(5-ox0-1,3-oxazolidin-4-yl)acetic acids: versatile intermediates in the synthesis of peptidomimetics

A ndrew D. A bell,* Ross A. E dwards and M ark D. O Idham<br>Department of Chemistry, U niversity of C anterbury, Christchurch, New Z ealand

The X -ray crystal structures of [(2'R ,4'S )-3'-benzoyl-4'-benzyl-5'-oxo-2'-phenyloxazolidin-4'-yl]acetic acid 16 and $\left[\left(2^{\prime} S, 4^{\prime}\right.\right.$ R )-3'-acetyl-4'-benzyl-5'-oxo-2'-phenyloxazolidin-4'-yl]acetic acid 19 have been determined and their conformations compared to those of related oxazolidinones. Compounds of the type 16 and 19 have also been shown to be useful precursors to succinimide-based peptidomimetics possessing conformational restriction and latent reactivity.

## Introduction

In recent years enormous effort has gone into the design and synthesis of peptidomimetics. These compounds maintain important structural features found in biologically active peptides while offering the advantage of increased bio-availability, bio-stability, bio-efficiency and bio-selectivity against the natural biological target of the parent peptide. ${ }^{1}$ In extreme cases, peptidomimetics bear only a scant resemblance to the original parent peptide. Peptidomimetics can either inhibit (i.e. act as an antagonist or inhibitor) or enhance (i.e. act as an agonist) the effects of the original peptide and as a result they offer a high potential as medicinal agents.

The introduction of rings into peptidomimetics results in structures of well-defined conformation that can be used as biological probes to mimic and test the biological conformations adopted by peptides. ${ }^{1,2}$ Examples of this include potent peptidomimetic inhibitors of renin ${ }^{3}$ (e.g. 1) and the HIV

1

2
protease ${ }^{4}$ F unctional groups possessing latent reactivity have also been incorporated into peptidomimetics to provide selective mechanism-based inactivators of enzymes. ${ }^{5}$ For example, peptidomimetic halogeno enol lactones of the type $\mathbf{2}$ are potent inactivators of serine proteases. ${ }^{6}$

We and others have used $N$-protected (5-oxo-1,3-oxazolidin4 -yl)acetic acids ${ }^{7,8}$ and their derivatives (see Scheme 1, structure 3) as key synthetic intermediates to peptidomimetics with latent reactivity (e.g. 4 and 5) and conformational restriction (e.g. 6-9). A cylated enamino esters 4 are inactivators of serine proteases, a class of enzymethat catalyses the cleavage of peptides. ${ }^{8}$ N -M ethylsulfonyloxysuccinimides have been shown to be

Scheme 1
potent mechanism-based inactivators of serine proteases. ${ }^{9,10}$ These compounds function by an enzyme-mediated hydrolysis with subsequent Lossen rearrangement to release a highly reactive isocyanate which results in irreversible enzyme inactivation. We have attempted to increase the peptidic nature of these simple amino acid analogues, with a view to increasing potency and selectivity towards a given protease, by incorporating them into a peptidic sequence as in 5 . A mino succinimides of thetype $\mathbf{7}$ have been reported to display anticonvulsant activity ${ }^{11}$ and also to play a critical role in protein splicing and other post-translational protein modifications. ${ }^{12}$ A mino succinimdes of the type 6 , reported for the first time here, are phenylalanine analogues of the known peptidomimetics 7. Peptidomimetic lactams 8 have found wide application as conformationally restricted inhibitors of renin ${ }^{\mathbf{3}}$ (e.g. compound $\mathbf{1}$ ) and other biological targets, ${ }^{13,14}$ while $\alpha$-methylated amino acids 9 display helix-inducing properties. ${ }^{15}$

H ere we detail the synthesis and X -ray crystallographic structure analysis of N -protected ( 5 -oxo-1,3-oxazolidin-4-yl) acetic acids and also their application to the preparation of imidebased peptidomimetics of the type 5, 6 and 7 .

## Results and discussion

The required N -protected (5-oxo-1,3-oxazolidin-4-yl)acetic acids $13,{ }^{\text {8b }} 16$ and 19 were prepared (Scheme 2) using an exten-

Scheme 2 Reagents and conditions: i, $\mathrm{NaOH}, \mathrm{PhCHO}$, then RCOX -20 to $4^{\circ} \mathrm{C}$; ii, LiHMDS, THF, $-78^{\circ} \mathrm{C}$, then $\mathrm{BrCH}_{2} \mathrm{CO}_{2} \mathrm{CH} \mathrm{Ph}_{2}$; iii, TFA
sion of the methods pioneered by Seebach for the stereoselective preparation of $\alpha, \alpha$-disubstituted amino acids. ${ }^{16}$

The starting oxazolidinones 11,14 and 17 were prepared from L- and D-phenylalanine under standard conditions ${ }^{8,16}$ (Scheme 2), i.e. treatment of the Schiff base sodium salt of the amino acid/benzaldehyde with either benzyl chloroformate (to give 11), benzoyl chloride (to give 14) or acetyl chloride (to give 17). It is interesting to note that the reaction conditions gave either the syn (e.g. 11) or the anti (e.g. 14 and 17) isomers as the major products depending on the nature of the acylating agent. The configurations of $11,{ }^{8} 14^{7}$ and $17^{17}$ were assigned as shown based on NOE data and/or X-ray crystallographic studies. In addition, the $X$-ray crystal structure of 13 has been published ${ }^{8}$ and the structures of $\mathbf{1 6}$ and 19 are reported here.

The precursor oxazolidinones $\mathbf{1 1}, \mathbf{1 4}$ or $\mathbf{1 7}$ were deprotonated with lithium hexamethyldisilazide at $-78^{\circ} \mathrm{C}$, and the resulting C4 anion was treated with diphenylmethyl bromoacetate to give 12, 15 and 18 respectively. Hydrolysis then gave the desired compounds 13, 16 and 19.

