#### Abstract

The macrocycle $\mathbf{2 5}$ which has the required functionality around the macrocyclic ring for incorporation into a synthesis of cytochalasin D 1 has been synthesized using an intramolecular Diels-Alder reaction to form the 11membered ring. The Diels-Alder precursor $\mathbf{2 4}$ was prepared in a convergent fashion from the dienyl phosphonate 17, the aldehyde 16 and the pyrrolidinone 21, with phenylselenenylation and oxidative elimination being used to convert the pyrrolidinone 22 into the unstable pyrrolinone 24 . The Diels-Alder reaction of the pyrrolinone $\mathbf{2 4}$ under high dilution conditions gave the required endo-adduct 25 in a yield of $53 \%$ based on the phenylselenopyrrolidinone 23. N -Debenzoylation gave the NH -lactam $\mathbf{2 6}$ but preliminary attempts to effect removal of the SEM-groups led to the formation of the methylenedioxy compound 27.

The cytochalasans are a group of macrocyclic fungal metabolites which have attracted considerable attention from synthetic chemists because of their potent biological activity. ${ }^{1,2}$ The preceding paper ${ }^{3}$ reports details of the first synthesis of the [11]cytochalasan, cytochalasin D $\mathbf{1}$ using an intramolecular Diels-Alder reaction of a pyrrolinone to prepare the advanced intermediate $2 .{ }^{4}$ One aspect of this synthesis is the introduction

of most of the functionality around the 11-membered ring including the stereogenic centres at $\mathrm{C}(18)$ and $\mathrm{C}(21)$ after the macrocyclisation step, using the conformational preferences of the macrocyclic ring to control stereochemistry. An advantage of this approach is that the Diels-Alder product 2, which has the intact carbon skeleton of the [11]cytochalasans, is formed relatively early in the synthesis, only eleven linear steps being required to prepare it from methacrolein. However, a disadvantage is that the conversion of this intermediate into cytochalasin D is quite lengthy. We now report details of preliminary studies of an alternative approach to cytochalasin D $\mathbf{1}$ using an intramolecular Diels-Alder reaction, in which more functionality is introduced before the Diels-Alder step. ${ }^{5}$

## Results and discussion

The synthesis of the alcohol 15 which corresponds to the $C(14)-C(21)$ fragment of cytochalasin D is outlined in Scheme 1. The anti-2,4-dimethylhexa-1,5-dien-3-ol 3, ee $84 \%$, together with $c a .10 \%$ of its syn-diastereoisomer, is available from the reaction between methacrolein and $(E)$-but-2-enyldiisopinocampheylborane. ${ }^{3}$ Sharpless epoxidation of this mixture using (+)-diethyl tartrate gave the hydroxyepoxide 4, $57 \%$,

[^0]together with $c a .10 \%$ of a mixture of diastereoisomeric epoxides. ${ }^{6}$ Interestingly the ee of the hydroxyepoxide 4 was found to correspond to $98 \%$ (Mosher's derivative), significantly better than that of the starting alcohol, perhaps because of the preferential formation of the epoxide $\mathbf{6}$, a diastereoisomer of epoxide 4, from the Sharpless epoxidation of the enantiomer of allylic alcohol 3 .

The hydroxyepoxide 4 was protected as its 2-trimethylsilylethoxymethyl (SEM) ether $5^{7}$ but attempts to open this epoxide using the lithium enolate of ethyl acetate ${ }^{8}$ or lithiated 2-methyloxazolines ${ }^{9}$ or metallated ethoxyacetylenes, ${ }^{10}$ were unsuccessful. However, ring-opening of the epoxide was eventually achieved by heating a solution of the epoxide in $p$-methoxybenzyl alcohol containing powdered sodium hydroxide ${ }^{11}$ at $80^{\circ} \mathrm{C}$ for three days to give the p-methoxybenzyl ether 7 in reasonable yield $(71 \%)$. The relative configurations of this ether at $C(2)$ and $C(4)$ were checked by deprotection of the 3-hydroxy group to give the diol $\mathbf{8}$ which was converted into the cyclic carbonate 9 . The configuration of this cyclic carbonate was confirmed by ${ }^{1} \mathrm{H}$ NMR, e.g. by the observation of significant NOE enhancements between the cis-disposed substituents about the 5-membered ring.

