 \times \mathrm{C}=\mathrm{O})$; $m / z$ (FD) $517\left(\mathrm{M}^{+}, 100 \%\right)$.

5-Acetoxymethyl-3-(2-methoxycarbonylethyl)-4-(2-trimethyl-silylethoxycarbonylmethyl)pyrrole-2-carboxylic acid 25
A solution of the pyrrole ester 24 ( $1 \mathrm{~g}, 1.93 \mathrm{mmol}$ ) in tetrahydrofuran ( $7 \mathrm{~cm}^{3}$ ) was stirred with $10 \%$ palladium-oncharcoal ( 0.1 g ) under an atmosphere of hydrogen at room temperature for 90 min and then filtered through Celite. The residue was washed with tetrahydrofuran $\left(3 \mathrm{~cm}^{3}\right)$ and the combined filtrate and washings were evaporated and the residue was recrystallised from methyl acetate-hexane to give the acid $25(0.81 \mathrm{~g}, 98 \%), \mathrm{mp} 108-110^{\circ} \mathrm{C}$ (decomp.) (Found: $\mathrm{M}^{+}, 427.1660 . \mathrm{C}_{19} \mathrm{H}_{29} \mathrm{NO}_{8}$ Si requires $M, 427.1662$ ); $\lambda_{\text {max }}\left(\mathrm{CH}_{2}-\right.$ $\left.\mathrm{Cl}_{2}\right) / \mathrm{nm} 276$; $v_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3420,3300-2500,2940,1725$ br, 1660,1170 and $835 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 0.02(9 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{Me}_{3} \mathrm{Si}\right), 0.98\left(2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{Si}\right), 2.07(3 \mathrm{H}, \mathrm{s}, \mathrm{Ac}), 2.61$ and 3.03 (each $2 \mathrm{H}, \mathrm{t}, \mathrm{J}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), $3.52\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.65(3$ $\mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.15\left(2 \mathrm{H}, \mathrm{t}, \mathrm{J} 8, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 5.07(2 \mathrm{H}, \mathrm{s}$, $\mathrm{CH}_{2} \mathrm{OAc}$ ) and $9.30(1 \mathrm{H}$, br s, NH$) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ $-1.56\left(\mathrm{Me}_{3} \mathrm{Si}\right), 17.33\left(\mathrm{CH}_{2} \mathrm{Si}\right), 20.27\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 20.85$ ( COMe ), $29.81\left(\mathrm{CH}_{2} \mathrm{CO}_{2}\right), 34.54\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 51.53(\mathrm{OMe})$, $56.97\left(\mathrm{CH}_{2} \mathrm{OAc}\right), 63.36\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 117.41,118.42,129.98$ and $131.59(\mathrm{C}=\mathrm{C})$ and $165.43,171.55(2 \mathrm{C})$ and 173.71 $(4 \times \mathrm{C}=\mathrm{O}) ; m / z(\mathrm{FD}) 427\left(\mathrm{M}^{+}, 100 \%\right)$.

Methyl 5-acetoxymethyl-2-tert-butoxycarbonyl-4-(2-trimethyl-silylethoxycarbonylmethyl)pyrrole-3-propionate 26
A solution of the acid $25(1 \mathrm{~g}, 2.34 \mathrm{mmol})$ in tert-butyl alcohol (8 $\mathrm{cm}^{3}$ ) and dichloromethane ( $8 \mathrm{~cm}^{3}$ ) was stirred with a solution of $N, N^{\prime}$-dicyclohexylcarbodiimide $(0.58 \mathrm{~g}, 2.81 \mathrm{mmol})$ in tertbutyl alcohol ( $2 \mathrm{~cm}^{3}$ ) under argon for 90 min and then evaporated. The residue was purified by flash chromatography on silica, eluting with diethyl ether-hexane ( $1: 1$ ), and crystallisation from diethyl ether-hexane to give the pyrrole ester $26\left(1.09 \mathrm{~g}, 96 \%\right.$ ) as needles, $\mathrm{mp} 69-71^{\circ} \mathrm{C}$ (Found: $\mathrm{M}^{+}$, 483.2297. $\mathrm{C}_{23} \mathrm{H}_{37} \mathrm{NO}_{8} \mathrm{Si}$ requires $\left.M, 483.2288\right)$; $\lambda_{\text {max }}\left(\mathrm{CH}_{2}{ }^{-}\right.$ $\left.\mathrm{Cl}_{2}\right) / \mathrm{nm} 269 ; v_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3430,1723 \mathrm{~s}$ br, 1690,1170 and $835 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 0.01\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Me}_{3} \mathrm{Si}\right), 0.97(2 \mathrm{H}, \mathrm{t}$, $\left.J 9, \mathrm{CH}_{2} \mathrm{Si}\right), 1.54\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t}\right), 2.05(3 \mathrm{H}, \mathrm{s}, \mathrm{Ac}), 2.55$ and 2.97 (each $\left.2 \mathrm{H}, \mathrm{t}, \mathrm{J}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.49\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.64$ (3 $\mathrm{H}, \mathrm{s}, \mathrm{OMe}), 4.13\left(2 \mathrm{H}, \mathrm{t}, J 9, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 5.04(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{2} \mathrm{OAc}\right)$ and $9.13(1 \mathrm{H}$, br s, NH$) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)$ $-1.55\left(\mathrm{Me}_{3} \mathrm{Si}\right), 17.34\left(\mathrm{CH}_{2} \mathrm{Si}\right), 20.50\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 20.87$ (COMe), $28.38\left(\mathrm{CMe}_{3}\right), \quad 29.85\left(\mathrm{CH}_{2} \mathrm{CO}_{2}\right), 34.95\left(\mathrm{CH}_{2}-\right.$ $\left.\mathrm{CH}_{2} \mathrm{CO}_{2}\right), 51.44(\mathrm{OMe}), 56.95\left(\mathrm{CH}_{2} \mathrm{OAc}\right), 63.24\left(\mathrm{CH}_{2} \mathrm{CH}_{2}-\right.$ Si), $81.28\left(\mathrm{CMe}_{3}\right), 116.84,120.81,127.81$ and $128.30(\mathrm{C}=\mathrm{C})$ and $160.36,171.46,171.63,173.60(4 \times \mathrm{C}=\mathrm{O}) ; m / z(\mathrm{FD}) 483\left(\mathrm{M}^{+}\right.$, $100 \%$ ).