The syn and anti oxazolidinones 11 and 14, both derived from l-phenylalanine, gave rise to products ( $\mathbf{1 2}$ and 15) of opposite configuration on alkylation (Scheme 2). For this reason, d-phenylalanine was used in the N -acetyl series to give 17 and hence 18, which then has the same configuration as 12

This allowed the preparation of $\mathbf{5}$ and $\mathbf{6}$ with the same configuration, a requirement for our biological studies. ${ }^{18}$
The unsubstituted oxazolidinone 10 was prepared by reaction of N -Z-L-aspartic acid with paraformaldehyde and toluene-p-sulfonic acid (PTSA) according to the method of Scholtz and Bartlett (Scheme 2). ${ }^{19}$

## Synthesis of peptidomimetics

A mino succinimides, e.g. 7, are traditionally prepared by reaction of an N -protected aspartic acid anhydride with an amine or an amino acid ester. The intermediate ring-opened $\alpha$ - and $\beta$-acid amides are then cyclised by reaction with acetic anhydride. ${ }^{20}$ A lternatively, side chain-protected aspartylcontaining peptides can be cyclised with triethylamine to give amino succinyl peptides. ${ }^{21}$ A mino succinimide formation of the second type is also involved in the biochemistry of a number of post-translational protein modification procedures. ${ }^{12} \mathrm{H}$ ere, attack of a peptide amide nitrogen on an asparaginyl or aspartyl side chain gives an amino succinimde that can undergo ring opening to give two products, containing either an $\alpha$ - or $\beta$-linkage.

In the present study, an N,N-dicyclohexylcarbodiimide (DCC)-catalysed coupling of the Z-protected aspartic acid oxazolidinone $\mathbf{1 0}$ with L-phenylalanine ethyl ester, in the presence of 1-hydroxybenzotriazole ( $\mathrm{H} O B T$ ), gave a mixture of 20 and 21 which was separable by chromatography (Scheme 3).

Scheme 3 Reagents and conditions: i, l-PheOEt•HCl, Et ${ }_{3}$, DCC, HOBT, $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; ii, excess $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, reflux; iii, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$

The reaction was carried out a number of times giving variable ratios of $\mathbf{2 0}$ and $\mathbf{2 1}$. Treatment of $\mathbf{2 0}$ with triethylamine at room temp. gave compound $\mathbf{2 1}$ while the reaction of either a mixture of $\mathbf{2 0} / \mathbf{2 1}$, or a separate sample of $\mathbf{2 1}$, with an excess of triethylamine at reflux gave the desired amino succinimide 7 and recovered starting material (Scheme 3).

The advantage of the current procedure over the existing literature procedures is not just that compounds of the type $\mathbf{7}$ can be prepared, but also that it can be extended to the preparation of substituted succinimides of the type 6, a Phe-Phe dipeptidomimetic (Scheme 4). In this case, the phenylalaninederived oxazolidinone $\mathbf{1 3}$ was coupled to L-phenylalanine ethyl ester to give $\mathbf{2 2}$ in $65 \%$ yield, which was either cyclised directly to give the dipeptidomimetic 6 (73\%) or treated with toluene-psulfonic acid (PTSA ) to give the amino succinimide 23 (58\%). A DCC-catalysed coupling of 23 with N -acetyl- L -leucine then gave the tripeptidomimetic 24 (67\%). An intermediate of the type 21 was not observed in this case, unlike the example given in Scheme 3. A complementary preparation of amino succinimides has been reported (Scheme 5). ${ }^{11} \mathrm{H}$ ere the oxazolidinone ring, rather than the acid side chain of $\mathbf{1 0}$, is reported to react with an amine to give $\mathbf{2 5}$ (step i, Scheme 5). M ethylation (step ii) and cyclisation (step iii) then gave the succinimde 27.

A related sequence to that given in Scheme 4 was used to prepare peptidomimetics of the type $\mathbf{5}$ (Scheme 6). To this end,

Scheme 4 Reagents and conditions: i, l-PheOEt $\cdot \mathrm{HCl}, \mathrm{Et}_{3} \mathrm{~N}, \mathrm{DCC}$ $\mathrm{HOBT}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$; ii, $\mathrm{Et}_{3} \mathrm{~N}, \mathrm{CH}_{2} \mathrm{Cl}_{2}$, room temp.; iii, $4-\mathrm{M} \mathrm{eC}{ }_{6} \mathrm{H}_{4} \mathrm{SO}_{3} \mathrm{H}$ toluene, reflux; iv, $\mathrm{N}-\mathrm{Ac}$-L-Leu, DCC, $\mathrm{HOBT}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 0^{\circ} \mathrm{C}$ to room temp.

Scheme 5 R eagents and conditions: i, RNH $\mathrm{H}_{2}, \mathrm{MeOH}$, reflux; $\mathrm{ii}, \mathrm{H}_{2} \mathrm{SO}_{4}$ M eOH , reflux; iii, 4-M eC $6_{6} \mathrm{H}_{4} \mathrm{SO}_{3} \mathrm{H}$, toluene, reflux
reaction of the phenylalanine-derived oxazolidinone acid 19 with 0 -benzylhydroxylamine in the presence of benzotriazol-1yloxytris(dimethylamino)phosphonium hexafluorophosphate (BOP) gave a separable mixture of 28 (26\%) and 29 (56\%). The reaction of 28 with an excess of triethylamine at room temp. gave a quantitative conversion to 29 . Catalytic hydrogenation of 29 gave the hydroxysuccinimide 30 ( $96 \%$ ) which was reacted with methanesulfonyl chloride, in the presence of diisopropylethylamine, to give the desired pseudo dipeptide $\mathbf{5}$ in $83 \%$ yield (Scheme 6).

