Atropisomeric compounds whose chirality resides in a rotationally restricted aryl- $\mathrm{CONR}_{2}$ bond may be employed as chiral auxiliaries. The electron-withdrawing amide group causes problems in the diastereoselective functionalisation of enolates derived from atropisomeric phenyl esters, but a strategy based on atroposelective nucleophilic addition to a chiral aldehyde followed by stereospecific [3,3] sigmatropic rearrangement allows atropisomeric naphthamides to be used as auxiliaries. The auxiliaries are resolved by dynamic resolution during aminal formation using a prolinederived diamine.

## Introduction

In a series of publications, ${ }^{1-11}$ we have demonstrated that the stereogenic axis of hindered, atropisomeric tertiary aromatic amides of general structure $\mathbf{1}$ is capable of controlling high

2
levels of stereoselectivity. We have also described two ways of making this class of atropisomeric compounds as single enantiomers, ${ }^{12,13}$ both involving the control of axial stereochemistry by the conformational influence of an adjacent stereogenic centre. In this paper we describe our progress towards using atropisomeric amides as a new class of chiral auxiliaries. We begin with our attempts to design an auxiliary suitable for use in asymmetric anti-aldol chemistry, before moving on to the asymmetric synthesis of 2 -substituted alcohols using a chiral, atropisomeric, peri-substituted naphthamide chiral auxiliary. ${ }^{14}$ We found that the use of a hydrolysable ester linkage between the auxiliary and the substrate led to many problems, and for our successful development of the naphthamide auxiliary we use the strategy of linking the auxiliary to the substrate via a $\mathrm{C}-\mathrm{C}$ bond, the auxiliary itself being an aldehyde. Our published ${ }^{15}$ use of 2-dibenzylamino-3-phenylpropanal as a chiral auxiliary uses a similar strategy.

## Atropisomeric chiral auxiliaries

Atropisomers which arise from restricted rotation in bonds to aromatic rings-and the vast majority of atropisomeric compounds fall into this category-can be seen as chiral modifications of the aromatic rings themselves. The famous and powerful atropisomeric phosphine ligands such as BINAP $\mathbf{2}^{16}$ are in essence modifications to triphenylphosphine in which

[^0]one of the phenyl rings is made chiral by incorporating it into the atropisomeric binaphthyl system. The philosophy of constructing chiral aryl groups by complexation to transition metals (principally chromium ${ }^{17,18}$ for benzenoid rings and iron ${ }^{19,20}$ for cyclopentadienyl) has also been fruitful in the invention of new chiral reagents, ligands and auxiliaries.
We were initially drawn to the idea of using atropisomeric chiral auxiliaries for aldol chemistry by the work of Heathcock, ${ }^{21,22}$ who showed in 1980 that the propionate esters 3-5 of heavily substituted phenols undergo highly anti-selective aldol reactions with aldehydes (Scheme 1).

Scheme 1 anti-Aldol reactions with hindered phenyl esters.

The DMP ester $\mathbf{3}$ gives ratios of $88: 12$ to $86: 14$ anti- $\mathbf{6}:$ syn- 6 with aromatic aldehydes and $\alpha$-unbranched aliphatic aldehydes, and pure anti products with $\alpha$-branched aliphatic aldehydes $(>98:<2)$. The BHT and BHA esters 4 and 5 give only antialdols with all aldehydes. All are readily prepared from the commercially available phenols. The products 6 from the less selective DMP esters 3 may be hydrolysed; the BHT and BHA esters from 4 and 5 resist hydrolysis, but the latter may be cleaved oxidatively. The anti-selective aldol reactions of hindered aryl esters appear as key steps in synthetic routes to davanone, ${ }^{23}$ lankanolide, ${ }^{24}$ the pamamycins, ${ }^{25}$ erythronolides $\mathrm{A}^{26}$ and $\mathrm{B}^{27}$ and the vitamin E side chain, ${ }^{28}$ among others. ${ }^{29,30}$

Table 1 Synthesis of the carbamoylphenols

Scheme 2 Fuji's anti-aldol with an atropisomeric, hindered ester.

A chiral version of these hindered aryl groups offers the chance to achieve anti-diastereoselectivity in an enantioselective fashion. Previous studies in this area include those of Fuji and co-workers, ${ }^{31}$ who have reported that the enolate of the binaphthyl ester 7 reacts with aldehyde electrophiles to give the anti-aldol products anti-8 with high diastereoselectivity and in good yields (Scheme 2).

Our aim in the work described in this paper was to achieve similar anti-selectivity in aldol reactions of esters derived from hindered atropisomeric phenols bearing tertiary amide substituents. We hoped to exploit the Lewis-basicity of the amide group to enhance the degree of chelation control in the aldol transition state. We hoped then to develop an asymmetric antialdol reaction by using enantiomerically pure atropisomeric amides.
Enantiomerically pure non-biaryl atropisomers have only recently found uses in asymmetric synthesis, and the most wellstudied class to date are anilides related to 9 (Scheme 3). These

Scheme 3 syn-Aldol reaction of an atropisomeric anilide.
have been obtained in enantiomerically enriched form ${ }^{32-35}$ and employed as chiral auxiliaries to asymmetric enolate alkylations and aldol reactions, ${ }^{32,33}$ cycloadditions ${ }^{34}$ and iodolactonisations. ${ }^{35}$ Simpkins and co-workers achieved high syndiastereoselectivity in aldol reactions of atropisomeric anilide 9 derived from ortho-tert-butylaniline (Scheme 3). ${ }^{36,33}$
$\mathrm{We}^{12}$ and others ${ }^{37}$ have recently reported enantioselective routes to atropisomeric benzamides 2 and the related naphthamides, but uses for enantiomerically enriched atropisomeric benzamides have been confined to NADH model studies ${ }^{38}$ and components of tachykinin $\mathrm{NK}_{1}$ receptor agonists. ${ }^{39}$

## Results

## Aldol reactions of $\mathrm{N}, \mathrm{N}$-dialkylcarbamoylphenyl esters

Our first task was to establish whether aldol reactions of the esters of amide-substituted phenols were even possible, irrespective of stereochemistry.

Our first reactions were attempted using 2-hydroxybenzamide 13a. Phenol 11a and diisopropylcarbamoyl chloride in refluxing pyridine gave the carbamate 12a, which was converted to the amide 13a using the "anionic ortho-Fries" rearrangement developed by Snieckus ${ }^{40}$-essentially an intramolecular acyl transfer reaction of an ortholithiated carbamate. The ortholithiated carbamate is stable at $-78^{\circ} \mathrm{C}$, but undergoes rearrangement to the phenoxide on warming and thence gives 13a on aqueous quench (Scheme 4). Esterification with propionyl chloride gave propionate $\mathbf{1 4 a}$ (Table 1).

with LDA at $-78^{\circ} \mathrm{C}$ and quenching with benzaldehyde gave only 2 -hydroxybenzamide 13a and recovered starting material 14a: no aldol products 15 were observed (Table 2, entry 1). The formation of 13a can be explained by decomposition of the enolate according to Scheme 6. Compound 13a was also

Scheme 6 Decomposition of the enolate of 14a.
formed when the enolate was quenched at $-78^{\circ} \mathrm{C}$ with ammonium chloride (entry 2 ).

We assume the problem arises from the stability of the phenoxide, stabilised as it is by conjugation with the amide carbonyl group. We therefore next made the amino-substituted hydroxybenzamide 13c, hoping that destabilisation of the phenoxide by the para-amino substituent would disfavour the competing elimination. Compound 13c was made from 4 -aminophenol 11b by methylation to give 11c, carbamate formation to give 12c and anionic ortho-Fries rearrangement to 13c. Unfortunately, formation of the lithium enolate of the propionate ester 14 c of the amino-substituted phenol 13c still led to decomposition by elimination of $\mathbf{1 3 c}$ (entry 3 ).

A successful atropisomeric chiral auxiliary would necessarily be a 2,6 -disubstituted benzamide, or it would lack conformational stability. ${ }^{41}$ We wondered whether the enforced perpendicular conformation ${ }^{4}$ of a 2,6-disubstituted amide would furthermore lessen the ability of the amide group to stabilise the phenoxide anion by conjugation. Both 2 -substituted and 2,6-disubstituted benzamides adopt a perpendicular conformation in the ground state, ${ }^{4}$ but we expected rotation of the latter into a conformation allowing some degree of conjugation to incur a significantly greater cost in steric strain. Our next target phenol was therefore 13d, in which the methylenedioxy group has a dual role: it increases the electron density on the ring, and blocks any overlap of the amide $\pi^{*}$ with the conjugated phenoxide orbitals. The synthesis of 13d was again straightforward: the only additional point of interest is the regioselectivity of the anionic ortho-Fries rearrangement of 12d, which followed precedent: ${ }^{40}$ lithiation occurred in between the two ortho-directors (carbamate and alkoxy) to give the 1,2,3,4tetrasubstituted phenol 13d. Esterification gave 14d, but unfortunately the lithium enolate of $\mathbf{1 4 d}$ was again unstable, and collapsed to give significant amounts of $\mathbf{1 3 d}$ at $-78^{\circ} \mathrm{C}$ (Table 2, entry 4).
We briefly investigated the possibility of "insulating" the phenoxide from the electronic effect of the amide by attaching the two groups to the separate rings of a naphthalene system. To maintain the stereochemical communication between the two groups necessary for any successful asymmetric induction,
we decided to attempt an aldol reaction on the enolate of esters of the 8 -hydroxynaphthamide $\mathbf{1 6}$. This type of compound was

particularly attractive because it can be made from naphthalic anhydride by a high-yielding route, ${ }^{42}$ and the peri-relationship between the hydroxy group and the amide is expected to result in good conformational stability. Esterification of $\mathbf{1 6}$ and enolisation of $\mathbf{1 7}$ with LDA however still led to decomposition by elimination (Table 2, entry 5).
We finally concluded that to have any chance of preventing the decomposition of the enolate, we would need to make it a dianion. We therefore decided to try next the dihydroxybenzamide 13g. We expected problems with a dianionic ortho-Fries rearrangement of $\mathbf{1 2 g}$ (which we required later in the project), so we made $\mathbf{1 3 g}$ by demethylation of 13 e using boron tribromide-dimethyl sulfide complex. Compound 13e was easily made by the usual route from 4-methoxyphenol 11e (Table 1). Esterification of the unsymmetrical diol $\mathbf{1 3 g}$ gave a separable mixture of the desired monoester $\mathbf{1 4 g}$ and the diester 14h. Encouragingly, treatment of the monoester 14 g with two equivalents of LDA at $-78^{\circ} \mathrm{C}$ and quenching with saturated aqueous ammonium chloride gave starting material only (no decomposition products) by ${ }^{1} \mathrm{H}$ NMR (Table 2, entry 6 ).

Lack of regioselectivity in the esterification of $\mathbf{1 3 g}$ hampered further work with $\mathbf{1 4 g}$, so we decided to turn to a protecting group for the para-hydroxy group which we could retain until after esterification with propionyl chloride. Table 1 shows how hydroquinone $\mathbf{1 1 g}$, with one equivalent of diisopropylcarbamoyl chloride in pyridine, gave carbamate $\mathbf{1 2 g}$ in good yield. The remaining hydroxy group of $\mathbf{1 2 g}$ was protected with chloromethyl methyl ether to give carbamate 12i in excellent yield. Anionic Fries rearrangement of 12i gave 13i, which was esterified to give $\mathbf{1 4 i}$ and then selectively relieved of its MOM group by sodium iodide in acetone in the presence of catalytic conc. HCl , giving cleanly $\mathbf{1 4 g}$.
The result of the aldol reaction of $\mathbf{1 4 g}$ is shown in Scheme 7 and Table 2, entry 7. Treatment of a solution of two equivalents of LDA in THF at $-78^{\circ} \mathrm{C}$ with ester $\mathbf{1 4 g}$ and then benzaldehyde afforded a mixture of aldol products $\mathbf{1 8}$ in $62 \%$ yield after purification. Evaluation of the diastereoisomeric ratio by NMR was complicated by slow rotation about the amide $\mathrm{Ar}-\mathrm{CO}$ and $\mathrm{C}-\mathrm{N}$ bonds. However, lithium aluminium hydride in refluxing THF gave a readily identifiable mixture of the diols $\mathbf{2 0}$ in a diastereoisomeric ratio of 31 (anti): 69 (syn) (identification of

Scheme 8 2,6-Disubstituted phenyl esters by regioselective anionic ortho-Fries rearrangement.
the diastereoisomers described below). These conditions also reduced the amide to 19 in $22 \%$ yield.

Encouragingly, we had now confirmed that the dianion enolates were stable, and underwent clean aldol reactions. We were, at this stage, hopeful that the $2: 1 \mathrm{syn}$-selectivity would be overturned by introduction of a second substituent ortho to the ester linkage (in the manner of 5) so we decided to use ortholithiation of the carbamate precursor to achieve this. We took carbamates 12e and 12f, lithiated them with $s$-BuLi at $-78^{\circ} \mathrm{C}$, and added methyl iodide to give 21a and 21b in 95 and $96 \%$ yields respectively (Scheme 8). The anionic Fries rearrangement of these compounds to $\mathbf{2 2 a}$ and $\mathbf{2 2 b}$ was surprisingly complicated by a lack of regioselectivity in their lithiation reactions. Although lateral lithiation (i.e. lithiation at an ortho benzylic site) commonly dominates ortholithiation in amides, ${ }^{4,9,94}$ even ortho-methyl substituted carbamates typically undergo clean anionic ortho-Fries rearrangement. ${ }^{40}$ Not so 21a and 21b: both showed evidence of considerable lateral lithiation and migration of the amide substituent to the benzylic position (Table 3). Warming lithiated carbamate 21a to ambient temperature and quenching with water afforded a mixture of the desired 22a (18\%), the product of lateral lithiation and rearrangement 23a ( $26 \%$ ) and remaining 21a $(24 \%)$. Judging the main difference between our molecules and those of Snieckus to be the nitrogen substituents, we next tried rearranging 21b. The yield of the anionic ortho-Fries product 22b ( $20 \%$ ) was not increased by this change, and the by-products included not only the laterally rearranged 23b ( $13 \%$ ) and remaining 21b ( $43 \%$ ) but also its acylated analogue 24b ( $8 \%$ ), which presumably arises by intermolecular attack of lithiated 23b on remaining unreacted 21b.

Snieckus obtained ortho migration in 70\% yield for a similar ortho-methyl $N, N$-diethylcarbamate which differed only by lacking the para-methoxy substituent. ${ }^{40}$ Presumably this is sufficient to disfavour metallation of the more electron-rich ring.
Snieckus has demonstrated the use of trimethylsilyl as a temporary blocking group for kinetically acidic sites, allowing control over the regioselectivity of deprotonation. ${ }^{45}$ In our own work we have found that the magnitude of the kinetic isotope effect for low-temperature lithiation, ${ }^{46}$ which has been shown experimentally to exceed 50 at $-78^{\circ} \mathrm{C},{ }^{47}$ allows the use of deuterium substituents as protecting groups for carbon atoms, directing lithiation to other acidic sites in the molecule. ${ }^{48}$ We decided to test both of these methods as a means of encouraging the anionic ortho-Fries rearrangement to become the major reaction pathway for compounds 21. We ortholithiated carbamate 12e and quenched with $d_{3}$-methyl iodide or chlorotrimethylsilane to give 21c and 21d in 86 and $70 \%$ yields respectively (Table 3).

Under the usual conditions (sec-butyllithium at $-78^{\circ} \mathrm{C}$, followed by warming to $20^{\circ} \mathrm{C}$ ), both 21c and 21d underwent clean anionic ortho-Fries rearrangement to give 22c and 22d in excellent yield. The complete overturning of the regioselectivity of 21a's rearrangement is a remarkable testimony to the synthetic power of kinetic isotope effects. ${ }^{48}$

Esterification of 22c and 22d with $n$-butyllithium and propionyl chloride gave the esters $\mathbf{2 5 c}$ and $\mathbf{2 5 d}$ in good to excellent yield. Not surprisingly, a test exposure of the ester $\mathbf{2 5}$ c to LDA at $-78^{\circ} \mathrm{C}$, quenching with saturated aqueous ammonium chloride, returned a mixture of phenol 22c and recovered starting material 25 c in a ratio of $60: 40$ (Table 2, entry 8).

Scheme 9 Aldol reaction of $\mathbf{2 5 f}$.

In order to build on the encouraging results with enolate dianions (Table 2, entries 6 and 7), attempts were made to dealkylate the methyl ether 25 c with $\mathrm{BCl}_{3}$ and TMSI which are reportedly more selective than $\mathrm{BBr}_{3}{ }^{4,50}$ However $\mathrm{BCl}_{3}$ $\left(-78-0^{\circ} \mathrm{C}\right)$ converted $31 \%$ of ester $\mathbf{2 5}$ c to the phenol 22c. Addition of $\mathrm{BCl}_{3}$ to ester $\mathbf{2 5 c}$ at $0^{\circ} \mathrm{C}$ and stirring for 8 minutes before quenching with water converted $60 \%$ to 22 c . After 48 h at ambient temperature, $\mathbf{2 5} \mathrm{c}$ had not reacted with TMSI.

We decided to revert to the more readily removed protecting group, MOM, for protection of the second phenolic OH . Ortholithiation with sec-butyllithium, quenching with chlorotrimethylsilane, afforded ortho-substituted carbamate 21e (Table 3) in a low yield of $47 \%$. Anionic ortho-Fries rearrangement gave the phenol 22 e in a yield of $82 \%$, which was esterified to give 25 e and deprotected (using sodium iodide in acetone with a catalytic amount of concentrated hydrochloric acid) to the phenolic ester $\mathbf{2 5 f}$ in $80 \%$ yield.