## 3-(2-Methoxycarbonylethyl)-4-(methoxycarbonylmethyl)-pyrrole-2-carboxylic acid 28

A solution of the pyrrole ester $27^{20}(360 \mathrm{mg}, 1.11 \mathrm{mmol})$ in dry dichloromethane $\left(20 \mathrm{~cm}^{3}\right)$ was cooled to $0^{\circ} \mathrm{C}$ and treated with
stannic chloride ( $140 \mathrm{~mm}^{3}, 1.20 \mathrm{mmol}$ ) dropwise. The mixture was stirred for 2 h , then treated with $10 \%$ aqueous sodium acetate $\left(20 \mathrm{~cm}^{3}\right)$ and stirred for a further 10 min . The layers were separated and the aqueous layer extracted with dichloromethane ( $2 \times 50 \mathrm{~cm}^{3}$ ). The combined organic layers were extracted with $10 \%$ aqueous sodium carbonate $(3 \times 50$ $\mathrm{cm}^{3}$ ) and these aqueous extracts were acidified with concentrate hydrochloric acid to pH 1 . The precipitated solid was collected by filtration and dissolved in dichloromethane $\left(4 \times 50 \mathrm{~cm}^{3}\right)$. The solution was dried and evaporated and the residue was crystallised from dichloromethane-diethyl etherhexane to give the acid 28 ( $233 \mathrm{mg}, 78 \%$ ), mp $140-142^{\circ} \mathrm{C}$ (Found: $\mathrm{MH}^{+}$, 270.0963. $\mathrm{C}_{12} \mathrm{H}_{15} \mathrm{NO}_{6}$ requires $M+H$, 270.0978); $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 268 ; v_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3685$, $1735,1660,1605,1200$ and $1175 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 2.62$ and 3.04 (each $2 \mathrm{H}, \mathrm{t}, \mathrm{J} 8, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), $3.52\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}\right.$ ), 3.65 and 3.69 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), $6.91(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 3,5-\mathrm{H})$ and 9.27 ( 1 H , br s, NH); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) 20.21\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right)$, $30.48\left(\mathrm{CH}_{2} \mathrm{CO}_{2}\right), 34.56\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 51.56$ and 52.06 (OMe), 117.69, 118.54 and $131.31(\mathrm{C}=\mathrm{C}), 122.95(\mathrm{C}-5)$ and $165.72,172.38$ and $173.84(3 \times \mathrm{C}=\mathrm{O})$.

## Methyl 4-methoxycarbonylmethyl-2-(2,2,2-tribromoethoxy-carbonyl)pyrrole-3-propionate 29

A solution of acid $28(150 \mathrm{mg}, 0.558 \mathrm{mmol})$ in dry dichloromethane ( $4 \mathrm{~cm}^{3}$ ) was cooled to $0^{\circ} \mathrm{C}$, treated with oxalyl chloride ( $146 \mathrm{~mm}^{3}, 1.67 \mathrm{mmol}$ ) and $N, N$-dimethylformamide ( 3 drops) (vigorous effervescence), stirred under argon at $0^{\circ} \mathrm{C}$ for 30 min and evaporated. The residue was dissolved in dichloromethane ( $2 \mathrm{~cm}^{3}$ ), stirred with 2,2,2-tribromoethanol $(1.18 \mathrm{~g}, 4.18 \mathrm{mmol})$ and 4-dimethylaminopyridine $(81.7 \mathrm{mg}$, 0.669 mmol ) under argon for 30 min and then evaporated under reduced pressure. The residue was purified by flash chromatography on silica, eluting with diethyl ether-hexane ( $1: 1$ ), to give the tribromoethyl ester 29 as an oil ( $198 \mathrm{mg}, 67 \%$ ) (Found: $\mathrm{MH}^{+}, 531.8643 . \mathrm{C}_{14} \mathrm{H}_{16}{ }^{79} \mathrm{Br}_{3} \mathrm{NO}_{6}$ requires $M+H$, 531.8608); $\lambda_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 274 ; \quad v_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3450$, $1740,1570,1510,1410,1120$ and $940 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right)$ 2.64 and 3.09 (each $\left.2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.53(2 \mathrm{H}$, s, $\mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.63 and 3.69 (each $3 \mathrm{H}, \mathrm{s}$, OMe ), $5.10(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{2} \mathrm{CBr}_{3}\right), 6.96(1 \mathrm{H}, \mathrm{d}, J 3,5-\mathrm{H})$ and $9.03(1 \mathrm{H}$, br s, NH); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right) 20.24\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 30.44\left(\mathrm{CH}_{2} \mathrm{CO}_{2}\right)$, $34.98\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 35.83\left(\mathrm{CH}_{2} \mathrm{CBr}_{3}\right), 51.52$ and 52.07 ( OMe ), $76.87\left(\mathrm{CH}_{2} \mathrm{CBr}_{3}\right), 117.78,117.85$ and $130.97(\mathrm{C}=\mathrm{C})$, $123.29(\mathrm{C}-5)$ and $159.00,172.28$ and $173.55(3 \times \mathrm{C}=\mathrm{O})$.

## Dimethyl 1-(tert-butoxycarbonyl)-7-methoxycarbonylmethyl-9-

 (2,2,2-tribromoethoxycarbonyl)3-(2-trimethylsilylethoxy-carbonylmethyl)-5,10-dihydrodipyrrin-2,8-dipropionate 30 A solution of the $\alpha$-free pyrrole $29(599 \mathrm{mg}, 1.12 \mathrm{mmol})$ and the acetoxymethylpyrrole $26(542 \mathrm{mg}, 1.12 \mathrm{mmol})$ in dichloromethane $\left(7 \mathrm{~cm}^{3}\right)$ was stirred with toluene- $p$-sulfonic acid $(21 \mathrm{mg}$, 0.11 mmol ) under argon at room temperature for 2 h , then washed with $5 \%$ aqueous sodium carbonate $\left(2 \times 15 \mathrm{~cm}^{3}\right)$ followed by water ( $1 \times 15 \mathrm{~cm}^{3}$ ), dried and evaporated. The residue was purified by flash chromatography on silica, eluting with diethyl ether-hexane ( $1: 1$ ), to give the dihydrodipyrrin 30 as a foam ( $893 \mathrm{mg}, 84 \%$ ) (Found: $\mathrm{M}^{+}, 954.0590 . \mathrm{C}_{35} \mathrm{H}_{49} \mathrm{Br}_{3}-$ $\mathrm{N}_{2} \mathrm{O}_{12} \mathrm{Si}$ requires $\left.M, 954.0605\right) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 0.05(9$ $\left.\mathrm{H}, \mathrm{s}, \mathrm{Me}_{3} \mathrm{Si}\right), 1.02\left(2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{Si}\right), 1.51\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{\mathrm{t}}\right), 2.52$, $2.58,2.98$ and 3.10 (each $2 \mathrm{H}, \mathrm{t}, J 8,2 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.52 and 3.59 (each $2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.62, 3.63 and 3.77 (each 3 H , $\mathrm{s}, \mathrm{OMe}), 3.82\left(2 \mathrm{H}, \mathrm{s}, 5-\mathrm{H}_{2}\right), 4.26\left(2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 5.06$ $\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CBr}_{3}\right)$ and 10.11 and 10.47 (each 1 H , br s, NH); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)-1.44\left(\mathrm{Me}_{3} \mathrm{Si}\right), 17.27\left(\mathrm{CH}_{2} \mathrm{Si}\right), 20.40$ and $22.58\left(2 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 28.39\left(\mathrm{CMe}_{3}\right), 29.24$ and 29.76 $\left(2 \times \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 35.00(2 \mathrm{C})$ and $35.19\left(2 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right.$ and $\left.\mathrm{CH}_{2} \mathrm{CBr}_{3}\right), 51.41(2 \mathrm{C})$ and $52.65(3 \times \mathrm{OMe}), \quad 64.02$ $\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 77.00\left(\mathrm{CH}_{2} \mathrm{CBr}_{3}\right), 80.49\left(\mathrm{CMe}_{3}\right), 113.67,114.22$,$117.04,119.90,128.43,130.63,130.78$ and $134.09(\mathrm{C}=\mathrm{C})$ and 158.84, $160.20,173.56,173.66(2 \mathrm{C})$ and $173.74(6 \times \mathrm{C}=\mathrm{O}) ; \mathrm{m} / \mathrm{z}$ (FD) $954,956,958$ and $960\left(1: 3: 3: 1, \mathrm{M}^{+}, 100 \%\right)$.