## X-R ay molecular structures

Perspective drawings of compounds 16 and 19, with atom labelling, are presented in Figs. 1 and 2. The phenyl and benzyl ring substituents are syn, as would be expected from the alkylation of precursor oxazolidinones $\mathbf{1 1}$ and $\mathbf{1 4}$, respectively. The abso lute configurations follow from the configuration of the starting amino acids (Scheme 2). The conformations adopted by 16, 19, the previously reported derivatives $13,31-33^{7}$ and related examples ${ }^{22}$ are very similar. In particular, the oxazolidinone rings adopt a shallow envelope conformation (e.g. see Fig. 3) such that the phenyl substituent occupies a quasi-equatorial position. In this conformation the phenyl-substituted carbon atom is slightly out of the plane formed by the other four ring atoms. This is supported by the fact that the angles between the least-squares plane of $O(1)-C(5)-C(4)-N(3)$ and the plane of

33

35
and 19 (and the previously reported examples 13 and $31-33)^{7}$ are also very similar. The $C(21)-C(26)$ and $C(61)-C(66)$ aromatic rings of 16 (Fig. 1) and 19 ( Fig .2 ) show an edge-on $\pi-\pi$ interaction ${ }^{23}$ [the distance between $C(22) / C(26)$ and the plane of $C(61)-C(66)$ is 3.336 and $3.444 \AA$ for 16 and 19 , respectively]. The $C(21)-C(26)$ and $C(71)-C(76)$ aromatic rings in the structure of 16 also show some evidence of $\pi-\pi$ stacking ${ }^{23}$ [angle between the aromatic ring planes defined by $C(21)-C(26)$ and $C(71)-C(76)$ is $23.8^{\circ}$ and the distance between $C(26)$ and the plane defined by $C(71)-C(76)$ is $3.162 \AA$ ]. The structures of 16 and 19 also revealed intermolecular hydrogen bonds between the carboxylic acid group $[\mathrm{O}(11)]$ and the N -acyl carbonyl group [O (7)] of a second molecule [O (7)-O(11) distance is 2.604 and $2.625 \AA$ for 16 and 19 , respectively].

The amide nitrogens of $13,16,19$ and 31 - $\mathbf{3 3}$ show a very slight pyramidalisation, with the angles at the nitrogen atom summing to a value slightly less than $360^{\circ}$ (Table 1). This is further supported by small, but significant, $\tau_{1}$ and $\tau_{2}$ angles (Table 1). The limited pyramidalisation observation is consistent with electron delocalisation between the nitrogen and carbonyl centre (see $\mathrm{N}-\mathrm{C}=\mathrm{O}$ bond lengths, Table 1). A number of syn $N$-acylated oxazolidinones, e.g. 34, and $N$-acylated imidazolidinones, e.g. 35, are reported to show significantly greater pyramidalisation of the amide nitrogen. ${ }^{24}$ In these cases, the acyl group and the other ring substituents are located on opposite sides of the ring and the tert-butyl group occupies a quasi-axial, rather than a quasi-equatorial, position. ${ }^{24} \mathrm{~N}$ onacylated analogues are reported to show even greater ring puckering. ${ }^{24}$ This pyramidalisation is thought to contribute strongly to the steric bias between the two faces of the ring and hence influence the stereoselectivity of reactions of these heterocycles.

The N -acyl carbonyl oxygen atom [O(7)] of 16 and 19 occupies an approximate s-trans position with the phenyl substituent of the acetal carbon atom [C (2), Figs. 1-3]. A similar conformation was noted in the structures of 13 and 31-33 all of which, like 16 and 19, are geminally disubstituted at $C(4) .{ }^{7}$ The $X$-ray crystal structures of less congested examples, which are monosubstituted at $C(4)$, reveal the alternative s-cis conformation. ${ }^{24}$

The work described here gives an analysis of the X-ray structures of N -protected (5-0xo-1,3-oxazolidin-4-yl)acetic acids and provides a platform for their application to the synthesis of peptidomimetics with conformational restriction and latent reactivity.

