#### Abstract

Syntheses of the oxygen analogues $\mathbf{6 , 7}$ and $\mathbf{8}$ of the michellamines $\mathbf{1}$ and korupensamines $\mathbf{2}$ are described. Racemic 5-iodo-6,8-dimethoxy-trans-1,3-dimethylisochromane $\mathbf{1 0}$ was synthesised in eleven steps from 2,4-dimethoxybenzaldehyde in an overall yield of $51 \%$. The isopropoxy analogue $\mathbf{1 1}$ was synthesised in a similar manner. Isochromane 10 was coupled using Suzuki methodology with 4-isopropoxy-5-methoxy-7-methylnaphthalene-1-boronic acid 9 to produce 7 in $96 \%$ yield. This was converted in good yield into the desired product $\mathbf{6}$ by oxidative dimerisation followed by reduction of the cross-conjugated ene-dione intermediate 45 .

## Introduction

The michellamines (e.g., michellamine B, 1) are a growing class of novel naphthylisoquinoline alkaloids isolated from the tropical liana Ancistrocladus korupensis, found in the Cameroon. ${ }^{1}$ These compounds are of interest to the scientific community as they show activity against the Human Immunodeficiency Virus (HIV). ${ }^{2}$ In addition, as a result of their intriguing structures, chemists have been interested in the synthesis of these molecules and a number of groups have published total syntheses or approaches to their synthesis. ${ }^{3}$

Most of the published syntheses rely on the dimerisation of a (5)-naphthylisoquinoline such as 2 , which in turn is constructed from a suitably protected tetrahydroisoquinoline precursor, e.g. 3. Isoquinoline 3 is invariably made by means of a BischlerNapieralski cyclisation. ${ }^{4}$ The bromonaphthalene 4 is a key intermediate in several reported syntheses. ${ }^{3 e, p, 5}$ The biaryl axis is then formed between $\mathbf{3}$ and various naphthalene boronic acids such as 5 , which are themselves prepared from the brominated precursor 4. The formation of the biaryl axis has been accomplished using both Suzuki ${ }^{3 a-d, h-j, l, o, q}$ and Stille ${ }^{3 e, p}$ coupling procedures, with the Suzuki methodology ${ }^{6}$ used more frequently. Removal of $\mathrm{R}^{2}$ from the diastereoisomeric biaryl products $\mathbf{2}$, dimerisation and deprotection of the remaining phenolic groups result in formation of the michellamines, e.g. 1. The biaryl products 2 , the 'monomers' of the michellamines, are also found in Nature and are known as the korupensamines. ${ }^{7}$ They do not show activity against the HIV, but do show biological activity against the malaria parasite, Plasmodium falciparum.

As a result of the activities associated with natural products such as the michellamines, the National Cancer Institute (NCI) of the USA has encouraged researchers to synthesise analogues of these naturally occurring compounds, ${ }^{8}$ and several have been reported. ${ }^{9}$ Most of the analogues prepared have unnatural biaryl linkages in which the isoquinoline and naphthalene moieties are joined at sites other than those found in $\mathbf{1}$. In this paper we report in full on a synthesis of racemic methoxyand isopropoxy-isochromane analogues of the korupensamines ( $\mathbf{7}$ and $\mathbf{8}$ ) as well as the methoxylated michellamine oxygen analogue 6. Preliminary details have previously appeared in a communication. ${ }^{10}$

## Results and discussion

the target into account, and leads to 7. This important intermediate was in turn disconnected to give isochromane $\mathbf{1 0}$ and the naphthalene 9 . In 10, the phenolic groups are protected as their methyl ethers, but we also chose to prepare the analogue 11 possessing isopropyl protecting groups, as it was hoped that these groups could be selectively removed when required to afford phenolic analogues of $6 .{ }^{11}$

We elected to synthesise the desired isochromanes $\mathbf{1 0}$ and $\mathbf{1 1}$ from 1-allyloxy-2,4-dimethoxybenzene $\mathbf{1 3}$ and its isopropoxy analogue 14. The bromide analogue $\mathbf{1 2}$ was also prepared from

the method of choice as the intermediate products were formed in higher yields and were easier to handle. Compound $\mathbf{1 4}$ was synthesised from 2,4-diisopropoxybenzaldehyde, which is readily made by Vilsmeier-Haack formylation of 1,3-diisopropoxybenzene. ${ }^{14}$ Following the same steps as outlined for the formation of 13, 2,4-diisopropoxybenzaldehyde was converted into $\mathbf{1 4}$ via 18 in good overall yields ( $62 \%$ ). With both 13 and 14 in hand, the acetyl functionality was introduced by treatment with a mixture of acetic acid and trifluoroacetic anhydride at ambient temperature to yield 19 ( $66 \%$ ) and $20(94 \%) .{ }^{15}$ The
location of the acetyl group in both products was unambiguous, as the ${ }^{1} \mathrm{H}$ NMR spectra showed, inter alia, two singlets (i.e., no ortho or meta coupling) at $\delta 7.45$ and 6.50 for 19 and $\delta 7.44$ and 6.50 for 20.

Efficient conversion (ca. 80\%) of both 19 and 20 into 21 and 22, respectively, was achieved by heating the compounds neat at $160^{\circ} \mathrm{C}$ (to induce a Claisen rearrangement) and protecting the resulting phenols as benzyl ethers. Reduction of $\mathbf{2 1}$ and $\mathbf{2 2}$ gave the racemic alcohols 23 and $\mathbf{2 4}$ (both in 93-94\% yield).

Utilising methodology developed by Giles et al., ${ }^{16}$ we converted both of these alcohols into the desired racemic trans-1,3-dimethylisochromanes 25 and 26 by treatment with potassium tert-butoxide in DMF at $75^{\circ} \mathrm{C}$. Evidence for the formation of the trans-product in both cases was again obtained from the ${ }^{1} \mathrm{H}$ NMR spectra. It has been shown that $3-\mathrm{H}$ for trans-1,3dimethylisochromanes occurs upfield $(\delta \approx 4)$ in relation to the cis-isomer $(\delta \approx 3.8) .{ }^{17}$ In these examples, the ${ }^{1} \mathrm{H}$ NMR spectra showed $3-\mathrm{H}$ for $\mathbf{2 5}$ as a multiplet at $\delta 3.99-3.91$, and for the isopropyl analogue $\mathbf{2 6}$ as a multiplet at $\delta 3.98-3.93$. The relative stereochemistry was confirmed by an X-ray crystal-structure determination on compound $\mathbf{3 6}$, prepared later in the synthetic sequence.