## 2,8-Bis(2-methoxycarbonylethyl)-7-methoxycarbonylmethyl-9-

 (2,2,2-tribromoethoxycarbonyl)-3-(2-trimethylsilylethoxy-carbonylmethyl)-5,10-dihydrodipyrrin-1-carboxylic acid 31A solution of the dipyrromethane $\mathbf{3 0}(4.71 \mathrm{~g}, 4.92 \mathrm{mmol})$ in dry dichloromethane ( $33 \mathrm{~cm}^{3}$ ) was stirred under argon at between -10 and $-15^{\circ} \mathrm{C}$ and stannic chloride ( $432 \mathrm{~mm}^{3}, 3.69 \mathrm{mmol}$ ) was added dropwise over 1 min . The solution was allowed to warm to $5^{\circ} \mathrm{C}$ over 40 min and then treated with $5 \%$ aqueous sodium acetate ( $47 \mathrm{~cm}^{3}$ ). After a further 5 min , the organic layer was separated and the aqueous layer was extracted with dichloromethane ( $5 \times 50 \mathrm{~cm}^{3}$ ). The combined organic layers were washed with brine ( $2 \times 50 \mathrm{~cm}^{3}$ ), dried and evaporated. The residue was purified by flash chromatography on silica, eluting with dichloromethane-methanol (19:1), to give the acid $31(2.78 \mathrm{~g}, 63 \%), \mathrm{mp} 154-155^{\circ} \mathrm{C}$ (from methyl acetatehexane); $\lambda_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} \quad 287 ; v_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3400-$ $2800,3310,2950,1750-1630 \mathrm{~s}, 1230,1165$ and $890 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right.$, $400 \mathrm{MHz}) 0.05\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Me}_{3} \mathrm{Si}\right), 1.01\left(2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{Si}\right)$, 2.56, 2.60, 3.02 and 3.10 (each $2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.54 and 3.61 (each $2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.62, 3.63 and 3.77 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.88\left(2 \mathrm{H}, \mathrm{s}, 5-\mathrm{H}_{2}\right), 4.24(2 \mathrm{H}, \mathrm{t}, J 8$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 5.05\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CBr}_{3}\right)$ and 10.34 and 10.66 (each 1 H , br s, NH); $m / z$ (FD) 898, 900, 902 and 904 (1:3:3:1, $\mathrm{M}^{+}, 100 \%$ ).

4-[5-Benzyloxycarbonyl-3-(2-methoxycarbonylethyl)-4-methoxycarbonylmethylpyrrol-2-ylmethyl]-2,8-bis(2-methoxy-carbonylethyl)-7-methoxycarbonylmethyl-9-(2,2,2-tribromo-ethoxycarbonyl)-3-(2-trimethylsilylethoxycarbonylmethyl)-4,5-dihydrodipyrrin-1 $(10 \mathrm{H})$-one 33
A solution of the acid $31(250 \mathrm{mg}, 0.278 \mathrm{mmol})$ in dichloromethane ( $1.7 \mathrm{~cm}^{3}$ ) was stirred vigorously with a solution of sodium hydrogen carbonate ( $69.9 \mathrm{mg}, 0.832 \mathrm{mmol}$ ) in water ( $1.3 \mathrm{~cm}^{3}$ ) and an aqueous solution ( $2.78 \mathrm{~cm}^{3}$ ) of iodine ( $0.1 \mathrm{~mol} \mathrm{dm}^{-3}$ ) and potassium iodide ( $0.2 \mathrm{~mol} \mathrm{dm}^{-3}$ ) was added over 5 min . After a further 35 min , solid sodium metabisulfite was added to destroy the excess iodine, the organic layer was separated and the aqueous layer was extracted with dichloromethane ( $3 \times 1 \mathrm{~cm}^{3}$ ). The combined organic layers were dried and evaporated under reduced pressure. The residual oil was purified by flash silica chromatography on silica, eluting with diethyl ether-hexane (3:2), to give the iododihydrodipyrrin 32 as a foam ( 241 mg ) which was used directly in the next step.
A stirred solution of the iododihydrodipyrrin $32(239 \mathrm{mg}$, 0.243 mmol ) and the acetoxymethylpyrrole ${ }^{8} 13$ ( $105 \mathrm{mg}, 0.243$ mmol ) in dry dichloromethane ( $2.5 \mathrm{~cm}^{3}$ ) under argon at $0^{\circ} \mathrm{C}$ and was treated with a solution of stannic chloride ( $28.4 \mathrm{~mm}^{3}$, 0.243 mmol ) in dichloromethane ( $1 \mathrm{~cm}^{-3}$ ) and then, after 30 min , with saturated aqueous sodium hydrogen carbonate ( 2.6 $\mathrm{cm}^{3}$ ). After a further 10 min , the organic layer was separated and the aqueous layer extracted with dichloromethane ( $3 \times 5$ $\mathrm{cm}^{3}$ ). The combined organic layers were dried and evaporated under reduced pressure. The residual oil was dissolved in tetrahydrofuran ( $3.4 \mathrm{~cm}^{3}$ ) and water ( $0.34 \mathrm{~cm}^{3}$ ) and toluene-$p$-sulfonic acid monohydrate ( $66.2 \mathrm{mg}, 0.35 \mathrm{mmol}$ ) and silver acetate ( $21.9 \mathrm{mg}, 0.13 \mathrm{mmol}$ ) were added. The mixture was stirred under argon for 17 h , then diluted with water $\left(18 \mathrm{~cm}^{3}\right)$ and extracted with dichloromethane $\left(4 \times 18 \mathrm{~cm}^{3}\right)$. The combined organic extracts were dried and evaporated and the residual oil was purified by flash chromatography on silica, eluting with diethyl ether-hexane $(97: 3$ ) followed by diethyl ether, to give the dipyrrolic lactam 33 as a foam ( $104 \mathrm{mg}, 30 \%$ ); $\lambda_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 284 ; v_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{cm}^{-1} 3410,3290,2940$, $1710 \mathrm{~s}, \mathrm{br}, 1190,1170$ and $1075 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 0.05(9 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{Me}_{3} \mathrm{Si}\right), 1.05\left(2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{Si}\right), 2.43-2.55$ and $2.69-2.71$
(each $6 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 2.74 and $3.04(2 \mathrm{H}, \mathrm{ABq}, J$ 15 ) and 2.85 and $3.13\left(2 \mathrm{H}, \mathrm{ABq}, J 15, \mathrm{CH}_{2} \mathrm{CCH}_{2}\right), 3.14$ and $3.49(2 \mathrm{H}, \mathrm{ABq}, J 16), 3.38$ and $3.66(2 \mathrm{H}, \mathrm{ABq}, J 18)$ and 3.73 and $3.83\left(2 \mathrm{H}, \mathrm{ABq}, J 17,3 \times \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.54,3.59,3.59,3.60$ and 3.63 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), $4.29\left(2 \mathrm{H}, \mathrm{t}, J 8, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 5.01$ and $5.11(2 \mathrm{H}, \mathrm{ABq}, J 12)$ and 5.18 and $5.27(2 \mathrm{H}, \mathrm{ABq}, J 12$, $\mathrm{CH}_{2} \mathrm{CBr}_{3}$ and $\left.\mathrm{CH}_{2} \mathrm{Ph}\right), 7.29-7.39(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 7.54(1 \mathrm{H}, \mathrm{br} \mathrm{s}$, lactam-NH) and 9.22 and 10.36 (each 1 H , br s, pyrrole-NH); $\delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right)-1.47\left(\mathrm{Me}_{3} \mathrm{Si}\right), 17.34\left(\mathrm{CH}_{2} \mathrm{Si}\right), 19.28$, 19.92 and $20.39\left(3 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 29.02,30.46(2 \mathrm{C}), 30.58$, $30.93,32.95,34.73,34.98$ and $36.07\left(3 \times \mathrm{CH}_{2} \mathrm{CO}_{2}, 3 \times \mathrm{CH}_{2}\right.$ $\mathrm{CH}_{2} \mathrm{CO}_{2}, \mathrm{CH}_{2} \mathrm{CCH}_{2}$ and $\mathrm{CH}_{2} \mathrm{CBr}_{3}$ ), 51.47, 51.58, 51.80 , 51.88 and $52.34(5 \times \mathrm{OMe}), 65.17$ and $65.73(2 \mathrm{C})\left(\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right.$, $\mathrm{CH}_{2} \mathrm{Ph}$ and $\left.\mathrm{C}-4\right), 76.88\left(\mathrm{CH}_{2} \mathrm{CBr}_{3}\right), 115.99,116.83,119.44$, 122.18, 122.51, 127.60, 128.18, 128.42, 128.49, 130.09, 136.00, 138.51 and $149.10(\mathrm{C}=\mathrm{C}), 158.54$ and $160.11\left(\right.$ pyrrole $\left.-\mathrm{CO}_{2}\right)$ and $171.60,171.75,172.02,173.35,173.42$ and $173.59\left(6 \times \mathrm{CO}_{2}\right.$ and CONH); $m / z$ (FD) 1241, 1243, 1245 and 1247 (1:3:3:1, $\mathrm{M}^{+}, 100 \%$ ).