## Experimental

M ps were obtained using a H ot Stage M icroscope and are uncorrected. NMR Spectra were obtained in $\mathrm{CDCl}_{3}$ (unless otherwise stated) at 300 M Hz for ${ }^{1} \mathrm{H}$ and 75 M Hz for ${ }^{13} \mathrm{C}$; J values are given in Hz . Infrared spectra were obtained using a Perkin-EImer 1600 FTIR spectrophotometer. M ass spectra were obtained on a K ratos M S80R FA magnetic sector double focusing mass spectrometer. Optical rotations were measured on a JA SCO J-20C recording spectropolarimeter, and $[a]_{D}$ values are given in units of $10^{-1}$ degrees $\mathrm{cm}^{2} \mathrm{~g}^{-1}$. Preparative chromatography was carried out using a Chromatotron (H arrison Research Inc.) using glass plates coated with silica gel (P.F. 254 60). Lithium hexamethyldisilazide (LiH M D S) was obtained as a 1.0 m solution in THF from the A Idrich chemical company.
(2S,4R )-(-)-3-A cetyl-4-benzyl-2-phenyl-1,3-ox azolidin-5-one 17 D-Phenylalanine ( $2.50 \mathrm{~g}, 15.1 \mathrm{mmol}$ ) was dissolved in 1 m aq. $\mathrm{NaOH}\left(15.2 \mathrm{~cm}^{3}, 15.2 \mathrm{mmol}\right)$, with slight warming, to give the corresponding sodium salt. The solvent was removed under reduced pressure to give a white sticky solid. To this was added benzaldehyde ( $2.3 \mathrm{~cm}^{3}, 22.6 \mathrm{mmol}$ ) and cyclohexane ( $60 \mathrm{~cm}^{3}$ ) and the mixture was refluxed for 23 h using a D ean and Stark apparatus for the azeotropic removal of water. The solvent was evaporated under reduced pressure and to the resultant white solid residue was added dichloromethane ( $50 \mathrm{~cm}^{3}$ ) and the mixture was cooled to $-20^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. A cetyl chloride ( $1.5 \mathrm{~cm}^{3}$, 21.1 mmol ) was added and the mixture was stirred at $-20^{\circ} \mathrm{C}$ for a further 2 h and then at $4^{\circ} \mathrm{C}$ for 4 days. The mixture was allowed to warm to room temp. over 3.5 h before the solvent was removed under reduced pressure. The pale orange oil residue was taken up into a mixture of ethyl acetate ( $60 \mathrm{~cm}^{3}$ ) and $5 \%$ aq. $\mathrm{NaHCO}_{3}\left(50 \mathrm{~cm}^{3}\right)$. The organic phase was separated and washed with $5 \%$ aq. $\mathrm{KHSO}_{4}\left(50 \mathrm{~cm}^{3}\right.$ ) and water ( $50 \mathrm{~cm}^{3}$ ). The organic phase was separated and after the addition of solid NaCl , dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and the solvent removed. The anti oxazolidinone 17, which crystallised from the residue, was recrystallised from ethyl acetate and light petroleum ( $1.64 \mathrm{~g}, 37 \%$ ), mp $148-150{ }^{\circ} \mathrm{C}$ (Found: $\mathrm{C}, 73.3 ; \mathrm{H}, 5.9 ; \mathrm{N}, 4.5 . \mathrm{C}_{18} \mathrm{H}_{17} \mathrm{~N} \mathrm{O}_{3}$ requires

## (2'S, $\mathbf{4}^{\prime}$ R )-(+)-3'-A cetyl-4'-benzyl-5'-oxo-2'-phenyl-1', $3^{\prime}$ ' oxazolidin-4'-yl)acetic acid 19

LiHM DS ( $3.75 \mathrm{~cm}^{3}$ of 1 m solution in THF, $3.75 \mathrm{mmol}, 1.1$ equiv.) was added to oxazolidinone $\mathbf{1 7}(1.00 \mathrm{~g}, 3.39 \mathrm{mmol})$ dissolved in THF ( $40 \mathrm{~cm}^{3}$ ) at $-78^{\circ} \mathrm{C}$ under $\mathrm{N}_{2}$. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for 7 min , after which time a solution of $\mathrm{BrCH}_{2} \mathrm{CO}_{2} \mathrm{CHPh}_{2}(1.50 \mathrm{~g}, 4.92 \mathrm{mmol})$ in dry THF $\left(4 \mathrm{~cm}^{3}\right)$ was added. The mixture was stirred at $-78^{\circ} \mathrm{C}$ for a further 2 h and then at room temp. for 20 h . The solvent was evaporated under reduced pressure and the residue was taken up into a mixture of diethyl ether $\left(50 \mathrm{~cm}^{3}\right)$ and saturated aq. $\mathrm{NH}_{4} \mathrm{Cl}\left(40 \mathrm{~cm}^{3}\right)$. The aqueous phase was extracted with diethyl ether ( $3 \times 30 \mathrm{~cm}^{3}$ ) and the diethyl ether fractions were combined, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and solvent removed. The resulting clear yellow oil was purified by radial chromatography using a 4 mm silica gel plate and eluting with ethyl acetate-light petroleum ( $1: 4$ ) to give 18 as a clear colourless oil ( $1.47 \mathrm{~g}, 83 \%$ ), which was used in subsequent steps without further purification [H RM S: found (EI) $\mathrm{M}^{+}$, 519.2048. $\mathrm{C}_{33} \mathrm{H}_{29} \mathrm{NO}_{5}$ requires 519.2046]; [a] $]_{\mathrm{D}}^{20}+10$ (c 2.2 dichloromethane); $v_{\max }(\mathrm{K} \mathrm{Br}) / \mathrm{cm}^{-1} 3065,3032,2928,1794$, 1734 and 1666; $\delta_{\mathrm{H}} 1.30\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 3.17$ and $4.09(2 \mathrm{H}$, $\left.\mathrm{ABq}, \mathrm{J}_{\mathrm{AB}} 17.1, \mathrm{CH}_{2} \mathrm{CO}\right), 3.32$ and $3.78\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\mathrm{AB}} 13.7\right.$, $\mathrm{CH}_{2} \mathrm{Ph}$ ), 6.02 ( $1 \mathrm{H}, \mathrm{s}, \mathrm{H} 2$ ), 6.05 ( $2 \mathrm{H}, \mathrm{d}, \mathrm{J} 7.3, \mathrm{ArH}$ ), 6.89 ( 1 $\mathrm{H}, \mathrm{s}, \mathrm{CHPh} 2$ ), $7.00(2 \mathrm{H}, \mathrm{t}, \mathrm{J} 7.8, \mathrm{ArH}), 7.19(1 \mathrm{H}, \mathrm{t}, \mathrm{J} 7.4$ ArH ) and 7.22-7.39 ( $15 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$ ); $\delta_{\mathrm{c}} 24.2,39.6,41.9,66.2$, 77.9, 90.8, 126.7, 127.2, 127.6, 127.7, 127.9, 128.1, 128.5 128.5, 128.5, 129.0, 129.9, 130.6, 134.8, 135.1, 139.1, 139.5 169.3, 169.7 and 172.7 .

