#### Abstract

Optically active ( $R, S$ )- and ( $S, R$ )-tricarbonyl \{2-[1-( $N, N$-dimethylamino)ethyl]benzenethiol\}chromiums have been prepared in moderate yield by the regioselective lithiation of tricarbonyl [ $N, N$-dimethyl- $\alpha(R)$ phenylethylamine]chromium and subsequent reaction of the product with elemental sulfur. The structure of the ( $R, S$ )-benzenethiolchromium complex was fully characterized by X-ray crystallography. The chiral benzenethiolchromium complexes reacted with cyclopentene oxide, cyclohexene oxide, 1-methylcyclohexene oxide, cycloheptene oxide and cyclooctene oxide and, after oxidative removal of the chromium moiety, gave the corresponding trans $\beta$-hydroxyalkyl aryl sulfides in high yield with moderate diastereoselectivity. The reaction proceeded without additives and the diastereoselectivity was not affected by the addition of lanthanide(III) complexes which are known to promote the ring-opening of an epoxide with benzenethiol.

## Introduction

Recently we have been interested in the preparation of chiral chalcogenide (sulfur, selenium, and tellurium) compounds for use in asymmetric organic synthesis. We have already prepared chiral diferrocenyl dichalcogenides and demonstrated that they are effective in achieving highly selective asymmetric organic syntheses: e.g., selenoxide elimination, ${ }^{1}$ a ligand of a rhodium catalyst for hydrosilylation, ${ }^{2}$ a catalyst for ethylation with diethylzinc, ${ }^{3}$ methoxyselenylation, ${ }^{4}$ and the ring opening of meso-epoxides. ${ }^{5}$ We have now prepared new chiral arenechromium complex-based sulfur compounds and applied them to the asymmetric ring opening of meso-epoxides. We here report the results of this study.

## Results and discussion <br> Preparation of $(R, S)$ - and $(S, R)$-tricarbonyl $\{2-[1-(N, N$-dimethylamino)ethyl]benzenethiol\}chromium 2

The highly diastereoselective ortho lithiation of tricarbonyl[ $N, N$-dimethyl- $\alpha(R)$-phenylethylamine]chromium 1a with $\mathrm{Bu}^{t} \mathrm{Li}$ followed by the addition of sulfur afforded a single diastereoisomer of tricarbonyl\{2-[1-( $N, N$-dimethylamino)ethyl]benzenethiol $\}$ chromium 2a. Its stereochemistry was determined to be $R, S$-configurated according to the literature (Scheme 1). ${ }^{6}$ Similarly, starting from the enantiomer of 1a, i.e.,

Scheme 1
the $S$ isomer, the corresponding diastereoisomerically pure ( $S, R$ )-benzenethiolchromium complex 2b was prepared in moderate yield ( $46 \%$ ). In contrast, the chiral $N, N$-1-dimethyl-aminoethylferrocene-based sulfur compounds can be isolated as disulfides, ${ }^{5}$ and the arenechromium-based sulfur compounds can be isolated as thiols. We refer to these compounds in an abbreviated form as ( $R, S$ )- and ( $S, R$ )- $\mathrm{Cr} * \mathrm{SH}$, respectively. The structure of 2a was fully characterized by X-ray crystallography, and its absolute configuration was confirmed to be $R, S$, where the configuration around the benzene ring is $S$

${ }^{a}$ The reaction was carried out at room temperature using $\mathrm{Cr} * \mathrm{SH}(0.50 \mathrm{mmol})$, cyclohexene oxide ( 0.60 mmol ), and an additive ( 0.10 mmol ) in a solvent ( 20 ml ). ${ }^{b}$ Determined by GC. ${ }^{c}$ Determined by ${ }^{1} \mathrm{H}$ NMR and/or HPLC using a Daicel Chiralcel OD column. ${ }^{d} 0.5 \mathrm{mmol}$ of $\mathrm{Et}_{3} \mathrm{~N}$ was added.

