#### Abstract

The extension of our recently developed strategy using the key intermediate 2 , obtainable in two steps ( $52 \%$ overall yield) from manool 1, to the synthesis of naturally occurring ring C aromatic diterpene derivatives provides in three steps (+)-12-methyl-7-oxopodocarpa-8,11,13-triene-13-carboxylic acid 4b and its isomer 6b, and in seven steps (+)-nimbiol 11b, in good overall yields. This synthesis discloses that the structure 4b assigned to margolone isolated from Azadirachta indica A. Juss is incorrect and needs to be reinvestigated.

## Introduction

We have recently developed a highly efficient, short route to the synthesis of naturally occurring, biologically active drimanetype sesquiterpenes, ${ }^{1}(+)$-confertifolin, $(+)$-isodrimenin, $(+)$ euryfuran and ( - -warburganal, ${ }^{2}$ and also bicyclofarnesanetype sesquiterpenes, $(+)$-albicanol and $(+)$-bicyclofarnesol. ${ }^{3}$ In all these syntheses, the diene $\mathbf{2},{ }^{4}$ obtained in two steps ( $52 \%$ overall yield) (Scheme 1) from commercially available manool

Scheme 1
1, has been used as a common key intermediate. This paper aims to demonstrate another utility of this diene for the synthesis of optically active ring C aromatic diterpene derivatives, ${ }^{5}$ such as compounds $\mathbf{4 b}, \mathbf{6 b}$ and $\mathbf{1 1 b}$.

Because of its wide range of therapeutic and pesticidal properties, the study of the constituents of Azadirachta indica A. Juss (Meliaceae), commonly known as neem, has attracted much interest among natural product chemists during the past two decades. ${ }^{6,7}$ A series of new terpenoidal constituents have been isolated from the various parts of neem. The tricyclic diterpenoid margolone was one of them and its chemical structure has been assigned the structure $\mathbf{4 b}$ on the basis of spectroscopic evidence. This compound appears to be interesting from

## Results and discussion

Diels-Alder reaction of the diene 2 with methyl but-2-ynoate was carried out by heating the neat mixture in a sealed tube. No reaction took place below $160^{\circ} \mathrm{C}$. Above $180^{\circ} \mathrm{C}$, however, reaction was accompanied by a considerable degree of pyrolytic aromatization ${ }^{8}$ and the major products were not the diene adducts but ring C aromatic compounds. At $214^{\circ} \mathrm{C}$ almost quantitative aromatization occurred and a mixture of two isomeric products $\mathbf{3}$ and $\mathbf{5}$ (ratio of $3: 2$ ) was obtained in $80 \%$ yield. These two compounds were separated by medium pressure liquid chromatography over silica gel and their structures were differentiated by means of 2D NMR ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ single and multiple bond correlation studies. ${ }^{5}$ The less polar product was assigned the structure 5 and the other more polar isomer, the structure 3, which appeared to be that required for the synthesis of margolone. On benzylic oxidation with tert-butyl hydroperoxide and chromium hexacarbonyl ${ }^{9}$ compound $\mathbf{3}$ afforded the 7 -oxo-derivative $\mathbf{4 a}$ ( $80 \%$ yield). Subsequent alkaline hydrolysis led to the desired compound $\mathbf{4 b}(100 \%$ yield). When, however, the physical and spectroscopic properties of this synthetic compound $\mathbf{4 b}$ were compared with those ${ }^{6}$ reported for natural margolone, some significant discrepancies ${ }^{5}$ were observed between them. We report here that the structure published for margolone is not correct and needs to be reinvestigated. The diterpene having the structure $\mathbf{4 b}$ cannot be coloured yellow as reported with UV $\lambda_{\text {max }} 360$ and 383 nm . Probably the isolated compound was impure and needs to be properly characterised.

Benzylic oxidation of the isomeric compound 5 with tertbutyl hydroperoxide and pyridinium dichromate ${ }^{10}$ afforded the other ring C aromatic diterpene 6a ( $78 \%$ yield). Subsequent alkaline hydrolysis led to compound $\mathbf{6 b}(100 \%$ yield).

