#### Abstract

Model compounds for the dibenzodioxocine structure, a new structural unit recently discovered in wood lignins, have been synthesised by two different methods. In one route, the 8 -membered ring is formed by ring closure of an arylglycerol $\beta$-aryl ether with a $5,5^{\prime}$-biphenyl structure in the aryl ether moiety. The other, which gave better yields, involves a biomimetic oxidative phenol coupling. Crystal structures have been obtained for one $\boldsymbol{\beta}$-aryl ether and of two dibenzodioxocine isomers, as well as of a product of acid hydrolysis containing a 7 -membered ring structure.

An important feature of the chemical structure of wood lignins is the $o, o$-dihydroxybiphenyl structures that are especially prominent in softwood lignins. We have recently ${ }^{1}$ discovered that a large part of these structures is, in fact, connected by ether bonds to phenylpropane units in the lignin, forming 8 membered ring structures. The discovery of these dibenzodioxocine structures may have important consequences for the understanding of lignin reactivity both in pulping processes and in the biodegradation of wood. For the purpose of obtaining data for the spectroscopic determination of such structures and for studying their reactivity, we have explored two synthetic routes to the dibenzodioxocine structure. In the first, we built an arylglycerol $\beta$-aryl ether with a $5,5^{\prime}$-biphenyl in the aryl ether moiety, using conventional methods. ${ }^{2}$ The threo isomer of this novel $\beta$-ether structure crystallised in a form that allowed crystal structure determination (Fig. 1). Although a quinomethane methide generated from this phenolic benzyl alcohol (Scheme 1) did form the expected 8 -membered ring it was in low yield, the main product being a 7 -membered ring diphenylmethane structure formed by acid catalysis. A second route ${ }^{3}$ using a biomimetic oxidative phenol coupling proved more useful for the preparation of these dibenzodioxocines. The dibenzodioxocines are formed as a mixture two diastereoisomers. The crystal structures of two such isomers have been obtained (Figs. 2 and 4).

The synthesis of the $\boldsymbol{\beta}$-aryl ethers
The starting material was propylguaiacol (made from commercial isoeugenol by hydrogenation) which was dimerised to the biphenyl 1. In a first approach, compound 1 was monomethylated to $2(\mathrm{R}=\mathrm{Me})$ and treated with the $\alpha$-bromo ketone 3 to give $4(R=M e)(S c h e m e ~ 1) . ~ R e a c t i o n ~ w i t h ~$ formaldehyde, borohydride reduction and debenzylation afforded crystalline compound 6 , the structure of which was determined by X-ray crystallography and shown to have a threo configuration (Fig. 1). The reduction with sodium borohydride seems to be strongly threo selective in this case. We then found that the $\beta$-aryl ether could be prepared without protecting one of the phenolic groups in 1. Reaction of 1 with the bromo ketone 3 gave a nearly quantitative yield of $4(R=H)$, reaction of which with formaldehyde followed by borohydride reduction and debenzylation gave in this case a $1: 1$ mixture of erythro and threo isomers of 7 .

## The ring closure

To test whether an 8 -membered ring structure could be formed via a quinomethane (Scheme 2) ketone $4(\mathrm{R}=\mathrm{H})$ was reduced to 8 and treated with trimethylsilyl bromide, followed

$7 \mathrm{R}=\mathrm{H}$

by sodium hydrogen carbonate. The solution was evaporated to dryness and acetylated. Chromatographic work-up yielded crystalline $9(33 \%)$. This demonstrates that ring closure can occur via a quinomethane. When compound 7 was treated in the same way as $\mathbf{8}$, the corresponding dibenzodioxocine derivative 10a was isolated in $8 \%$ yield. The main product ( $82 \%$ yield) in the latter reaction was a mixture of two diastereoisomers 11a and 11 b ( 64 and $18 \%$, respectively); the peracetate of the more abundant isomer, obtained in crystalline form, was subjected to X-ray analysis and shown to have the 7 -membered ring structure $\mathbf{1 2}$ (Fig. 3). The formation of this product probably occurs under the acidic conditions of the TMSBr treatment: treatment of 7 with toluene- $p$-sulfonic acid in dioxane yielded a similar mixture of products 10 and 11 . A benzyl cation is probably formed more readily from 7 than from 8, and reacts with an adjacent aromatic ring forming the diphenylmethane structure in 11.