Complex 2a exhibited the expected three-legged piano-stool structure and a staggered conformation with respect to the bonding between the $\eta^{6}$-arene and $\mathrm{Cr}(\mathrm{CO})_{3}$ moieties. The $\mathrm{Cr}-\mathrm{C}(1)$ distance $\{2.351(6) \AA\}$ is significantly longer than those of the other five (av. $2.23 \AA$ ) and the $\mathrm{C}(1)-\mathrm{C}(2)$ distance $\{1.447(8) \AA$ \} is slightly longer than those of other five (av. 1.40 $\AA$ ). Thus, the thiol sulfur and the ipso-carbon $[\mathrm{C}(1)]$ are significantly bent away from the $\mathrm{Cr}(\mathrm{CO})_{3}$ fragment [deviation from the plane defined by $\mathrm{C}(3), \mathrm{C}(4), \mathrm{C}(5), \mathrm{C}(6): \mathrm{S}, 0.285$ and $\mathrm{C}(1)$, $0.075 \AA$ §] while the $\mathrm{CHMeNMe}{ }_{2}$ carbon $\mathrm{C}(7)$ and the ipsocarbon $[\mathrm{C}(2)]$ are slightly bent toward the $\mathrm{Cr}(\mathrm{CO})_{3}[\mathrm{C}(7)$, -0.126 and $C(2),-0.030]$. A comparable degree of distortion has been observed in $\left[1,4-\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{Bu}^{t}\right] \mathrm{Cr}(\mathrm{CO})_{2} \mathrm{PPh}_{3} .{ }^{7}$ We assume that the structure 2a largely arises from steric hindrance between the substituents and $\mathrm{Cr}(\mathrm{CO})_{3}$ moiety, although Hunter et al. discussed in detail the distortions in the arene planarity of the $\left(\eta^{6}\right.$-arene $) \mathrm{Cr}(\mathrm{CO})_{3}$ complexes based on the electronic effects of the substituents on the arene. ${ }^{8}$

## Asymmetric ring-opening of meso-epoxides with the chiral benzenethiolchromium complex, $\mathrm{Cr}^{*} \mathrm{SH}^{9}$

The reaction of $(R, S)-\mathrm{Cr}^{*} \mathrm{SH} \mathbf{2 a}$ with cyclohexene oxide in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature followed by oxidation with ceric ammonium nitrate (CAN) gave a diastereoisomeric mixture of the corresponding trans-( $R, S$ )-2-(1- $N, N$-dimethylaminoethyl)phenyl 2-hydroxycyclohexyl sulfide 4 in a high yield ( $93 \%$ ) but with moderate selectivity ( $40 \%$ de) (Scheme 2 ). The diastereo-

Scheme 2
isomeric excess (de) was determined by ${ }^{1} \mathrm{H}$ NMR integration of the methine proton of the amino group and/or HPLC using a Daicel Chiralcel OD column. In contrast to the ring opening of epoxides with benzenethiol which requires a Lewis acid catalysis, ${ }^{9,10}$ whereas the reaction with $\mathrm{Cr} * \mathrm{SH}$ proceeded without additives. However, the ring-opening reaction is slow and requires a long reaction time ( 65 h ). When the reaction was carried out for shorter periods of time, i.e., 20 or 40 h , the yield remarkably decreased ( 20 h ) or was not satisfactory ( 40 h ). In
an attempt to improve the de value, the reaction was carried out in the presence of various additives. The results are summarized in Table 2. Since Vougioukas and Kagan reported that trivalent lanthanide compounds effectively catalyze the ring opening of an epoxide with benzenethiol, some lanthanide compounds were screened as additives. ${ }^{10}$ The addition of $\mathrm{SmCl}_{3}$ spoiled the reaction since it reacted itself with cyclohexene oxide to give 1-chlorohexan-2-ol. The addition of $\mathrm{Yb}(\mathrm{OTf})_{3}$ or $\mathrm{Eu}(\mathrm{fod})_{3}$ showed no notable effect on the reaction. A chiral lanthanide reagent such as $(-)-\mathrm{Eu}(\mathrm{hfc})_{3}$, and $(-)-\mathrm{Yb}(\mathrm{hfc})_{3}$ did not significantly affect the de value obtained from the reaction with either diastereoisomer of $(R, S)-\mathrm{Cr} * \mathrm{SH} \mathbf{2 a}$ or $(S, R)-\mathrm{Cr} * \mathrm{SH}$ 2b. The addition of triethylamine gave a decrease in the yield and selectivity. The yield and selectivity of the ring-opened product was not affected by solvent; similar yields and selectivities were obtained when THF and toluene were used as solvents.