Oxidative removal of the $p$-methoxybenzyl group ${ }^{12}$ from the ether $\mathbf{7}$ gave the diol $\mathbf{1 0}$ which was oxidized to the aldehyde 11. Condensation with methoxycarbonylmethylene(triphenyl)phosphorane gave the unsaturated ester 12 which was further protected as its bis-SEM derivative 13. This was hydroborated regioselectively using 9-borabicyclo[3.3.1]nonane (9-BBN) to give the primary alcohol 14 and hydrogenation gave the saturated hydroxyester 15.

Oxidation of this hydroxyester gave the aldehyde 16 which was condensed with the phosphonate $17^{3,13}$ under the usual conditions to give the ( $E, E, E$ )-trienyl ester 18 containing $c a .15 \%$ of its ( $Z, E, E$ )-isomer ( ${ }^{1} \mathrm{H}$ NMR), see Scheme 2. Saponification of this ester gave the acid 19 which was converted into the acyl imidazole 20. This was used to acylate the $N$-benzoylpyrrolidinone $21^{14}$ to give an epimeric mixture of the 3-alkenoylpyrrolidinones 22. Phenylselenation and oxidative elimination then gave the unstable pyrrol-2( 5 H$)$-one 24 . This was not isolated, rather it was heated in dilute solution in toluene to give the tricyclic Diels-Alder adduct 25, which was isolated in a yield of $53 \%$ based on the phenylselenopyrrolidinone 23, together with $c a .5 \%$ of a mixture of minor isomeric Diels-Alder adducts which were not fully characterized.

The structure of the major Diels-Alder adduct 25 was

assigned on the basis of precedent ${ }^{3,4}$ and was confirmed by extensive ${ }^{1} \mathrm{H}$ NMR studies. It corresponds to endo-addition of the triene onto the less hindered face of the pyrrol-2(5H)-one as has been observed in all other similar cases. ${ }^{4}$ The $53 \%$ isolated yield of this Diels-Alder product is of note. However, problems were encountered in continuing with the synthesis. $N$-Deprotection gave the $N H$-lactam 26, but attempts to introduce a phenylselenenyl group at $\mathrm{C}(20)$ using lithium amide bases and benzeneselenenyl chloride were unsuccessful. Moreover, treatment with aqueous hydrogen fluoride, in an attempt to remove the two SEM ethers, gave the cyclic acetal 27 rather than the required diol.

## Summary and conclusions

This approach to a synthesis of cytochalasin D 1 complements
that in the preceding paper in that more of the functionality about the 11 -membered ring is introduced before the DielsAlder step. This should mean that less chemistry is required after the Diels-Alder cyclisation. The satisfactory yield, $53 \%$, of the bis-SEM protected Diels-Alder adduct 25 is of interest but this work was not continued because of the completion of the total synthesis of cytochalasin D $\mathbf{1}$ described in the preceding paper. ${ }^{3}$

disilazide ( 6.93 mmol ) in THF $\left(20 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$ via a cannula and the mixture stirred for 45 min . The imidazole $20(2.05 \mathrm{~g}$, $3.38 \mathrm{mmol})$ in THF $\left(25 \mathrm{~cm}^{3}\right)$ was added and the mixture stirred for 2 h at $-78^{\circ} \mathrm{C}$ then for 1 h at ambient temperature. Saturated aqueous ammonium chloride ( $15 \mathrm{~cm}^{3}$ ) was added and the mixture extracted with ether $\left(3 \times 75 \mathrm{~cm}^{3}\right)$. The ethereal extracts were dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated under reduced pressure. Chromatography of the residue on base washed silica using light petroleum-ether ( $4: 1$ ) as eluant gave the pyrrolidinone 22 $(2.55 \mathrm{~g}, 92 \%)$ as a pale yellow oil; $\delta_{\mathrm{H}} 0.00-0.10(18 \mathrm{H}, \mathrm{m}$, $6 \times \mathrm{SiMe}), 0.80-1.13\left(10 \mathrm{H}, \mathrm{m}, 4^{\prime}-\mathrm{CH}_{3}, 6^{\prime}-\mathrm{CH}_{3}, 2 \times \mathrm{CH}_{2} \mathrm{Si}\right)$, 1.7-3.0 ( 15 H , overlapping m), 3.2-3.8 ( $8 \mathrm{H}, \mathrm{m}, 5^{\prime}-\mathrm{H}, \mathrm{CH}_{2} \mathrm{Ph}$, $\left.3-\mathrm{H}, 2 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 4.65-4.85\left(5 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{OCH}_{2} \mathrm{O}, 5-\mathrm{H}\right)$, $5.43\left(0.15 \mathrm{H}, \mathrm{m}, 9^{\prime}{ }_{Z}-\mathrm{H}\right), 5.50-5.78\left(1.85 \mathrm{H}, \mathrm{m}, 9^{\prime}{ }_{E^{-}}-\mathrm{H}, 13^{\prime}-\mathrm{H}\right)$, $6.00-6.25(3 \mathrm{H}, \mathrm{m}$, vinylic H$)$ and $7.25-7.70(10 \mathrm{H}, \mathrm{ArH})$; $m / z$ (DCI-ZAB) $835\left(\mathrm{M}^{+}+18\right), 818\left(\mathrm{M}^{+}+1\right)$; followed by recovered lactam $21(0.75 \mathrm{~g})$.