## 4-[5-Benzyloxycarbonyl-3-(2-methoxycarbonylethyl)-4-methoxycarbonylmethylpyrrol-2-ylmethyl]-7-carboxymethyl-2,8-bis(2-methoxycarbonylethyl)-9-(2,2,2-tribromoethoxy-carbonyl)-3-(2-trimethylsilylethoxycarbonylmethyl)-4,5-dihydrodipyrrin-1 $(10 \mathrm{H})$-one 6

A solution of ester $33(419 \mathrm{mg}, 0.33 \mathrm{mmol})$ in tetrahydrofuran ( $12 \mathrm{~cm}^{3}$ ) was stirred with tetrabutylammonium fluoride trihydrate ( $316 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) under argon at room temperature for 1 h , then mixed with dichloromethane ( 15 $\mathrm{cm}^{3}$ ) and washed with dilute sulfuric acid ( $\mathrm{pH} 3.0-3.5$; $2 \times 10 \mathrm{~cm}^{3}$ ) followed by water ( $10 \mathrm{~cm}^{3}$ ), dried and evaporated. The residue was purified by flash chromatography on silica, eluting with dichloromethane-methanol (9:1), to give the acid 6 as a glass ( $271 \mathrm{mg}, 71 \%$ ) which was used without further purification to make the following series of esters; $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 2.21-3.93(37 \mathrm{H}$, series of br m, $3 \times \mathrm{CH}_{2} \mathrm{CO}_{2}, 3 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}, \mathrm{CH}_{2} \mathrm{CCH}_{2}$ and $5 \times \mathrm{OMe}$ ), 4.95-5.33 ( $4 \mathrm{H}, \mathrm{br} \mathrm{m}, \mathrm{CH}_{2} \mathrm{Ph}$ and $\mathrm{CH}_{2} \mathrm{CBr}_{3}$ ), $7.20-7.46(5 \mathrm{H}$, $\mathrm{m}, \mathrm{Ph}), 8.00(1 \mathrm{H}$, br s, lactam-NH) and $9.45(2 \mathrm{H}$, br s, $2 \times$ pyrrole-NH); $m / z$ (FD) 1141, 1143, 1145 and 1147 $\left(1: 3: 3: 1, \mathrm{M}^{+}, 50 \%\right)$ and 1097, 1099, 1101 and 1103 ( $1: 3: 3: 1, \mathrm{M}-\mathrm{CO}_{2} 100 \%$ ).

## 4-[5-Benzyloxycarbonyl-3-(2-methoxycarbonylethyl)-4-methoxycarbonylmethylpyrrol-2-ylmethyl]-2,8-bis(2-methoxy-carbonylethyl)-7-methoxycarbonylmethyl-3-[(1S)-1-phenyl-ethoxycarbonylmethyl]-9-(2,2,2-tribromoethoxycarbonyl)-4,5-dihydrodipyrrin-1 ( 10 H )-one 34

A solution of acid $6(14.6 \mathrm{mg}, 13 \mu \mathrm{~mol})$ in dry dichloromethane ( $0.5 \mathrm{~cm}^{3}$ ) was stirred with 1-chloro-1-dimethylamino-2-methylprop-1-ene ${ }^{13}(3.42 \mathrm{mg}, 20 \mu \mathrm{~mol})$ under argon at room temperature for 20 min and then treated with $(S)-(-)-1-$ phenylethanol ( $18.0 \mathrm{mg}, 147 \mu \mathrm{~mol}$ ). After a further 2.5 h , the solvent was evaporated under reduced pressure and the residue was purified by preparative TLC, eluting with dichloromethane-methanol (19:1), to give recovered acid 6 (3.2 $\mathrm{mg}, 22 \%$ ) and ester $34(6.0 \mathrm{mg}, 36 \%)$ as an oil, shown by ${ }^{1} \mathrm{H}$ NMR to be a mixture of two diastereoisomers (1:1), contaminated with byproducts giving NMR signals indicating that they had a 2,2-dibromoethenyl group and a 2,2dibromoethyl group, respectively, replacing the 2,2,2-tribromoethyl residue of the main products. This interpretation is supported by the isolation and characterisation of analogous byproducts in a later experiment; $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 279$ and 219; $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 1.59-1.63(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{PhCH} M e)$, 2.33-3.14 and 3.32-3.85 $\left(44 \mathrm{H}\right.$, series of $\mathrm{m}, 6 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$, $2 \times \mathrm{CH}_{2} \mathrm{CCH}_{2}$ and $\left.6 \times \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.47-3.64(30 \mathrm{H}, \mathrm{m}$, $10 \times \mathrm{OMe}), 5.00-5.12\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2} \mathrm{CBr}_{3}\right)$ and 5.17 and 5.27 (each $\left.2 \mathrm{H}, \mathrm{ABq}, J 13,2 \times \mathrm{CH}_{2} \mathrm{Ph}\right), 5.98-6.05(2 \mathrm{H}, \mathrm{m}$, $2 \times \mathrm{PhCHMe}), 7.29-7.37(20 \mathrm{H}, \mathrm{m}, 4 \times \mathrm{Ph}), 7.48$ and 7.53
(each 1 H , br s, lactam-NH), 9.17 and 9.27 (each 1 H , br s, pyrrole-NH) and $10.16(2 \mathrm{H}$, br s, $2 \times$ pyrrole-NH) [byproducts: $4.63-4.74\left(\mathrm{~m}, 2 \times \mathrm{CH}_{2} \mathrm{CHBr}_{2}\right)$ and 5.83 (m, $2 \times \mathrm{CHBr}_{2}$ ) $\left(\right.$ ca. $22 \%$ ); 8.01 and 8.06 (each s, $2 \times \mathrm{CH}=\mathrm{CBr}_{2}$ ) (ca. 22\%)]; $m / z$ (FD) 1245, 1247, 1249 and 1251 (1:3:3:1, $\mathrm{M}^{+}$, $100 \%$ ).