To evaluate the influences of the tricarbonylchromium moiety, the ring-opening reaction of the cyclohexene oxide was carried out using chromium-free arenethiol, i.e., ( $R$ )-2-[1-( $N, N$-dimethylamino)ethyl]benzenethiol ${ }^{11}$ in the presence of $\mathrm{Eu}(\mathrm{fod})_{3}$. The ring-opened product 4 was obtained with lower selectivity ( $13 \%$ de) and a moderate yield ( $41 \%$ ) (Scheme 3). The electron-withdrawing tricarbonylchromium moiety

Scheme 3
activates the nucleophilicity of the thiol group and the configuration around the benzene ring is essential for the diastereoselective nucleophilic reaction.

The ring opening of various epoxides was carried out with 2a under specific conditions, i.e., at room temperature for 65 h in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (Scheme 4). The results are shown in Table 3. The selectivity with each epoxide was low ( $20-30 \%$ de) and the chemical yield of the ring-opened product was moderate (44$69 \%$ ).

The configuration of the ring-opened product 4 was confirmed by sulfoxide elimination of the benzoate ester of $\beta$-hydroxy sulfide 9 (Scheme 5). ${ }^{9,12}$ Thus, the oxidation of the diastereoisomeric mixture of $9(40 \%$ de $)$ by $m$-chloroperbenzoic acid occurred when the compound was refluxed in toluene to give cyclohex-2-enyl benzoate $10(53 \%)$. The enantiomeric excess was determined by HPLC (Daisel Chiralcel OB column) and the configuration of the product was determined by

Table 3 Asymmetric ring opening reaction of meso-epoxides with $(R, S)-\mathrm{Cr}^{*} \mathrm{SH}^{a}$

| Run | Epoxide | Product | Yield (\%) $^{\boldsymbol{b}}$ | De (\%) $^{c}$ |
| :--- | :--- | :--- | :--- | :--- |
| 1 | Cyclopentene oxide | $\mathbf{5}$ | 65 | 20 |

${ }^{a}$ The reaction was carried out at room temperature for 65 h in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ using $(R, S)-\mathrm{Cr}^{*} \mathrm{SH}(0.50 \mathrm{mmol})$ and epoxide $(0.60 \mathrm{mmol}) .{ }^{b}$ Determined by GC. ${ }^{c}$ Determined by ${ }^{1} \mathrm{H}$ NMR and/or HPLC using a Daicel Chiralcel OD column.

## Scheme 5

comparison with authentic samples. ${ }^{5}$ The $(R)-\mathbf{1 0}$ was formed in $40 \%$ ee from $(R, S)-\mathrm{Cr} * \mathrm{SH}$. The determined enantiomeric excess was consistent with the diastereoisomer excess of 4.

## Experimental

## General

${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a JEOL JNM A-400 NMR ( 400 MHz ) spectrometer as solutions in $\mathrm{CDCl}_{3}$. The chemical shifts are reported in $\delta$ units downfield from the internal reference, $\mathrm{Me}_{4} \mathrm{Si} . J$ Values are given in Hz . IR spectra were obtained with a JASCO Herschel FT/IR-230A spectrometer. HPLC analyses were carried out on a Hitachi L-6200 apparatus equipped with a UV detector using Daicel Chiralcel OB and OD columns ( $0.46 \mathrm{~mm}, 25 \mathrm{~cm}$ ) eluting with propan-2-ol-hexane (1:9). Elemental analyses were carried out using a Yanaco CHN CORDER MT-5. Preparative TLC was conducted using a $20 \times 20 \mathrm{~cm}$ glass sheet coated with a $2-\mathrm{mm}$ thick layer of Merck Kieselgel $60 \mathrm{PF}_{254}$. [a] Values are recorded as $10^{-1} \mathrm{deg} \mathrm{cm}^{2} \mathrm{~g}^{-1}$.

## Materials

Hexacarbonylchromium was purchased from Strem Chemicals, Inc. Chromium complexes 1a and $\mathbf{1 b}$ were prepared according
to the literature method. ${ }^{6}$ Sulfur was purified by sublimation before use. Epoxides were prepared by oxidation of the corresponding alkenes with $m$-chloroperbenzoic acid. $\mathrm{Bu}^{t} \mathrm{Li}$ was purchased from Kanto Chemicals (Japan) Co., Ltd and used after titration.