Treatment of ester $\mathbf{2 5 f}$ with two equivalents of LDA at $-78^{\circ} \mathrm{C}$ followed by benzaldehyde and work-up with saturated aqueous ammonium chloride (Scheme 9 and Table 2, entry 9) gave $73 \%$ combined yield ( $41 \%$ and $32 \%$ ) of the two aldol products 26, with only $13 \%$ of elimination product 22f. Determination of the sense of diastereoselectivity at this stage was hampered by complex NMR data due to slow rotation in the amides 26. The least polar diastereoisomer ( $32 \%$ yield) was reduced with lithium aluminium hydride in refluxing THF to afford the amine 27 and a single diol $\mathbf{2 0}$. To determine the relative stereochemistry of $\mathbf{2 0}$, it was converted to its benzylidene acetal 28, whose ${ }^{3} J_{\mathrm{HH}}-\mathrm{CHMeCH}(\mathrm{Ph})-$ coupling constant of 2.5 Hz indicated axial-equatorial, and hence syn, stereochemistry. The crude ratio of anti:syn aldol products from $\mathbf{2 5 f}$ turned out to be 59:41.

We were pleased that the aldol reaction was now antiselective, though disappointed that the selectivity was not higher, and that the phenol decomposition by-product was again appearing in the product mixture. To facilitate further studies, we decided to attempt to reduce the number of steps required to reach the model auxiliaries. Snieckus ${ }^{51}$ had made compound 29a, and it was hoped that the analogue 29b ( $\mathrm{R}=$ $i-\mathrm{Pr}$ ) would lead to ester $\mathbf{3 0}$ in three further steps (Scheme 10). Ester 30 would have the oxy anion as well as the steric bulk required for good diastereoselectivity when reacted with an aldehyde. The dicarbamate 29b was made in $86 \%$ yield from the phenol 12g and subsequent double ortholithiation with two equivalents of $s e c$-butyllithium, quenching with chlorotrimethylsilane, afforded 31 in $84 \%$ yield. Treatment of 31 with two equivalents of sec-butyllithium at $-78^{\circ} \mathrm{C}$, warming to ambient temperature and stirring overnight afforded 32 in $44 \%$ yield with other minor unidentifiable products. Presumably the tetrasubstituted benzene $\mathbf{3 1}$ is too hindered to undergo deprotonation: the sec-butyllithium removes a trimethylsilyl group to

Scheme 10 Attempted double anionic ortho-Fries rearrangement.
give an anion which undergoes an anionic ortho-Fries rearrangement to give $\mathbf{3 2}$ after aqueous work-up.
At this point we decided to abandon this route to a potential auxiliary. The problems posed by the phenyl ester linkage are too great for us to have a reasonable expectation of success in designing useful chiral auxiliaries. We decided to overcome this lack of stability in the auxiliary-substrate linkage by connecting the two through a $\mathrm{C}-\mathrm{C}$ bond. ${ }^{52}$ We had already demonstrated the use of a phenylalanine-derived aldehyde 38 as a $\mathrm{C}-\mathrm{C}$ bonded auxiliary in the synthesis of 2 -substituted primary alcohols, ${ }^{15}$ and the strategy we used then is outlined in Scheme 11. The auxiliary 33, an aldehyde, is chosen such that nucleophilic additions of vinyl anion equivalents are highly diastereoselective. This was true, as demonstrated by Reetz and co-workers, ${ }^{53-55}$ for the phenylalanine-derived 38, but central to our use of atropisomeric amides is our recent demonstration that 2-formylnaphthamides 39 also undergo extremely diastereoselective nucleophilic additions. ${ }^{5,7}$ The addition of a vinyl anion equivalent (in general, we have used alkynyl nucleophiles followed by reduction) gives allylic alcohol 34 .

The enantiomerically and diastereoisomerically pure allylic alcohol 34 is functionalised to give 35 in such a way that stereospecific rearrangement (probably [3,3] sigmatropic) can be induced to give $\mathbf{3 6}$. Finally, the auxiliary is recovered by oxidative cleavage of the alkene to give a pair of aldehydes, the recyclable auxiliary $\mathbf{3 3}$ and the 2-substituted aldehyde product 37.

A similar approach has been used by Spino and Beaulieu, ${ }^{56,57}$ who employed a terpene-derived ketone as an auxiliary in a similar route, by Thomas and co-workers, who have used lactic acid as the source of chirality (not truly an auxiliary as it was never recovered) in the synthesis of polyoxamic acid, ${ }^{58}$ and by Larchevêque and co-workers in the synthesis of dipeptide isosteres. ${ }^{59}$

We decided to use $\mathbf{3 9}$ as the basis of our design for a new chiral auxiliary, aiming to introduce features which would lead to total stability about the $\mathrm{Ar}-\mathrm{CO}$ bond (and therefore resistance to racemisation). We hoped to build on our understanding of the stereoselective additions of nucleophiles to $39^{5,7}$ and to exploit the shift of the double bond of $\mathbf{3 5}$ into conjugation with the aromatic ring in $\mathbf{3 6}$. From previous work, we knew that the 8 -substituents of aldehydes $\mathbf{4 0}, \mathbf{4 1}$ and $\mathbf{4 2}$ led to much increased conformational stability, with the greatest effect being exerted by the $8-\mathrm{MeO}$ group of 42 . A bonding interaction between the 8 -substituent and the amide carbonyl, evident by X-ray crystallography, is responsible for this effect. ${ }^{60}$ We therefore decided to start by studying the stereoselectivity of nucleophilic additions (Scheme 12) to 40, 41 and 42, which were all available by our published route. ${ }^{42}$

Table 4 summarises these results, and includes, for comparison, published results obtained with 39.

Aldehyde 39 and its analogues had generally showed moderate anti-selectivity in additions of organolithiums such as BuLi and $\mathrm{MeLi}^{7}{ }^{7}$ and we were pleased to find that BuLi added to 41 even more anti-selectively (entry 1). Unfortunately, the high level of anti-selectivity was not displayed by the unsaturated nucleophiles we need to use: both octynyllithium and ethynylmagnesium bromide gave only moderate anti-selectivity with $\mathbf{4 1}$ (entries 2 and 3). The anti-selective addition of octynyllithium contrasts with the moderately syn-selective addition of this nucleophile to 39 , and when we tried this reaction with 42 we again saw moderate syn-selectivity. The product of this reac-

Fig. 1 X-Ray crystal structure of syn-46b.

Scheme 12 Nucleophilic additions to peri-substituted 2-formyl-1naphthamides.
tion, syn-46b, was characterised by X-ray crystallography (Fig. 1), and allowed us continued confidence in our provisional assignment of anti-stereochemistry to the less polar diastereoisomer in all other cases. ${ }^{4,6}$ The amino group of $\mathbf{4 1}$ must be playing a role in altering selectivity, perhaps by becoming involved in coordination with the aggregated organolithium nucleophile. With amino aldehyde 40, octynyllithium showed no stereoselectivity at all.

Alkyltriisopropoxytitaniums, bulky nucleophiles which react under non-chelation control, ${ }^{61}$ had shown excellent antiselectivity with $39^{7}$ (entries 4-6) but we found that with 40 this selectivity dropped substantially. With 41, no alcohol products were observed-instead, the Lewis acidity of the titanium species in the reaction mixture had promoted lactonisation to $\mathbf{4 7}, \mathbf{4 8}$, or $\mathbf{4 9}$, and even some reduction to $\mathbf{5 0}$ (presumably by hydride transfer from $\left.\mathrm{BuTi}(\mathrm{O} i-\mathrm{Pr})_{3}\right)$. The other highly selective additions observed with 39 had been those of organolithiums in the presence of alkylaluminium reagents such as DIBAL-H or $\mathrm{Me}_{3} \mathrm{Al}$ (entries 7-9). ${ }^{7}$ Adding DIBAL-H to the reaction of octynyllithium with 40 increased the selectivity to $96: 4$, and extremely high levels of anti-selectivity resulted from the addition of octynyllithium to 41 in the presence of DIBAL-H. Not surprisingly, both reactions tended to be accompanied by reduction of the aldehyde: the addition to $\mathbf{4 1}$

was quite capricious in this regard, and on one occasion generated $88 \%$ of the alcohol 51 .

At some small cost to selectivity, we found that the alternative, to use $\mathrm{Me}_{3} \mathrm{Al}$ as the additive, ${ }^{7}$ reliably gave moderate to good yield and good anti-selectivity. From the reaction of octynyllithium with 41 in the presence of 0.1 equiv. $\mathrm{Me}_{3} \mathrm{Al}$, for example, it was possible to isolate $51 \%$ yield of the anti alcohol anti-46b. Replacing trimethylaluminium with triethylaluminium led only to recovery of starting material.
Although we experimented with selective additions to all three of $\mathbf{4 0 - 4 2}$, the final decision to use $\mathbf{4 2}$ as the prospective chiral auxiliary was based on the stability of its derivatives to racemisation or epimerisation. We knew that 40 racemised considerably faster than $\mathbf{4 1}$ or $\mathbf{4 2} .{ }^{60}$ Compound $\mathbf{4 1}$ has a half-life for racemisation in dioxane solution of 6 days at $20^{\circ} \mathrm{C}$, even though it bears only a -CHO substituent ortho to the amide. (Trigonal substituents usually permit easy bond rotation. ${ }^{41}$ ) To assess the stability to epimerisation of its addition products, we took anti-45a and incubated it at $60^{\circ} \mathrm{C}$ for 4 h . No sign of epimerisation to syn-45a was evident, suggesting a rate constant of $<1.4 \times 10^{-6} \mathrm{~s}^{-1}$ for this process, and hence a barrier to epimerisation of $>120 \mathrm{~kJ} \mathrm{~mol}^{-1}$. Compound 42 racemises almost 25 times more slowly than 41, and this informed our final choice of $\mathbf{4 2}$ as auxiliary.
The next challenge was to resolve $\mathbf{4 1}$ and $\mathbf{4 2}$. We decided to convert them to pairs of diastereoisomeric aminals ${ }^{62} 53$ and 54 by refluxing with the proline-derived diamine $\mathbf{5 2}{ }^{63}$ We intended to use 52 as a resolving agent, aiming to separate the diastereoisomeric aminals by column chromatography. In the event, something more complex, and more useful, than a simple resolution took place (Scheme 13). Instead of forming in a $1: 1$ ratio, as would be expected for a simple resolution, the product aminals were formed with a significant excess ( 4 or $5: 1$ ) of one diastereoisomer over the other. We were unable to prove that the minor diastereoisomer is an atropisomer of the major, though this would account nicely for the enantiomeric excesses obtained when the aminals were hydrolysed back to the aldehydes (see below). Aminals derived from 52 typically form with high exo-selectivity for the new stereogenic centre. ${ }^{64}$

The stereogenic axis of the amide is inverting during the course of the aminal-forming reaction, though at this stage it was not clear to us whether this inversion was a racemisation of the starting material or an epimerisation of the product. The two diastereoisomers of each pair of aminals were separable by flash chromatography on alumina (though the minor diastereoisomers 53b and 54b turned out to be very unstable), and we were able to distinguish between these two possibilities by resubjecting purified 54a to the conditions of the reaction. No $\mathbf{5 4 b}$ was formed, suggesting that the inversion is a racemisation of the starting material which occurs before aminal formation takes place. The temperatures of the reactions $\left(110-140^{\circ} \mathrm{C}\right)$ should racemise $\mathbf{4 1}$ and $\mathbf{4 2}$ in a matter of minutes. ${ }^{60}$

The $4: 1$ mixture of aminals $\mathbf{5 4}$ was hydrolysed to the aldehyde (-)-42 in $92 \%$ yield. The aldehyde was formed in $62 \%$ ee by HPLC on a chiral stationary phase. Alternatively, the purified major aminal 54a could be hydrolysed to give (-)-42 with $99 \%$ ee.

Overall, the resolution has features of a dynamic resolution, because the starting material racemises as the resolution takes place. The dynamic resolution appears to be under kinetic control, since re-subjection of the purified product to the conditions of the reaction does not regenerate the same ratio of products as the reaction itself. ${ }^{65}$ We had previously noted a dynamic thermodynamic resolution ${ }^{66}$ during similar aminal formation from 39, ${ }^{12}$ but in that case (where $\mathrm{R}=\mathrm{H}$ ), the barrier to epimerisation of the product is significantly lower. Incidentally, that dynamic thermodynamic resolution was apparently accompanied by an inconsequential dynamic kinetic resolution in the opposite direction, which was overridden by the subsequent equilibration of the product diastereoisomers. For 53 and

43a ( $\mathrm{R}^{1}=\mathrm{H}$ )

45a $\left(R^{1}=\mathrm{Me}_{2} \mathrm{~N}\right)$

$54(R=\mathrm{MeO}) 100 \%$ (4:1 dias.)

53b

54, our assignment of stereochemistry to 53a and 54a is not proven, but we chose to follow the precedent of the proven stereoselectivity of a similar reaction of $\mathbf{3 9}$, since the resulting absolute axial chirality is consistent with the known absolute stereochemistry of the final product of the sequence, $\mathbf{6 1}$.

The remarkable and useful consequence of the dynamic resolution is that it allows a simple two-step aminal form-ation-hydrolysis sequence to generate material of $62 \%$ ee from racemate in almost quantitative yield. We felt that $62 \%$ ee was insufficient for use as a chiral auxiliary, so we chose to work with the $99 \%$ ee material available by aqueous hydrolysis of purified 54a. Losses on purification of the unstable aminal meant that the overall yield of this essentially enantiomerically pure material was, at $56 \%$, just more than could be expected from a simple, non-dynamic resolution.

The diamine 52, though recoverable, is made by a fourstep sequence from proline. ${ }^{63}$ Following some success with ephedrine $\mathbf{5 5}$ as an agent of dynamic thermodynamic resolution with atropisomeric amido-aldehydes, ${ }^{67}$ we attempted a similar resolution with 42 . Unfortunately, the products 56 a and 56b were formed in equal quantities, and after hydrolysis 42 was recovered with only $5 \%$ ee (Scheme 14).

With enantiomerically pure (-)-42 it was a straightforward matter to make enantiomerically pure alkyne $(+)$-anti-46b

Scheme 14 Attempted dynamic resolution with ephedrine.
using the catalytic $\mathrm{Me}_{3} \mathrm{Al}$ method (Table 4, entry 8). For the auxiliary strategy, the alkyne required reduction to the allylic alcohols 57 , and we made both the $E$ - and $Z$-isomers by reduction with RedAl or hydrogenation over Lindlar's catalyst (Scheme 15).

To recover the newly created stereogenic centre we decided to use two variants of the $[3,3]$ sigmatropic Claisen rearrangement of known stereospecificity. Allylic alcohol (+)-(Z)-57 was heated with trimethyl orthoacetate to give the ketene acetal 63 which underwent a stereospecific Johnson-Claisen rearrangement ${ }^{68}$ in 12 h at $110{ }^{\circ} \mathrm{C}$ (Scheme 16). The product ester ( + )-64 was isolated as a single diastereoisomer in $84 \%$ yield. By

Scheme 15 Reduction to allylic alcohols $57(\mathrm{R}=n$-hexyl).
contrast, Eschenmoser-Claisen rearrangement ${ }^{69}$ of (+)-(Z)-57 with dimethylacetamide dimethoxy acetal in refluxing xylene at $140^{\circ} \mathrm{C}$ for 20 h gave a mixture of epimers of the product amide $(+)-59$. The most reasonable explanation for this is that the higher temperature allows equilibration of the atropisomeric epimers, particularly in the rearranged product which has a small, ${ }^{41}$ trigonal substituent (a trans double bond) adjacent to the amide axis. The newly formed centre was nonetheless evidently formed with high stereospecificity, because ozonolysis of $\mathbf{5 9}$ with reductive work-up yielded an optically active alcohol $(R)-(-)-61$ whose Mosher ester ${ }^{70} 62$ (formed from $\alpha$-methoxy- $\alpha$-(trifluoromethyl)phenylacetyl chloride, (+)MTPACl) contained less than $5 \%$ of the diastereoisomer formed from the known ${ }^{15}(S)-(+)$-61. Fig. 2 compares the relevant portions of the ${ }^{1} \mathrm{H}$ NMR spectra of the ( + )-MTPA esters of $(R)-(-)-61,(S)-(+)-61$ and the $( \pm)$-MTPA ester of $(S)-(+)-61$.

Unfortunately, it proved impossible to recover the auxiliary (in its reduced form) from the ozonolysis step: the only other product turned out to be a benzamide $\mathbf{6 0}$ derived from further oxidation of the naphthalene's more electron-rich ring.

Although our route depends on resolution with naturally derived proline, and hence is not viable in the enantiomeric series, we demonstrated reduction to the $(E)$-, as well as the $(Z)$-, allylic alcohol 57. Rearrangement chemistry from ( $E$ )-57 should allow us to use the same strategy to make the enantiomeric series of alcohol products. A trial reaction on some racemic $( \pm)-(E)-59$ suggested that the longer reaction times required to rearrange ( $E$ )-allylic alcohols would lead
to epimerisation of the axis, preventing recovery of the auxiliary in enantiomerically pure form even if the problem of decomposition to $\mathbf{6 0}$ could be overcome. Other allylic alcohol rearrangements ${ }^{71}$ (preferably ones which occur at lower temperatures) could be used to generate a variety of substituted allylic products: in our previous work with a phenylalaninederived auxiliary ${ }^{15}$ we demonstrated the use of a palladium(II)catalysed allylic transposition of allyl esters.

Scheme 16 Stereospecific rearrangements and cleavage ( $\mathrm{R}=n$-hexyl).