The naphthalene 9 required for the coupling with the isochromane moiety was synthesised using standard methodology. 2-Bromo-5-isopropoxybenzaldehyde ${ }^{18}$ was treated with dimethyl succinate in the presence of potassium tert-butoxide to give the intermediate Stobbe condensation product 27 as a mixture of geometrical isomers ( $60: 40$ ). This was treated with acetic anhydride and sodium acetate ${ }^{19}$ to give the naphthalene 28. The overall yield of this two-step sequence was $49 \%$. Following a series of functional-group manipulations ${ }^{3 e}$ $\mathbf{( 2 8} \longrightarrow \mathbf{2 9} \longrightarrow \mathbf{3 0} \longrightarrow \mathbf{3 1} \longrightarrow \mathbf{3 2}$ ), 5-bromo-8-isopropoxy-1-methoxy-3-methylnaphthalene 4 was obtained. Conversion into the corresponding naphthaleneboronic acid 9 was accomplished in high yield by sequential treatment of 4 with $n$-butyllithium at $-78^{\circ} \mathrm{C}$ and triisopropyl borate followed by hydrolysis as outlined in Scheme 2.

With the synthesis of both the isochromane skeleton and the naphthalene accomplished, it was necessary to modify functional groups to allow for efficient coupling of the two moieties. In particular, the benzyl ether at C-5 in both isochromanes 25 and $\mathbf{2 6}$ must be converted into a functional group suitable for coupling with the naphthalene 9 . While the specific choice of functional group was not obvious at this stage, it was clear that hydrogenolysis of the benzyl group was an essential first step. Removal of the benzyl protecting group was accomplished with either $10 \%$ palladium on charcoal or palladium black under a hydrogen atmosphere to give a quantitative yield of both 33 and 34. The isochromane ring, itself a benzylic ether, was unaffected during this reaction.

Phenol 33 was converted into triflate $\mathbf{3 5}$ by treatment with triflic anhydride in the presence of pyridine (Scheme 3).

Scheme 3 Reagents and conditions: (i) $10 \% \mathrm{Pd} / \mathrm{C}, \mathrm{MeOH}, \mathrm{H}_{2}(100 \%)$ ( $\mathbf{2 5} \longrightarrow \mathbf{3 3}$ ) and ( $\mathbf{2 6} \longrightarrow \mathbf{3 4}$ ); (ii) $\mathrm{Tf}_{2} \mathrm{O}, \mathrm{CHCl}_{3}$, pyridine ( $88 \%$ ); (iii) ( EtO$)_{2} \mathrm{POCl}, \mathrm{NaH}, \mathrm{THF}(100 \%)(\mathbf{3 3} \longrightarrow \mathbf{3 6})$ (or $81 \%$ ) ( $\mathbf{3 4} \longrightarrow \mathbf{3 7}$ ); (iv) $\mathrm{K}, \mathrm{NH}_{3},-78^{\circ} \mathrm{C}(100 \%)(\mathbf{3 6} \longrightarrow \mathbf{3 8})($ or $91 \%)(\mathbf{3 7} \longrightarrow \mathbf{3 9})$; (v) $\mathrm{Ag}_{2} \mathrm{SO}_{4}, \mathrm{I}_{2}, \mathrm{EtOH}(94 \%)(\mathbf{3 8} \longrightarrow \mathbf{1 0})$ and $(\mathbf{3 9} \longrightarrow \mathbf{1 1})$; or $\mathrm{Br}_{2}, \mathrm{AcOH}-$ $\mathrm{CHCl}_{3}(93 \%)(\mathbf{3 8} \longrightarrow \mathbf{1 2}$ ).

Attempted coupling reactions with two model systems, 1-naphthylboronic acid $\mathbf{4 0}{ }^{\mathbf{2 0}}$ and tributyl-(4-methoxyphenyl)stannane $\mathbf{4 2},{ }^{21}$ were unsuccessful. This is probably due to the electron-rich nature of the isochromane, which makes it more difficult for palladium(0) to be inserted between the triflate oxygen and carbon in the aromatic ring. ${ }^{22}$ Hence we chose to replace the benzyloxy group with a halogen before attempting coupling reactions. For isochromane 25, this was done by using an uneventful high yielding deoxygenation sequence, ${ }^{23}$ $\mathbf{2 5} \longrightarrow \mathbf{3 3} \longrightarrow \mathbf{3 6} \longrightarrow \mathbf{3 8}$, which proceeded overall in quantitative yield. An X-ray crystal structure ${ }^{24}$ of 36 provided conclusive evidence of the structure of the molecule and verified the 1,3-trans-dimethyl stereochemistry of the pyran ring. Isochromane 38 was converted into both the bromide 12 and iodide 10 using bromine in acetic acid or iodine and silver(I) sulfate ${ }^{25}$ in yields of 93 and $94 \%$, respectively. A similar sequence of reactions was used for converting the isopropoxyisochromane 34 into iodide 11 via 37 and 39. The regiochemistry of all three products 10, 11 and $\mathbf{1 2}$ was confirmed by NOE experiments. Irradiation of the single aromatic proton showed enhancement of both methoxy groups in 10 and 12, while irradiation of 11 showed enhancement of both isopropoxy groups.