## Preparation of ( $R, S$ )-tricarbonyl\{2-[1-( $N, N$-dimethylamino)-

 ethyl]benzenethiol\}chromium ( $\mathbf{C r} * \mathbf{S H}$ ) 2aA $50-\mathrm{cm}^{3}$ three-neck round-bottom flask containing a magnetic stirring bar was charged with tricarbonyl $[N, N$-dimethyl- $\alpha(R)$ phenylethylamine]chromium 1a ( $105 \mathrm{mg}, 3.7 \mathrm{mmol}$ ) under nitrogen. Dry diethyl ether $\left(30 \mathrm{~cm}^{3}\right)$ was added to the flask followed by a hexane solution of $\mathrm{Bu}^{t} \mathrm{Li}\left(1.6 \mathrm{~m} ; 2.7 \mathrm{~cm}^{3}, 4.40\right.$ mmol ) using a syringe through a rubber septum at $-40^{\circ} \mathrm{C}$ over a period of 15 min . After the addition of dry THF $\left(4.6 \mathrm{~cm}^{3}\right)$, the resulting solution was stirred at $-40^{\circ} \mathrm{C}$ for 1 h . Sulfur powder ( $141 \mathrm{mg}, 4.4 \mathrm{mmol}$ ) was then added portionwise to the mixture at the same temperature. The resulting mixture was allowed to warm to $-10^{\circ} \mathrm{C}$ at which temperature it was stirred for 3 h ; subsequently it was stirred at room temperature for an additional 17 h . After this, the mixture was poured into water and unchanged 1a extracted with diethyl ether. The water layer was adjusted to pH 7 with dilute aq. HCl and then extracted with $\mathrm{CHCl}_{3}\left(20 \mathrm{~cm}^{3} \times 3\right)$. The combined extracts were washed with brine, dried $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right)$ and evaporated to afford crude $\mathbf{2 a}(513 \mathrm{mg}, 44 \%)$ as a yellow solid which was recrystallized from hexane- $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (Found: C, 49.20; H, 4.70; N, 4.41. Calc. for $\mathrm{C}_{13} \mathrm{H}_{15} \mathrm{NO}_{3} \mathrm{SCr}$ : C, 49.20; H , 4.76; $\mathrm{N}, 4.41 \%$ ); $\mathrm{mp} 116^{\circ} \mathrm{C}$ (decomp.) (from hexane); $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 2972,2828,1958$ and 1877; $\delta_{\mathrm{H}} 1.58(3 \mathrm{H}, \mathrm{d}, J$ $\left.7.0 \mathrm{CHCH}_{3}\right), 2.67\left[6 \mathrm{H}, \mathrm{s}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right]$ and $4.6-5.6(6 \mathrm{H}, \mathrm{m}, \mathrm{Ph}$ and $\mathrm{C} H) ; \delta_{\mathrm{C}} 7.4,36.9,64.0,84.2,93.5,96.7,98.7$ and 139.9; $[a]_{\mathrm{D}}^{25}-256.3\left(c 0.515\right.$ in $\left.\mathrm{CHCl}_{3}\right)$.

## ( $S, R$ )-Tricarbonyl\{2-[1-( $N, N$-dimethylamino)ethyl]benzene-

 thiol\}chromium 2bThe title compound was similarly prepared from [ $N, N-$ dimethyl- $\alpha(S)$-phenylethylamine]chromium ( $536 \mathrm{mg}, 46 \%$ ) as a yellow solid (Found: C, 49.30; H, 4.60; N, 4.31. Calc. for $\mathrm{C}_{13} \mathrm{H}_{15} \mathrm{NO}_{3} \mathrm{SCr}: \mathrm{C}, 49.20 ; \mathrm{H}, 4.76 ; \mathrm{N}, 4.41 \%$ ); mp $116^{\circ} \mathrm{C}$ (decomp.) (from hexane); $[a]_{\mathrm{D}}^{25} 128.71$ ( $c 0.213$ in $\mathrm{CHCl}_{3}$ ).