## Summary

The instability of amide-substituted phenyl esters poses severe problems for the use of atropisomeric amides as chiral auxiliaries in a conventional sense-enolate chemistry of the esters is made very difficult. However, allowing the new stereogenic centre to be formed by nucleophilic attack adjacent to the aromatic ring allows a way round this problem, albeit at the expense of a rather long synthetic sequence. Atropisomeric auxiliaries have some nice features - not least their potential for synthesis via dynamic resolution-but are evidently not a realistic competitive alternative to the more widely used and versatile alternatives.

## Experimental

Flash chromatography refers to chromatography carried out by the method of Still et al. ${ }^{72}$ Preparative HPLC was carried out on a Dynamax-60A column at a pressure of 0.15 kPa at room temperature using a Gilson 305 Pump with flow rate at 15.0 $\mathrm{ml} \mathrm{min}^{-1}$. Analytical HPLC on a chiral stationary phase was carried out using a Regis Whelk-O1 chiral column. Detection was at 280 nm using a Gilson 115 UV Detector. Ether refers to diethyl ether; petrol to the fraction of petroleum ether boiling between 40 and $60^{\circ} \mathrm{C} . J$ values are in Hz .

Further experimental details are available as electronic supplementary information.

## Phenyl $\boldsymbol{N}, \boldsymbol{N}$-diisopropylcarbamate 12a ${ }^{73}$

A solution of phenol ( $2.586 \mathrm{~g}, 27.47 \mathrm{mmol}$ ), $N, N$-diisopropylcarbamoyl chloride ( $4.496 \mathrm{~g}, 27.47 \mathrm{mmol}$ ) and anhydrous pyridine ( 10 ml ) was heated to reflux for 2 days. The mixture was allowed to cool, poured onto ice-cooled water ( 50 ml ) and extracted with ether ( $4 \times 40 \mathrm{ml}$ ). The combined ethereal extracts were washed with aqueous 1 M hydrochloric acid $(4 \times 20 \mathrm{ml})$ and saturated aqueous sodium hydrogen carbonate $(4 \times 20 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to give the crude carbamate. Purification by Kugelrohr distillation yielded the carbamate 12a ${ }^{73}$ as a colourless liquid ( $5.599 \mathrm{~g}, 92 \%$ ) which crystallised on standing, bp $150-155^{\circ} \mathrm{C}, 2.1 \mathrm{mmHg} ; v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 2996,2971,2935,2876$, 1710,$1692 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.41(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.23(1 \mathrm{H}$, $\mathrm{m}, \mathrm{ArH}), 7.18(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 4.15(1 \mathrm{H}, \mathrm{br} \mathrm{m}, \mathrm{NCH}), 4.03(1 \mathrm{H}$, br m, NCH), $1.38\left(12 \mathrm{H}, \mathrm{brm}, 4 \times \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 153.9, 151.3, 129.1, 124.9, 121.8, 46.8 (br), 21.5 (br), 20.5 (br); $m / z$ (CI) $222\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right) ; m / z$ (EI) $221\left(2 \%, \mathrm{M}^{+}\right)$and 86 (100).

## 4-Hydroxyphenyl $N, N$-diisopropylcarbamate 12 g

In the same way, a solution of hydroquinone $\mathbf{1 1 g}(3.124 \mathrm{~g}, 28.37$ mmol ), $N, N$-diisopropylcarbamoyl chloride ( $4.643 \mathrm{~g}, 28.37$ $\mathrm{mmol})$ and anhydrous pyridine ( 10 ml ) gave carbamate $\mathbf{1 2 g}$ $(5.908 \mathrm{~g}, 88 \%)$ as a white solid which required no further purification, mp $141-145^{\circ} \mathrm{C}(\mathrm{EtOAc}) ; R_{\mathrm{f}} 0.23$ [5:1 petrol-EtOAc]; $\lambda_{\text {max }} / \mathrm{nm}\left(\varepsilon_{\text {max }}\right)\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 230$ (10630), 278 (5234); $v_{\text {max }}($ film $) /$ $\mathrm{cm}^{-1} 3287,3277,2970,2934,2874,1672 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $7.35(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}), 6.84(2 \mathrm{H}, \mathrm{d}, J 8.8, \mathrm{ArH}), 6.58(2 \mathrm{H}, \mathrm{d}, J 8.9$, ArH), $4.18(1 \mathrm{H}, \mathrm{br} \mathrm{m}, \mathrm{NCH}), 3.96(1 \mathrm{H}, \mathrm{br} \mathrm{m}, \mathrm{NCH}), 1.34$ $\left(12 \mathrm{H}, \mathrm{br} \mathrm{m}, 4 \times \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 153.8,148.1,143.8$, $122.3,116.3,47.0,46.0,21.3,20.4 ; \mathrm{m} / \mathrm{z}$ (CI) 238 ( $100 \%$, $\mathrm{M}+\mathrm{H}^{+}$) (Found: $\mathrm{M}^{+}$, 237.1362. $\mathrm{C}_{13} \mathrm{H}_{19} \mathrm{NO}_{3}$ requires $M$, 237.1365).

## 4-(Methoxymethoxy)phenyl $\mathbf{N}, \mathbf{N}$-diisopropylcarbamate 12i

Sodium hydride ( $0.707 \mathrm{~g}, 17.67 \mathrm{mmol}, 60 \%$ dispersion) was added in portions to a solution of carbamate $\mathbf{1 2 g}(3.807 \mathrm{~g}$, $16.06 \mathrm{mmol})$ in THF $(210 \mathrm{ml})$ at $0^{\circ} \mathrm{C}$ and stirred for 2 hours 45 minutes to give a deep blue mixture. Chloromethyl methyl ether
$(1.34 \mathrm{ml}, 17.67 \mathrm{mmol})$ was added dropwise. The mixture was warmed to ambient temperature and stirred overnight. The white precipitate was filtered off and the solvent removed under reduced pressure. The crude solid was dissolved in ether ( 50 ml ) and washed with water ( 50 ml ), $10 \%$ aqueous sodium hydroxide $(2 \times 50 \mathrm{ml})$ and water ( 50 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to give carbamate $\mathbf{1 2 i}(4.185 \mathrm{~g}$, $93 \%$ ) as a white solid which required no further purification, mp 49-51 ${ }^{\circ} \mathrm{C} ; R_{\mathrm{f}} 0.23$ [5:1 petrol-EtOAc]; $\lambda_{\text {max }} / \mathrm{nm}\left(\varepsilon_{\text {max }}\right)\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ 230 (24430), 276 (9486); $v_{\text {max }}$ (film)/ $/ \mathrm{cm}^{-1} 2969,2932,1712$; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.06(4 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 5.17\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right), 4.10$ $(2 \mathrm{H}, \mathrm{br} \mathrm{m}, 2 \times \mathrm{NCH}), 3.50\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 1.35(12 \mathrm{H}, \mathrm{br} \mathrm{m}$, $\left.4 \times \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 154.3,145.8,122.6,122.3$, 116.8, 94.7, 55.7, 46.8, 46.0, 21.4, 20.5; m/z (CI) 282 ( $100 \%$, $\left.\mathrm{M}+\mathrm{H}^{+}\right) ; m / z(\mathrm{EI}) 281\left(4 \%, \mathrm{M}^{+}\right), 128\left(53, \mathrm{CONi}-\mathrm{Pr}_{2}\right)$ and 45 (100) (Found: $\mathrm{M}^{+}, 281.1634 . \mathrm{C}_{15} \mathrm{H}_{23} \mathrm{NO}_{4}$ requires $M$, 281.1627).

## $N, N$-Diisopropyl-2-hydroxybenzamide $13 a^{73}$

sec-Butyllithium ( $1.84 \mathrm{ml}, 2.39 \mathrm{mmol} ; 1.3 \mathrm{M}$ solution in hexanes) was added dropwise over 10 minutes to a solution of carbamate 12a ( $528 \mathrm{mg}, 2.39 \mathrm{mmol}$ ) in THF ( 36 ml ) at $-78^{\circ} \mathrm{C}$ under an atmosphere of nitrogen. After 1 h , the resulting solution was warmed to ambient temperature, stirred for a further 12 hours and quenched with saturated aqueous ammonium chloride ( 10 ml ). The THF was removed under reduced pressure and the aqueous residue was extracted with dichloromethane ( $4 \times 20 \mathrm{ml}$ ). The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to afford the benzamide $\mathbf{1 3 a}^{73}$ ( $495 \mathrm{mg}, 94 \%$ ) as white needles which required no further purification, $\mathrm{mp} \quad 159-160^{\circ} \mathrm{C}$ (EtOAc); $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 3206,2998,2969,2934,1611,1590$; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.28(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{OH}), 7.32(1 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$, $7.22(1 \mathrm{H}, \mathrm{dd}, J 7.7$ and $1.7, \mathrm{ArH}), 7.03(1 \mathrm{H}, \mathrm{dd}, J 8.2$ and 1.1 , $\mathrm{ArH}), 6.88(1 \mathrm{H}, \mathrm{dt}, J 7.5$ and 1.1, ArH$), 3.99(2 \mathrm{H}, \mathrm{br} \mathrm{m}$, $2 \times \mathrm{NCH}), 1.43\left(12 \mathrm{H}, \mathrm{d}, J 6.7,4 \times \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $170.9,157.7,131.4,126.6,120.5,118.5,117.8,48.9,20.9 ; \mathrm{m} / \mathrm{z}$ (CI) $222\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right) ; m / z$ (EI) $221\left(100 \%, \mathrm{M}^{+}\right), 178(65$, $\mathrm{M}-i-\mathrm{Pr})$ and $121\left(88, \mathrm{M}-\mathrm{N} i-\mathrm{Pr}_{2}\right)$.

## $\mathrm{N}, \mathrm{N}$-Diisopropyl-2-hydroxy-5-(methoxymethoxy)benzamide 13i

By the method used for 13a, a mixture of carbamate 12i (2.283 $\mathrm{g}, 8.13 \mathrm{mmol}$ ) and sec-butyllithium ( $7.50 \mathrm{ml}, 9.75 \mathrm{mmol} ; 1.3 \mathrm{M}$ solution in hexanes) in THF ( 60 ml ) gave, after flash chromatography on silica gel [3:2 petrol-EtOAc], benzamide 13i $(1.330 \mathrm{~g}, 58 \%)$ as white blades, $\mathrm{mp} 160-161{ }^{\circ} \mathrm{C}(\mathrm{EtOAc})$; $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 3215-3101,2996,2965,2935,1589 ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 8.70(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 7.01(1 \mathrm{H}, \mathrm{dd}, J 8.8$ and $2.9, \mathrm{ArH})$, $6.95(1 \mathrm{H}, \mathrm{d}, J 2.6, \mathrm{ArH}), 6.92(1 \mathrm{H}, \mathrm{d}, J 9.2, \mathrm{ArH}), 5.10(2 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{CH}_{2}\right), 3.97(2 \mathrm{H}, \mathrm{br} \mathrm{m}, 2 \times \mathrm{NCH}), 3.50\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 1.42$ $\left(12 \mathrm{H}, \mathrm{d}, J 6.7,4 \times \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{c}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 170.5$, 152.4, 149.4, 120.4, 118.5, 114.6, 95.5, 55.7, 20.9; m/z (CI) 282 $\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right) ; m / z(\mathrm{EI}) 281\left(7 \%, \mathrm{M}^{+}\right)$and 49 (100) (Found: $\mathrm{M}^{+}$, 281.1623. $\mathrm{C}_{15} \mathrm{H}_{23} \mathrm{NO}_{4}$ requires $M$, 281.1627).

## 2-(Diisopropylcarbamoyl)phenyl propionate 14a

$n$-Butyllithium ( $1.31 \mathrm{ml}, 2.09 \mathrm{mmol} ; 1.6 \mathrm{M}$ solution in hexanes) was added to a solution of benzamide 13a ( $462 \mathrm{mg}, 2.09 \mathrm{mmol}$ ) in THF ( 5.5 ml ) at $0^{\circ} \mathrm{C}$ under an atmosphere of nitrogen. After 10 minutes propionyl chloride ( $0.27 \mathrm{ml}, 3.14 \mathrm{mmol}$ ) was added, and the mixture was allowed to warm to ambient temperature, stirred overnight, quenched with saturated aqueous ammonium chloride ( 10 ml ) and extracted with ether ( $4 \times 15$ ml ). The combined ethereal extracts were washed with saturated aqueous sodium hydrogen carbonate $(3 \times 10 \mathrm{ml})$ and brine ( 20 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to afford the crude product. Purification by flash chromatography on silica gel [2:1 petrol-EtOAc] afforded the ester $\mathbf{1 4 a}(549 \mathrm{mg}, 95 \%)$ as a pale yellow oil, which crystal-
lised on standing; $R_{\mathrm{f}} 0.44$ [2:1 petrol-EtOAc]; $\lambda_{\max } / \mathrm{nm}\left(\varepsilon_{\max }\right)$ $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 232$ (24530), 294 (1577); $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 3062,2985$, $2929,2882,1764,1633 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.42-7.33(2 \mathrm{H}, \mathrm{m}$, $\mathrm{ArH}), 7.24(1 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 7.17(1 \mathrm{H}, \mathrm{d}, J 8.1, \mathrm{ArH}), 3.77(1 \mathrm{H}$, septet, $J 6.7, \mathrm{NCH}), 3.50(1 \mathrm{H}$, septet, $J 6.7, \mathrm{NCH}), 2.57(2 \mathrm{H}, \mathrm{q}$, $\left.J 7.6, \mathrm{CH}_{2}\right), 1.54\left(6 \mathrm{H}, \mathrm{m}, 2 \times \mathrm{NCHCH}_{3}\right), 1.24(3 \mathrm{H}, \mathrm{t}, J 7.6$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.12\left(6 \mathrm{H}, \mathrm{br} \mathrm{d}, 2 \times \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $172.3,166.8,146.6,131.6,129.2,126.2,125.7,123.0,50.8,45.7$, 27.4, 20.7, 20.4, 8.9; m/z (CI) $278\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right) ; m / z(\mathrm{EI}) 277$ ( $17 \%, \mathrm{M}^{+}$), 221 ( $77, \mathrm{M}-\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}$ ), 178 (78) and 121 (100) (Found: $\mathrm{M}^{+}, 277.1681 . \mathrm{C}_{16} \mathrm{H}_{23} \mathrm{NO}_{3}$ requires $M, 277.1678$ ).

## 2-(Diisopropylcarbamoyl)-4-(methoxymethoxy)phenyl propionate 14i

In the same way as for compound 14a, a mixture of benzamide 13i ( $1.330 \mathrm{~g}, 4.73 \mathrm{mmol}$ ) and $n$-butyllithium ( $3.55 \mathrm{ml}, 5.68$ mmol; 1.6 M solution in hexanes) in THF ( 60 ml ) was treated with propionyl chloride ( $0.62 \mathrm{ml}, 7.10 \mathrm{mmol}$ ). After work-up in the usual manner, flash chromatography on silica gel [2:1 petrol-EtOAc] afforded the ester $\mathbf{1 4 i}(1.487 \mathrm{~g}, 93 \%)$ as a colourless oil; $R_{\mathrm{f}} 0.48$ [ $1: 1$ petrol-EtOAc]; $v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 2968,2938$, 1760,$1637 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.15(1 \mathrm{H}, \mathrm{d}, J 8.9, \mathrm{ArH}), 7.00$ $(1 \mathrm{H}, \mathrm{d}, J 2.8, \mathrm{ArH}), 6.88(1 \mathrm{H}, \mathrm{d}, J 2.6, \mathrm{ArH}), 5.15(1 \mathrm{H}, \mathrm{d}, J 6.7$, $\left.\mathrm{OCH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{OCH}_{3}\right), 5.08\left(1 \mathrm{H}, \mathrm{d}, J 6.7, \mathrm{OCH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{OCH}_{3}\right), 3.77(1 \mathrm{H}$, septet, $J 6.7, \mathrm{NCH}), 3.45(1 \mathrm{H}$, septet, NCH), $3.35(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{OCH}_{3}\right), 2.51\left(2 \mathrm{H}, \mathrm{q}, J 6.7, \mathrm{CH}_{3} \mathrm{CH}_{2}\right), 1.49(6 \mathrm{H}, \mathrm{br} \mathrm{m}, 2 \times$ $\left.\mathrm{NCHCH}_{3}\right), 1.19\left(3 \mathrm{H}, \mathrm{t}, J 7.4, \mathrm{CH}_{3} \mathrm{CH}_{2}\right), 1.09(6 \mathrm{H}, \mathrm{d}, J 6.6$, $\left.2 \times \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 172.6,166.4,154.6,140.8$, $132.2,123.8,116.8,113.7,94.6,55.8,50.8,45.7,27.3,20.6,20.3$, 8.8; m/z (CI) 338 ( $100 \%, \mathrm{M}+\mathrm{H}^{+}$); m/z (EI) 281 ( $82 \%$ ), 337 (3, $\mathrm{M}^{+}$) and 45 (100) (Found: $\mathrm{M}^{+}, 337.1896 . \mathrm{C}_{18} \mathrm{H}_{27} \mathrm{NO}_{5}$ requires $M, 337.1889)$.