The stage was now set to couple the halogenated isochromanes $\mathbf{1 0}-\mathbf{1 2}$ with the substituted naphthaleneboronic acid 9 using the palladium-mediated Suzuki reaction. ${ }^{6}$ However, we considered it prudent to optimise reaction conditions by first performing some model reactions with readily accessible aromatic boronic acids before committing our more valuable naphthaleneboronic acid 9 . Treatment of bromoisochromane 12 with 1-naphthylboronic acid 40 in the presence of $10 \mathrm{~mol} \%$ tetrakis(triphenylphosphine)palladium(0) in toluene and of aq. sodium bicarbonate ${ }^{3 f}$ under argon gave a $28 \%$ yield of the desired product 43 as a mixture of diastereoisomers (ratio: $66: 34$ ), which arise from the creation of a stereogenic axis. Clear evidence for the formation of two diastereoisomers came from the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra, which showed doubling of virtually all the signals. In addition, the high-resolution mass spectrum showed the expected molecular ion at $\mathrm{M}^{+} 348.1717$ $\left(\mathrm{C}_{23} \mathrm{H}_{24} \mathrm{O}_{3}\right.$ requires $\left.M, 348.1725\right)$. As the yield of 43 was low the reaction was repeated using the method of Coudret. ${ }^{26}$ Reaction of 12 with 1 -naphthylboronic acid pinacol ester $41^{27}$ and dichloro-[1,1'-bis(diphenylphosphino)ferrocene]palladium(0) gave a very disappointing yield $(14 \%)$ of the desired product 43. Hence, at this stage it was decided that all future work on these reactions would be done on the iodinated isochromanes $\mathbf{1 0}$ and 11, as literature precedent indicated that iodine is the best halogen for Suzuki coupling reactions. ${ }^{3 f}$

After much experimentation, iodoisochromane 10 and naphthylboronic acid 9 were treated with $20 \mathrm{~mol} \%$ tetrakis(triphenylphosphine)palladium(0) in DMF under argon with tribasic potassium phosphate ${ }^{28}$ to give the desired biaryl compound 7 in an excellent yield of $96 \%$. Doubling of signals in both the ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra showed clearly that the product had been formed as a mixture of two diastereoisomers $(59: 41)$. The ${ }^{1} \mathrm{H}$ NMR spectrum showed a number of differences on the isochromane moiety as compared with that of the precursor $\mathbf{1 0}$, the most significant being the shift of the aromatic singlet $(7-\mathrm{H})$ from $\delta 6.34$ to $\delta 6.99$ and 6.97 for the diastereomeric products. Additionally, the two $4-\mathrm{H}$ protons, which appeared as double doublets at $\delta 2.74$ and 2.35 in $\mathbf{1 0}$, appeared in the product 7 as multiplets at $\delta 2.15-2.03$ and $1.88-1.81$.

Under the same conditions, coupling 11 with 9 gave the desired product $\mathbf{8}$ in a disappointing yield of $15 \%$. Even in the presence of an oxygen scavenger, 2,6-di-tert-butyl-4-methylphenol, ${ }^{29}$ the yield could not be improved. Nevertheless, compounds 7 and 8 are both oxygen analogues of the koru-pensamines-the first on record.

Selective removal of the isopropyl group of 7 with boron trichloride yielded the naphthol 44. This was treated with silver(I) oxide to afford 45 (Scheme 4). This purple compound was not characterised fully, but subjected to hydrogenation on a palladium-charcoal catalyst to yield the desired oxygen analogue of the michellamines $\mathbf{6}$ in good yield. The product was produced as a mixture of racemic diastereoisomers. This represents the first synthesis of an isochromane analogue of the michellamines. We are currently investigating the separation of these six possible diastereoisomers, after which biological evaluation of these new michellamine analogues will be undertaken. Furthermore, synthesis of the isochromane building blocks as pure enantiomers will also reduce the number of diastereoisomeric options in the final product, and this comparatively straightforward task is also under investigation.

## 5-Allyloxy-2,4-diisopropoxyacetophenone 20

Acetic trifluoroacetic anhydride was pre-formed by adding glacial acetic acid ( $0.33 \mathrm{~cm}^{3}, 0.35 \mathrm{~g}, 5.8 \mathrm{mmol}$ ) to stirred TFAA $\left(0.81 \mathrm{~cm}^{3}, 1.0 \mathrm{~g}, 4.8 \mathrm{mmol}\right)$ and the mixture was then added to a solution of 1-allyloxy-2,4-diisopropoxybenzene $\mathbf{1 4}(1.2 \mathrm{~g}, 4.8$ mmol ) in dichloromethane ( $20 \mathrm{~cm}^{3}$ ) under argon. The solution was stirred for 72 h and gradually darkened to a purple-blue colour. Water $\left(20 \mathrm{~cm}^{3}\right)$ and dichloromethane ( $50 \mathrm{~cm}^{3}$ ) were added to the solution, and the excess acid was neutralised by careful addition of solid sodium hydrogen carbonate during 2 h

The mixture was extracted with dichloromethane ( $6 \times 50 \mathrm{~cm}^{3}$ ) and this extract was dried $\left(\mathrm{MgSO}_{4}\right)$ and the solvent was removed in vacuo. The resultant residue was purified by column chromatography ( $5-10 \%$ ethyl acetate-hexane) to afford the ketone 20 as a dark oil ( $1.30 \mathrm{~g}, 94 \%$ ) (Found: $\mathrm{M}^{+}$, 292.1971. $\mathrm{C}_{17} \mathrm{H}_{24} \mathrm{O}_{4}$ requires $M$, 292.1675); $v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 1762 \mathrm{~s}(\mathrm{C}=\mathrm{O}), 1655$ ( $\mathrm{ArC=C}$ ), 1409 m $\left(\mathrm{CH}_{3}, \mathrm{CH}_{3} \mathrm{CO}\right), 1384 \mathrm{~m}$ and $1373 \mathrm{~m}\left(-\mathrm{CH}_{3}\right), 1021 \mathrm{~m}(\mathrm{C}-\mathrm{O}-\mathrm{C})$ and 999 m and $916 \mathrm{~m}(=\mathrm{CH}) ; \delta_{\mathrm{H}}\left(200 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{Me}_{4} \mathrm{Si}\right) 7.44$ $(1 \mathrm{H}, \mathrm{s}, 6-\mathrm{H}), 6.50(1 \mathrm{H}, \mathrm{s}, 3-\mathrm{H}), 6.13-5.96\left(1 \mathrm{H}, \mathrm{m}, 2^{\prime}-\mathrm{H}\right), 5.46-$ $5.20\left(2 \mathrm{H}, \mathrm{m}, 3^{\prime}-\mathrm{H}_{2}\right), 4.65-4.53\left[4 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right.$ and $\left.1^{\prime}-\mathrm{H}_{2}\right], 2.60\left(3 \mathrm{H}, \mathrm{s}, \mathrm{COCH}_{3}\right)$ and $1.39[12 \mathrm{H}, \mathrm{d}, J 6.1,4 \times$ $\left.\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right] ; \delta_{\mathrm{C}}\left(50.32 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 197.5(\mathrm{C}=\mathrm{O}), 153.6,152.8$ and $143.0(3 \times \mathrm{ArC}-\mathrm{O}), 133.4\left(2^{\prime}-\mathrm{C}\right), 120.9$ ( $1-\mathrm{C}$ ), 117.1 ( $3^{\prime}-\mathrm{C}$ ), $116.2(6-\mathrm{C}), 102.6(3-\mathrm{C}), 71.8$ and $71.2\left[2 \times \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right], 70.4$ (1'-C), $32.2\left(\mathrm{COCH}_{3}\right)$ and 22.0 and $21.9\left[2 \times \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right] ; m / z$ (EI) 292 ( $\mathrm{M}^{+}, 17 \%$ ), 277 (4), 250 (3), 235 (2), 209 (7), 167 (100), 149 (77) and 41 (60).