Nimbiol was isolated from the trunk bark of Melia azadirachta Linn. (syn. Azadirachta indica Juss) and was shown to possess the structure 11b. ${ }^{11}$ Two independent groups of chemists ${ }^{12}$ previously synthesised this diterpene from podocarpic acid. In our synthesis compound $\mathbf{6 b}$, one of the

intermediates obtained earlier, was employed as a convenient precursor

Reduction of compound $\mathbf{5}$ with lithium aluminium hydride afforded the alcohol 7 ( $94 \%$ yield). Oxidation of alcohol 7 with tetra- $n$-propylammonium perruthenate and $N$-methylmorpholine $N$-oxide ${ }^{13}$ gave the aldehyde 8 ( $94 \%$ ). Baeyer-Villiger oxidation ${ }^{14}$ of the aldehyde 8 was effected by heating with $m$ chloroperoxybenzoic acid in methylene chloride at refluxing temperature for 24 h . The resulting formate 9 ( $64 \%$ yield) was hydrolysed with methanolic potassium hydroxide to the phenol 10a ( $96 \%$ yield). Acetylation of the phenol 10a with acetic anhydride in pyridine afforded the acetate 10b ( $90 \%$ yield) which was then oxidised with tert-butyl hydroperoxide and pyridinium dichromate ${ }^{10}$ to give the 7 -oxo derivative 11a ( $74 \%$ yield). Subsequent alkaline hydrolysis afforded compound 11b, identical with natural ( + )-nimbiol ${ }^{11,12}$ ( $100 \%$ yield).

The importance of the diene 2 as a key precursor in this synthesis has now been well demonstrated. Our strategy using the diene $\mathbf{2}$ as a building block will continue to find wide application in the synthesis of many other similar naturally occurring ring C aromatic diterpenes.

## Experimental

Melting points were measured on a Kofler hot-stage apparatus and are uncorrected. IR spectra were recorded with a Nicolet 5DXC FT-IR spectrometer. UV spectra were determined with a UV-VIS Milton Roy 3000 array instrument. NMR spectra were obtained for solutions in $\mathrm{CDCl}_{3}$ on a Bruker AM 300 spectrometer. $J$ Values are given in Hz . The assignments of carbon signals were made by means of 2 D NMR ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ single bond and multiple bond correlation studies. Mass spectra were determined on a Kratos MS 25 RFA spectrometer at 70 eV using a direct inlet system. Rotations were measured in chloroform solutions at $25^{\circ} \mathrm{C}$ with a Zeiss ' 0.01 ' polarimeter. For column chromatography, silica gel 60 (Merck, 70-230 mesh) was used. Thin layer chromatograms were prepared on silica gel G or silica gel $\mathrm{GF}_{254} 60$ (Merck) and the spots were observed by exposure to iodine vapour or UV light. All organic extracts were dried over anhydrous sodium sulfate and evaporated under reduced pressure below $60^{\circ} \mathrm{C}$. Ether refers to diethyl ether.

## Benzylic oxidation of compound 3

To a stirred solution of compound $\mathbf{3}(70 \mathrm{mg}, 0.23 \mathrm{mmol})$ in benzene ( 4 ml ) and Celite ( 0.2 g ) was added pyridinium dichromate $(0.351 \mathrm{~g}, 0.93 \mathrm{mmol})$ followed by the addition of tert-butyl hydroperoxide ( $0.5 \mathrm{ml}, 5.21 \mathrm{mmol}$ ) at $10^{\circ} \mathrm{C}$. After 15 $\min$ at $10^{\circ} \mathrm{C}$, the reaction mixture was stirred for 24 h at room temperature. The excess reagents were decomposed by addition of methanol and the reaction mixture was filtered through a pad of Celite by eluting with hexane. The eluate was evaporated in vacuo to dryness.