## 2-(Diisopropylcarbamoyl)-4-hydroxyphenyl propionate 14g

Concentrated hydrochloric acid (one drop) was added to a stirred solution of ester $\mathbf{1 4 i}(1.487 \mathrm{~g}, 4.41 \mathrm{mmol})$ and sodium iodide ( $1.981 \mathrm{mg}, 13.24 \mathrm{mmol}$ ) in acetone ( 30 ml ) at ambient temperature. The pale green solution was stirred for 30 minutes, by which time it had turned red-brown. The mixture was heated to $50^{\circ} \mathrm{C}$ for 4 hours, cooled to ambient temperature, treated with water ( 5 ml ) and extracted with dichloromethane ( $4 \times$ $10 \mathrm{ml})$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to give the crude product as a brown oil. Purification by flash chromatography on silica gel [2:1 petrol-EtOAc] afforded the ester $\mathbf{1 4 g}$ ( $533 \mathrm{mg}, 41 \%$ ) as a sticky pale brown solid; $R_{\mathrm{f}} 0.21$ [1:1 petrolEtOAc]; $v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 3223,2972,2939,2881,1759,1612 ;$ $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.90(1 \mathrm{H}, \mathrm{br}$ s, OH$), 6.88(1 \mathrm{H}, J 8.8$, $\mathrm{ArH}), 6.68(1 \mathrm{H}, \mathrm{dd}, J 8.7$ and $2.6, \mathrm{ArH}), 6.56(1 \mathrm{H}, \mathrm{d}, J 2.6$, $\mathrm{ArH}), 3.84(1 \mathrm{H}$, septet, $J 6.6, \mathrm{NCH}), 3.52(1 \mathrm{H}$, septet, $J 6.6$, $\mathrm{NCH}), 2.52\left(2 \mathrm{H}, \mathrm{q}, J 7.6, \mathrm{CH}_{2}\right), 1.54\left(6 \mathrm{H}, \mathrm{br} \mathrm{m}, 2 \times \mathrm{NCHCH}_{3}\right)$, $1.22\left(3 \mathrm{H}, \mathrm{t}, J 7.6, \mathrm{CH}_{3} \mathrm{CH}_{2}\right), 1.10\left(6 \mathrm{H}, \mathrm{br} \mathrm{m}, 2 \times \mathrm{NCHCH}_{3}\right)$; $\delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 172.9,168.1,154.6,138.8,130.5,123.5$, 117.2, 113.1, 51.2, 45.9, 27.3, 20.5, 20.3, 8.9; m/z (CI) 294 $\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right)$(Found: $\mathrm{M}^{+}$, 293.1628. $\mathrm{C}_{16} \mathrm{H}_{23} \mathrm{NO}_{4}$ requires $M, 293.1627$ ).

## 4-Methoxy-2-methylphenyl $N, N$-diisopropylcarbamate 21a

sec-Butyllithium ( $2.07 \mathrm{ml}, 2.69 \mathrm{mmol} ; 1.3 \mathrm{M}$ solution in hexanes) was added dropwise to a solution of TMEDA ( 0.41 ml , 2.69 mmol ) in THF ( 20 ml ) at $-78^{\circ} \mathrm{C}$ under an atmosphere of nitrogen. After 10 minutes a solution of carbamate 12e (562 $\mathrm{mg}, 2.24 \mathrm{mmol}$ ) in THF ( 10 ml ) was added. After 1 h , methyl iodide ( $0.70 \mathrm{ml}, 11.24 \mathrm{mmol}$ ) was added. The mixture was stirred for a further 60 minutes and allowed to warm to ambient temperature. Water $(10 \mathrm{ml})$ was added, the THF was removed under reduced pressure, and the aqueous residue was extracted with dichloromethane $(4 \times 20 \mathrm{ml})$. The combined organic
extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to afford carbamate 21a ( $568 \mathrm{mg}, 96 \%$ ) as a colourless oil which required no further purification; $R_{\mathrm{f}} 0.53$ [2:1 petrol-EtOAc]; $v_{\text {max }}$ (film)/cm ${ }^{-1}$ 2996, 2969, 2934, 2876 , 2836,$1712 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.98(1 \mathrm{H}, \mathrm{d}, J 8.7, \mathrm{ArH}), 6.78$ $(1 \mathrm{H}, \mathrm{d}, J 2.9, \mathrm{ArH}), 6.74(1 \mathrm{H}, \mathrm{dd}, J 8.7$ and $3.0, \mathrm{ArH}), 4.08(2 \mathrm{H}$, br m, $2 \times \mathrm{NCH}$ ), $3.81\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.23\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 1.35$ $\left(12 \mathrm{H}, \mathrm{br} \mathrm{m}, 4 \times \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 156.7,153.8$, $143.5,131.5,122.8,116.0,111.6,55.5,46.6,46.1,21.5,20.5$, 16.7, 16.6; m/z (CI) $266\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right), 128\left(18, \mathrm{CON} i-\mathrm{Pr}_{2}\right) ;$ EI $265\left(9, \mathrm{M}^{+}\right), 86$ (100) (Found: $\mathrm{M}^{+}$, 265.1675. $\mathrm{C}_{15} \mathrm{H}_{23} \mathrm{NO}_{3}$ requires $M$, 265.1678).

## 4-Methoxy-2-(trideuteriomethyl)phenyl $\mathrm{N}, \mathrm{N}$-diisopropylcarbamate 21c

In a similar way, a mixture of carbamate 12e $(800 \mathrm{mg}, 3.19$ mmol ) in THF ( 10 ml ) was added to a solution of secbutyllithium ( $2.70 \mathrm{ml}, 3.51 \mathrm{mmol} ; 1.3 \mathrm{M}$ solution in hexanes) and TMEDA ( $0.53 \mathrm{ml}, 3.51 \mathrm{mmol}$ ) in THF ( 20 ml ) and treated with methyl iodide- $d_{3}(0.40 \mathrm{ml}, 6.38 \mathrm{mmol})$. Work-up in the usual manner afforded carbamate 21c ( $737 \mathrm{mg}, 86 \%$ ) as a colourless oil which required no further purification; $R_{\mathrm{f}} 0.50$ [2:1 petrol-EtOAc]; $v_{\text {max }}$ (film)/cm ${ }^{-1}$ 2997, 2970, 2936, 2875, 2836; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.99(1 \mathrm{H}, \mathrm{d}, J 8.7, \mathrm{ArH}), 6.79(1 \mathrm{H}$, d, $J 2.9, \mathrm{ArH}), 6.76(1 \mathrm{H}, \mathrm{dd}, J 8.7$ and $3.0, \mathrm{ArH}), 4.08(2 \mathrm{H}$, $\mathrm{br} \mathrm{m}, 2 \times \mathrm{NCH}), 3.81(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 1.37(12 \mathrm{H}, \mathrm{br} \mathrm{m}, 4 \times$ $\left.\mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 156.7,153.8,143.6,131.4$, $122.8,122.6,116.0,114.2,111.6,55.4,46.6,46.1,21.5,20.5 ; \mathrm{m} / \mathrm{z}$ (CI) $269\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right) ; m / z$ (EI) $268\left(4 \%, \mathrm{M}^{+}\right), 86$ (100) (Found: $\mathrm{M}^{+}, 268.1860 . \mathrm{C}_{15} \mathrm{H}_{20} \mathrm{NO}_{3} \mathrm{D}_{3}$ requires $M, 268.1866$ ).

## 4-Methoxy-2-(trimethylsilyl)phenyl $N, N$-diisopropylcarbamate 21d

In the same way, a mixture of carbamate 12e $872 \mathrm{mg}, 3.47$ mmol ) in THF ( 10 ml ) was added to a solution of secbutyllithium ( $3.21 \mathrm{ml}, 4.17 \mathrm{mmol}$; 1.3 M solution in hexanes) and TMEDA ( $0.63 \mathrm{ml}, 4.17 \mathrm{mmol}$ ) in THF ( 20 ml ) and treated with chlorotrimethylsilane ( $1.0 \mathrm{ml}, 7.88 \mathrm{mmol}$ ). Work-up in the usual manner followed by flash chromatography on silica gel [8:1 petrol-EtOAc] afforded carbamate 21d ( $789 \mathrm{mg}, 70 \%$ ) as a sticky white solid; $R_{\mathrm{f}} 0.30$ [ $8: 1$ petrol-EtOAc]; $\lambda_{\text {max }} / \mathrm{nm}\left(\varepsilon_{\max }\right)$ $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 232$ (29980), 282 (5976); $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 2996,2964$, 2938, 2899, 1712; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.96(1 \mathrm{H}, \mathrm{d}, J 2.9$, ArH), $6.92(1 \mathrm{H}, \mathrm{d}, J 8.8, \mathrm{ArH}), 6.87(1 \mathrm{H}, \mathrm{dd}, J 8.8$ and 2.9 , $\mathrm{ArH}), 4.34(1 \mathrm{H}$, septet, $J 6.9, \mathrm{NCH}), 3.78\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 3.69$ $(1 \mathrm{H}$, septet, $J 6.7, \mathrm{NCH}), 1.33\left(6 \mathrm{H}, \mathrm{d}, J 6.9,2 \times \mathrm{NCHCH}_{3}\right)$, $\left.1.28(6 \mathrm{H}, \mathrm{d}, J 6.7,2 \times \mathrm{NCHCH})_{3}\right), 0.27\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{3}\right)$ ) $\delta_{\mathrm{C}}(75$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) $156.2,153.5,149.6,132.9,123.2,119.9,115.0$, 55.5, 46.9, 45.8, 21.2, 20.5, 1.0; m/z (CI) $324\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right)$, 128 (28, CON $\left.i-\mathrm{Pr}_{2}\right) ; m / z(\mathrm{EI}) 323\left(3 \%, \mathrm{M}^{+}\right), 128$ (72, CON $\left.i-\mathrm{Pr}_{2}\right)$, 86 (100) (Found: $\mathrm{M}^{+}$, 323.1920. $\mathrm{C}_{17} \mathrm{H}_{29} \mathrm{NO}_{3} \mathrm{Si}$ requires $M$, 323.1917).

## N,N-Diisopropyl-2-hydroxy-5-methoxy-3-methylbenzamide 22a

By a method similar to that used for 13a, a solution of carbamate 21a ( $530 \mathrm{mg}, 2.00 \mathrm{mmol}$ ) in THF ( 10 ml ) was added to a solution of sec-butyllithium ( $1.54 \mathrm{ml}, 2.00 \mathrm{mmol} ; 1.3 \mathrm{M}$ solution in hexanes) and TMEDA ( $0.30 \mathrm{ml}, 2.00 \mathrm{mmol}$ ) in THF ( 20 ml ), allowed to warm to ambient temperature and stirred overnight. After work-up in the usual manner, purification by flash chromatography on silica gel [5:1 petrol-EtOAc] afforded the benzamide 22a ( $94 \mathrm{mg}, 18 \%$ ) as a colourless oil, $\lambda_{\max } / \mathrm{nm}\left(\varepsilon_{\max }\right)$ $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 232$ (14470), 318 (5533); $v_{\text {max }}$ (film)/ $/ \mathrm{cm}^{-1} 3108,2968$, 2934, $1601 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.52(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 6.79(1 \mathrm{H}$, d, $J 3.0, \mathrm{ArH}$ ), 6.58 ( $1 \mathrm{H}, \mathrm{d}, J 2.9, \mathrm{ArH}$ ), 3.98 ( 2 H , br m, $2 \times \mathrm{NCH}), 3.78\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 2.38\left(3 \mathrm{H}, \mathrm{s}, \mathrm{ArCH}_{3}\right), 1.42(12 \mathrm{H}$, d, $\left.J 6.7,4 \times \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 171.0,151.2$, $149.5,128.0,120.3,118.7,108.7,55.7,48.9,20.9,16.2 ; m / z$ (CI)
$266\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right) ; m / z$ (EI) $265\left(21 \%, \mathrm{M}^{+}\right), 49$ (100) (Found: $\mathrm{M}^{+}$, 265.1674. $\mathrm{C}_{15} \mathrm{H}_{23} \mathrm{NO}_{3}$ requires $M, 265.1678$ ).

Also obtained was $\mathrm{N}, \mathrm{N}$-diisopropyl-2-(2-hydroxy-5-methoxyphenyl)acetamide 23a ( $140 \mathrm{mg}, 26 \%$ ) as a white solid; mp 154 $156^{\circ} \mathrm{C}(\mathrm{EtOAc}) ; \lambda_{\max } / \mathrm{nm}\left(\varepsilon_{\max }\right)\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 232$ (21458), 296 (12870); $v_{\text {max }}$ (film)/ $\mathrm{cm}^{-1} 2963,2932,1613,1596 ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 6.91(1 \mathrm{H}, \mathrm{d}, J 8.7, \mathrm{ArH}), 6.75(1 \mathrm{H}, \mathrm{dd}, J 8.7$ and 2.8 , $\mathrm{ArH}), 6.61(1 \mathrm{H}, \mathrm{d}, J 2.8, \mathrm{ArH}), 4.24(1 \mathrm{H}, \mathrm{br}$ septet, $J 6.3$, $\mathrm{NCH}), 3.76(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.70\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right), 3.63(1 \mathrm{H}$, $\mathrm{m}, \mathrm{NCH}), 1.36\left(6 \mathrm{H}, \mathrm{d}, J 6.7,2 \times \mathrm{NCHCH}_{3}\right), 1.27(6 \mathrm{H}, \mathrm{d}$, $J$ 6.7, $\left.2 \times \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 172.1,152.9$, $150.9,122.2,118.2,116.0,113.2,55.7,46.5,38.7,21.1$, 20.9, 20.3; m/z (CI) $266\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right)$; $m / z$ (EI) $265(8 \%$, $\mathrm{M}^{+}$), 86 (100) (Found: $\mathrm{M}^{+}, 265.1679 . \mathrm{C}_{15} \mathrm{H}_{23} \mathrm{NO}_{3}$ requires $M$, 265.1678). Also obtained was recovered carbamate 21a (127 $\mathrm{mg}, 24 \%$ ).

## $N, N$-Diisopropyl-2-hydroxy-5-methoxy-3-(trideuteriomethyl)benzamide 22c

In a similar way, a solution of carbamate 21c ( $629 \mathrm{mg}, 2.35$ mmol ) in THF ( 10 ml ), sec-butyllithium ( $1.81 \mathrm{ml}, 2.35 \mathrm{mmol}$; 1.3 M solution in hexanes) and TMEDA ( $0.35 \mathrm{ml}, 2.35 \mathrm{mmol}$ ) in THF ( 20 ml ) gave, after flash chromatography on silica gel [4:1 petrol-EtOAc], the benzamide 22c ( $542 \mathrm{mg}, 86 \%$ ) as a white solid, $\mathrm{mp} 112-114^{\circ} \mathrm{C}(\mathrm{EtOAc}) ; R_{\mathrm{f}} 0.53$ [2:1 petrolEtOAc]; $v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 3066,2996,2969,2937,2836,1599 ;$ $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.55(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 6.79(1 \mathrm{H}, \mathrm{d}, J 3.0, \mathrm{ArH})$, $6.57(1 \mathrm{H}, J 3.0, \mathrm{ArH}), 3.97(2 \mathrm{H}, \mathrm{br} \mathrm{m}, 2 \times \mathrm{NCH}), 3.78(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{OCH}_{3}\right), 1.42\left(12 \mathrm{H}, \mathrm{d}, J 6.7,4 \times \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{c}}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 171.0,151.2,149.5,120.3,118.7,108.7,55.7,48.8$, 20.9; m/z (CI) $269\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right) ; \mathrm{m} / \mathrm{z}$ (EI) $268\left(21 \%, \mathrm{M}^{+}\right)$, 167 (100) (Found: $\mathrm{M}^{+}, 268.1863, \mathrm{C}_{15} \mathrm{H}_{20} \mathrm{NO}_{3} \mathrm{D}_{3}$ requires $M$, 268.1866).

## $N, N$-Diisopropyl-2-hydroxy-5-methoxy-3-(trimethylsilyl)benzamide 22d

In the same way, a solution of carbamate 21d ( $716 \mathrm{mg}, 2.22$ mmol ) in THF ( 10 ml ), sec-butyllithium ( $1.71 \mathrm{ml}, 2.22 \mathrm{mmol}$; 1.3 M solution in hexanes) and TMEDA ( $0.33 \mathrm{ml}, 2.22 \mathrm{mmol}$ ) in THF ( 20 ml ) gave, after flash chromatograhy on silica gel [2:1 petrol-EtOAc], benzamide 22d ( $694 \mathrm{mg}, 97 \%$ ) as a pale yellow oil; $\lambda_{\text {max }} / \mathrm{nm}\left(\varepsilon_{\max }\right)\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 234$ (28412), 322 (12312); $v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 3240,2996,2964,2902,1612,1584 ; \delta_{\mathrm{H}}(300$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.73(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 6.98(1 \mathrm{H}, \mathrm{d}, J 3.0, \mathrm{ArH}), 6.70$ $(1 \mathrm{H}, \mathrm{d}, J 3.0, \mathrm{ArH}), 3.95(2 \mathrm{H}, \mathrm{br} \mathrm{m}, 2 \times \mathrm{NCH}), 3.76(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{OCH}_{3}\right), 1.40\left(12 \mathrm{H}, \mathrm{d}, J 6.7,4 \times \mathrm{NCHCH}_{3}\right), 0.30(9 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 171.2,156.3,151.2,129.7$, 123.1, 119.3, 112.3, 55.8, 48.9, 20.9, 1.2; m/z (CI) 324 ( $100 \%$, $\mathrm{M}+\mathrm{H}^{+}$); $m / z$ (EI) $323\left(23 \%, \mathrm{M}^{+}\right.$), 207 (100) (Found: $\mathrm{M}^{+}$, 323.1921. $\mathrm{C}_{17} \mathrm{H}_{29} \mathrm{NO}_{3} \mathrm{Si}$ requires $M, 323.1917$ ).