## Asymmetric ring-opening of meso-epoxides

The following is a typical experimental procedure for the asymmetric ring-opening of meso-epoxides. A $20-\mathrm{cm}^{3}$ two-neck round-bottom flask containing a magnetic stirring bar was charged with 2a ( $159 \mathrm{mg}, 0.50 \mathrm{mmol}$ ) and $(-)-\mathrm{Eu}(\mathrm{hfc})_{3}(119$ $\mathrm{mg}, 0.10 \mathrm{mmol})$ under nitrogen. $\mathrm{ACH}_{2} \mathrm{Cl}_{2}\left(2.5 \mathrm{~cm}^{3}\right)$ solution of cyclohexene oxide ( $60 \mathrm{mg}, 0.60 \mathrm{mmol}$ ) was added to the flask and the resulting mixture was stirred at room temperature for 65 h with shielding from the light. The completion of the reaction was checked by TLC. After concentration of the mixture by evaporation of the solvent, the residue was treated with a methanol solution ( $25 \mathrm{~cm}^{3}$ ) of CAN ( $2.74 \mathrm{~g}, 5.0 \mathrm{mmol}$ ) and $\mathrm{K}_{2} \mathrm{CO}_{3}$ in order to remove the chromium moiety. The mixture was stirred at room temperature for 1 h after which insoluble material was filtered off. The filtrate was poured into water and the pH of the solution was adjusted to $c a .7$ with aqueous $\mathrm{NaHCO}_{3}$. The solution was extracted with ethyl acetate (10 $\left.\mathrm{cm}^{3} \times 3\right)$ and the combined extracts were dried $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right)$ and evaporated to afford a yellow oil. This was purified by preparative TLC on neutral alumina with hexane-ethyl acetate (4:1) as the eluent to give a diastereoisomeric mixture of trans-[(R,S)-2-(1- $N, N$-dimethylaminoethyl)phenyl] 2-hydroxycyclohexyl sulfide 4 as a pale yellow oil ( $133 \mathrm{mg}, 0.48 \mathrm{mmol}, 95 \%$ based on $\mathrm{Cr} * \mathrm{SH}$ ) (Found: C, 68.70; H, 8.96; N, 4.71. Calc. for $\mathrm{C}_{16} \mathrm{H}_{25}$ NOS: C, 68.77; H, 9.02; N, $5.01 \%$ ); $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 3393$, 2933, 1447, 1357, 1080 and 755; $\delta_{\mathrm{H}}$ (major diastereoisomer) 1.31 ( $3 \mathrm{H}, \mathrm{d}, J 6.9, \mathrm{NCHCH}_{3}$ ), 1.4-1.7 ( $8 \mathrm{H}, \mathrm{m}$, cyclohexyl), $2.26[6$ $\left.\mathrm{H}, \mathrm{s}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right], 2.85\left(\mathrm{q}, 1 \mathrm{H}, \mathrm{J} 8.0, \mathrm{NCHCH}_{3}\right), 3.45(0.7 \mathrm{H}, \mathrm{q}, J$
$7.0, \mathrm{CHO}), 4.66(0.7 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{CHS})$ and $7.1-7.6(4 \mathrm{H}, \mathrm{m}, 4 \mathrm{H}$, $\mathrm{Ph})$; $\delta_{\mathrm{H}}$ (minor diastereoisomer, distinct signals) $3.07(0.3 \mathrm{H}$, $\mathrm{q}, J 7.0, \mathrm{CHO})$ and $4.38(0.3 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{C} H \mathrm{~S}) ; \delta_{\mathrm{C}}$ (major diastereoisomer) $8.6,24.5,26.5,33.2,34.5,39.4,41.1,58.5$, $61.2,70.7,76.7,126.5,126.7,127.5,135.1,137.8$ and 142.8 ; $\delta_{\mathrm{C}}$ (minor diastereoisomer) $26.6,34.4,57.4,60.2,126.8,127.9$, 132.8, 135.6 and 146.0.