4-[5-Benzyloxycarbonyl-3-(2-methoxycarbonylethyl)-4-methoxycarbonylmethylpyrrol-2-ylmethyl]-2,8-bis(2-methoxy-carbonylethyl)-7-methoxycarbonylmethyl-9-(2,2,2-tribromo-ethoxycarbonyl)-3-\{(1S,2R,4S)-1,7,7-trimethylbicyclo[2.2.1]-heptan-2-yloxycarbonylmethyl\}-4,5-dihydrodipyrrin-1(10H)one 35
A solution of acid $6(11 \mathrm{mg}, 10 \mu \mathrm{~mol})$ in dry dichloromethane $\left(0.5 \mathrm{~cm}^{3}\right)$ was stirred with 1-chloro-1-dimethylamino-2-methylprop-1-ene ${ }^{13}(2.6 \mathrm{mg}, 19 \mu \mathrm{~mol})$ under argon at room temperature for 30 min and then treated with (1S)-endo-borneol ( $27 \mathrm{mg}, 220 \mu \mathrm{~mol}$ ). After a further 2 h , the solvent was evaporated under reduced pressure and the residue was purified by preparative TLC, eluting with dichloromethane-methanol ( $24: 1$ ), to give recovered acid 6 ( $3.2 \mathrm{mg}, 29 \%$ ) and ester 35 ( 4.1 $\mathrm{mg}, 32 \%$ ) as an oil, shown by ${ }^{1} \mathrm{H}$ NMR to be a mixture of two diastereoisomers ( $1: 1$ ) contaminated with byproducts analogous to those reported in the foregoing experiment; $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 285$ and $218 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 0.84$ and 0.86 (each $3 \mathrm{H}, \mathrm{s}, 2 \times$ bornyl-Me), 0.87 ( $12 \mathrm{H}, \mathrm{s}, 4 \times$ bornylMe ), 0.98-1.07, 1.24-1.43, 1.58-1.83, 1.93-2.03 and 2.31-2.42 ( $14 \mathrm{H}, \mathrm{m}, 6 \times$ bornyl-CH ${ }_{2}$ and $2 \times$ bornyl-CH), 2.42-2.57, 2.70-2.74 and 2.82-3.05 $\left(28 \mathrm{H}, \mathrm{m}, 6 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right.$ and $\left.2 \times 5-\mathrm{CH}_{2}\right), 2.85$ and $3.17\left(\right.$ each $\left.1 \mathrm{H}, \mathrm{ABq}, J 15,5-\mathrm{CH}_{2}\right), 2.85$ and 3.17 (each $1 \mathrm{H}, \mathrm{ABq}, J 15,5-\mathrm{CH}_{2}$ ), 3.16 and 3.43 (each 1 H , $\mathrm{ABq}, J 15, \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.16 and 3.44 (each $1 \mathrm{H}, \mathrm{ABq}, J 15$, $\mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.48-3.75 ( $6 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.54-3.64 ( 30 H , $\mathrm{m}, 10 \times \mathrm{OMe}$ ), 3.65 and 3.66 (each $1 \mathrm{H}, \mathrm{ABq}, J 15, \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 4.97-5.16 ( $6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2} \mathrm{CBr}_{3}$ and $2 \times$ bornyl-CHO), $5.18-5.27\left(4 \mathrm{H}, 2 \times \mathrm{ABq}, \mathrm{J} 12,2 \times \mathrm{CH}_{2} \mathrm{Ph}\right), 7.26-7.39(10 \mathrm{H}$, $\mathrm{m}, 2 \times \mathrm{Ph}), 7.54(2 \mathrm{H}, \mathrm{s}, 2 \times$ lactam-NH), 9.28 and 10.28 (each 2 H , br s, $4 \times$ pyrrole-NH) [impurities: $4.60-4.76$ (ABq of d, $J$ 11 and $7,2 \times \mathrm{CH}_{2} \mathrm{CHBr}_{2}$ ) and 5.79 and 5.80 (each $\mathrm{t}, J 7$, $\left.\left.2 \times \mathrm{CHBr}_{2}\right)(c a .21 \%) ; 8.01\left(\mathrm{~s}, 2 \times \mathrm{CH}=\mathrm{CBr}_{2}\right)(c a .22 \%)\right] ; m / z$ (FD) 1277, 1279, 1281 and 1283 (1:3:3:1, $\mathrm{M}^{+}, 100 \%$ ).

## 4-[5-Benzyloxycarbonyl-3-(2-methoxycarbonylethyl)-4-methoxycarbonylmethylpyrrol-2-ylmethyl]-3-[(3R)-4,4-dimethyl-2-oxotetrahydrofuran-3-yloxycarbonylmethyl]-2,8-bis(2-methoxycarbonylethyl)-7-methoxycarbonylmethyl-9-(2,2,2-tribromoethoxycarbony)-4,5-dihydrodipyrrin-1(10H)one 36