The benzhydryloxazolidinone 18 ( $250 \mathrm{mg}, 0.48 \mathrm{mmol}$ ) was dissolved in dry THF $\left(20 \mathrm{~cm}^{3}\right)$, trifluoroacetic acid $\left(0.74 \mathrm{~cm}^{3}\right.$, 9.61 mmol ) was added and the mixture was stirred for 3 h at room temp. under $N_{2}$. The mixture was evaporated under reduced pressure and the residue was taken up into ethyl acetate $\left(75 \mathrm{~cm}^{3}\right)$ and washed with dilute aq. $\mathrm{HCl}\left(100 \mathrm{~cm}^{3}\right)$ and water ( $50 \mathrm{~cm}^{3}$ ). The organic phase was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and solvent was removed to give a residue that was washed with dichloromethane ( $3 \mathrm{~cm}^{3}$ ) to give 19 as a white solid ( $106 \mathrm{mg}, 62 \%$ ), mp $228-229{ }^{\circ} \mathrm{C}$ (Found: C, 68.0; $\mathrm{H}, 5.5 ; \mathrm{N}, 3.9 . \mathrm{C}_{20} \mathrm{H}_{19} \mathrm{NO}_{5}$ requires C, 68.0; H , 5.4; N , 4.0\%); [a] $]_{0}^{20}+16$ (c 1.0, methanol); $v_{\max }(\mathrm{K} \mathrm{Br}) /$ $\mathrm{cm}^{-1} 2932,1794,1726$ and 1622; $\delta_{\mathrm{H}}\left(\mathrm{CD}_{3} \mathrm{OD}\right) 1.52\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right)$, 3.03 and $3.82\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\mathrm{AB}} 7.6, \mathrm{CH}_{2} \mathrm{CO}_{2}\right), 3.26$ and $3.73(2 \mathrm{H}$, $\left.\mathrm{ABq}, \mathrm{J}_{\mathrm{AB}} 13.2, \mathrm{CH}_{2} \mathrm{Ph}\right), 6.25(2 \mathrm{H}, \mathrm{d}, \mathrm{J} 7.3, \mathrm{ArH}) 6.49(1 \mathrm{H}, \mathrm{s}$, H2), $7.09(2 \mathrm{H}, \mathrm{t}, \mathrm{J} 7.8, \mathrm{ArH})$ and $7.20-7.46(6 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$; $\delta_{\mathrm{c}}$ 24.9, 40.9, 43.3, 68.5, 92.9, 129.3, 129.7, 130.2, 130.5, 131.6, $132.0,137.0,137.3,172.6,174.1$ and 175.2.
( $2^{\prime} S, 4^{\prime}$ ' )-(-)-2-( $3^{\prime}$ - A cetyl-4'-benzyl-5'-oxo-2'-phenyl-1', $3^{\prime}$ -oxazolidin- $\left.4^{\prime}-\mathrm{yl}\right)-\mathrm{N}$-benzylox yacetamide 28 and ( 3 R )-(+)-3-acetylamino-3-benzyl-1-benzyloxysuccinimide 29
M ethod A. Triethylamine ( $125 \mu \mathrm{l}, 0.90 \mathrm{mmol}, 1$ equiv.) was added to a stirred suspension of 19 ( $316 \mathrm{mg}, 0.89 \mathrm{mmol}$ ), BOP ( $442 \mathrm{mg}, 0.10 \mathrm{mmol}$ ) and 0 -benzylhydroxylamine ( $142 \mathrm{mg}, 1.15$ mmol ) in dichloromethane ( $12 \mathrm{~cm}^{3}$ ) under $\mathrm{N}_{2}$. A fter stirring at room temp. for 80 min ., a further equivalent of triethylamine ( $125 \mu \mathrm{l}, 0.9$ ) was added and stirring was continued for a further 80 min . The solvent was evaporated under reduced pressure and the residue was taken up into ethyl acetate $\left(20 \mathrm{~cm}^{3}\right)$. The organic phase was washed with $5 \%$ aq. $\mathrm{HCl}\left(20 \mathrm{~cm}^{3}\right)$, water $\left(20 \mathrm{~cm}^{3}\right), 5 \%$ aq. $\mathrm{NaHCO}_{3}\left(20 \mathrm{~cm}^{3}\right)$ and water $\left(20 \mathrm{~cm}^{3}\right)$, and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. The solvent was removed and the residue was purified by radial chromatography on a 1 mm silica gel chrom-
atotron plate eluting with ethyl acetate-light petroleum (1:1). Crystallisation from ethyl acetate and light petroleum gave 28 as fine white splintery crystals ( $108 \mathrm{mg}, 26 \%$ ), mp $160-162{ }^{\circ} \mathrm{C}$ (softens at $155{ }^{\circ} \mathrm{C}$ ) (Found: $\mathrm{C}, 70.5 ; \mathrm{H}, 5.6 ; \mathrm{N}, 6.3 . \mathrm{C}_{27} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{5}$ requires C, 70.7; H, 5.7; N, 6.1\%); [a] ${ }_{\mathrm{D}}^{20}-20$ (c 1.1, dichloromethane); $v_{\text {max }}(\mathrm{K} \mathrm{Br}) / \mathrm{cm}^{-1} 3196,3031,1793$ and 1667; $\delta_{\mathrm{H}}\left(\left[{ }^{2} \mathrm{H}_{8}\right]-\right.$ dioxane, $90^{\circ} \mathrm{C}$ ) $1.66\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.90(1 \mathrm{H}, \mathrm{d}, \mathrm{J} 16.1$, $\left.\mathrm{CH}_{2} \mathrm{CO}\right), 3.43$ and $3.84\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\mathrm{AB}} 13.6, \mathrm{CH}_{2} \mathrm{Ph}\right), 3.77(1 \mathrm{H}$, br, $\mathrm{CH}_{2} \mathrm{CO}$ ), 4.99 and $5.02\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\mathrm{AB}} 11.2, \mathrm{OCH}_{2} \mathrm{Ph}\right)$, $6.55(1 \mathrm{H}, \mathrm{s}, \mathrm{H} 2), 6.59(2 \mathrm{H}, \mathrm{d}, \mathrm{J} 7.3, \mathrm{ArH}), 7.23(2 \mathrm{H}, \mathrm{t}, \mathrm{J} 7.3$, ArH ), 7.36-7.58 ( $11 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$ ) and $9.64(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{NH}) ; \delta_{\mathrm{c}}$ $24.3,38.3,42.0,66.7,78.2,90.9,127.7,127.9,128.5,128.7$, 129.1, 129.3, 130.1, 130.6, 134.8, 135.0, 135.04 166.7, 170.9 and 172.9.