## The oxidative coupling

In the phenol oxidation method a practical problem is the optimisation of the conditions for the cross-coupling of the $o, 0-$ dihydroxybiphenyl compound with coniferyl alcohol (Scheme 3). The concentrations of phenoxyl radicals from the two species have to be of the same magnitude for the cross-coupling to occur. The best results were obtained when compound 1 was oxidised in the presence of an excess of coniferyl alcohol with silver oxide in dichloromethane. Flash chromatography of the crude mixture yielded 10a (34\%). A diastereoisomer 10b was obtained in $19 \%$ yield, bringing the total cyclisation products to $53 \%$. Oxidations with $\mathrm{H}_{2} \mathrm{O}_{2}-\mathrm{HRP}$ were less satisfactory. Oxidation of 1 in aqueous dioxane ( pH 6 ) and with gradual addition of coniferyl alcohol and oxidant gave $c a .3 \%$ of 10 a and 10b. A similar oxidation with dehydrodivanillyl alcohol 13 as the biphenyl component, gave $c a .18 \%$ of a dibenzodioxocine. The crystalline peracetate was shown by X-ray analysis to have structure 14 (Fig. 4). An important by-product in this case (ca. $30 \%$ ) is a tetrameric dioxepine 15 , similar to the one obtained by Pew and Connors. ${ }^{4}$

## Experimental

## General

Melting points, determined in open-capillary tubes with an electrothermal apparatus, are uncorrected. Horse-radish peroxidase (HRP) (EC 1.11.1.7) was from Serva, activity 277 U $\mathrm{mg}^{-1}$ (purpurogallin method). Hydrogen peroxide (a $30 \%$ solution, Merck) was diluted to give a $3 \%$ solution before use. Analytical TLC was performed on silica gel $60 \mathrm{~F}_{254}$ plates

Scheme 2
(Merck) and flash chromatography on silica gel 60, 230-400 mesh (Merck). NMR spectra were recorded on Varian Unity 500 and Varian Gemini 200 spectrometers with tetramethylsilane as internal standard. Mass spectra were obtained with a JEOL JMS-01SG-2 instrument.

## Bromination of 4-benzyloxy-3-methoxyacetophenone

The benzylated ketone ${ }^{9}(40.7 \mathrm{~g}, 0.16 \mathrm{~mol})$ was dissolved in $99 \%$ warm ethanol and the solution was cooled to room temperature with a stream of nitrogen. The nitrogen flow was stopped and bromine ( $31.2 \mathrm{ml}, 0.2 \mathrm{~mol}$ ) was added in one portion. Passage of
nitrogen was then resumed and the mixture was stirred. After ca. 30 min a white precipitate began to form at the same time as the bromine colour disappeared. The nitrogen stream was maintained for 2 h after which the mixture was cooled in a refrigerator to give crystalline compound 3 . This was filtered off and recrystallised from ethanol ( $49.7 \mathrm{~g} \mathrm{74} \mathrm{\%}$ ), mp $104-106^{\circ} \mathrm{C}$ (lit., ${ }^{10} 102.5-103{ }^{\circ} \mathrm{C}$ ).

## Oxidative coupling of dehydrodipropylguaiacol 1 and coniferyl alcohol with silver(1) oxide

Dehydrodipropylguaiacol $1(0.66 \mathrm{~g}, 2 \mathrm{mmol})$ and coniferyl alcohol ( $0.72 \mathrm{~g}, 4 \mathrm{mmol}$ ) were dissolved in dichloromethane ( 50 $\mathrm{ml})$ and silver oxide ( $0.70 \mathrm{~g}, 3 \mathrm{mmol}$ ) was added to the solution which was then stirred for 45 h at room temp. After filtration (Celite) and evaporation of the mixture the product was fractionated by flash chromatography (acetic acid-diethyl ether- $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ 1:10:100) to give the dibenzodioxocine 10a (trans-isomer) ( $34 \%$ ).