trans- $\{(R, S)$-2-[1-( $N, N$-Dimethylamino)ethyl]phenyl $\}$ 2-hydroxycyclopentyl sulfides 5
The title compound, obtained as a mixture of diastereoisomers by the reaction of cyclopentene oxide with $(R, S)-\mathrm{Cr}^{*} \mathrm{SH}$ followed by treatment with CAN ( $86 \mathrm{mg}, 65 \%$ ), was a pale yellow oil (Found: C, 67.71; H, 8.82; N, 5.14; Calc. for $\mathrm{C}_{15} \mathrm{H}_{23} \mathrm{NOS}$ : C, $67.88 ; \mathrm{H}, 8.73 ; \mathrm{N}, 5.28 \%) ; v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 3376,2963,2774$, $1588,1469,1076$ and $755 ; \delta_{\mathrm{H}}$ (major diastereoisomer) $1.22(3 \mathrm{H}$, d, $J 6.9$, $\mathrm{NCHCH}_{3}$ ), 1.5-1.9 ( $8 \mathrm{H}, \mathrm{m}$, cyclopentyl) $2.20[6 \mathrm{H}$, $\mathrm{s}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}$ ], $2.98\left(0.6 \mathrm{H}, \mathrm{q}, J 8.0, \mathrm{NCHCH}_{3}\right), 3.59(0.6 \mathrm{H}, \mathrm{q}$, $J 7.0, \mathrm{CHO}), 4.63(1 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{CHS})$ and $7.1-7.5(4 \mathrm{H}, \mathrm{m}$, $\mathrm{Ph})$; $\delta_{\mathrm{H}}$ (minor diastereoisomer, distinct signals) $3.07(0.4 \mathrm{H}, \mathrm{q}$, $J 6.8$, cyclopentyl) and $4.25(0.4 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{CHS})$; $\delta_{\mathrm{C}}$ (major diastereoisomer) 10.9, 20.0, 29.9, 31.7, 40.2, 54.4, 58.9, 76.0, 127.0, 127.1, 127.7, 133.7, 135.4 and 144.2; $\delta_{\mathrm{C}}$ (minor diastereoisomer) $14.5,21.0,31.2,32.2,41.5,58.7,60.0,81.0$, 127.2, 128.0, 133.9, 136.6 and 145.4.
trans-\{(R,S)-2-[1-(N,N-Dimethylamino)ethyl]phenyl\} 2-hydroxy-2-methylcyclohexyl sulfides 6
The title compound, obtained as a mixture of diastereoisomers by the reaction of 1-methylcyclohexene oxide with $(R, S)$ $\mathrm{Cr}^{*} \mathrm{SH}$ followed by treatment with CAN ( $64.6 \mathrm{mg}, 44 \%$ ), was a pale yellow oil (Found: C, 69.36; H, 9.27; N, 4.77. Calc. for $\left.\mathrm{C}_{17} \mathrm{H}_{27} \mathrm{NOS}: \mathrm{C}, 69.58 ; \mathrm{H}, 9.27 ; \mathrm{N}, 4.77 \%\right) ; v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 3391$, 2974, 2859, 1462, 1370 and $759 ; \delta_{\mathrm{H}}$ (major diastereoisomer) 1.2 $1.3\left(6 \mathrm{H}, \mathrm{m}, \mathrm{NCHCH}_{3}\right.$ and $\left.\mathrm{CH}_{3}\right), 1.4-1.8(8 \mathrm{H}, \mathrm{m}$, cyclohexyl), $2.15\left[6 \mathrm{H}, \mathrm{s}, \mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right], 2.96\left(1 \mathrm{H}, \mathrm{m}, J 8.0, \mathrm{NCHCH}_{3}\right), 4.56$ $(0.6 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{C} H \mathrm{~S})$ and $7.1-7.5(4 \mathrm{H}, \mathrm{m}, \mathrm{Ph}) ; \delta_{\mathrm{H}}($ minor diastereoisomer, distinct signals) $3.80(0.4 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{C} H \mathrm{~S})$; $\delta_{\mathrm{C}}$ (major diastereomer) $9.0,20.0,23.2,27.1,33.7,39.8,43.5$, 58.7, 66.2, 72.9, 127.2, 127.8, 128.1, 135.0, 139.0 and 143.1; $\delta_{\mathrm{C}}$ (minor diastereoisomer) 21.6, 22.6, 26.2, 32.6, 39.9, 63.1, 72.6, 126.9, 127.3, 133.3 and 146.4.