## Methyl 4-acetoxy-8-bromo-5-isopropoxy-2-naphthoate 28

A solution of 2-bromo-5-isopropoxybenzaldehyde ${ }^{18}$ ( 2.97 g , $0.12 \mathrm{mmol})$ and dimethyl succinate ( $2.14 \mathrm{~g}, 0.15 \mathrm{mmol}$ ) in dry tert-butyl alcohol ( $10 \mathrm{~cm}^{3}$ ) was added to a boiling solution of freshly sublimed potassium tert-butoxide ( $1.51 \mathrm{~g}, 13.4 \mathrm{mmol}$ ) in dry tert-butyl alcohol $\left(40 \mathrm{~cm}^{3}\right)$ over a period of 15 min . The reaction mixture was heated under reflux for a further 45 min , then allowed to cool, diluted with water $\left(50 \mathrm{~cm}^{3}\right)$ and acidified with conc. hydrochloric acid. The organic material was extracted into toluene ( $3 \times 100 \mathrm{~cm}^{3}$ ) and the solvent removed by evaporation under reduced pressure. Diethyl ether $\left(100 \mathrm{~cm}^{3}\right)$ and saturated aq. sodium hydrogen carbonate ( $20 \mathrm{~cm}^{3}$ ) were added to the resultant oil. The organic phase was separated and the aqueous phase washed a further two times with diethyl ether $\left(2 \times 100 \mathrm{~cm}^{3}\right)$. After 4 h the mixture was filtered through a small Celite plug and the solvent was removed in vacuo to afford the isochromanol 33 as a dark oil ( $0.48 \mathrm{~g}, 100 \%$ ) (Found: $\mathrm{M}^{+}$, 238.1193. $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{O}_{4}$ requires $M, 238.1205) ; v_{\max }($ film $) / \mathrm{cm}^{-1} 3300 \mathrm{br}(\mathrm{OH}), 1626 \mathrm{~s}$ ( $\mathrm{ArC}=\mathrm{C}$ ), 1260 s and $1087 \mathrm{~s}(\mathrm{C}-\mathrm{O}-\mathrm{C}) ; \delta_{\mathrm{H}}\left(200 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right.$; $\left.\mathrm{Me}_{4} \mathrm{Si}\right) 6.39(1 \mathrm{H}, \mathrm{s}, 7-\mathrm{H}), 5.07(1 \mathrm{H}, \mathrm{q}, J 6.5,1-\mathrm{H}), 4.55(1 \mathrm{H}, \mathrm{br} \mathrm{s}$, $\mathrm{OH}), 4.15-3.95(1 \mathrm{H}, \mathrm{m}, 3-\mathrm{H}), 3.86$ and 3.77 (each $3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}$ ), $2.81(1 \mathrm{H}$, dd, $J 17.0$ and 3.4, 4-H pseudo-equatorial), 2.36 ( 1 H , dd, $J 17.0$ and 10.8, 4-H pseudo-axial), 1.48 ( $3 \mathrm{H}, \mathrm{d}, J 6.5$, $\left.1-\mathrm{CH}_{3}\right)$ and $1.33\left(3 \mathrm{H}, \mathrm{d}, J 6.1,3-\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(50.32 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right)$ $148.5,144.3$ and $136.4(3 \times \mathrm{ArC}-\mathrm{O}), 120.9$ and $120.5(2 \times$ $\mathrm{ArC}-\mathrm{C}), 93.8$ (7-C), 68.1 (1-C), 62.2 (3-C), 56.2 and 55.8 $\left(2 \times \mathrm{OCH}_{3}\right), 30.1(4-\mathrm{C}), 21.9\left(1-\mathrm{CH}_{3}\right)$ and $19.7\left(3-\mathrm{CH}_{3}\right) ; \mathrm{m} / \mathrm{z}$ (EI) $238\left(\mathrm{M}^{+}, 24 \%\right), 223(100), 208(14)$ and 193 (7).

Method B. A small scoop of palladium black ( $\approx 0.050 \mathrm{~g}$ ) in water was washed with methanol $\left(2 \times 20 \mathrm{~cm}^{3}\right)$ followed by dry methanol $\left(2 \times 2 \mathrm{~cm}^{3}\right)$. (CAUTION: dry palladium black is very pyrophoric and the catalyst must stay wet with solvent.) A formic acid-methanol mixture ( $10 \% ; 2 \mathrm{~cm}^{3}$ ) was added and the reaction mixture was stirred vigorously for 10 min . The benzylprotected compound $\mathbf{2 5}(0.088 \mathrm{~g}, 0.27 \mathrm{mmol})$ was added to the catalyst in a formic acid-methanol mixture ( $10 \% ; 2 \mathrm{~cm}^{3}$ ) and the reaction mixture was stirred for 45 min at ambient temperature under an argon atmosphere. The palladium black was removed by filtration and the catalyst was washed with methanol ( $2 \times 20 \mathrm{~cm}^{3}$ ). The solvent was removed in vacuo to afford the isochromanol 33 as a dark oil ( $0.064 \mathrm{~g}, 100 \%$ ). Spectral data for this product were identical to those obtained in method A.