The cis-isomer of the dibenzodioxocine, 10b was isolated ( $19 \%$ ) and had $\mathrm{mp} 136-138^{\circ} \mathrm{C} ; \delta_{\mathrm{H}}\left(200 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 1.00(6 \mathrm{H}$, $\left.\mathrm{m}, \mathrm{CH}_{3}\right), 1.68\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 2.60\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 3.12(3 \mathrm{H}, \mathrm{br}$ $\mathrm{s}, \mathrm{OMe}), 3.31(3 \mathrm{H}, \mathrm{br}$ s, OMe), $3.84(1 \mathrm{H}, \mathrm{m}, \gamma-\mathrm{H}), 3.95(3 \mathrm{H}, \mathrm{s}$, OMe), $4.20(1 \mathrm{H}, \mathrm{d}, \gamma-\mathrm{H}, J 9), 4.46(1 \mathrm{H}, \mathrm{m}, \beta-\mathrm{H}), 5.14(1 \mathrm{H}, \mathrm{d}, \alpha-$ $\mathrm{H}, J 2.9$ ), $5.61(1 \mathrm{H}, \mathrm{s}, \mathrm{ArOH}), 6.38(1 \mathrm{H}, \mathrm{s}, \mathrm{ArH})$ and $6.65-7.00$ ( $6 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$ ); $\delta_{\mathrm{C}} 13.9,24.7,38.1,55.0,55.4,55.9,63.4,80.3(\alpha-$ C), 89.2 ( $\beta-\mathrm{C}), 111.0,111.4,112.6,112.8,121.7,123.1,125.4$, $126.8,133.9,134.1,139.2,139.5,144.2,144.5,145.7,151.0$ and 153.6 (C arom.). The product was recrystallised for X-ray analysis (Fig. 2).

## Oxidative coupling of dehydrodipropylguaiacol 1 and coniferyl alcohol in aqueous dioxane

Compound $1(0.43 \mathrm{~g}, 1.3 \mathrm{mmol})$ was dissolved in a mixture of dioxane ( 400 ml ) and citrate-phosphate buffer solution ( 400 $\mathrm{ml} ; 0.005 \mathrm{~m}, \mathrm{pH} 6)$ to which HRP ( 20 mg ) was then added. Coniferyl alcohol ( $0.40 \mathrm{~g}, 2.2 \mathrm{mmol}$ ) was dissolved in 5 ml of dioxane buffer solution mixture (1:1) and hydrogen peroxide ( 2.2 mmol ) was diluted to 5 ml with dioxane-buffer solution. The coniferyl alcohol and hydrogen peroxide solutions were then injected simultaneously during 3.5 h into the reaction mixture. After being stirred overnight at room temperature, the mixture was extracted twice with ethyl acetate and the extract dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and evaporated. The resulting product ( 740 mg ) was acetylated and with acetic anhydridepyridine ( $1: 1$ ) and purified by flash chromatography (EtOAc-toluene, 1:3) to yield the dibenzodioxocine 10a (diacetate) ( $3 \%$ calculated on coniferyl alcohol); spectral data given in ref. 3.

Oxidative coupling of dehydrodivanillyl alcohol 13 and coniferyl alcohol in aqueous dioxane
Dehydrodivanillyl alcohol ${ }^{11} 13(1 \mathrm{~g}, 3.3 \mathrm{mmol})$ was dissolved in dioxane ( 27 ml ) to which citrate-phosphate buffer solution ( 27 $\mathrm{ml} ; 0.005 \mathrm{~m}, \mathrm{pH} 6)$ and HRP ( 20 mg ) were then added. Coniferyl alcohol ( $0.5 \mathrm{~g}, 2.8 \mathrm{mmol}$ ) was dissolved in dioxane-buffer solution ( $1: 1$ ); 5 ml . Hydrogen peroxide ( 2.8 mmol ) was diluted to 5 ml with dioxane-buffer solution. The reaction and the work-up were carried out as described above. The acetylated product ( 1.65 g ) was fractionated by flash chromatography (EtOAc-toluene 1:2) to give 7-(4-acetyloxy-3-methoxyphenyl)-