## trans-\{(R,S)-2-[1-(N,N-Dimethylamino)ethyl]phenyl\} 2-hydroxy-

 cycloheptyl sulfides 7The title compound, obtained as a mixture of diastereoisomers by the reaction of cycloheptene oxide with $(R, S)-\mathrm{Cr}^{*} \mathrm{SH}$ followed by treatment with CAN ( $99 \mathrm{mg}, 69 \%$ ), was a pale yellow oil (Found: C, $70.24 ; \mathrm{H}, 9.46 ; \mathrm{N}, 4.58$; Calc. for $\mathrm{C}_{18} \mathrm{H}_{29} \mathrm{NOS}: \mathrm{C}$, $70.31 ; \mathrm{H}, 9.51 ; \mathrm{N}, 4.56) ; v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 3358,2946,2804,1432$, 1025 and 748; $\delta_{\mathrm{H}}$ (major diastereoisomer) $1.20(3 \mathrm{H}, \mathrm{d}, J 6.8$, $\mathrm{NCHCH}_{3}$ ), 1.4-1.8 ( $10 \mathrm{H}, \mathrm{m}$, cycloheptyl), $2.04[6 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right], 3.14\left(1 \mathrm{H}, \mathrm{q}, J 8.0, \mathrm{NCHCH}_{3}\right), 3.83(0.65 \mathrm{H}, \mathrm{q}, J 7.0$, $\mathrm{CHO}), 4.22(0.65 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{CHS})$ and $7.0-7.6(4 \mathrm{H}, \mathrm{m}, \mathrm{Ph})$; $\delta_{\mathrm{H}}$ (minor diastereoisomers, distinct signals) $3.56(0.35 \mathrm{H}, \mathrm{q}, J$ $7.0, \mathrm{CHO})$ and $4.18(0.35 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{CHS})$; $\delta_{\mathrm{C}}$ (major diastereoisomer) 10.9, 21.2, 22.3, 25.9, 27.3, 32.9, 40.3, 59.2, 63.0, $78.4,126.8,127.2,127.8,134.0,137.6$ and $143.1 ; \delta_{\mathrm{C}}$ (minor diastereoisomer) 26.6, 28.0, 34.3, 41.8, 60.8, 73.9, 126.9, 127.1, 127.3, 127.4 and 146.6.

## trans-\{(R,S)-2-[1-(N,N-Dimethylamino)ethyl]phenyl 2 2-hydroxycyclooctyl sulfides 8

The title compound, obtained as a mixture of diastereoisomers by the reaction of cyclooctene oxide with $(R, S)-\mathrm{Cr} * \mathrm{SH}$ followed by treatment with CAN ( $101 \mathrm{mg}, 65 \%$ ), was a pale yellow oil (Found: C, 69.44; H, 9.34; N, 4.77. Calc. for $\mathrm{C}_{17} \mathrm{H}_{27} \mathrm{NOS}$ : C, 69.58; H, 9.27; N, 4.77\%); $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 3396,2929,2858$, 1457, 1037 and 754 ; $\delta_{\mathrm{H}}$ (major diastereoisomer) $1.22(3 \mathrm{H}, \mathrm{d}, J$ 6.9, $\mathrm{NCHCH}_{3}$ ), 1.3-1.8 ( $12 \mathrm{H}, \mathrm{m}$, cyclooctyl), $2.16[6 \mathrm{H}, \mathrm{s}$,
$\left.\mathrm{N}\left(\mathrm{CH}_{3}\right)_{2}\right], 3.02\left(1 \mathrm{H}, \mathrm{q}, J 8.0, \mathrm{NCHCH}_{3}\right), 3.78(0.6 \mathrm{H}, \mathrm{q}$, $J 7.0, \mathrm{CHO}), 5.21(0.6 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{CHS})$ and $7.3-7.8(4 \mathrm{H}, \mathrm{m}$, $\mathrm{Ph})$; $\delta_{\mathrm{H}}$ (minor diastereoisomer, distinct signals) $3.56(0.4 \mathrm{H}$, $\mathrm{q}, J 7.0, \mathrm{CHO})$ and $4.93(0.4 \mathrm{H}, \mathrm{q}, J 7.0, \mathrm{CHS}) ; \delta_{\mathrm{C}}$ (major diastereoisomer) 10.0, 22.3, 25.9, 27.1, 28.0, 32.1, 34.6, 40.3, 59.1, 63.1, 78.5, 126.7, 127.2, 127.8, 133.9, 136.1 and 143.1; $\delta_{\mathrm{C}}$ (minor diastereoisomer) 21.2, 26.7, 27.7, 33.4, 34.4, 41.3, $59.5,60.8,74.9,126.9,127.1,127.3,127.5$ and 146.6.