## 6,8-Dimethoxy-trans-1,3-dimethylisochroman-5-yl trifluoromethanesulfonate 35

Dry pyridine ( $\left.0.27 \mathrm{~cm}^{3}, 0.26 \mathrm{~g}, 3.3 \mathrm{mmol}\right)$ was added to a solution of isochromanol $33(0.71 \mathrm{~g}, 3.00 \mathrm{mmol})$ in dry chloroform ( $20 \mathrm{~cm}^{3}$ ) under an argon atmosphere in a Schlenk tube. This mixture was added through a cannula to a Schlenk tube containing trifluoromethanesulfonic anhydride $(0.95 \mathrm{~g}, 3.30$ $\mathrm{mmol})$, forming a purple-red reaction mixture. The reaction mixture was then stirred for 18 h under argon. Ice-water (10 $\mathrm{cm}^{3}$ ) were added and the water layer was extracted with chloroform $\left(3 \times 10 \mathrm{~cm}^{3}\right)$, which was separated, dried $\left(\mathrm{MgSO}_{4}\right)$, and removed in vacuo. Column chromatography (dichloromethane) yielded the triflate 35 as a white semi-solid ( $0.98 \mathrm{~g}, 88 \%$ ) (Found: $\mathrm{M}^{+}, 370.0699 . \mathrm{C}_{14} \mathrm{H}_{17} \mathrm{~F}_{3} \mathrm{O}_{6} \mathrm{~S}$ requires $M, 370.0698$ ); $v_{\max }(\mathrm{KBr}$ pellet $) / \mathrm{cm}^{-1} 1618 \mathrm{~m}$ and $1589 \mathrm{~m}(\mathrm{ArC}=\mathrm{C}), 1207 \mathrm{vs}$ and $1135 \mathrm{vs}\left(\mathrm{R}-\mathrm{SO}_{2}-\mathrm{OR}\right)$, 1086s ( $\mathrm{C}-\mathrm{O}-\mathrm{C}$ ) and 763m (C-F, $\mathrm{CF}_{3}$ ); $\delta_{\mathrm{H}}\left(200 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{Me}_{4} \mathrm{Si}\right) 6.46(1 \mathrm{H}, \mathrm{s}, 7-\mathrm{H}), 5.03(1 \mathrm{H}, \mathrm{q}$, $J 6.6,1-\mathrm{H}), 4.11-3.96(1 \mathrm{H}, \mathrm{m}, 3-\mathrm{H}), 3.87$ and 3.83 (each 3 H , s, $\left.\mathrm{OCH}_{3}\right), 2.77(1 \mathrm{H}, \mathrm{dd}, J 16.8$ and 3.3, 4-H pseudo-equatorial), $2.44(1 \mathrm{H}, \mathrm{dd}, J 16.8$ and $J 10.6,4-\mathrm{H}$ pseudo-axial), 1.47 (3H, d, $\left.J 6.6,1-\mathrm{CH}_{3}\right)$ and $1.33\left(3 \mathrm{H}, \mathrm{d}, J 6.1,3-\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}(50.32 \mathrm{MHz}$; $\left.\mathrm{CDCl}_{3}\right) 155.0$ and $150.1(2 \times \mathrm{ArC}-\mathrm{O}), 128.8$ (5-C), 121.8 and 120.7 ( $2 \times \mathrm{ArC-C}$ ), 118.6 (q, J 320.2, $\mathrm{CF}_{3}$ ), 94.1 (7-C), 67.8 $(1-\mathrm{C}), 61.9(3-\mathrm{C}), 56.0$ and $55.5\left(2 \times \mathrm{OCH}_{3}\right), 30.5(4-\mathrm{C}), 21.6$ $\left(1-\mathrm{CH}_{3}\right)$ and $19.4\left(3-\mathrm{CH}_{3}\right) ; m / z(\mathrm{EI}) 370\left(\mathrm{M}^{+}, 22 \%\right), 355$ (100), 237 (72), 222 (22), 207 (22) and 193 (95).

## 6,8-Dimethoxy-trans-1,3-dimethylisochroman 38

Phosphate $38(0.28 \mathrm{~g}, 0.75 \mathrm{mmol})$ was dissolved in diethyl ether $\left(5 \mathrm{~cm}^{3}\right)$ and added to a stirred solution of liquid ammonia ( 50 $\mathrm{cm}^{3}$ ) at $-78^{\circ} \mathrm{C}$. Potassium metal was added in small pieces until a dark blue colour persisted for 15 min . Excess of ammonium chloride was then added and propan-2-ol $\left(50 \mathrm{~cm}^{3}\right)$ was added to destroy excess of potassium metal. The ammonia was allowed to evaporate overnight and water ( $20 \mathrm{~cm}^{3}$ ) was added to the mixture. The aqueous layer was extracted with diethyl ether $\left(5 \times 20 \mathrm{~cm}^{3}\right)$, which was dried $\left(\mathrm{MgSO}_{4}\right)$, and concentrated in vacuo. Column chromatography gave the isochromane 38 as a clear oil ( $0.17 \mathrm{~g}, 100 \%$ ) (Found: $\mathrm{M}^{+}$, 222.1268. $\mathrm{C}_{13} \mathrm{H}_{18} \mathrm{O}_{3}$ requires $M, 222.1256)$; $v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 2850 \mathrm{~m}\left(\mathrm{OCH}_{3}\right), 1608 \mathrm{~m}$ and $1600(\mathrm{ArC}=\mathrm{C})$ and 1212 s and $1090 \mathrm{~s}(\mathrm{C}-\mathrm{O}-\mathrm{C}) ; \delta_{\mathrm{H}}(200$ $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{Me}_{4} \mathrm{Si}\right) 6.29(1 \mathrm{H}, \mathrm{d}, J 2.3,5-\mathrm{H}), 6.21(1 \mathrm{H}, \mathrm{d}, J 2.3$, $7-\mathrm{H}), 5.03(1 \mathrm{H}, \mathrm{q}, J 6.5,1-\mathrm{H}), 4.16-4.00(1 \mathrm{H}, \mathrm{m}, 3-\mathrm{H}), 3.78(6 \mathrm{H}$, $\left.\mathrm{s}, 2 \times \mathrm{OCH}_{3}\right), 2.68-2.49\left(2 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}_{2}\right), 1.48(3 \mathrm{H}, \mathrm{d}, J 6.5$, $\left.1-\mathrm{CH}_{3}\right)$ and $1.30\left(3 \mathrm{H}, \mathrm{d}, J 6.1,3-\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(50.32 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right)$ 158.9 and $156.5(2 \times \mathrm{ArC}-\mathrm{O}), 135.1$ and $120.6(2 \times \mathrm{ArC}-\mathrm{C})$, 104.0 ( $5-\mathrm{C}$ ), 96.3 ( $7-\mathrm{C}$ ), 68.3 (1-C), 62.6 (3-C), 55.2 and 55.1 $\left(2 \times \mathrm{OCH}_{3}\right), 36.4(4-\mathrm{C}), 21.8\left(1-\mathrm{CH}_{3}\right)$ and $19.8\left(3-\mathrm{CH}_{3}\right) ; \mathrm{m} / \mathrm{z}(\mathrm{EI})$ $222\left(\mathrm{M}^{+}, 18 \%\right), 207(100), 192$ (6) and 177 (6).