## $N, N$-Diisopropyl-2-hydroxy-5-(methoxymethoxy)-3-(trimethylsilyl)benzamide 22e

In the same way, a solution of carbamate 21e $(813 \mathrm{mg}, 2.30$ mmol ) in THF ( 15 ml ), sec-butyllithium ( $2.13 \mathrm{ml}, 2.76 \mathrm{mmol}$; 1.3 M solution in hexanes) and TMEDA ( $0.42 \mathrm{ml}, 2.76 \mathrm{mmol}$ ) in THF ( 30 ml ) gave, after purification by flash chromatography on silica gel [10:1 petrol-EtOAc], benzamide 22e ( 669 mg , $82 \%$ ) as a pale yellow oil; $R_{\mathrm{f}} 0.42$ [5:1 petrol-EtOAc]; $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 3224,2967,2936,2899,1612,1581 ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 9.07(1 \mathrm{H}, \mathrm{s}, \mathrm{OH}), 7.08(1 \mathrm{H}, \mathrm{d}, J 2.9, \mathrm{ArH}), 6.96(1 \mathrm{H}$, d, $J 2.9, \mathrm{ArH}), 5.06\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right), 3.95(2 \mathrm{H}, \mathrm{br} \mathrm{m}, 2 \times \mathrm{NCH})$, $3.47\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right), 1.39\left(12 \mathrm{H}, \mathrm{d}, J 6.6,4 \times \mathrm{NCHCH}_{3}\right)$, $0.30\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 171.2, 157.6 , 148.9, 129.7, 126.1, 118.9, 115.6, 95.6, 55.6, 48.8, 20.9, 1.2; $m / z(C I) 354\left(100 \%, M+\mathrm{H}^{+}\right) ; m / z$ (EI) $353\left(15 \%, \mathrm{M}^{+}\right)$, 45 ( $100 \%$ ) (Found: $\mathrm{M}^{+}$, 353.2021. $\mathrm{C}_{18} \mathrm{H}_{31} \mathrm{NO}_{4} \mathrm{Si}$ requires $M$, 353.2022).

## 2-(Diisopropylcarbamoy)-4-(methoxymethoxy)-6-(trimethylsilyl)phenyl propionate 25 e

By the method used for 14a, benzamide 22e ( $167 \mathrm{mg}, 0.47$ mmol), $n$-butyllithium ( $0.33 \mathrm{ml}, 0.52 \mathrm{mmol} ; 1.6 \mathrm{M}$ solution in hexanes) in THF ( 7 ml ) and propionyl chloride ( $0.06 \mathrm{ml}, 0.71$ mmol ) gave, after flash chromatography on silica gel [5:1 petrol-EtOAc], ester 25e ( $173 \mathrm{mg}, 89 \%$ ) as a colourless oil; $R_{\mathrm{f}}$ 0.73 [2:1 petrol-EtOAc]; $v_{\text {max }}$ (film)/ $\mathrm{cm}^{-1}$ 2964, 2903, 1756, $1637 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.07(1 \mathrm{H}, \mathrm{d}, J 3.0, \mathrm{ArH}), 6.93(1 \mathrm{H}$, d, J $2.9, \mathrm{ArH}$ ), $5.16(1 \mathrm{H}, J 6.7, \mathrm{OCHaHbO}), 5.07(1 \mathrm{H}, \mathrm{d}, J 6.7$, $\mathrm{OCHaHbO}), 3.90(1 \mathrm{H}$, septet, $J 6.6, \mathrm{NCH}), 3.44\left(3 \mathrm{H}, \mathrm{s}, \mathrm{OCH}_{3}\right)$, $3.44(1 \mathrm{H}, \mathrm{m}, \mathrm{NCH}), 2.52\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{3} \mathrm{CH}_{2}\right), 1.49(3 \mathrm{H}, \mathrm{d}, J 7.3$, $\left.\mathrm{NCHCH}_{3}\right), 1.45\left(3 \mathrm{H}, \mathrm{d}, J 7.3, \mathrm{NCHCH}_{3}\right), 1.19(3 \mathrm{H}, \mathrm{t}, J 7.6$, $\mathrm{CH}_{3} \mathrm{CH}_{2}$ ), $1.13\left(6 \mathrm{H}, \mathrm{d}, J 6.5,2 \times \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{C}}(75 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 173.0,166.9,154.0,146.2,135.0,132.0,123.0,114.8$, $94.8,55.8,55.8,50.9,45.7,27.5,20.7,20.3,20.2,8.7,1.0 ; \mathrm{m} / \mathrm{z}$ (CI) $410\left(65 \%, \mathrm{M}+\mathrm{H}^{+}\right), 74$ (100) (Found: $\mathrm{M}+\mathrm{H}^{+}, 410.2358$. $\mathrm{C}_{21} \mathrm{H}_{35} \mathrm{NO}_{5} \mathrm{Si}$ requires $M+\mathrm{H}, 410.2362$ ).

## 2-(Diisopropylcarbamoyl)-4-hydroxy-6-(trimethylsilyl)phenyl propionate $25 f$

By the method used to deprotect 14i, ester 25e ( $172 \mathrm{mg}, 0.42$ mmol ) and sodium iodide ( $189 \mathrm{mg}, 1.26 \mathrm{mmol}$ ) in acetone ( 5 ml ) gave, after purification by flash chromatography on silica gel [6:1 petrol-EtOAc], ester $\mathbf{2 5 f}(123 \mathrm{mg}, 80 \%)$ as a white solid; $\mathrm{mp} 178-179^{\circ} \mathrm{C} ; R_{\mathrm{f}} 0.24$ [5:1 petrol-EtOAc]; $\lambda_{\max } / \mathrm{nm}\left(\varepsilon_{\max }\right)$ $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) 232$ (24820), 292 (10790); $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 3386-3192$, 2944, 2935, 2870, 1756; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.90(1 \mathrm{H}, \mathrm{br} \mathrm{s}$, $\mathrm{OH}), 6.77(1 \mathrm{H}, \mathrm{d}, J 2.8, \mathrm{ArH}), 6.45(1 \mathrm{H}, \mathrm{d}, J 2.8, \mathrm{ArH}), 3.93$ $(1 \mathrm{H}$, septet, $J 6.6, \mathrm{NCH}), 3.46(1 \mathrm{H}$, septet, $J 6.9, \mathrm{NCH}), 2.49$ $\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.51\left(3 \mathrm{H}, \mathrm{d}, J 7.0, \mathrm{NCHCH}_{3}\right), 1.47(3 \mathrm{H}, \mathrm{d}, J 6.9$, $\left.\mathrm{NCHCH}_{3}\right), 1.19\left(3 \mathrm{H}, \mathrm{t}, J 7.6, \mathrm{CH}_{2} \mathrm{CH}_{3}\right), 1.13(3 \mathrm{H}, \mathrm{d}, J 6.5$, $\left.\mathrm{NCHCH}_{3}\right), 1.08\left(3 \mathrm{H}, \mathrm{d}, J 6.6, \mathrm{NCHCH}_{3}\right), 0.20(9 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 173.2,168.7,153.7,144.1,134.2$, 129.9, 123.2, 115.0, 51.3, 45.9, 27.6, 20.7, 20.2, 20.1, 8.8, 1.0; $m / z(\mathrm{CI}) 366\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right) ; m / z(\mathrm{EI}) 365\left(\mathrm{M}^{+}\right), 309(83$, $\mathrm{M}-\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{O}$ ), 193 (100) (Found: C, 62.04; H, 8.61; N, 3.61\%; $\mathrm{M}^{+}, 365.2022 . \mathrm{C}_{19} \mathrm{H}_{31} \mathrm{NO}_{4} \mathrm{Si}$ requires $\mathrm{C}, 62.4 ; \mathrm{H}, 8.5 ; \mathrm{N}, 3.8 \%$; M, 365.2022).

## General procedure for assessment of enolate stability

A solution of $n$-butyllithium ( $0.5 \mathrm{mmol} ; 1.6 \mathrm{M}$ solution in hexanes) in THF ( 3 ml ) at $-78^{\circ} \mathrm{C}$ was treated with diisopropylamine $(0.075 \mathrm{ml}, 0.55 \mathrm{mmol})$. After 10 min , a solution of the ester 14a ( 0.5 mmol ) in THF ( 2 ml ) was added. After 60 minutes, saturated aqueous ammonium chloride ( 2 ml ) was added. The mixture was allowed to warm to ambient temperature and extracted with dichloromethane $(4 \times 10 \mathrm{ml})$. The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to afford the crude product, which was analysed by ${ }^{1} \mathrm{H}$ NMR. Table 2 shows the results for esters $\mathbf{1 4 a}, \mathbf{1 4 c}, \mathbf{1 4 d}, \mathbf{1 7}, \mathbf{1 4 g}, \mathbf{2 5 c}$ and $\mathbf{2 5 f}$.
$\left(2 S^{*}, 3 S^{*}\right)$ - and $\left(2 R^{*}, 3 S^{*}\right)$-2-(Diisopropylcarbamoyl)-4-hydroxy-6-(trimethylsilyl)phenyl 3-hydroxy-2-methyl-3-phenylpropanoate, syn-26 and anti-26
$n$-Butyllithium ( $0.237 \mathrm{ml}, 0.318 \mathrm{mmol} ; 1.6 \mathrm{M}$ solution in hexanes) was added dropwise to a solution of diisopropylamine $(0.045 \mathrm{ml}, 0.32 \mathrm{mmol})$ in THF $(1 \mathrm{ml})$ at $0^{\circ} \mathrm{C}$ under nitrogen. After stirring for 10 minutes the solution was cooled to $-78^{\circ} \mathrm{C}$ and a solution of ester $\mathbf{2 5 f}(58 \mathrm{mg}, 0.16 \mathrm{mmol})$ in THF ( 2 ml ) was added dropwise over 3 minutes to give a yellow solution. After 65 minutes, benzaldehyde ( $0.048 \mathrm{ml}, 0.048 \mathrm{mmol}$ ) was added, the mixture was stirred for a further 2 hours 20 minutes, and saturated aqueous ammonium chloride ( 5 ml ) was added dropwise to give a solution that turned green, then pale yellow, then colourless upon warming to ambient temperature. Water $(5 \mathrm{ml})$ was added, and the mixture was extracted with dichloro-
methane ( $5 \times 5 \mathrm{ml}$ ). The combined organic extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to give an oil. Purification by flash chromatography on silica gel [4:1 petrol-EtOAc] afforded the syn aldol syn-26 ( $24 \mathrm{mg}, 32 \%$ ) as a colourless oil; $R_{\mathrm{f}} 0.52$ [1:1 petrol-EtOAc]; $\nu_{\text {max }}($ film $) / \mathrm{cm}^{-1}$ 3307-3215, 2967, 2938, 1754, 1606, 1581; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, 90^{\circ} \mathrm{C}\right.$, DMSO- $d_{6}$ ) 9.26 ( $1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{ArOH}$ ), 7.67-7.20 ( $5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}$ ), 6.89 $(1 \mathrm{H}, J 2.6, \mathrm{ArH}), 6.63(1 \mathrm{H}, \mathrm{d}, J 2.8, \mathrm{ArH}), 5.25(1 \mathrm{H}, \mathrm{br}$ s, OH$)$, $4.89(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{CHOH}), 3.65(2 \mathrm{H}, \mathrm{br} \mathrm{m}, 2 \times \mathrm{NCH}), 2.84(1 \mathrm{H}, \mathrm{br}$ $\left.\mathrm{m}, \mathrm{PhCH}(\mathrm{OH}) \mathrm{CHCH}_{3}\right), 1.25\left(12 \mathrm{H}, \mathrm{br} \mathrm{m}, 4 \times \mathrm{NCHCH}_{3}\right), 1.07$ $\left(3 \mathrm{H}, \mathrm{d}, J 7.0, \mathrm{PhCH}(\mathrm{OH}) \mathrm{CHCH} \mathrm{H}_{3}\right), 0.20\left(9 \mathrm{H}, \mathrm{s}, \mathrm{Si}\left(\mathrm{CH}_{3}\right)_{3}\right) ; \delta_{\mathrm{C}}(75$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 177.6, 172.2, 159.3, 149.1, 148.7, 139.6, 136.9, $133.0,131.8,131.0,126.5,119.2,76.9,76.7,52.0,51.8,25.5$, 14.3, 4.7, 4.5, 4.2, 4.0; m/z (CI) 472 ( $100 \%, \mathrm{M}+\mathrm{H}^{+}$); m/z (EI) $105(100 \%), 309$ ( $29, \mathrm{M}-\mathrm{PhC}_{4} \mathrm{H}_{6} \mathrm{O}_{2}$ ) (Found: $\mathrm{M}+\mathrm{H}^{+}$, 472.2526. $\mathrm{C}_{26} \mathrm{H}_{37} \mathrm{NO}_{5} \mathrm{Si}$ requires $M+\mathrm{H}, 472.2519$ ).

Also obtained was the anti aldol anti-26 ( $31 \mathrm{mg}, 41 \%$ ) as a colourless oil; $R_{\mathrm{f}} 0.50$ [1:1 petrol-EtOAc]; $v_{\text {max }}$ (film)/ $/ \mathrm{cm}^{-1}$ 3306, 2969, 2936, 1749, 1607, 1580; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, 9{ }^{\circ} \mathrm{C}\right.$, DMSO- $d_{6}$ ) $9.25(1 \mathrm{H}, \mathrm{br} \mathrm{s}, \mathrm{ArOH}), 7.37-7.22(5 \mathrm{H}, \mathrm{m}, \mathrm{Ph}), 6.89$ $(1 \mathrm{H}, \mathrm{d}, J 2.9, \mathrm{ArH}), 6.62(1 \mathrm{H}, \mathrm{d}, J 2.9, \mathrm{ArH}), 5.08(1 \mathrm{H}, \mathrm{d}, J 4.0$, $\mathrm{OH}), 4.74(1 \mathrm{H}, \mathrm{dd}, J 8.2$ and $3.8, \mathrm{CHOH}), 3.61(2 \mathrm{H}, \mathrm{brm}$, $2 \times \mathrm{NCH}), 2.85\left(1 \mathrm{H}\right.$, quintet, $\left.J 7.3, \mathrm{PhCH}(\mathrm{OH}) \mathrm{CH}\left(\mathrm{CH}_{3}\right)\right), 1.3$ $\left(12 \mathrm{H}, \mathrm{br} \mathrm{m}, 4 \times \mathrm{NCHCH}_{3}\right), 0.91(3 \mathrm{H}, \mathrm{d}, J 7.3, \mathrm{PhCH}(\mathrm{OH})-$ $\left.\mathrm{CH}\left(\mathrm{CH}_{3}\right)\right), 0.21\left(9 \mathrm{H}, \mathrm{s}, \mathrm{SiMe}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 173.3$, 154.3, 144.0, 142.9, 134.8, 132.2, 128.3, 127.5, 127.1, 121.9, $114.5,114.3,75.0,47.7,47.4,20.5,14.1,13.8 ; \mathrm{m} / z$ (CI) 472 ( $16 \%, \mathrm{M}+\mathrm{H}^{+}$), 102 ( $100 \%$ ) (Found: $\mathrm{M}+\mathrm{H}^{+}$, 472.2522. $\mathrm{C}_{26} \mathrm{H}_{37} \mathrm{NO}_{5} \mathrm{Si}$ requires $M+\mathrm{H}, 472.2519$ ).

Also recovered was $\mathrm{N}, \mathrm{N}$-diisopropyl-2,5-dihydroxy-3-(trimethylsilyl) benzamide $22 \mathrm{f}(5 \mathrm{mg}, 13 \%$ ) as a white solid; mp $182-185^{\circ} \mathrm{C}$ (EtOAc); $R_{\mathrm{f}} 0.56$ [1:1 petrol-EtOAc]; $v_{\text {max }}($ film $) /$ $\mathrm{cm}^{-1} 3258,2961,2925,2872,2854,1586 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ $6.86(1 \mathrm{H}, \mathrm{d}, J 2.9, \mathrm{ArH}), 6.62(1 \mathrm{H}, J 3.09, \mathrm{ArH}), 3.94(2 \mathrm{H}, \mathrm{br}$ m, $2 \times \mathrm{NCH}), 1.38\left(12 \mathrm{H}, \mathrm{d}, J 6.7,4 \times \mathrm{NCHCH}_{3}\right), 0.29(9 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{Si}\left(\mathrm{CH}_{3}\right)_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 170.9,155.6,147.2,129.8,123.9$, 120.0, 114.1, 29.6, 20.9, -1.2; m/z (CI) $310\left(100 \%, \mathrm{M}+\mathrm{H}^{+}\right)$; $m / z$ (EI) $309\left(3 \%, \mathrm{M}^{+}\right), 49$ (100) (Found: $\mathrm{M}^{+}, 309.1759$ $\mathrm{C}_{16} \mathrm{H}_{27} \mathrm{NO}_{3} \mathrm{Si}$ requires $M, 309.1760$ ). Also recovered was ester $25 f(6 \mathrm{mg}, 10 \%)$.
$\left(2 S^{*}, 3 S^{*}\right)$ - and ( $\left.2 R^{*}, 3 S^{*}\right)$-2-(Diisopropylcarbamoyl)-4-hydroxy-
phenyl 3-hydroxy-2-methyl-3-phenylpropanoate syn- and anti-18
By the same method, a solution of LDA [from diisopropylamine ( $0.14 \mathrm{ml}, 0.99 \mathrm{mmol}$ ) and $n$-butyllithium ( $0.64 \mathrm{ml}, 0.99$ mmol; 1.54 M solution in hexanes) in THF ( 30 ml )] at $-78^{\circ} \mathrm{C}$ was treated with a solution of ester $\mathbf{1 4 g}(145 \mathrm{mg}, 0.50 \mathrm{ml})$ in THF ( 25 ml ). After 25 minutes, a solution of benzaldehyde $(0.13 \mathrm{ml}, 1.24 \mathrm{mmol})$ in THF ( 5 ml ) was added and the mixture was stirred overnight. After work-up in the manner described above, purification by flash chromatography on silica gel [4:1 petrol-EtOAc] afforded a mixture of aldol products syn-18 and anti-18 (123 mg, $62 \%$ ) as a colourless oil.