Further elution with ethyl acetate gave 29 ( $177 \mathrm{mg}, 56 \%$ ), mp $186-189{ }^{\circ} \mathrm{C}$ (softens at $182{ }^{\circ} \mathrm{C}$ ) (Found: C, 68.1; H, 5.9; N, 8.1. $\mathrm{C}_{20} \mathrm{H}_{20} \mathrm{~N}_{2} \mathrm{O}_{4}$ requires $\mathrm{C}, 68.2 ; \mathrm{H}, 5.7 ; \mathrm{N}, 8.0 \%$ ); $[a]_{0}^{20}+80$ (c 1.1, dichloromethane); $v_{\text {max }}(\mathrm{K} \mathrm{Br}) / \mathrm{cm}^{-1} 3344,3033,1790,1729,1651$ and 1538; $\delta_{\mathrm{H}} 2.02\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 2.96$ and $2.98\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\mathrm{AB}}\right.$ $\left.17.6, \mathrm{CH}_{2} \mathrm{CO}\right), 3.00$ and $3.13\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\text {AB }} 13.2, \mathrm{CH}_{2} \mathrm{Ph}\right), 4.94$ and $4.99\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\text {AB }} 9.7, \mathrm{OCH}_{2} \mathrm{Ph}\right), 5.90(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}), 7.16$ $(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.35(6 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$ and $7.48(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$; $\delta_{\mathrm{c}}$ 22.7, 37.4, 42.0, 57.3, 78.7, 128.3, 128.4, 129.09, 129.2, 129.7, $130.1,132.0,133.5,168.5,170.4$ and 172.3 .
M ethod B. Triethylamine ( $92 \mu \mathrm{l}, 0.66 \mathrm{mmol}$ ) was added to a solution of 28 ( $30 \mathrm{mg}, 0.07 \mathrm{mmol}$ ) in dichloromethane $\left(0.8 \mathrm{~cm}^{3}\right)$ and the mixture stirred at room temp. for 1 h . The solution was diluted with dichloromethane ( $15 \mathrm{~cm}^{3}$ ) and washed with $5 \%$ aq. $\mathrm{HCl}\left(10 \mathrm{~cm}^{3}\right)$, followed by water $\left(2 \times 10 \mathrm{~cm}^{3}\right)$. The organic phase was dried $\left(\mathrm{M} \mathrm{GSO}_{4}\right)$ and the solvent removed to give a residue that was purified by radial chromatography using a 1 mm silica gel chromatotron plate eluting with ethyl acetatelight petroleum ( $3: 1$ ) to yield 29 as a clear colourless oil ( 23 mg , 100\%).

## (3R )-(+)-3-A cetylamino-3-benzyl-1-hydroxysuccinimide 30

A mixture of 29 ( $105 \mathrm{mg}, 0.30 \mathrm{mmol}$ ) and $10 \%$ Pd on C ( 10 mg ) in dry THF ( $5 \mathrm{~cm}^{3}$ ) was stirred under a $\mathrm{H}_{2}$ atmospherefor 2.5 h . The reaction mixture was filtered, the filtrate evaporated and the solid residue was washed with ethyl acetate to give 30 as a white solid ( $75 \mathrm{mg}, 96 \%$ ), mp $182-188^{\circ} \mathrm{C}$ (softens at $112{ }^{\circ} \mathrm{C}$ ) (Found: C, 55.6; H, 5.7; N, 9.8. $\mathrm{C}_{13} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{4} \cdot \mathrm{H}_{2} \mathrm{O}$ requires C , 55.2; $\mathrm{H}, 5.8 ; \mathrm{N}, 10.0 \%$ ); $[a]_{\mathrm{D}}^{20}+90\left(\mathrm{c} \mathrm{1.1}, \mathrm{CH}_{3} \mathrm{OH}\right.$ ); $v_{\max }(\mathrm{K} \mathrm{Br}) /$ $\mathrm{cm}^{-1} 3318,1792,1718,1655$ and $1543 ; \delta_{\mathrm{H}}\left(\mathrm{CD}_{3} \mathrm{OD}\right) 1.98(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{CH}_{3}\right), 2.82$ and $2.87\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\mathrm{AB}} 17.6, \mathrm{CH}_{2} \mathrm{CO}\right), 2.99$ and $3.22\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\text {AB }} 13.2, \mathrm{CH}_{2} \mathrm{Ph}\right), 7.17(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$ and 7.23 (3 H, m, ArH ); $\delta_{\mathrm{c}}\left(\mathrm{CD}_{3} \mathrm{OD}\right) 22.4,37.8,42.6,59.1,129.2,130.1$, $131.6,134.1,171.9,173.6$ and 175.5.