## 5-Iodo-6,8-dimethoxy-trans-1,3-dimethylisochromane 10

Sublimed iodine ( $0.23 \mathrm{~g}, 0.89 \mathrm{mmol}$ ) and silver(I) sulfate ( 0.28 g , $0.89 \mathrm{mmol})$ in absolute ethanol $\left(10 \mathrm{~cm}^{3}\right)$ were added dropwise to a stirred solution of $38(0.17 \mathrm{~g}, 1.08 \mathrm{mmol})$ in absolute ethanol $\left(10 \mathrm{~cm}^{3}\right)$. Additional absolute ethanol $\left(10 \mathrm{~cm}^{3}\right)$ was used to wash residues from the dropping funnel into the reaction mixture. Sodium hydride ( $60 \%$ in oil; $0.13 \mathrm{~g}, 3.24 \mathrm{mmol}$ ) was added to a solution of isochromanol $34(0.79 \mathrm{~g}, 2.7 \mathrm{mmol}$ ) in THF ( 50 $\mathrm{cm}^{3}$ ) and the mixture was stirred for 20 min under an argon atmosphere. Diethyl phosphorochloridate $\left(0.43 \mathrm{~cm}^{3}, 0.51 \mathrm{~g}, 3.0\right.$ mmol ) was added dropwise by syringe and the mixture was
stirred at room temperature for 20 h . Diethyl ether $\left(50 \mathrm{~cm}^{3}\right)$ was added and the organic phase was washed successively with aq. sodium hydroxide ( $10 \% \mathrm{~m} / v ; 3 \times 20 \mathrm{~cm}^{3}$ ) and water $\left(50 \mathrm{~cm}^{3}\right)$. The organic layer was dried $\left(\mathrm{MgSO}_{4}\right)$, and removed in vacuo to give a light yellow residue. This was purified by column chromatography ( $50 \%$ ethyl acetate-hexane to $10 \%$ methanol-hexane) to give the phosphate ester 37 as a clear oil ( $0.93 \mathrm{~g}, 81 \%$ ) (Found: $\mathrm{M}^{+}, 430.2111 . \mathrm{C}_{21} \mathrm{H}_{35} \mathrm{O}_{7}$ requires $M, 430.2120$ ); $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 2860 \mathrm{w}\left(\mathrm{OCH}_{2}\right), 1610 \mathrm{~m}(\mathrm{ArC=C}), 1367 \mathrm{~m}\left(\mathrm{CH}_{3}\right)$, $1295 \mathrm{~m}(\mathrm{P}=\mathrm{O})$, 1124s ( $\mathrm{C}-\mathrm{O}-\mathrm{C}$ ) and 1035s ( $\mathrm{P}-\mathrm{O}-\mathrm{C}$ ); $\delta_{\mathrm{H}}(400$ $\left.\mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{Me}_{4} \mathrm{Si}\right) 6.36(1 \mathrm{H}, \mathrm{s}, 7-\mathrm{H}), 5.00(1 \mathrm{H}, \mathrm{q}, J 6.5,1-\mathrm{H})$, 4.54-4.44 [ $2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}$ ], $4.28-4.21(4 \mathrm{H}, \mathrm{m}, 2 \times$ $\left.\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 4.05-4.00(1 \mathrm{H}, \mathrm{m}, 3-\mathrm{H}), 2.90(1 \mathrm{H}, \mathrm{dd}, J 16.9$ and 3.1 , 4-H pseudo-equatorial), $2.46(1 \mathrm{H}, \mathrm{dd}, J 16.9$ and $10.9,4-\mathrm{H}$ pseudo-axial), $1.47\left(3 \mathrm{H}, \mathrm{d}, J 6.6,1-\mathrm{CH}_{3}\right), 1.37-1.33(15 \mathrm{H}, \mathrm{m}$, $\left.5 \times \mathrm{CH}_{3}\right), 1.31\left(3 \mathrm{H}, \mathrm{d}, J 6.1, \mathrm{CH}_{3}\right)$ and $1.29(3 \mathrm{H}, \mathrm{d}, J 6.0$, $\left.3-\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(100.63 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right)$ (values in parentheses refer to the minor stereoisomer) 150.5 (150.4), 147.4 (147.4) (132.3) and 132.2, ( $3 \times \mathrm{ArC}-\mathrm{O}$ ), 127.8 (127.8) and 121.3 ( $2 \times \mathrm{ArC}-\mathrm{C}$ ), 99.0 (7-C), 71.1 and $69.8\left[2 \times \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right], 67.9$ (1-C), (64.0), 63.9 , 63.9 and (63.9) $\left(2 \times \mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 62.0$ (3-C), 30.9 (4-C), 21.9 $\left(1-\mathrm{CH}_{3}{ }^{\mathrm{a}}\right), 21.9,21.8,21.8$ and $21.7\left[2 \times \mathrm{CH}\left(\mathrm{CH}_{3}\right)^{\mathrm{a}}{ }^{\mathrm{a}}\right]$ ], 19.4 $\left(3-\mathrm{CH}_{3}{ }^{\mathrm{a}}\right)$ and 15.9 and $15.9\left(2 \times \mathrm{OCH}_{2} \mathrm{CH}_{3}\right) ; m / z(\mathrm{EI}) 430\left(\mathrm{M}^{+}\right.$, $31 \%$ ), 415 (62), 373 (100), 331 (33) and 43 (20).