## ( $1 R^{*}, 2 S^{*}$ )-2-Methyl-1-phenylpropane-1,3-diol syn-20 by reduction of syn-26

A solution of ester syn- $\mathbf{2 6}(43 \mathrm{mg}, 0.09 \mathrm{mmol})$ in THF ( 4 ml ) was added to a stirred solution of lithium aluminium hydride $(17 \mathrm{mg}, 0.45 \mathrm{mmol})$ at $0{ }^{\circ} \mathrm{C}$ in THF ( 2 ml ). The mixture was warmed to ambient temperature, stirred for 3 hours, heated to reflux overnight, allowed to cool and treated successively with water ( 0.5 ml ), $15 \%$ aqueous sodium hydroxide ( 0.5 ml ) and water ( 1.5 ml ). The mixture was extracted with diethyl ether $(3 \times 10 \mathrm{ml})$, and the combined ethereal extracts were dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to afford the crude product. Purification by flash chromatography on silica gel [5:1 petrol-EtOAc] afforded 2-(diisopropylamino-methyl)-6-( trimethylsilyl) benzene-1,4-diol $27(10 \mathrm{mg}, 49 \%)$ as a sticky brown oil, $v_{\max }$ (film)/ $\mathrm{cm}^{-1} 3359,2968,2932,2897,2876$,

2855; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.45(1 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 6.25(1 \mathrm{H}, \mathrm{s}$, $\mathrm{ArH}), 5.03\left(2 \mathrm{H}, \mathrm{d}, J 1.9, \mathrm{CH}_{2}\right), 2.86(2 \mathrm{H}$, septet, $J 6.7$, $2 \times \mathrm{NCH}), 0.83\left(12 \mathrm{H}, \mathrm{d}, J 6.5, \mathrm{~N}\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)_{2}\right), 0.01(9 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{SiMe}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 156.7,148.1,126.3,122.5,119.4$, 116.7, 67.8, 47.6, 19.7, -1.1; m/z (CI) $296\left(6 \%, \mathrm{M}+\mathrm{H}^{+}\right)$, 102 (100) (Found: $\mathrm{M}+\mathrm{H}^{+}$, 296.2043. $\mathrm{C}_{16} \mathrm{H}_{29} \mathrm{NO}_{2} \mathrm{Si}$ requires $M+\mathrm{H}, 296.2046$ ).
Also obtained was the diol syn-20 ( $17 \mathrm{mg}, 100 \%$ ) as a colourless oil.

## Diols 20 by reduction of esters syn- and anti-18

In the same way lithium aluminium hydride ( $17 \mathrm{mg}, 0.45 \mathrm{mmol}$ ) at $0{ }^{\circ} \mathrm{C}$ in THF ( 2 ml ) and a solution of diastereoisomeric aldols $18(123 \mathrm{mg}, 0.308 \mathrm{mmol})$ in THF ( 4 ml ) gave, after heating to reflux for 3 hours and after purification by flash chromatography on silica gel [2:1 petrol-EtOAc $+1 \% \mathrm{Et}_{3} \mathrm{~N}$ ], 2-(diiso-propylcarbamoyl)benzene-1,4-diol 19 ( $14 \mathrm{mg}, 22 \%$ ) as a sticky brown solid; $v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 3260,2964,2928,2871,2855$, 2751,$2732 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 6.59(2 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 6.48(1 \mathrm{H}$, $\mathrm{s}, \mathrm{ArH}), 3.74\left(2 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{2}\right), 3.12(2 \mathrm{H}$, septet, $J 6.7,2 \times \mathrm{NCH})$, $1.10\left(12 \mathrm{H}, \mathrm{d}, J 6.6, \mathrm{~N}\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 169.6, 151.7, 123.1, 116.0, 114.9, 114.5, 48.3, 47.6, 19.5; $m / z$ (CI) $224\left(72 \%, \mathrm{M}+\mathrm{H}^{+}\right), 102(100 \%) ; m / z$ (EI) 223 ( $1 \%$, $\mathrm{M}^{+}$), 49 (100) (Found: $\mathrm{M}^{+}$, 223.1568. $\mathrm{C}_{13} \mathrm{H}_{21} \mathrm{NO}_{2}$ requires $M$, 223.1572).

Also obtained was a mixture of ( $1 S^{*}, 2 S^{*}$ )- and ( $1 R^{*}, 2 S^{*}$ )-2-methyl-1-phenylpropane-1,3-diol syn- and anti-20 (10 mg, $20 \%$ ) in a ratio of 69:31.

## ( $2 R^{*}, \mathbf{4} \boldsymbol{R}^{*}, \mathbf{5} S^{*}$ )-5-Methyl-2,4-diphenyl-1,3-dioxane 28

A mixture of diol syn-20 ( $17 \mathrm{mg}, 0.10 \mathrm{mmol}$ ), benzaldehyde ( 0.5 $\mathrm{ml}, 4.9 \mathrm{mmol}$ ), toluene-p-sulfonic acid (a few crystals), $4 \AA$ molecular sieves and toluene ( 2 ml ) was heated to reflux overnight, cooled to ambient temperature, diluted with diethyl ether ( 15 ml ), washed with saturated aqueous sodium hydrogen carbonate $(2 \times 10 \mathrm{ml})$ and brine $(10 \mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$, filtered and concentrated under reduced pressure to afford the crude product. Purification by flash chromatography on neutral alumina [5:1 petrol-EtOAc] afforded dioxane 28 ( $26 \mathrm{mg}, 100 \%$ ) as a colourless oil; $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 3305-2848,1721 ; \delta_{\mathrm{H}}(300$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.54(2 \mathrm{H}, \mathrm{dd}, J 7.8$ and 1.9, ArH$), 7.38-7.16$ $(8 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 5.65(1 \mathrm{H}, \mathrm{s}, \mathrm{OCHOPh}), 5.09(1 \mathrm{H}, \mathrm{d}, J 2.5$, $\mathrm{PhCHOCHCH} 3), 4.25\left(1 \mathrm{H}, \mathrm{dd}, J 11.1\right.$ and $\left.2.2, \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 4.07$ ( 1 H , dd, $J 11.1$ and $1.2, \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}$ ), $1.87\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CHCH}_{3}\right), 0.90$ $\left(3 \mathrm{H}, \mathrm{d}, J 7.0, \mathrm{CHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 128.8,128.2,128.0$, 126.9, 126.1, 125.2, 101.9, 80.7, 73.3, 34.0, 11.2; m/z (CI) 255 $\left(82 \%, \mathrm{M}+\mathrm{H}^{+}\right), 106$ (100) (Found: $\mathrm{M}^{+}$, 254.1302. $\mathrm{C}_{17} \mathrm{H}_{18} \mathrm{O}_{2}$ requires $M, 254.1307$ ).

## ( $\boldsymbol{R}^{*} \mathrm{a}, \mathbf{1}^{\prime} \boldsymbol{R}^{*}$ )- and ( $\boldsymbol{R}^{*} \mathrm{a}, \mathbf{1}^{\prime} \boldsymbol{S}^{*}$ )-N, $N$-Diisopropyl-8-(dimethyl-amino)-2-(1'-hydroxypentyl)-1-naphthamide anti-45a and syn-45a

The aldehyde $\mathbf{4 1}(0.2 \mathrm{~g}, 0.6 \mathrm{mmol})$ in THF $(50 \mathrm{ml})$ was added to a stirred solution of $n$-butyllithium ( $0.38 \mathrm{ml} ; 1.6 \mathrm{M}$ solution in hexane) in THF ( 50 mL ) under nitrogen at $-78^{\circ} \mathrm{C}$. After 30 min the mixture was warmed to room temperature for 30 min . Saturated $\mathrm{NH}_{4} \mathrm{Cl}$ was added and the mixture was extracted with dichloromethane ( $2 \times 60 \mathrm{ml}$ ). The extracts were washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure. Analytical HPLC of the crude mixture showed that the atropisomers were present in a ratio of 15.5 (anti) : 1 (syn). Purification by flash chromatography on $\mathrm{SiO}_{2}$ [1:5 EtOAc-petrol] gave the anti alcohol anti-45a ( $0.12 \mathrm{~g}, 57 \%$ ) as white plates, mp $124-128^{\circ} \mathrm{C} ; R_{\mathrm{f}}[1: 5 \mathrm{EtOAc}$-petrol $] 0.37 ; v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 3422$ $(\mathrm{O}-\mathrm{H}), 1628(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.86(1 \mathrm{H}, \mathrm{d}, J 8.5$, $\mathrm{ArH}), 7.70(1 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}), 7.60(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 7.44(1 \mathrm{H}$, $\mathrm{t}, J 7.5, \mathrm{ArH}), 7.28(1 \mathrm{H}, \mathrm{d}, J 7.5, \mathrm{ArH}), 5.05(1 \mathrm{H}, \mathrm{dt}, J 3.5$ and 9 , $H \mathrm{COH}), 3.50\left[1 \mathrm{H}\right.$, septet, $\left.J 6.5, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 3.10[1 \mathrm{H}$, septet,

## ( $R^{*}$ a, $\mathbf{1}^{\prime} \boldsymbol{R}^{*}$ )- $N, N$-Diisopropyl-8-(dimethylaminomethyl)-2( $\mathbf{1}^{\prime}$-hydroxynon-2'-ynyl)-1-naphthamide anti-44b

Method A. $n$-Butyllithium ( 0.83 ml ; 1.6 M solution in hexane) was added dropwise to a stirred solution of oct-1-yne $(0.20 \mathrm{ml}, 1.3 \mathrm{mmol})$ in THF ( 30 ml ) under nitrogen at $0^{\circ} \mathrm{C}$. After 30 min at $0^{\circ} \mathrm{C}$, the aldehyde $40(0.3 \mathrm{~g}, 0.8 \mathrm{mmol})$ was added and the mixture was stirred for 30 min at $-78^{\circ} \mathrm{C}, 30$ $\min$ at $0^{\circ} \mathrm{C}$ and 30 min at room temperature. The mixture was poured into aqueous $\mathrm{HCl}(1 \mathrm{M}, 30 \mathrm{ml})$ and extracted with dichloromethane $(2 \times 30 \mathrm{ml})$. The extracts were washed with sodium bicarbonate solution and brine, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure. Analytical HPLC of the crude mixture showed that the atropisomers were present in a ratio of 1 (anti): 1 (syn). Purification by flash chromatography on $\mathrm{SiO}_{2}(20: 1 \mathrm{EtOAc}-\mathrm{MeOH})$ gave the anti alcohol anti-44b $(0.26 \mathrm{~g}, 66 \%)$ as a yellow oil; $R_{\mathrm{f}}(20: 1 \mathrm{EtOAc}-\mathrm{MeOH}) 0.33 ; v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 3357(\mathrm{OH}), 2931(\mathrm{CH}), 1624(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.94(1 \mathrm{H}, \mathrm{d}, J 7, \mathrm{ArH}), 7.80(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 7.65(1 \mathrm{H}$, d, $J 8, \mathrm{ArH}), 7.42(1 \mathrm{H}, \mathrm{t}, J 8, \mathrm{ArH}), 7.40(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH})$, $5.60(1 \mathrm{H}, \mathrm{s}, \mathrm{C} H \mathrm{OH}), 4.14\left(1 \mathrm{H}, \mathrm{d}, J 15.5, \mathrm{Me}_{2} \mathrm{NCH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right)$, $3.88\left(1 \mathrm{H}, \mathrm{d}, J 15.5, \mathrm{Me}_{2} \mathrm{NCH}_{\mathrm{A}} H_{\mathrm{B}}\right), 3.52[1 \mathrm{H}$, septet, $J 7$, $\left.\mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 3.05\left[1 \mathrm{H}\right.$, septet, $\left.J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 2.20(6 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{NMe}_{2}\right), 1.60\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 1.55(3 \mathrm{H}, \mathrm{d}, J 7$, $\left.\mathrm{NCHCH}_{3}\right), 1.50\left[2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 1.40[2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2} \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right], 1.20\left[6 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right], 0.90(3 \mathrm{H}, \mathrm{d}$, $\left.J 7, \mathrm{NCHCH}_{3}\right), 0.85\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 0.85(3 \mathrm{H}, \mathrm{t}, J 7$, $\left.\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 170.0(\mathrm{C}=\mathrm{O}), 138.3,135.6,134.2$, $131.5,130.2,130.2,127.8,127.5,126.3,124.4$ (ArH), 88.0 $(\mathrm{COH}), 80.1,79.4$ (alkyne C), $61.5\left(\mathrm{Me}_{2} \mathrm{NCH}_{2}\right), 50.8$ $\left(\mathrm{NMe}_{2}\right), 46.3,45.6(2 \times \mathrm{NCH}), 31.2,28.4,22.4,20.3,20.2$ $\left(5 \times \mathrm{CH}_{2}\right), 20.0,19.8,19.6,18.8\left(4 \times \mathrm{CH}_{3}\right), 13.9\left(\mathrm{CH}_{3}\right) ; m / z(\mathrm{CI})$ $451\left(100 \%,(\mathrm{M}+\mathrm{H})^{+}\right)$(Found (EI): $(\mathrm{M}+\mathrm{H})^{+}, 451.3332$. $\mathrm{C}_{29} \mathrm{H}_{42} \mathrm{~N}_{2} \mathrm{O}_{2}$ requires $M, 451.3246$ ).

Method B. Alternatively, $n$-butyllithium ( $0.8 \mathrm{ml} ; 1.6 \mathrm{M}$ solution in hexane) was added dropwise to a stirred solution of oct-1-yne ( $0.20 \mathrm{ml}, 1.3 \mathrm{mmol}$ ) in THF ( 30 ml ) under nitrogen at $-78^{\circ} \mathrm{C}$. After 30 min at $-78^{\circ} \mathrm{C}$, chlorotitanium triisopropoxide $(0.34 \mathrm{~g}, 1.3 \mathrm{mmol})$ was added dropwise and the mixture warmed to $0^{\circ} \mathrm{C}$ and stirred at this temperature for 45 min . The
aldehyde $\mathbf{4 0}(0.3 \mathrm{~g}, 0.8 \mathrm{mmol})$ was added and the mixture was stirred for 6 h at $0^{\circ} \mathrm{C}$ and room temperature for 30 min , poured into aqueous $\mathrm{HCl}(1 \mathrm{M}, 30 \mathrm{ml})$ and extracted with dichloromethane $(2 \times 30 \mathrm{ml})$. The extracts were washed with sodium bicarbonate solution and brine, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure. Analytical HPLC of the crude mixture showed that the atropisomers were present in a ratio of 2 (anti): 1 (syn). Purification by flash chromatography on $\mathrm{SiO}_{2}$ (20:1 EtOAc-MeOH) gave the anti alcohol anti-44b ( 47 mg , $36 \%$ ) as a yellow oil.

## ( $\boldsymbol{R}^{*} \mathrm{a}, \mathbf{1}^{\prime} \boldsymbol{R}^{*}$ ) and ( $\boldsymbol{R}^{*} \mathrm{a}, \mathbf{1}^{\prime} \boldsymbol{S}^{*}$ )- $N, N$-Diisopropyl-8-(dimethyl-amino)-2-[1'-hydroxynon-2'-ynyl]-1-naphthamide anti-45b and syn-45b