## (3R )-(+)-3-A cetylamino-3-benzyl- 1-methylsulfonylox ysuccin-

 imide 5M ethanesulfonyl chloride ( $27 \mu \mathrm{l}, 0.35 \mathrm{mmol}$ ) was added to a solution of $30(60 \mathrm{mg}, 0.30 \mathrm{mmol})$ and diisopropylethylamine ( $44 \mu \mathrm{l}, 0.25 \mathrm{mmol}$ ) in dichloromethane ( $1 \mathrm{~cm}^{3}$ ) at $0^{\circ} \mathrm{C}$ and the mixture was stirred at $0^{\circ} \mathrm{C}$ for 20 min and then at room temp. for 1 h . The mixture was diluted with dichloromethane ( $15 \mathrm{~cm}^{3}$ ) and washed successively with cold water ( $10 \mathrm{~cm}^{3}$ ), cold $5 \%$ aq. $\mathrm{HCl}\left(10 \mathrm{~cm}^{3}\right)$ and cold $10 \%$ aq. $\mathrm{NaHCO}_{3}\left(10 \mathrm{~cm}^{3}\right)$. The organic phase was dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and the solvent removed to give 5 as a clear colourless oil which crystallised from diethyl ether (65 mg, 83\%), mp $64-67^{\circ} \mathrm{C}$ (Found: C, 47.6; H, 4.9. $\mathrm{C}_{14} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{~S} \cdot 3 / 4 \mathrm{H}_{2} \mathrm{O}$ requires C, 47.5; H,5.0\%); [a] $]_{\mathrm{D}}^{20}+36$ (c 0.8 , dichloromethane); $v_{\max }(\mathrm{K} \mathrm{Br}) / \mathrm{cm}^{-1} 3269,3036,2936,1809$, 1747, 1661 and 1531; $\delta_{\mathrm{H}} 2.03\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3} \mathrm{CO}\right), 3.04$ and 3.11 ( $2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\mathrm{Ab}} 17.6, \mathrm{CH}_{2} \mathrm{CO}$ ), 3.06 and $3.23\left(2 \mathrm{H}, \mathrm{ABq}, \mathrm{J}_{\mathrm{AB}}\right.$ 13.2, CH ${ }_{2} \mathrm{Ph}$ ), $3.35\left(3 \mathrm{H}, \mathrm{s}, \mathrm{SCH}_{3}\right), 5.95(1 \mathrm{H}, \mathrm{s}, \mathrm{NH}), 7.19$ (2 $\mathrm{H}, \mathrm{m}, \mathrm{ArH})$ and $7.39(3 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$; $\delta_{\mathrm{c}} 22.2,37.4,39.6,41.5$, 57.8, 128.3, 129.0, 130.2, 131.4, 166.6, 170.5 and 171.1 [HRMS: found (EI) M ${ }^{+}$, 340.0725. $\mathrm{C}_{14} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{6} \mathrm{~S}$ requires 340.0729].

## (2S,3'R )-( -)-E thyl 2-(3'-benzyl-3'-benzyloxycarbonylamino-succinimido)-3-phenylpropanoate 6

A solution of $22(25 \mathrm{mg}, 0.04 \mathrm{mmol})$ in dichloromethane ( 0.55 $\mathrm{cm}^{3}$ ) was treated with triethylamine ( $0.06 \mathrm{~cm}^{3}, 0.43 \mathrm{mmol}$ ) for 3 $h$ at room temp. under $N_{2}$. The reaction mixture was then diluted with dichloromethane ( $15 \mathrm{~cm}^{3}$ ) and washed with $5 \%$ aq. $\mathrm{HCI}\left(20 \mathrm{~cm}^{3}\right)$ and water $\left(20 \mathrm{~cm}^{3}\right)$. The organic phase was dried ( $\mathrm{M} \mathrm{gSO}_{4}$ ), the solvent was evaporated under reduced pressure and the residue was purified by preparative silica TLC eluting with ethyl acetate-light petroleum (1:2) to give $6(15 \mathrm{mg}, 73 \%)$ [HRMS: found (EI) $\mathrm{M}^{+}$, 514.2105. $\mathrm{C}_{30} \mathrm{H}_{30} \mathrm{~N}_{2} \mathrm{O}_{6}$ requires 514.2104]; [a] ${ }_{D}^{20}-46$ (c 1.2, dichloromethane); $v_{\text {max }}\left(\mathrm{K} \mathrm{Br}^{2}\right) / \mathrm{cm}^{-1}$ $3358,3032,2930,1786$ and $1715 ; \delta_{\mathrm{H}} 1.21\left(3 \mathrm{H}, \mathrm{t}, \mathrm{J} 7.3, \mathrm{CH}_{3}\right)$, 2.80 and 2.91 ( $2 \mathrm{H}, \mathrm{ABq}, \mathrm{J} 13.8, \mathrm{C}^{\prime}-\mathrm{CH}_{2} \mathrm{Ph}$ ), 2.89 and 3.06 (2 $\mathrm{H}, \mathrm{ABq}, \mathrm{J} 18.3, \mathrm{CH}_{2} \mathrm{CO}$ ), $3.26(1 \mathrm{H}, \mathrm{dd}, \mathrm{J} 10.2,14.6$, $\mathrm{CHCH}_{2} \mathrm{Ph}$ ), $3.53\left(1 \mathrm{H}, \mathrm{dd}, \mathrm{J} 6.3,14.6, \mathrm{CHCH}_{2} \mathrm{Ph}\right), 4.18(2 \mathrm{H}$ $\left.\mathrm{m}, \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 5.04\left(3 \mathrm{H}, \mathrm{m}, 3 \mathrm{H}, \mathrm{CH}\right.$ and $\left.\mathrm{OCH}_{2} \mathrm{Ph}\right), 7.02(2 \mathrm{H}$, $\mathrm{m}, \mathrm{ArH}$ ) and 7.15-7.39 ( $13 \mathrm{H}, \mathrm{m}, \mathrm{ArH}$ ); $\delta_{\mathrm{c}}$ 14.0, 33.9, 39.4, 42.0, 53.4, 59.7, 62.0, 67.2, 126.9, 127.9, 128.3, 128.4, 128.5, $128.6,128.9,129.1,130.2,133.3,135.8,136.6,154.7,168.1$, 173.2 and 176.6.