## 6,8-Diisopropoxy-trans-1,3-dimethylisochromane 39

Liquid ammonia ( $50 \mathrm{~cm}^{3}$ ) was distilled into a solution of isochromane $37(0.53 \mathrm{~g}, 1.23 \mathrm{mmol})$ in diethyl ether $\left(5 \mathrm{~cm}^{3}\right)$ at $-78^{\circ} \mathrm{C}$. Potassium metal was added in small pieces until a dark blue colour persisted for 15 min . Excess of ammonium chloride was then added and propan-2-ol ( $50 \mathrm{~cm}^{3}$ ) was added to destroy excess of potassium metal. The ammonia was allowed to evaporate overnight and water $\left(50 \mathrm{~cm}^{3}\right)$ was added to the mixture. The aqueous layer was extracted with diethyl ether ( $3 \times 50$ $\mathrm{cm}^{3}$ ), which was dried $\left(\mathrm{MgSO}_{4}\right)$, and concentrated in vacuo. Column chromatography gave the isochromane 39 as a clear oil $(0.31 \mathrm{~g}, 91 \%)$ (Found: $\mathrm{M}^{+}, 278.1875 . \mathrm{C}_{17} \mathrm{H}_{26} \mathrm{O}_{3}$ requires $M$, 278.1882); $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 1610$ and $1591(\mathrm{ArC}=\mathrm{C}), 1383 \mathrm{~m}$ and $1372 \mathrm{~m}\left[\mathrm{CH}_{3}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right]$ and $1204 \mathrm{~m}, 1069 \mathrm{~s}$ and $829 \mathrm{~m}(\mathrm{C}-\mathrm{O}-$ C); $\delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{Me}_{4} \mathrm{Si}\right) 6.25(1 \mathrm{H}, \mathrm{d}, J 2.1,5-\mathrm{H}), 6.18$ $(1 \mathrm{H}, \mathrm{d}, J 2.1,7-\mathrm{H}), 5.00(1 \mathrm{H}, \mathrm{q}, J 6.6,1-\mathrm{H}), 4.53-4.45[2 \mathrm{H}, \mathrm{m}$, $\left.2 \times \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right], 4.09-4.04(1 \mathrm{H}, \mathrm{m}, 3-\mathrm{H}), 2.62-2.51(2 \mathrm{H}, \mathrm{m}$, $\left.4-\mathrm{H}_{2}\right), 1.48\left(3 \mathrm{H}, \mathrm{d}, J 6.6,1-\mathrm{CH}_{3}\right), 1.34-1.31\left[9 \mathrm{H}, \mathrm{m}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)-\right.$ $\left.\mathrm{CH}_{3}, \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right], 1.30\left[3 \mathrm{H}, \mathrm{d}, J 6.0, \mathrm{CH}\left(\mathrm{CH}_{3}\right) \mathrm{CH}_{3}\right]$ and 1.28 $\left(3 \mathrm{H}, \mathrm{d}, J 6.1,3-\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(100.63 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 157.0$ and 154.6 $(2 \times \mathrm{ArC}-\mathrm{O}), 135.1$ and $121.1(2 \times \mathrm{ArC}-\mathrm{C}), 106.0$ (5-C), 99.5 (7-C), 69.8 and $69.5\left[2 \times \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right], 68.5(1-\mathrm{C}), 62.6(3-\mathrm{C})$, $36.5(4-\mathrm{C}), 22.2,22.1,22.1$ and $21.8\left[2 \times \mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}{ }^{\mathrm{a}}\right]$ ], 21.8 $\left(1-\mathrm{CH}_{3}{ }^{\mathrm{a}}\right)$ and $19.8\left(3-\mathrm{CH}_{3}\right) ; m / z(\mathrm{EI}) 278\left(\mathrm{M}^{+}, 18 \%\right), 263(100)$, 221 (40), 179 (89) and 43 (17).

Method 1. Bromide 12 ( $0.090 \mathrm{~g}, 0.30 \mathrm{mmol}$ ), 1-naphthylboronic acid $40(0.10 \mathrm{~g}, 0.60 \mathrm{mmol})$ and tetrakis(triphenylphosphine) palladium( 0 ) ( $0.035 \mathrm{~g}, 0.03 \mathrm{mmol}, 10 \mathrm{~mol} \%$ ) were added under a stream of argon to a Pyrex culture tube. Degassed toluene ( $1.5 \mathrm{~cm}^{3}$ ) and saturated aq. sodium bicarbonate $\left(1.5 \mathrm{~cm}^{3}\right)$ were added and the tube was sealed. The organic extracts were combined, dried $\left(\mathrm{MgSO}_{4}\right)$, and then the solvent was removed in vacuo. Purification of the residue by preparative thin-layer chromatography (PLC) (5\% ethyl acetate-hexane) afforded the biaryl compound $\mathbf{4 3}$ as a brown oil $(0.029 \mathrm{~g}, 28 \%)$ (diastereomeric ratio 66:34), naphthalene ( $0.020 \mathrm{~g}, 26 \%$ ) and unreacted bromoisochromane 12 ( $0.033 \mathrm{~g}, 37 \%$ ) (Found: $\mathrm{M}^{+}$, 348.1717. $\mathrm{C}_{23} \mathrm{H}_{24} \mathrm{O}_{3}$ requires $\mathrm{M}, 348.1725$ ); $v_{\max }$ (film) $/ \mathrm{cm}^{-1}$ 3055w (ArC-H), 2837w (C-H, OCH 3 ), 1597s ( $\mathrm{ArC=C}$ ), 1485 m ( $\mathrm{ArC}-\mathrm{C}$ ) and $1210 \mathrm{~s}, 1087 \mathrm{~s}$ and $1070 \mathrm{~m}(\mathrm{C}-\mathrm{O}-\mathrm{C}) ; \delta_{\mathrm{H}}(400 \mathrm{MHz}$; $\mathrm{CDCl}_{3}$ ) (assignments in brackets are for the minor diastereoisomer) $7.90-7.84(2 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{ArH}), 7.55-7.24(5 \mathrm{H}, \mathrm{m}$, $5 \times \mathrm{ArH}), 6.49(1 \mathrm{H}, \mathrm{s}, 7-\mathrm{H}), 5.18-5.14(1 \mathrm{H}, \mathrm{m}, 1-\mathrm{H}), 3.90-3.80$ $\left(1 \mathrm{H}, \mathrm{m}\right.$ overlapping with $\left.\mathrm{OCH}_{3}, 3-\mathrm{H}\right)(3.92), 3.91\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$ (3.61), $3.60\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.25-2.17(1 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}$ pseudoequatorial), $1.93-1.87(1 \mathrm{H}, \mathrm{m}, 4-\mathrm{H}$ pseudo-axial), 1.56 (1.55) $\left(3 \mathrm{H}, \mathrm{d}, J 6.5,1-\mathrm{CH}_{3}\right)$ and $1.07(1.04)\left(3 \mathrm{H}, \mathrm{d}, J 6.1,3-\mathrm{CH}_{3}\right)$; $\delta_{\mathrm{C}}\left(100.63 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right)(156.8), 156.7,155.8(3 \times \mathrm{ArC}-\mathrm{O})$, $135.1,134.6$ (134.5), 133.7 (133.7), 132.7 (4a-, 1'-, $4 a^{\prime}-, 8 a^{\prime}-C$ ), 128.2 (128.2), 128.0 (127.6), 127.3 (125.9) (125.8), 125.8, 125.7 (125.6), 125.6, 125.6 and (125.5) $(7 \times \mathrm{ArC}-\mathrm{H}), 120.4$ (120.3) 120.2 and 120.1 ( $8 \mathrm{a}-\mathrm{and} 5-\mathrm{C}$ ), 93.3 (93.3) (7-C), 68.4 (68.3) (1-C), 62.8 (62.7) (3-C) (56.1), 56.0 and $55.3\left(2 \times \mathrm{OCH}_{3}\right), 34.7$ (33.8) (4-C), $21.8(21.7)\left(1-\mathrm{CH}_{3}\right)$ and $20.0(19.9)\left(3-\mathrm{CH}_{3}\right) ; ~ m / z$ (EI) $348\left(\mathrm{M}^{+}, 75 \%\right), 334$ (100) and 166 (45).