By method A, $n$-butyllithium ( 0.43 ml ; 1.6 M solution in hexane), oct-1-yne ( $0.14 \mathrm{~mL}, 0.9 \mathrm{mmol}$ ) and aldehyde 41 ( 150 $\mathrm{mg}, 0.46 \mathrm{mmol}$ ) gave a crude product. Analytical HPLC of the crude mixture showed that the atropisomers were present in a ratio of 2 (anti): 1 (syn). Purification by flash chromatography on $\mathrm{SiO}_{2}(1: 5 \mathrm{EtOAc}$-petrol) gave the anti alcohol anti-45b as a yellow oil ( $69 \mathrm{mg}, 35 \%$ ); $R_{\mathrm{f}}[1: 5 \mathrm{EtOAc}-$ petrol $] 0.23 ; v_{\text {max }}$ (film)/ $\mathrm{cm}^{-1} 3388(\mathrm{OH}), 1627(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.74(1 \mathrm{H}, \mathrm{d}$, $J 8.5, \mathrm{ArH}), 7.74(1 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}), 7.46(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH})$, $7.34(1 \mathrm{H}, \mathrm{t}, J 7.5, \mathrm{ArH}), 7.14(1 \mathrm{H}, \mathrm{d}, J 7.5, \mathrm{ArH}), 5.70(1 \mathrm{H}, \mathrm{m}$, $\mathrm{HCOH}), 3.40\left[1 \mathrm{H}\right.$, septet, $\left.J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 2.80[1 \mathrm{H}$, septet, $J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}$, $2.72(3 \mathrm{H}, \mathrm{s}, \mathrm{NMe}), 2.66(1 \mathrm{H}, \mathrm{d}, J 5.5, \mathrm{OH})$, $2.46(3 \mathrm{H}, \mathrm{s}, \mathrm{NMe}), 2.15\left[2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 1.60(3 \mathrm{H}, \mathrm{d}$, $\left.J 7, \mathrm{NCHCH}_{3}\right), 1.55\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 1.40-1.20(8 \mathrm{H}, \mathrm{m}$, $\left.\left(\mathrm{CH}_{2}\right)_{4}\right), 0.84\left(3 \mathrm{H}, \mathrm{t}, J 7, \mathrm{CH}_{3}\right), 0.78\left[3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right]$; $\delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 170.7(\mathrm{C}=\mathrm{O}), 151.6,136.9,134.8,131.6$, $129.0,126.4,126.1,125.9,124.2,116.7(\mathrm{ArC}), 88.0(\mathrm{COH})$, 78.4, 62.4 (alkyne C), $50.5,50.2\left(\mathrm{NMe}_{2}\right), 45.9,43.5(\mathrm{NCH} \times 2)$, $31.2,28.5,28.4,22.4,20.5\left(5 \times \mathrm{CH}_{2}\right), 20.4,20.2,19.4,18.8$ $\left(4 \times \mathrm{CH}_{3}\right), 13.9\left(\mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}) 437\left(100 \%,(\mathrm{M}+\mathrm{H})^{+}\right)$, (EI) 226 (52), 86 ( $30,2 \times i$-Pr) (Found: $(\mathrm{M}+\mathrm{H})^{+}, 437.3176$. $\mathrm{C}_{28} \mathrm{H}_{40} \mathrm{~N}_{2} \mathrm{O}_{2}$ requires $M+1,437.3168$ ).
Also obtained was the syn alcohol syn-45b as a yellow oil (35 $\mathrm{mg}, 18 \%$ ); $R_{\mathrm{f}}\left[1: 5 \mathrm{EtOAc}\right.$-petrol] $0.14 ; v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 3388$ $(\mathrm{OH}), 1627(\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.00(1 \mathrm{H}, \mathrm{d}, J 8.5$, $\mathrm{ArH}), 7.76(1 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}), 7.50(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 7.35$ ( $1 \mathrm{H}, \mathrm{t}, J 8, \mathrm{ArH}$ ), $7.16(1 \mathrm{H}, \mathrm{d}, J 7.5, \mathrm{ArH}), 5.70(1 \mathrm{H}, \mathrm{s}, \mathrm{CHOH})$, $4.20(1 \mathrm{H}, \mathrm{br}, \mathrm{OH}), 3.45\left[1 \mathrm{H}\right.$, septet, $\left.J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 2.92[1 \mathrm{H}$, septet, $J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}$ ], $2.72(3 \mathrm{H}, \mathrm{s}, \mathrm{NMe}), 2.42(3 \mathrm{H}, \mathrm{s}, \mathrm{NMe})$, $2.25\left(2 \mathrm{H}, \mathrm{m}\right.$, alkyne- $\left.\mathrm{CH}_{2}\right), 1.62\left(3 \mathrm{H}, \mathrm{d}, J 7 \mathrm{NCHCH}_{3}\right), 1.60$ $\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 1.35\left(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\right), 1.40-1.10[6 \mathrm{H}$, $\mathrm{m},\left(\mathrm{CH}_{2}\right)_{3}$, $0.85\left(3 \mathrm{H}, \mathrm{t}, J 7, \mathrm{CH}_{3}\right), 0.80(6 \mathrm{H}, \mathrm{d} \times 2, J 7$, $\left.\mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 170.7(\mathrm{C}=\mathrm{O}), 151.6,136.9$, 134.8, 131.6, 129.0, 126.4, 126.1, 125.5, 124.2, 116.7 (ArC), 88.0 $(\mathrm{COH}), 78.4,62.4$ (alkyne C), 50.5, 50.2 ( $\mathrm{NMe}_{2}$ ), 45.9, 43.5 $(\mathrm{NCH} \times 2), \quad 31.2, \quad 28.5, \quad 28.4, \quad 22.4, \quad 20.5\left(5 \times \mathrm{CH}_{2}\right), \quad 20.4$, 20.2, 19.4, $18.9\left(4 \times \mathrm{CH}_{3}\right), 13.9\left(\mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}) 437(40 \%$, $\left.(\mathrm{M}+\mathrm{H})^{+}\right), 419$ (73), (EI) 226 (75), 210 (73) and 86 ( $47,2 \times i$-Pr) (Found: $(\mathrm{M}+\mathrm{H})^{+}$, 437.3173. $\mathrm{C}_{28} \mathrm{H}_{40} \mathrm{~N}_{2} \mathrm{O}_{2}$ requires $M+1$, 437.3168).

## 9-(Dimethylamino)-3-(oct-1-ynyl)-1,3-dihydronaphtho[1,2-c]-furan-1-one 47

By method B, $n$-butyllithium ( 0.43 ml ; 1.6 M solution in hexane), oct-1-yne ( $0.14 \mathrm{~m}, 0.91 \mathrm{mmol}$ ), chlorotitanium triisopropoxide ( $0.30 \mathrm{ml} ; 1 \mathrm{M}$ solution in hexane) and aldehyde $\mathbf{4 1}$ ( $150 \mathrm{mg}, 0.46 \mathrm{mmol}$ ) gave, after purification by flash chromatography [1:6 EtOAc-petrol], the lactone 47 as a yellow oil ( 0.17 $\mathrm{g}, 83 \%) ; R_{\mathrm{f}}[1: 6 \mathrm{EtOAc}-$ petrol $] 0.2 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.98$ $(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 7.80(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 7.60(1 \mathrm{H}, \mathrm{d}, J 8$, $\mathrm{ArH}), 7.45(1 \mathrm{H}, \mathrm{d}, J 7, \mathrm{ArH}), 7.10(1 \mathrm{H}, \mathrm{t}, J 7, \mathrm{ArH}), 5.90(1 \mathrm{H}, \mathrm{s}$, $\mathrm{COCH}), 4.60\left(1 \mathrm{H}, \mathrm{m}\right.$, alkyne- $\left.\mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 4.45(1 \mathrm{H}, \mathrm{m}$, alkyne$\left.\mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}}\right), 2.90(3 \mathrm{H}, \mathrm{s}, \mathrm{NMe}), 2.85(3 \mathrm{H}, \mathrm{s}, \mathrm{NMe}), 1.65(2 \mathrm{H}, \mathrm{t}$, $J 7$, alkyne $\left.-\mathrm{CH}_{2} \mathrm{CH}_{2}\right), 1.28\left(6 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{2} \mathrm{CH}_{3}\right), 0.90(3 \mathrm{H}$, $\mathrm{m}, \mathrm{CH}_{3}$ ).
$\left(R^{*} \mathrm{a}, 1^{\prime} S^{*}\right)$ and $\left(R^{*} \mathrm{a}, 1^{\prime} R^{*}\right)$ - $N, N$-Diisopropyl-2-( $1^{\prime}$-hydroxynon-2'-ynyl)-8-methoxy-1-naphthamide anti-46b and syn-46b
By method A, $n$-butyllithium ( $1.1 \mathrm{ml} ; 1.6 \mathrm{M}$ solution in hexane), oct-1-yne ( $0.2 \mathrm{ml}, 1.4 \mathrm{mmol}$ ) and aldehyde $\mathbf{4 2}(150 \mathrm{mg}$, 0.48 mmol ) gave a crude product. Analytical HPLC of the crude mixture showed that the atropisomers were present in a ratio of 1 (anti):3 (syn). Purification by column chromatography [1:2 EtOAc-petrol], gave the anti alcohol anti-46b (14 $\mathrm{mg}, 7 \%)$ as a pale yellow oil; $R_{\mathrm{f}}[1: 2 \mathrm{EtOAc}$-petrol $] 0.56 ; \delta_{\mathrm{H}}(300$ $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.74(2 \mathrm{H}, \mathrm{d} \times 2, J 8.5, \mathrm{ArH}), 7.34(1 \mathrm{H}, \mathrm{t}, J 7$, $\mathrm{ArH}), 7.30(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 6.77(1 \mathrm{H}, \mathrm{d}, J 6.5, \mathrm{ArH}), 5.60$ $(1 \mathrm{H}, \mathrm{s}, \mathrm{HOCH}), 3.80(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.45[1 \mathrm{H}$, septet, $J 7$, $\left.\mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 3.35\left[1 \mathrm{H}\right.$, septet, $\left.J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 2.6(1 \mathrm{H}, \mathrm{br}$, $\mathrm{OH}), 2.10\left(\mathrm{CH}_{2}, \mathrm{~m}\right.$, alkyne- $\left.\mathrm{CH}_{2}\right), 1.60\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right)$, $1.55\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 1.30-1.10\left[8 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{4}\right], 1.0-0.8$ $\left[6 \mathrm{H}, \mathrm{d} \times 2, J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 0.80\left(3 \mathrm{H}, \mathrm{t}, J 7, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}(75$ $\mathrm{MHz}, \mathrm{CDCl}_{3}$ ) 169.4 (C=O), 155.8, 135.4, 134.7, 130.8, 128.5, 126.5, 125.6, 121.1, 120.8, 106.3 (ArC), 87.4 (COH), 80.8, 69.5 (alkyne), $61.5(\mathrm{OMe}), 50.9,45.8(\mathrm{NCH} \times 2), 31.2,28.7,28.3$, 22.4, $20.4\left(5 \times \mathrm{CH}_{2}\right), 20.1,19.4,18.8,18.7\left(4 \times \mathrm{CH}_{3}\right), 13.9$ $\left(\mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}) 424\left(100 \%,(\mathrm{M}+\mathrm{H})^{+}\right)$, (EI) $86(100,2 \times i-\mathrm{Pr})$, 43 (79, $i$-Pr) (Found (EI): $\mathrm{M}^{+}, 423.2770 . \mathrm{C}_{27} \mathrm{H}_{37} \mathrm{NO}_{3}$ requires M, 423.2773).

Also obtained was the syn alcohol syn-46b ( $73 \mathrm{mg}, 37 \%$ ) as a pale yellow oil; $R_{\mathrm{f}}$ [1:2 EtOAc-petrol] 0.33; $\delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 8.00(1 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}), 7.75(1 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}), 7.39$ $(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 7.34(1 \mathrm{H}, \mathrm{t}, J 8, \mathrm{ArH}), 6.80(1 \mathrm{H}, \mathrm{d}, J 7, \mathrm{ArH})$, $5.70(1 \mathrm{H}, \mathrm{s}, \mathrm{HOCH}), 3.85(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.65(1 \mathrm{H}, \mathrm{m}, \mathrm{OH}), 3.52$ $\left[1 \mathrm{H}\right.$, septet, $\left.J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 3.40[1 \mathrm{H}$, septet, $J 7$, NCH$\left(\mathrm{CH}_{3}\right)_{2}$ ], $2.25\left(2 \mathrm{H}, \mathrm{td}, J 7\right.$ and 2, alkyne $\left.\mathrm{CH}_{2}\right), 1.60(3 \mathrm{H}, \mathrm{d}$, $\left.J 7, \mathrm{NCHCH}_{3}\right), 1.55\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 1.35[2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right], 1.30-1.10\left[6 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{3} \mathrm{CH}_{3}\right], 0.90(3 \mathrm{H}, \mathrm{d}$, $\left.J 7, \mathrm{NCHCH}_{3}\right), 0.85\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 0.80(3 \mathrm{H}, \mathrm{t}, J 7$, $\left.\mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 169.4(\mathrm{C}=\mathrm{O}), 155.8,135.4,134.7$, $130.8,128.5,126.2,125.6,121.1,120.8,106.3$ (ArC), 87.4 $(\mathrm{COH}), 80.8,69.5$ (alkyne), $61.5(\mathrm{OMe}), 50.6,45.8(\mathrm{NCH} \times 2)$, 31.2, 28.4, 28.3, 22.4, $20.4\left(5 \times \mathrm{CH}_{2}\right), 20.1,19.4,18.8,18.7$ $\left(4 \times \mathrm{CH}_{3}\right), 13.9\left(\mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}) 424\left(8 \%,(\mathrm{M}+\mathrm{H})^{+}\right)$, (EI) 86 ( $98,2 \times i$-Pr) (Found (EI): $\mathrm{M}^{+}$, 423.2770. $\mathrm{C}_{27} \mathrm{H}_{37} \mathrm{NO}_{3}$ requires M, 423.2773).

Method C. Alternatively, $n$-butyllithium ( 1.1 ml of a 1.6 M solution in hexane) was added dropwise to a stirred solution of oct-1-yne ( $0.2 \mathrm{ml}, 1.4 \mathrm{mmol}$ ) in THF ( 10 ml ) under nitrogen at $-78^{\circ} \mathrm{C}$. After 30 min at $-78{ }^{\circ} \mathrm{C}$ DIBAL-H ( $1.4 \mathrm{ml}, 1.4 \mathrm{mmol}$ ) was added and the mixture stirred at this temperature for 30 min . The aldehyde $42(150 \mathrm{mg}, 0.48 \mathrm{mmol})$ was added and the mixture was stirred for 30 min at $-78^{\circ} \mathrm{C}$ and warmed to room temperature. Saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ was added and the mixture was extracted with dichloromethane ( $2 \times 30 \mathrm{ml}$ ). The extracts were washed with brine ( 30 ml ), dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure. Analytical HPLC of the crude mixture showed that the atropisomers were present in a ratio of $>99$ (anti): 1 (syn). Purification by column chromatography [1:2 EtOAc-petrol] gave only anti-46b ( $130 \mathrm{mg}, 65 \%$ ). On one occasion, using an essentially identical method, aldehyde $42(2.0 \mathrm{~g}, 6.4 \mathrm{mmol})$ gave $N, N$-diisopropyl-2-(hydroxy-methyl)-8-methoxy-1-naphthamide $51(1.8 \mathrm{~g}, 88 \%)$ as a white solid; mp 205-207 ${ }^{\circ} \mathrm{C} ; R_{\mathrm{f}}[1: 4 \mathrm{EtOAc}$-petrol $] 0.45 ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.60(1 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}), 7.43(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 7.28$ $(1 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}), 7.24(1 \mathrm{H}, \mathrm{t}, J 8, \mathrm{ArH}), 6.73(1 \mathrm{H}, \mathrm{d}, J 6$, $\mathrm{ArH}), 4.76\left(1 \mathrm{H}, \mathrm{d}, J 12, \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{OH}\right), 4.40\left(1 \mathrm{H}, \mathrm{d}, J 12, \mathrm{CH}_{\mathrm{A}^{-}}\right.$ $\left.H_{\mathrm{B}} \mathrm{OH}\right), 3.78(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.44\left[1 \mathrm{H}\right.$, septet, $\left.J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right]$, $3.28\left[1 \mathrm{H}\right.$, septet, $\left.J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 1.60\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right)$, $1.55\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 0.85\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 0.80$ $\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 171.8(\mathrm{C}=\mathrm{O}), 135.2$, $134.4,128.5,128.4,127.8,126.4,126.2,125.7,120.8,120.8$ $(\mathrm{ArC}), 105.9\left(\mathrm{CH}_{2} \mathrm{OH}\right), 62.7(\mathrm{OMe}), 50.8,45.9(\mathrm{NCH} \times 2)$, 20.4, 20.3, 20.2, $19.4\left(4 \times \mathrm{CH}_{3}\right) ; m / z(\mathrm{CI}) 316\left(32 \%,(\mathrm{M}+\mathrm{H})^{+}\right)$,

102 (100), (EI) 199 (27), 86 (55, $2 \times i$-Pr), 84 (70) and 49 (100) (Found (EI): $\mathrm{M}^{+}, 315.1838 . \mathrm{C}_{19} \mathrm{H}_{25} \mathrm{NO}_{3}$ requires $M, 315.1834$ ).

Method D. Alternatively, $n$-butyllithium ( $1.1 \mathrm{ml} ; 1.6 \mathrm{M}$ solution in hexane) was added dropwise to a stirred solution of oct-1-yne ( $0.2 \mathrm{ml}, 1.4 \mathrm{mmol}$ ) in THF ( 10 ml ) under nitrogen at $-78^{\circ} \mathrm{C}$. After 30 min at $-78^{\circ} \mathrm{C} \mathrm{Me} 3 \mathrm{Al}(24 \mu \mathrm{l} ; 2 \mathrm{M}$ solution in hexane) was added and the mixture stirred at this temperature for 30 min . The aldehyde $\mathbf{4 2}(150 \mathrm{mg}, 0.48 \mathrm{mmol})$ was added and the mixture stirred for 30 min at $-78^{\circ} \mathrm{C}$ and the mixture warmed to room temperature for 30 min . Saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ was added and the product extracted with dichloromethane ( $2 \times 30 \mathrm{ml}$ ). The extracts were washed with brine ( 30 $\mathrm{ml})$, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure. Analytical HPLC of the crude mixture showed that the atropisomers were present in a ratio of 21 (anti) :1 (syn). Purification by column chromatography on $\mathrm{SiO}_{2}$ [1:2 EtOAc-petrol] gave anti-46b ( $81 \mathrm{mg}, 40 \%$ ).

When $\mathrm{Et}_{3} \mathrm{Al}$ was used in place of $\mathrm{Me}_{3} \mathrm{Al}$, only starting material ( $97 \%$ ) was recovered.

## ( $S_{\mathrm{a}}, 1^{\prime} R$ )-N,N-Diisopropyl-2-(1'-hydroxynon-2'-ynyl)-8-methoxy-1-naphthamide (+)-anti-46b

By method D, enantiomerically pure ( - ) $\mathbf{- 4 2}(0.37 \mathrm{~g}, 1.17 \mathrm{mmol})$ gave optically active alcohol $(+)$-anti- $\mathbf{4 6 b}(0.20 \mathrm{~g}, 40 \%)$ as white plates; $\mathrm{mp} 122-126^{\circ} \mathrm{C} ;[a]_{\mathrm{D}}^{23}+61\left(c=1, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$.