## Benzoylation and oxidation of compound 4

To a pyridine ( $5 \mathrm{~cm}^{3}$ ) solution of trans-[ $(R, S)$-2-(1-dimethylaminoethyl)phenyl] 2-hydroxycyclohexyl sulfide 4 ( $552 \mathrm{mg}, 1.98$ mmol ) was added benzoyl chloride ( $361 \mathrm{mg}, 2.57 \mathrm{mmol}$ ). The reaction mixture was stirred at room temperature for 12 h and then quenched with water. The organic phase was extracted with diethyl ether $\left(20 \mathrm{~cm}^{3} \times 3\right)$ and the combined extracts were washed with aq. $\mathrm{NaHCO}_{3}$, dried $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right)$ and evaporated to afford the benzoylated product 9 as a yellow oil. $m$-Chloroperbenzoic acid ( $80 \%, 232 \mathrm{mg}, 1.34 \mathrm{mmol}$ ) was added to $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution of compound 9 and the mixture was stirred at room temperature for 5 h . It was then quenched with water and extracted with diethyl ether $\left(20 \mathrm{~cm}^{3} \times 3\right)$. The combined extracts were washed with aq. $\mathrm{NaHCO}_{3}$ and dried $\left(\mathrm{K}_{2} \mathrm{CO}_{3}\right)$. After evaporation of the solvent a toluene solution of the residue was stirred at reflux for 16 h and then allowed to cool to room temperature. Concentration of the mixture by evaporation of the solvent left $\mathbf{1 0}$ as a dark yellow oil which was subjected to preparative TLC on silica gel; hexane- $\operatorname{EtOAc}(5: 1)$ eluted cyclohex-2-enyl benzoate. The optical purity of $\mathbf{1 0}$ was determined by HPLC using a Daicel Chiralcel OB column.

X-Ray structure determination of compound 2a (Fig. 1, Table 1) The unit-cell parameters were determined and the intensities were collected on a Rigaku AFC 7S four-circle diffractometer, with a graphite-monochromated Mo-K $\alpha$ radiation ( $\lambda=0.71069$ $\AA\}$ ). Data for 2a (a light-yellow crystal, grown in hexane), $\mathrm{C}_{13} \mathrm{H}_{15} \mathrm{NO}_{3} \mathrm{SCr}, \quad M=317.32$. Monoclinic, space group $P 2_{1}$, $\alpha=6.396(1), \quad b=11.393(2), \quad c=9.970(1) \quad \AA, \quad \beta=99.59(1)^{\circ}$, $U=716.3(2) \AA^{3}, Z=2, D_{\mathrm{c}}=1.471 \mathrm{~g} \mathrm{~cm}^{-3}, \mu(\mathrm{Mo}-\mathrm{K} \alpha)=9.46$ $\mathrm{cm}^{-1}$, crystal size $0.30 \times 0.30 \times 0.15 \mathrm{~mm}$. The data were collected at a temperature of $296 \pm 1^{\circ} \mathrm{C}$ using the $\omega-2 \theta$ scan technique to a maximum $2 \theta$ value of $50.0^{\circ}$. Of the 1460 reflections which were collected, 1337 were unique ( $R_{\text {int }}=0.021$ ) and 1045 with $I \geqslant 3 \sigma(I)$ were used in all calculations. The intensity of three representative reflections, measured after every 150 reflections, showed no significant decay. Azimuthal scans of several reflections indicated no need for an absorption correction. The data were corrected for Lorentz and polarization effects. The structure was solved using the heavy-atom method and refined by full-matrix leastsquare minimization of $\Sigma w\left(\left|F_{\mathrm{o}}\right|-\mid F_{\mathrm{c}}\right)^{2}$ with anisotropic thermal parameters for all the non-hydrogen atoms. It was not possible to locate the hydrogen atom attached to S in the Fourier difference map and it was not included in the refinement model; other hydrogen atoms were generated geometrically. They were assigned isotropic temperature factors and included in the structure-factor calculations but not refined. All calculations were performed using the TEXSAN package (ver 5.1) on a micro Indy computer. Final $R=0.034$, $R_{\mathrm{w}}=0.034, \Delta \rho=+0.33$ e $\AA^{-3},-0.19$ e $\AA^{-3}$, maximum shift $/$ error $=0.04 . S=0.72$ for 171 parameters.