## X-R ay crystallographic determination for compounds 16 and 19

General. Intensity data were collected on a Siemens Fourcircle diffractometer, graphite monochromatised $\mathrm{M} 0-\mathrm{K} \alpha$ radiation ( $\lambda 0.7107 \AA$ ) being used. The structures were solved by direct methods with the SHELX S86. ${ }^{25} \mathrm{H}$ ydrogen atoms were fixed in idealised positions. All non-hydrogen atoms were refined with anisotropic atomic displacement parameters. N eu-
tral scattering factors and anomalous dispersion corrections for non-hydrogen atoms were taken from Ibers and Hamilton. ${ }^{26}$ A tomic coordinates, thermal parameters and bond lengths and angles have been deposited at the C ambridge C rystallographic D ata C entre (CCDC). See Instructions for Authors, J. Chem. Soc., Perkin Trans. 1, 1997, Issue 1. A ny request to the CCDC for this material should quote the full literature citation and the reference number 207/107.
Data for compound 16. $\mathrm{C}_{25} \mathrm{H}_{21} \mathrm{NO}_{5}, \mathrm{M}=415.43$, crystal dimensions $0.60 \times 0.28 \times 0.22 \mathrm{~mm}$, orthorhombic, $a=$ $6.8350(10), \mathrm{b}=16.178(2), \mathrm{c}=19.308(2) \AA, a=90, \beta=90$, $\gamma=90^{\circ}, \mathrm{V}=2135.0(5) \AA^{3}$, space group $\mathrm{P} 2_{1} 2_{1} 2_{1}, Z=4, F(000)=$ $872, D_{c}=1.292 \mathrm{M} \mathrm{g} \mathrm{m}^{-3}$, absorption coefficient $=0.090 \mathrm{~mm}^{-1}, \theta$ range for data collection $=2.11-24.96$, index ranges $=0 \leq h \leq 7$, $0 \leq \mathrm{k} \leq 19,0 \leq \mathrm{I} \leq 20$, data/restraints/parameters $=1668 / 0 / 281$, goodness-of-fit on $\mathrm{F}^{2}=1.084$, final R indices $[I>2 \sigma(\mathrm{I})]$ : $\mathrm{R}_{1}=0.0427, \mathrm{wR}_{2}=0.0904, \mathrm{R}$ indices (all data): $\mathrm{R}_{1}=0.0688$, $\mathrm{wR}_{2}=0.1036$, largest difference peak and hole $=0.225$ and -0.197 e $\AA^{-3}$. The unit cell parameters were obtained by leastsquares refinement of the setting angles of 32 reflections with $2 \leq 2 \theta \leq 22.5^{\circ}$. A unique data set was measured at $130(2) \mathrm{K}$ within $2 \theta_{\text {max }}=57^{\circ}$ limit ( $\omega$ scans). Of the 1724 reflections obtained, 1668 were unique ( $\mathrm{R}_{\text {int }}=0.0361$ ) and were used in the full-matrix least-squares refinement. ${ }^{27}$ The intensities of 3 standard reflections, measured every 97 reflections throughout the data collection, showed $0 \%$ decay.
Data for compound 19. $\mathrm{C}_{20} \mathrm{H}_{19} \mathrm{NO}_{5}, \mathrm{M}=353.36$, crystal dimensions $0.74 \times 0.62 \times 0.46 \mathrm{~mm}$, orthorhombic, $a=$ $7.3920(10), \mathrm{b}=15.1810(10), \mathrm{c}=15.7410(10) \AA, a=90, \beta=90$ $\gamma=90^{\circ}, \mathrm{V}=1766.4(3) \AA^{3}$, space group $\mathrm{P} 2_{1} 2_{1} 2_{1}, Z=4, \mathrm{~F}(000)$ $744, D_{c}=1.329 \mathrm{M} \mathrm{g} \mathrm{m}^{-3}$, absorption coefficient $=0.096 \mathrm{~mm}^{-1}$, $\theta$ range for data collection $=2.59$ to 30.00 , index ranges $=-10 \leq h \leq 3, \quad 0 \leq k \leq 21, \quad 0 \leq 1 \leq 22$, data/restraints/ parameters $=3932 / 0 / 237$, goodness-of-fit on $\mathrm{F}^{2}=0.890$, final R indices $[\mathrm{l}>2 \sigma(\mathrm{I})]: \mathrm{R}_{1}=0.0352, \mathrm{wR}_{2}=0.0710, \mathrm{R}$ indices (all data): $R_{1}=0.0517, \mathrm{wR}_{2}=0.0846$, largest difference peak and hole $=0.166$ and -0.184 e $\AA^{-3}$. The unit cell parameters were obtained by least-squares refinement of the setting angles of 42 reflections with $9.563 \leq 2 \theta \leq 25.020^{\circ}$. A unique data set was measured at $168(2) \mathrm{K}$ within $2 \theta_{\max }=57^{\circ}$ limit ( $\omega$ scans). Of the 4058 reflections obtained, 3933 were unique ( $\mathrm{R}_{\text {int }}=0.0222$ ) and were used in the full-matrix least-squares refinement. ${ }^{27}$ The intensities of 3 standard reflections, measured every 97 reflections throughout the data collection, showed $6.18 \%$ decay for which the data were scaled accordingly.