## 5-(4-Isopropoxy-5-methoxy-7-methyl-1-naphthyl)-6,8-dimethoxy-trans-1,3-dimethoxyisochromane 7

The bromonaphthalene $4(0.10 \mathrm{~g}, 0.32 \mathrm{mmol})$ was dissolved in dry THF ( $5 \mathrm{~cm}^{3}$ ) and the solution was cooled to $-78^{\circ} \mathrm{C}$ under an argon atmosphere. $n$-Butyllithium $\left(1.4 \mathrm{M} ; 0.27 \mathrm{~cm}^{3}, 0.38\right.$ mmol ) was added by syringe over a period of 10 min and the solution became yellow. After stirring of the mixture for a further 7 min , triisopropyl borate ( $0.22 \mathrm{~cm}^{3}, 0.95 \mathrm{mmol}$ ) was
added by syringe and the mixture was stirred at $-78^{\circ} \mathrm{C}$ for a further 5 min . The reaction mixture was then warmed to room temperature over a period of 18 h . Saturated aq. ammonium chloride ( $10 \mathrm{~cm}^{3}$ ) and ice ( $10 \mathrm{~cm}^{3}$ ) were added and the reaction mixture was stirred for a further 10 min before being extracted successively with diethyl ether $\left(2 \times 10 \mathrm{~cm}^{3}\right)$ and dichloromethane $\left(2 \times 10 \mathrm{~cm}^{3}\right)$. The organic phases were combined, dried $\left(\mathrm{MgSO}_{4}\right)$, and the solvent removed under vacuum to afford a residue of 4-isopropoxy-5-methoxy-7-methyl-1naphthylboronic acid 9 which was used without further purification and without delay.

The boronic acid 9 (assume 0.31 mmol ) was transferred to a small round-bottomed flask with DMF $\left(1 \mathrm{~cm}^{3}\right)$ and oxygen was excluded by three freeze-thaw cycles. The flask was sealed and transferred to an argon tent. Iodide $10(0.054 \mathrm{~g}, 0.15 \mathrm{mmol})$, tribasic potassium phosphate $\left(\mathrm{K}_{3} \mathrm{PO}_{4}\right)(0.10 \mathrm{~g}, 0.48 \mathrm{mmol})$, and tetrakis(triphenylphosphine) palladium(0) $(0.036 \mathrm{~g}, 0.031 \mathrm{mmol}$, $20 \mathrm{~mol} \%$ based on iodide 10) were added sequentially under flowing argon. The flask was sealed, and then heated, with stirring, under an argon atmosphere at $100^{\circ} \mathrm{C}$ for 65 h . The mixture was then cooled and brine ( $10 \mathrm{~cm}^{3}$ ) was added. The reaction mixture was extracted with diethyl ether $\left(4 \times 10 \mathrm{~cm}^{3}\right)$, which was dried $\left(\mathrm{MgSO}_{4}\right)$, and removed in vacuo. (a) Dimerisation. Phenol $44(0.015 \mathrm{~g}, 0.037 \mathrm{mmol})$ was dissolved in freshly dried chloroform ( $3 \mathrm{~cm}^{3}$ ) containing triethyl-
amine ( $0.2 \%$ ). Silver(I) oxide ( $0.15 \mathrm{~g}, 10$ mass equiv.) was added and the mixture was stirred under air for 9 days in the dark until all the starting material had been consumed with an extra portion of silver( I ) oxide ( 0.10 g ) added after 2 days. During this time the reaction mixture assumed a dark purple colour The mixture was filtered through a short Celite plug and the solvent was removed in vacuo. The residue was purified by column chromatography ( $5 \%$ methanol-dichloromethane) to afford the intermediate ene-dione $45(0.016 \mathrm{~g}, 100 \%)$ as a dark, purple semi-solid (Found: $\mathrm{M}^{+}, 812.3551 . \mathrm{C}_{50} \mathrm{H}_{52} \mathrm{O}_{10}$ requires $M$, $812.3561) ; m / z(E I) 812\left(\mathrm{M}^{+}, 100 \%\right)$ and 391 (17).

Method 2. The foregoing ene-dione $45(16 \mathrm{mg}, 0.019 \mathrm{mmol})$ was dissolved in methanol ( $25 \mathrm{~cm}^{3}$ ) and irradiated (GEC Alsthom 1500 W 230 V Visible Light) for 4 min with stirring of the solution during which time the reaction mixture's colour changed from a dark purple to a clear yellow. The solvent was removed in vacuo and the residue was purified by column chromatography ( $5-30 \%$ ethyl acetate-hexane) to afford the product 6 as a yellow oil $(0.007 \mathrm{~g}, 46 \%)$. The product 6 had the same spectroscopic properties as the product obtained from Method 1.