A solution of acid $6(21.1 \mathrm{mg}, 22 \mu \mathrm{~mol})$ in dry dichloromethane $\left(1 \mathrm{~cm}^{3}\right)$ was stirred with 1-chloro-1-dimethylamino-2-methylprop-1-ene ${ }^{13}(12.1 \mathrm{mg}, 90 \mu \mathrm{~mol})$ under argon at room temperature for 20 min , then treated with $(R)-(-)$-pantolactone $\ddagger(80 \mathrm{mg}, 0.61 \mathrm{mmol})$. After a further 30 min , the solvent was evaporated and the residue was purified by preparative TLC, eluting with dichloromethane-methanol ( $9: 1$ ), to give recovered acid $6(7 \mathrm{mg}, 33 \%)$ and the ester $36(6 \mathrm{mg}, 25 \%)$ as an oil, shown by ${ }^{1} \mathrm{H}$ NMR to be a mixture of two diastereoisomers (1:1) contaminated with small amounts of dibromo byproducts analogous to those seen earlier; $\lambda_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 284$ and 218. This mixture was purified by HPLC on a Spherisorb S5CN semi-preparative column, eluting with diethyl ether-ethyl acetate (3:1), to give the pure separate diastereoisomers of ester 36 as oils.
First eluted diastereoisomer: $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 1.19$ and 1.22 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{CMe}_{2}$ ), 2.49-2.57 and 2.68-3.23 ( 17 H , series of $\mathrm{m}, 3 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}, \mathrm{CH}_{2} \mathrm{CCH}_{2}$ and $\mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{CO}_{2}$ ), $3.50(1$ $\mathrm{H}, \mathrm{d}, J 17, \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{CO}_{2}$ ), 3.57, 3.58, 3.59, 3.61 and 3.64 (each 3 $\mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.64-3.88\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 4.04-4.09(2 \mathrm{H}$, $\mathrm{ABq}, J$ 9, lactone $-\mathrm{CH}_{2}$ ), $5.06\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CBr}_{3}\right)$ and $5.18-5.28$ ( $2 \mathrm{H}, \mathrm{ABq}, J 12, \mathrm{CH}_{2} \mathrm{Ph}$ ), $5.46(1 \mathrm{H}, \mathrm{s}$, lactone-CH), 7.28-7.39
$(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 7.43(1 \mathrm{H}$, br s, lactam-NH) and 9.35 and 9.92 (each $1 \mathrm{H}, \mathrm{br}$ s, pyrrole-NH); $m / z$ (FD) 1253, 1255, 1257 and 1259 (1:3:3:1, $\mathrm{M}^{+}, 100 \%$ ).
Second eluted diastereoisomer: $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 1.22$ and 1.27 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{CMe}_{2}$ ), 2.45-2.56, 2.71-2.78 and 2.95$3.21\left(17 \mathrm{H}\right.$, series of $\mathrm{m}, 3 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}, \mathrm{CH}_{2} \mathrm{CCH}_{2}$ and $\left.\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{CO}_{2}\right), 3.50\left(1 \mathrm{H}, \mathrm{d}, J 16, \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{CO}_{2}\right), 3.56,3.58,3.60$, 3.61 and 3.63 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), 3.69-3.96 ( $4 \mathrm{H}, \mathrm{m}, 2 \times$ $\left.\mathrm{CH}_{2} \mathrm{CO}_{2}\right), 4.05-4.10\left(2 \mathrm{H}, \mathrm{ABq}, J\right.$, lactone $\left.-\mathrm{CH}_{2}\right), 5.05(2 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{CH}_{2} \mathrm{CBr}_{3}\right)$ and $5.19-5.28\left(2 \mathrm{H}, \mathrm{ABq}, J 12, \mathrm{CH}_{2} \mathrm{Ph}\right), 5.50(1 \mathrm{H}$, s, lactone-CH), $7.30-7.42(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 7.67(1 \mathrm{H}, \mathrm{br} \mathrm{s}$, lactamNH) and 9.09 and 10.14 (each 1 H , br s, pyrrole-NH); $m / z$ (FD) $1253,1255,1257$ and 1259 ( $1: 3: 3: 1, \mathrm{M}^{+}, 100 \%$ ).

4-[5-Benzyloxycarbonyl-3-(2-methoxycarbonylethyl)-4-methoxycarbonylmethylpyrrol-2-ylmethyl $]-3-[(2 R, 3 R, 4 R)-3,4-$ isopropylidenedioxy-5-oxotetrahydrofuran-2-ylmethoxy-carbonylmethyl]-2,8-bis(2-methoxycarbonylethyl)-7-methoxy-carbonylmethyl-9-(2,2,2-tribromoethoxycarbonyl)-4,5-dihydro-dipyrrin-1 ( 10 H )-one 37
A solution of acid $6(8.39 \mathrm{mg}, 8 \mu \mathrm{~mol})$ in dry dichloromethane ( $0.5 \mathrm{~cm}^{3}$ ) was stirred with 1-chloro-1-dimethylamino-2-methylprop-1-ene ${ }^{13}(2.95 \mathrm{mg}, 22 \mu \mathrm{~mol})$ under argon at room temperature for 10 min , then treated with $2,3-\mathrm{O}$ -isopropylidene-d-(+)-ribono-1,4-lactone ${ }^{21} \quad(24.4 \mathrm{mg}, \quad 0.10$ mmol ). After a further 1 h , the solvent was evaporated and the residue purified by preparative TLC, eluting with dichloromethane-methanol (19:1), to give the ester 37 ( 4.3 mg , $43 \%$ ) as an oil, shown by ${ }^{1} \mathrm{H}$ NMR to be a mixture of two diastereoisomers ( $1: 1$ ) contaminated with small amounts of dibromo byproducts analogous to those seen earlier; $\lambda_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 284$ and $218 \mathrm{~nm} ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 1.40$ and $1.49\left(12 \mathrm{H}, 2 \times \mathrm{s}, 2 \times \mathrm{CMe}_{2}\right), 2.33-2.56,2.68-2.72,2.83-$ 2.86, 2.98-3.06, 3.14-3.19 and 3.41-3.79 (78 H, series of m, $6 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}, \quad 2 \times \mathrm{CH}_{2} \mathrm{CCH}_{2}, \quad 6 \times \mathrm{CH}_{2} \mathrm{CO}_{2}$ and $10 \times \mathrm{OMe}), 4.22-4.40\left(4 \mathrm{H}, \mathrm{m}, 2 \times\right.$ lactone $\left.-\mathrm{CH}_{2}\right), 4.76-4.83(4$ $\mathrm{H}, \mathrm{m}, 2 \times$ lactone-3- and $-4-\mathrm{H}), 4.99$ and $5.01(2 \mathrm{H}, \mathrm{ABq}, J 9$, $\left.\mathrm{CH}_{2} \mathrm{CBr}_{3}\right), 5.04-5.06\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CBr}_{3}+2 \times\right.$ lactone-2-H), 5.17 and $5.26\left(2 \mathrm{H}, \mathrm{ABq}, J 12, \mathrm{CH}_{2} \mathrm{Ph}\right), 5.18$ and $5.26(2 \mathrm{H}$, $\left.\mathrm{ABq}, J 12, \mathrm{CH}_{2} \mathrm{Ph}\right), 7.27-7.38(10 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{Ph}), 7.51$ and 7.67 (each 1 H , br s, lactam-NH) and 9.18, 9.41, 9.96 and 10.17 (each 1 H , br s, pyrrole-NH) [impurities: 4.65-4.71 ( $\mathrm{m}, \mathrm{CH}_{2} \mathrm{CHBr}_{2}$ ) and 5.04-5.06 (m, $\mathrm{CHBr}_{2}$ ) (ca. 15\%); 8.01 and 8.02 (each s , $\left.\left.\mathrm{CH}=\mathrm{CBr}_{2}\right)(c a .25 \%)\right] ; m / z(\mathrm{FD}) 1311,1313,1315$ and 1317 (1:3:3:1, $\mathrm{M}^{+}, 100 \%$ ).