A cooled solution of the pyrrolidinone $22(2.55 \mathrm{~g}, 3.12 \mathrm{mmol})$ in THF ( $20 \mathrm{~cm}^{3}$ ) was added to lithium hexamethyldisilazide ( 3.12 mmol ) in THF $\left(20 \mathrm{~cm}^{3}\right)$ at $-72^{\circ} \mathrm{C}$ via a cannula and the mixture stirred at this temperature for 30 min before adding benzeneselenenyl chloride ( $0.66 \mathrm{~g}, 3.43 \mathrm{mmol}$ ) in THF $\left(10 \mathrm{~cm}^{3}\right)$. The mixture was stirred for 2.5 h at $-72{ }^{\circ} \mathrm{C}$ then saturated aqueous ammonium chloride ( $20 \mathrm{~cm}^{3}$ ) was added and the mixture allowed to warm to room temperature. Water $\left(15 \mathrm{~cm}^{3}\right)$ was added, the mixture was extracted with ether $\left(3 \times 75 \mathrm{~cm}^{3}\right)$ and the ethereal extracts were washed with brine $\left(50 \mathrm{~cm}^{3}\right)$, dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated under reduced pressure. Chromatography of the residue on base washed silica using light petroleum-ether ( $5: 1$ ) as eluant gave the pyrrolidinone 23 $(2.45 \mathrm{~g}, 81 \%)$ as a $2: 1$ mixture of diastereoisomers; $\delta_{\mathrm{H}} 0.00$ and 0.05 (each $9 \mathrm{H}, \mathrm{s}, 3 \times \mathrm{SiMe}_{3}$ ), $0.85-1.05\left(7 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2} \mathrm{Si}\right.$, $\left.6^{\prime}-\mathrm{CH}_{3}\right), 1.25\left(2 \mathrm{H}, \mathrm{s}, 4^{\prime}-\mathrm{CH}_{3}\right), 1.28\left(1 \mathrm{H}, \mathrm{s}, 4^{\prime}-\mathrm{CH}_{3}\right), 1.70-2.10$ ( $10 \mathrm{H}, \mathrm{m}, 12^{\prime}-\mathrm{CH}_{3}, 14^{\prime}-\mathrm{H}_{3}, 6^{\prime}-\mathrm{H}, 7^{\prime}-\mathrm{H}, 3^{\prime}-\mathrm{H}_{2}$ ), $2.40-2.95$ ( $5 \mathrm{H}, \mathrm{m}, \mathrm{HCHPh}, 4-\mathrm{H}, 2^{\prime}-\mathrm{H}_{2}, 7^{\prime}-\mathrm{H}$ ), 3.18-3.40 (3 H, m, $5^{\prime}-\mathrm{H}$, $\mathrm{HCHPh}, 4-\mathrm{H}), 3.65\left(4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{Si}\right), 4.45-4.82(5 \mathrm{H}$, $\left.\mathrm{m}, 5-\mathrm{H}, 2 \times \mathrm{OCH}_{2} \mathrm{O}\right), 5.37-5.83\left(2 \mathrm{H}, \mathrm{m}, 9^{\prime}-\mathrm{H}, 13^{\prime}-\mathrm{H}\right), 6.00-$ $6.30\left(3 \mathrm{H}, \mathrm{m}, 8^{\prime}-\mathrm{H}, 10^{\prime}-\mathrm{H}, 11^{\prime}-\mathrm{H}\right)$ and $7.05-7.66(15 \mathrm{H}, \mathrm{m}$, $\mathrm{ArH}) ; m / z(\mathrm{CI}) 564$ (3\%) and 418 (13).