2,6,11-tris(acetyloxymethyl)-trans-6,7-dihydro-4,9-dimethoxydibenzo $[e, g][1,4]$ dioxocine 14 ( $18 \%$ calculated on coniferyl alcohol), mp 130-131 ${ }^{\circ} \mathrm{C}$; for spectral data see ref. 3. Crystals for X-ray analysis were grown from toluene-heptane; the crystal structure is shown in Fig. 4. A dimerisation product of 13, 6,9-bis(hydroxymethyl)-3',4,11-trimethoxy-5'-(2"-hydroxy-5"-hydroxymethyl-3"-methoxyphenyl)dibenzo[ $\left.d_{f}\right]$ ]-dioxepine-2-spiro-4'-cyclohexa-2', $5^{\prime}$-dienone 15 was isolated $(29 \%),{ }^{12} \mathrm{mp} \mathrm{200-202}{ }^{\circ} \mathrm{C}$ (decomp.); $\delta_{\mathrm{H}}\left(200 \mathrm{MHz} ;{ }^{2}{ }^{2} \mathrm{H}_{6}\right]$ DMSO) 3.63 (s, $3 \mathrm{H}, \mathrm{OMe}$ ), 3.82 (s, $3 \mathrm{H}, \mathrm{OMe}$ ), 3.89 ( $\mathrm{s}, 6 \mathrm{H}, 2 \times \mathrm{OMe}$ ), $4.45\left(\mathrm{~d}, 2 \mathrm{H}, \mathrm{CH}_{2}\right), 4.60\left(\mathrm{~d}, 4 \mathrm{H}, 2 \times \mathrm{CH}_{2}\right), 5.10(\mathrm{t}, 1 \mathrm{H}, \mathrm{OH})$, $5.37(\mathrm{t}, 2 \mathrm{H}, \mathrm{OH}), 5.88(\mathrm{~d}, 1 \mathrm{H},=\mathrm{CH}), 6.58(\mathrm{~d}, 1 \mathrm{H},=\mathrm{CH}), 6.68$ (d, $1 \mathrm{H}, \mathrm{ArH}), 6.95(\mathrm{~d}, 1 \mathrm{H}, \mathrm{ArH}), 7.15(\mathrm{~s}, 4 \mathrm{H}, \mathrm{ArH})$ and $8.70(\mathrm{~s}$, $1 \mathrm{H}, \mathrm{ArOH}) ; \delta_{\mathrm{C}} 59.2,59.6,59.8,66.8,66.9,112.7,113.4,114.3$, 114.6, 121.5, 123.9, 126.0, 137.1, 137.5, 140.8, 141.0, 143.7, 145.1, 147.1, 151.1, 154.4, 156.6 and 181.9.

## X-Ray crystallography

Data were collected on a Rikagu AFC7S diffractometer at $-80^{\circ} \mathrm{C}$ using graphite monochromated Mo-K $\alpha$ radiation ( $\lambda=$ $0.71073 \AA$ ). Three standard reflections monitored throughout the data collection showed no loss in intensity with time. The data were corrected for Lorentz and polarisation effects, no absorption corrections being applied. The structures were solved by direct methods and the non hydrogen atoms were refined anisotropically by full-matrix least-squares on $F^{2}$. The hydrogen atoms were placed at calculated positions and the atoms assigned isotropic thermal parameters, $U(\mathrm{H})=1.2 \quad U_{\mathrm{eq}}\left(\mathrm{CH}, \mathrm{CH}_{2}\right), \quad U(\mathrm{H})=1.5 \quad U_{\mathrm{eq}}\left(\mathrm{CH}_{3}\right)$, and allowed to ride on their parent carbon atoms. Computations were carried out using the SHELXTL-PC ${ }^{13}$ and SHELX93 ${ }^{14}$ program systems. Atomic coordinates, bond lengths, angles and thermal parameters have been deposited at the Cambridge Crystallographic Data Centre. For details see J. Chem. Soc., Perkin Trans. 1, 1996, Issue 1.