## 3-\{(3R,4R,5R)-4,5-[(R)-Benzylidenedioxy]-2-oxotetrahydro-pyran-3-yloxycarbonylmethyl\}-4-[5-benzyloxycarbonyl-

3-(2-methoxycarbonylethyl)-4-methoxycarbonylmethylpyrrol-2-ylmethyl]-2,8-bis(2-methoxycarbonylethyl)-7-methoxycarbonyl-methyl-9-(2,2,2-tribromoethoxycarbonyl)-4,5-dihydrodipyrrin-1(10H)-one 38
A solution of acid $6(500 \mathrm{mg}, 0.438 \mathrm{mmol})$ in dry dichloromethane ( $20 \mathrm{~cm}^{3}$ ) was stirred with 1-chloro-1-dimethylamino-2-methylprop-1-ene ${ }^{13}(221 \mathrm{mg}, 1.581 \mathrm{mmol})$ under argon at room temperature for 9 min , then treated with $3,4-O$-benzylidene-D-ribonic $\delta$-lactone ( $550 \mathrm{mg}, 2.328 \mathrm{mmol}$ ). After a further 3 h , the solvent was evaporated and the residue purified by flash chromatography on silica, eluting with dichloromethane-methanol (19:1), to give a mixture of the diastereoisomeric esters 38 as an oil ( $537 \mathrm{mg}, 90 \%$ ). An aliquot ( 106 mg ) was purified by HPLC on a Spherisorb S5CN semipreparative column, eluting with diethyl ether-ethyl acetate (3:1), to give four fractions, as follows.
(i) The ester 38b (peak Y in Fig. 1) as an oil ( $27.6 \mathrm{mg}, 23 \%$ ) (Found: $\mathrm{MH}^{+}, 1360.1447 . \mathrm{C}_{57} \mathrm{H}_{60} \mathrm{Br}_{3} \mathrm{~N}_{3} \mathrm{O}_{21}$ requires $M+H$, 1360.1349); $\lambda_{\text {max }}(\mathrm{MeCN}) / \mathrm{nm} \mathrm{283;} \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right) 2.35-$ $2.67\left(10 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 2.82$ and $3.07(2 \mathrm{H}, \mathrm{ABq}, J 15)$ and 2.86 and $3.10\left(2 \mathrm{H}, \mathrm{ABq}, J 15, \mathrm{CH}_{2} \mathrm{CCH}_{2}\right), 3.00(2 \mathrm{H}, \mathrm{m}$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), 3.32 and $3.42\left(2 \mathrm{H}, \mathrm{ABq}, J 17, \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.51$,

(iii) The 2,2-dibromoethenyl ester 39a (peak P in Fig. 1) as an oil ( $7.6 \mathrm{mg}, 7 \%$ ); $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 289 ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right.$ ) 2.41-2.69 and $2.96-3.01\left(12 \mathrm{H}, \mathrm{m}, 3 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 2.82$ and $3.11(2 \mathrm{H}, \mathrm{ABq}, J 15)$ and 2.85 and $3.14(2 \mathrm{H}, \mathrm{ABq}, J 15$, $\mathrm{CH}_{2} \mathrm{CCH}_{2}$ ), 3.23 and $3.48\left(2 \mathrm{H}, \mathrm{ABq}, J 17, \mathrm{CH}_{2} \mathrm{CO}_{2}\right.$ ), 3.54 , 3.56, 3.57, 3.61 and 3.62 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), 3.68 and $3.87(2 \mathrm{H}$, $\mathrm{ABq}, J 18, \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), $3.75\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2} \mathrm{CO}_{2}\right.$ ), 4.37 and 4.61 ( 2 $\mathrm{H}, \mathrm{ABq}, J 13$, lactone-6- $\mathrm{H}_{2}$ ), $4.70(1 \mathrm{H}, \mathrm{d}, J 8$, lactone-5-H), $4.89(1 \mathrm{H}, \mathrm{dd}, J 8$ and 3 , lactone-4-H), 5.18 and $5.24(2 \mathrm{H}, \mathrm{ABq}$, $\left.J 12, \mathrm{CH}_{2} \mathrm{Ph}\right), 5.57(1 \mathrm{H}, \mathrm{d}, J 3$, lactone-3-H), $5.80(1 \mathrm{H}, \mathrm{s}$, $\mathrm{CHPh}), 7.28-7.45(11 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{Ph}$ and lactam-NH), $8.02(1$ $\mathrm{H}, \mathrm{s}, \mathrm{CH}=\mathrm{CBr}_{2}$ ) and 9.38 and 9.80 (each 1 H , br s, pyrroleNH ); $m / z(\mathrm{FD}) 1279,1281$ and 1283 ( $1: 2: 1, \mathrm{M}^{+}, 100 \%$ ).
(iv) The 2,2-dibromoethenyl ester 39b (peak Q in Fig. 1) as an oil ( $4.7 \mathrm{mg}, 4 \%$ ); $\lambda_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} \mathrm{289;} \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right)$ 2.39-2.58, 2.67-2.73 and 2.95-3.05 (15 H, m, $3 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ and $\left.\mathrm{CH}_{2} \mathrm{CCH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 3.12\left(1 \mathrm{H}, \mathrm{d}, J 17, \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{CO}_{2}\right), 3.16(1 \mathrm{H}$, d, $\left.J 15, \mathrm{CH}_{2} \mathrm{CCH}_{\mathrm{A}} H_{\mathrm{B}}\right), 3.46-3.98\left(5 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{CO}_{2}\right.$ and $2 \times \mathrm{CH}_{2} \mathrm{CO}_{2}$ ), $3.53,3.55,3.56,3.58$ and 3.59 (each 3 H , s, $\mathrm{OMe}), 4.39$ and $4.63\left(2 \mathrm{H}, \mathrm{ABq}, J 13\right.$, lactone-6- $\mathrm{H}_{2}$ ), $4.77(1 \mathrm{H}$, d, $J 7$, lactone-5-H), 4.98 ( $1 \mathrm{H}, \mathrm{dd}, J 8$ and 3, lactone-4-H), 5.18 and $5.27\left(2 \mathrm{H}, \mathrm{ABq}, J 12, \mathrm{CH}_{2} \mathrm{Ph}\right), 5.60(1 \mathrm{H}, \mathrm{d}, J 3$, lactone-3H), $5.85(1 \mathrm{H}, \mathrm{s}, \mathrm{CHPh}), 7.27-7.65(10 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{Ph}), 7.65(1 \mathrm{H}$, br s, lactam-NH), $8.01\left(1 \mathrm{H}, \mathrm{s}, \mathrm{CH}=\mathrm{CBr}_{2}\right)$ and 8.99 and 10.11 (each $1 \mathrm{H}, \mathrm{br} \mathrm{s}$, pyrrole-NH); $m / z$ (FD) 1279, 1281 and 1283 (1:2:1, $\mathrm{M}^{+}, 100 \%$ ).

4-[5-Benzyloxycarbonyl-3-(2-methoxycarbonylethyl)-4-(methoxycarbonylmethyl)pyrrol-2-ylmethyl]-2,8-bis(2-methoxycarbonylethyl)-3,7-bis(methoxycarbonylmethyl)-9-(2,2,2-tribromoethoxycarbonyl)-4,5-dihydrodipyrrin-1 (10H)-one 40
A solution of the resolved lactam $\mathbf{3 8 b}(75.4 \mathrm{mg}, 55 \mu \mathrm{~mol})$ in methanol $\left(6.5 \mathrm{~cm}^{3}\right)$ and tetrahydrofuran ( $1.2 \mathrm{~cm}^{3}$ ) was stirred with a solution of sodium methoxide ( $1.19 \mathrm{mg}, 22 \mu \mathrm{~mol}$ ) in methanol ( $0.1 \mathrm{~cm}^{3}$ ) under argon at room temperature for 25 min . Water $\left(5 \mathrm{~cm}^{3}\right)$ was added, the pH was adjusted to $c a .4$ with glacial acetic acid and the solution was extracted with dichloromethane $\left(4 \times 4 \mathrm{~cm}^{3}\right)$. The combined extracts were washed with water ( $1 \times 2.5 \mathrm{~cm}^{3}$ ), dried and evaporated. The residue was purified by preparative TLC, eluting with diethyl ether-methanol (19:1), to give the lactam $\mathbf{4 0 b}(61.9 \mathrm{mg}, 97 \%)$ as a glass (Found: $\mathrm{M}^{+}, 1155.0782 . \mathrm{C}_{46} \mathrm{H}_{52} \mathrm{Br}_{3} \mathrm{~N}_{3} \mathrm{O}_{17}$ requires $M$, 1155.0847).

The resolved lactam 38a ( $94.0 \mathrm{mg}, 69 \mu \mathrm{~mol}$ ) was similarly converted into the enantiomeric lactam 40a ( $70.4 \mathrm{mg}, 88 \%$ ) (Found: $\mathrm{M}^{+}, 1155.0782$ ). Both enantiomers 40 were identical (apart from optical properties) to authentic racemic material ${ }^{7}$ by TLC [run separately and in admixture, $R_{\mathrm{f}} 0.32$, diethyl ether-methanol (19:1)], ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR and UV spectroscopy.

## 4,19-Methylene-2,8,13,18-tetrakis(2-methoxycarbonylethyl)-

 3,7,12,17-tetrakis(methoxycarbonylmethyl)bilan-1 (4H)-one 54The conversion of the resolved lactams 40 into the respective enantiomers of the spiro lactam 54 was accomplished using the chemistry and procedures developed for the racemic series. ${ }^{7}$ At each stage of the sequence $\mathbf{4 7} \longrightarrow \mathbf{4 8} \longrightarrow \mathbf{4 9} \longrightarrow \mathbf{5 0} \longrightarrow \mathbf{5 1}$, the pure enantiomers were shown by TLC, ${ }^{1} \mathrm{H}$ NMR spectroscopy and mass spectrometry to match authentic samples of their racemic analogues which had been rigorously characterised. ${ }^{7}$ Finally, the spiro lactams 54b (Found: $\mathrm{M}^{+}$, 964.3916. $\mathrm{C}_{48} \mathrm{H}_{60} \mathrm{~N}_{4} \mathrm{O}_{17}$ requires $M, 964.3954$ ) and 54a (Found: $\mathrm{M}^{+}$, 964.3905 ) were both identical to authentic racemic material by TLC [run separately and in admixture, $R_{\mathrm{f}}$ 0.37 , diethyl ether-methanol (19:1)], UV and ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopy. ${ }^{7}$

As described in the text, the first time the conversion of 48b into 50b was attempted under the published conditions, ${ }^{7}$ the main product after the hydrogenation step was the bis( $\alpha-f r e e)$ compound 53b (Found: $\mathrm{M}^{+}, 952.3946 . \mathrm{C}_{47} \mathrm{H}_{60} \mathrm{~N}_{4} \mathrm{O}_{17}$ requires $M, 952.3954) ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right.$ ) 2.24-2.40 and 2.51-2.72 ( $18 \mathrm{H}, \mathrm{m}, 4 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CO}_{2}$ and $\mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{CCH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}$ ), 2.91 and 2.92 (each $\left.1 \mathrm{H}, \mathrm{d}, J 15, \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{CCH}_{\mathrm{A}} H_{\mathrm{B}}\right), 3.25(1 \mathrm{H}, \mathrm{d}, J 16$, $\mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{CO}_{2}$ ), 3.34-3.77 ( $9 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{CO}_{2}, 3 \times \mathrm{CH}_{2} \mathrm{CO}_{2}$ and $\left.10-\mathrm{H}_{2}\right), 3.62(6 \mathrm{H}, \mathrm{s}, 2 \times \mathrm{OMe}), 3.65(9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{OMe})$, 3.68, 3.71 and 3.74 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}$ ), $6.43(2 \mathrm{H}, \mathrm{m}, 2 \times \alpha-\mathrm{H})$, 7.12 (s, lactam-NH) and $8.55,8.68$ and 9.22 (each 1 H , br s, pyrrole-NH); $m / z$ (FD) 952 ( $100 \%$ ).
This undesired process could be almost completely avoided simply by carrying out the iodination in the normal way ${ }^{7}$ except running the reaction at room temperature for just 20 min , followed by work-up and hydrogenation. This gave the desired product $50 \mathrm{~b}(86 \%)$ along with a very small amount of $\operatorname{bis}(\alpha-$ free $)$ product 53b (trace to $7 \%$ in different runs).

For the conversion of the bis $(\alpha-$ free $)$ product 53b into the spiro lactam 54b, paraformaldehyde ( 5.6 mg ) was first stirred with trifluoroacetic acid ( $10 \mathrm{~cm}^{3}$ ) at room temperature for 30 $\min$. An aliquot of this solution $\left(0.2 \mathrm{~cm}^{3}\right)$ and trifluoroacetic acid $\left(0.88 \mathrm{~cm}^{3}\right)$ were stirred with a solution of the bis $(\alpha-\mathrm{free})$ tripyrrolic lactam $\mathbf{5 3 b}(1.8 \mathrm{mg}, 1.9 \mu \mathrm{~mol})$ in methanol $\left(83 \mathrm{~mm}^{3}\right)$ under argon at room temperature. After 20 min , a further aliquot $\left(0.2 \mathrm{~cm}^{3}\right)$ of the paraformaldehyde-trifluoroacetic acid solution was added. After a further 35 min , the solution was evaporated and the residue was dissolved in dichloromethane ( $2 \mathrm{~cm}^{3}$ ), washed with water ( $1 \mathrm{~cm}^{3}$ ) followed by $5 \%$ aqueous sodium hydrogen carbonate ( $1 \mathrm{~cm}^{3}$ ), dried and evaporated.

The residue was purified by preparative TLC, eluting with dichloromethane-methanol (19:1), to give the spiro lactam $\mathbf{5 4 b}(0.5 \mathrm{mg}, 27 \%)$ identified by direct chromatographic and spectroscopic comparison with authentic material.

## Enzymic studies

Each enantiomer, 54a and 54b, of the spiro lactam was hydrolysed with aqueous methanolic potassium hydroxide exactly as described for racemic 54. ${ }^{7}$ These conditions had been shown to hydrolyse only the eight methyl ester groups. The solutions of the potassium salts of the enantiomeric octa-acids, $\mathbf{4 a}$ and $\mathbf{4 b}$, after adjustment of the pH as earlier, were used for inhibition experiments on cosynthetase with synthetic hydroxymethylbilane 1 as substrate. The methods and controls developed for the study of racemic 4 , which have been fully described, ${ }^{7}$ were followed. The data so obtained are presented as Dixon plots in Fig. 3, from which the $K_{\mathrm{i}}$ values in Table 1 are derived.

## Acknowledgements

Grateful acknowledgement is made to Zeneca, Roche Products, F. Hoffmann-La Roche and EPSRC for financial support. We also thank the SERC for an Instant Award (to M. C. C.) and for a Studentship (to N. C.), Dr A. F. Drake (Birkbeck College, London) for measuring the CD spectra, Dr G. J. Hart for assisting with the early enzymic studies and Dr A. Capretta and Dr A. C. Spivey for their help with the manuscript.