## ( $R_{\mathrm{a}}, 2^{\prime} R, 4^{\prime} S$ )- $N, N$-Diisopropyl-8-(dimethylamino)-2-[2'-phenyl-perhydropyrrolo[1,2-c]imidazol-3'-yl]-1-naphthamide 53a

The diamine $52^{63}$ ( $75 \mathrm{mg}, 0.46 \mathrm{mmol}$ ) was added to a solution of the aldehyde $41(150 \mathrm{mg}, 0.46 \mathrm{mmol})$ in toluene ( 20 ml ). The solution was heated to reflux in a Dean-Stark apparatus for 20 h , cooled and the toluene was removed under reduced pressure. Purification by flash chromatography on alumina [1:20 EtOAc-petrol] gave the aminal 53a ( $170 \mathrm{mg}, 79 \%$ ) as colourless plates; $R_{\mathrm{f}}\left[1: 20 \mathrm{EtOAc}\right.$-petrol] $0.40 ; v_{\text {max }}($ film $) / \mathrm{cm}^{-1} 2928$ $(\mathrm{CH}), 1618(\mathrm{~N}-\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.65(1 \mathrm{H}, \mathrm{d}, J 8$, $\mathrm{ArH}), 7.40(1 \mathrm{H}, \mathrm{d}, J 7, \mathrm{ArH}), 7.35(1 \mathrm{H}, \mathrm{t}, J 8, \mathrm{ArH}), 7.20(1 \mathrm{H}$, d, $J 8, \mathrm{ArH}), 7.10(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 7.10(2 \mathrm{H}, 2 \times \mathrm{t}, J 7, \mathrm{ArH})$, $6.75(2 \mathrm{H}, 2 \times \mathrm{d}, J 8, \mathrm{ArH}), 6.60(1 \mathrm{H}, \mathrm{t}, J 7, \mathrm{ArH}), 6.10(1 \mathrm{H}$, s, NCHN ), $4.1\left(1 \mathrm{H}, \mathrm{t}, J 7, \mathrm{NCHCH}_{2}\right), 3.95(1 \mathrm{H}, \mathrm{t}, J 7, \mathrm{PhN}-$ $\left.\mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 3.44\left(1 \mathrm{H}\right.$, septet, $\left.J 7, \mathrm{NCHCH}_{3}\right), 3.3\left(2 \mathrm{H}, \mathrm{m}, \mathrm{NCH}_{2}{ }^{-}\right.$ $\mathrm{CH}_{2}$ and C$), 2.80(3 \mathrm{H}, \mathrm{s}, \mathrm{NMe}), 2.75(2 \mathrm{H}, \mathrm{m}, \mathrm{NCHCH} 3$ and $\mathrm{PhNCH}_{\mathrm{A}} H_{\mathrm{B}}$ ), $2.60(3 \mathrm{H}, \mathrm{s}, \mathrm{NMe}), 2.00-1.80\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2}\right)$, $1.65\left[6 \mathrm{H}, 2 \times \mathrm{d}, J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 0.90\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right)$, $0.7\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right) ; m / z(\mathrm{CI}) 485(50 \%$, (M+H)+$)$, (EI) 86 (63, $2 \times i$-Pr) (Found (EI): $(\mathrm{M}+\mathrm{H})^{+}$, 485.3278. $\mathrm{C}_{31} \mathrm{H}_{40} \mathrm{~N}_{4} \mathrm{O}$ requires $M+1,485.3280)$.

## ( $S_{\mathrm{a}}, \mathbf{2}^{\prime} R, \mathbf{4}^{\prime} S$ )-N,N-Diisopropyl-8-methoxy-2-[2'-phenylperhydro-pyrrolo[1,2-c]imidazol-3-yl]-1-naphthamide 54a

The diamine $\mathbf{5 2}^{63}$ ( $470 \mathrm{mg}, 2.9 \mathrm{mmol}$ ) was added to a solution of the aldehyde $\mathbf{4 2}(600 \mathrm{mg}, 1.9 \mathrm{mmol})$ in xylene $(50 \mathrm{ml})$. The solution was heated to reflux in a Dean-Stark apparatus for 3 days and cooled and the xylene was removed under reduced pressure. Purification of the crude product (obtained in quantitative yield) by column chromatography on alumina [1:4 EtOAc-petrol] gave the aminal 54a ( $540 \mathrm{mg}, 60 \%$ ) as an amorphous solid; mp 207-210 ${ }^{\circ} \mathrm{C} ; R_{\mathrm{f}}$ [1:4 EtOAc-petrol] 0.23 ; $v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 2968(\mathrm{CH}), 1623(\mathrm{~N}-\mathrm{C}=\mathrm{O}) ; \delta_{\mathrm{H}}(300 \mathrm{MHz}$, $\left.\mathrm{CDCl}_{3}\right) 7.56(1 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}), 7.27(2 \mathrm{H}, 2 \times \mathrm{d}, J 7, \mathrm{ArH})$, $7.18(1 \mathrm{H}, \mathrm{t}, J 8.5, \mathrm{ArH}), 7.06(2 \mathrm{H}, \mathrm{t}, J 7, \mathrm{ArH}), 6.76(1 \mathrm{H}, \mathrm{t}, J 5$, $\mathrm{ArH}), 6.62(2 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 6.49(1 \mathrm{H}, \mathrm{t}, J 7, \mathrm{ArH}), 5.92(1 \mathrm{H}$, $\mathrm{s}, \mathrm{NCHN}), 4.08(1 \mathrm{H}, \mathrm{m}, \mathrm{NCHCH} 2), 3.86(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.74$ $\left(1 \mathrm{H}, \mathrm{t}, J 8, \mathrm{PhNCH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 3.52\left(1 \mathrm{H}\right.$, septet, $\left.J 7, \mathrm{NCH}\left(\mathrm{CH}_{2}\right)_{2}\right)$, $3.30\left[3 \mathrm{H}, \mathrm{m}, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right.$ and $\left.\mathrm{NCH}_{2} \mathrm{CH}_{2}\right], 2.62(1 \mathrm{H}, \mathrm{q}, J 7$, $\left.\mathrm{PhNCH}_{\mathrm{A}} H_{\mathrm{B}}\right), 2.00-1.80\left(4 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 1.70[6 \mathrm{H}, 2 \times \mathrm{d}$, $\left.J 7, \mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 1.14\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 0.84(3 \mathrm{H}, \mathrm{d}, J 7$,

## (R)-N,N-Diisopropyl-2-formyl-8-methoxy-1-naphthamide (-)-42

1 M aqueous $\mathrm{HCl}(50 \mathrm{ml})$ was added to a solution of the crude mixture of diastereoisomers of aminal $54(0.124 \mathrm{~g}, 0.27 \mathrm{mmol})$ in methanol at $0^{\circ} \mathrm{C}$. After 30 min at room temperature the mixture was extracted with dichloromethane ( $2 \times 60 \mathrm{ml}$ ). The extracts were washed with sodium bicarbonate solution and with brine, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure. The residue was recrystallised from ethyl acetate to give the aldehyde ( - )-42 ( $78 \mathrm{mg}, 92 \%$ ) as white prisms; mp 190$192{ }^{\circ} \mathrm{C} ;[a]_{\mathrm{D}}^{23}-9.2\left(c=1, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. Analytical HPLC of the crude reaction mixture on chiral stationary phase indicated $62 \%$ ee.

In the same way, hydrolysis of purified $\mathbf{5 4 a}(1.0 \mathrm{~g}, 2.12 \mathrm{mmol})$ gave a residue which was recrystallised from ethyl acetate to give the aldehyde ( - )-42 ( $627 \mathrm{mg}, 94 \%$ ) as white prisms; mp $191-192{ }^{\circ} \mathrm{C},[a]_{\mathrm{D}}^{23}-15\left(c=1, \mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. Analytical HPLC of the crude reaction mixture on chiral stationary phase indicated $99 \%$ ee. Evaporation of the mother liquors returned diamine 52 ( $270 \mathrm{mg}, 80 \%$ ).

## ( $S_{\mathrm{a}}, 1{ }^{\prime} S$ )-N,N-Diisopropyl-2-[(2E)-1'-hydroxynon-2-enyl]-8-methoxy-1-naphthamide ( $E$ )-57

Red-Al ${ }^{\circledR}(0.17 \mathrm{ml}, 0.87 \mathrm{mmol})$ was added dropwise over 20 min to the alkyne ( + )-anti- $46 \mathrm{~b}(184 \mathrm{mg}, 0.43 \mathrm{mmol})$ in ether ( 5 ml ) at $0^{\circ} \mathrm{C}$ under nitrogen. After 1 h , water $(2 \mathrm{ml})$ was added dropwise and the mixture, which was extracted into ether. The extracts were washed with brine, dried $\left(\mathrm{MgSO}_{4}\right)$ and evaporated under reduced pressure. Purification by column chromatography on $\mathrm{SiO}_{2}$ [1:4 EtOAc-petrol] gave the alkene ( $E$ )-57 ( $183 \mathrm{mg}, 99 \%$ ) as a yellow oil; $R_{\mathrm{f}}[1: 4 \mathrm{EtOAc}$-petrol $] 0.26 ;[a]_{\mathrm{D}}^{23}$ $+130(c=1, \mathrm{EtOH}) ; v_{\text {max }}$ (film) $/ \mathrm{cm}^{-1} 3424(\mathrm{OH}), 2926(\mathrm{CH})$, $1616(\mathrm{C}=\mathrm{O}), 828$ (alkene CH$)$; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.72(1 \mathrm{H}$, d, $J 8.5, \mathrm{ArH}$ ), 7.56 ( $1 \mathrm{H}, \mathrm{d}, J 8.5, \mathrm{ArH}$ ), $7.34(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH}), 6.80$ $(1 \mathrm{H}, \mathrm{dd}, J 7, \mathrm{ArH}), 5.70(2 \mathrm{H}, \mathrm{m}, \mathrm{CH}=\mathrm{CH}), 5.43[1 \mathrm{H}$, fine $\mathrm{m}, \mathrm{CHOH}], 3.84(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.50[2 \mathrm{H}$, septet $\times 2, J 7$, $\left.\mathrm{NCH}\left(\mathrm{CH}_{3}\right)_{2}\right], 1.90\left[2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 1.60(3 \mathrm{H}, \mathrm{d}, J 7$, $\left.\mathrm{NCHCH}_{3}\right), 1.55\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 1.20\left[8 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{4}-\right.$ $\left.\mathrm{CH}_{3}\right], 0.90\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 0.85\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right)$, $0.80\left(3 \mathrm{H}, \mathrm{t}, J 7, \mathrm{CH}_{3}\right) ; \delta_{\mathrm{C}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 169.7(\mathrm{C}=\mathrm{O}), 155.8$, 136.8 (alkene), $134.5,132.2,131.2,130.5,128.5,126.2,124.7$, 121.2, 120.8, $106.2(\mathrm{ArC}), 71.1(\mathrm{RCH}(\mathrm{OH}) \mathrm{R}), 55.2(\mathrm{OMe})$, 50.6, $45.7(\mathrm{CHN} \times 2), 32.1,31.6,28.9,28.8,22.5\left(5 \times \mathrm{CH}_{2}\right)$, 20.5, 20.4, 20.3, $19.5\left(4 \times \mathrm{CH}_{3}\right)$, $13.9\left(\mathrm{CH}_{3}\right) ; \mathrm{m} / z(\mathrm{CI}) 426(18 \%$, $\left.(\mathrm{M}+\mathrm{H})^{+}\right), 408(80), 102(100)$, (EI) 408 (50), 324 (52) and 86 (100, $2 \times i-\mathrm{Pr}$ ) (Found (EI): $\mathrm{M}^{+}, 425.2926 . \mathrm{C}_{27} \mathrm{H}_{39} \mathrm{NO}_{3}$ requires $M, 425.2929)$.

## Ethyl ( $S_{\mathrm{a}}, 1 R, E$ )-5-[1-(diisopropylcarbamoyl)-8-methoxy-2-naphthyl]-3-hexylpent-4-enoate 64

Triethyl orthoacetate ( $26 \mu \mathrm{l}, 0.14 \mathrm{mmol}$ ) and propionic acid ( $1 \mu \mathrm{l}$, cat.) were added to a solution of the alcohol ( $Z$ )-57 (20 $\mathrm{mg}, 0.05 \mathrm{mmol})$ in toluene $(20 \mathrm{ml})$. The solution was heated to reflux for 12 h , cooled, and concentrated under reduced pressure. Purification by flash chromatography [1:4 EtOAc-petrol] gave a single diastereoisomer of the ester $\mathbf{6 4}$ as a pale yellow oil ( $21 \mathrm{mg}, 84 \%$ ); $R_{\mathrm{f}}\left[1: 4\right.$ EtOAc-petrol] $0.38 ;[a]_{\mathrm{D}}^{23}+20(c=1$, $\mathrm{EtOH}) ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 7.62(2 \mathrm{H}, \mathrm{s}, \mathrm{ArH}), 7.28(2 \mathrm{H}, \mathrm{m}$, $\mathrm{ArH}), 6.78(1 \mathrm{H}, \mathrm{d}, J 7, \mathrm{ArH}), 6.73(1 \mathrm{H}, \mathrm{d}, J 16$, trans alkene $)$, $6.08(1 \mathrm{H}, \mathrm{dd}, J 8$ and 16, trans alkene), $4.05(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right), 3.83(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.40[2 \mathrm{H}, 2 \times$ septet, $J 7$,
$\left.\mathrm{N}\left(\mathrm{CH}\left(\mathrm{CH}_{3}\right)_{2}\right)_{2}\right], 2.65\left(1 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}=\mathrm{CH}_{2} \mathrm{CHR}_{2}\right), 2.38(2 \mathrm{H}, 2 \times \mathrm{d}$, $\left.J 7, \mathrm{EtOCOCH}_{2} \mathrm{R}_{2}\right), 1.60\left(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{NCHCH}_{3}\right), 1.55(3 \mathrm{H}, \mathrm{d}$, $\left.J 7, \mathrm{NCHCH}_{3}\right), 1.40\left[2 \mathrm{H}, \mathrm{m}, \mathrm{CH}_{2}\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}\right], 1.30-1.10[14 \mathrm{H}$, $\mathrm{m}, \mathrm{NCHCH}_{3},\left(\mathrm{CH}_{2}\right)_{4} \mathrm{CH}_{3}$ and $\left.\mathrm{OCH}_{2} \mathrm{CH}_{3}\right], 0.90(3 \mathrm{H}, \mathrm{d}, J 7$, $\left.\mathrm{NCHCH}_{3}\right), 0.80\left[3 \mathrm{H}, \mathrm{t}, J 7,\left(\mathrm{CH}_{2}\right)_{5} \mathrm{CH}_{3}\right] ; \delta_{\mathrm{c}}\left(75 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 172.4, 170.2, 155.7, 134.8, 134.3, 131.2, 131.1, 128.4, 127.7, $127.6,125.9,123.7,120.8,106.2,60.1,55.3,50.9,45.8,40.1$, $39.4,34.9,31.6,29.8,26.9,22.6,20.4,20.3,19.6,14.2,14.0$. (Found (EI): $\mathrm{M}^{+}, 495.3343 . \mathrm{C}_{31} \mathrm{H}_{45} \mathrm{NO}_{4}$ requires $M, 495.3348$ ).

## ( $R$ )-3-(Hydroxymethyl)- $\mathrm{N}, \mathrm{N}$-dimethylnonamide (-)-61 ${ }^{15}$

A solution of naphthamide $\mathbf{5 9}(30 \mathrm{mg}, 0.06 \mathrm{mmol})$ in MeOH at $0^{\circ} \mathrm{C}$ was treated with a steady stream of ozone in oxygen for 60 $\min$ at $0^{\circ} \mathrm{C}$. Excess ozone was removed by passing a stream of oxygen through the reaction mixture for 10 min , and the reaction mixture was diluted with $50 \%$ aqueous ethanol ( 8 ml ). Sodium borohydride ( $23 \mathrm{mg}, 0.6 \mathrm{mmol}$ ) was carefully added, and the reaction mixture was allowed to warm to $23^{\circ} \mathrm{C}$ and stirred for a further 1 h . Concentrated hydrochloric acid ( 0.5 $\mathrm{ml})$ and EtOAc ( 30 ml ) were added. The solution was washed with saturated aqueous $\mathrm{NaHCO}_{3}(10 \mathrm{ml})$, water $(10 \mathrm{ml})$ and brine ( 10 ml ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated under reduced pressure. Flash chromatography ( $1: 1 \mathrm{MeOH}-\mathrm{EtOAc}$ ) gave the alcohol ( - )-61 ${ }^{15}$ as a pale yellow oil ( $10 \mathrm{mg}, 77 \%$ ); $R_{\mathrm{f}}[1: 1$ EtOAc-petrol] $0.25 ; \delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 3.70(1 \mathrm{H}, \mathrm{dd}, J 11$ and $\left.4, \mathrm{CH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{OH}\right), 3.50\left(1 \mathrm{H}, \mathrm{dd}, J 11\right.$ and $\left.4, \mathrm{CH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{OH}\right), 3.08$ $\left(3 \mathrm{H}, \mathrm{s}, \mathrm{N} M e_{\mathrm{A}} \mathrm{Me}_{\mathrm{B}}\right), 3.00\left(3 \mathrm{H}, \mathrm{s}, \mathrm{NMe}_{\mathrm{A}} M e_{\mathrm{B}}\right), 2.53(1 \mathrm{H}, \mathrm{dd}, J 4$ and $\left.16, \mathrm{OCCH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}}\right), 2.40\left(1 \mathrm{H}\right.$, dd, $J 9$ and $\left.16, \mathrm{OCH}_{\mathrm{A}} H_{\mathrm{B}}\right), 2.10$ $\left(1 \mathrm{H}, \mathrm{m}, \mathrm{HOCH}_{2} \mathrm{CH}\right), 1.30\left[10 \mathrm{H}, \mathrm{m},\left(\mathrm{CH}_{2}\right)_{5}\right], 0.9(3 \mathrm{H}, \mathrm{t}, J 7$, $\mathrm{CH}_{2} \mathrm{Me}$ ).

Also obtained was 2-(N,N-diisopropylcarbamoyl)-3,6-bis(hydroxymethyl)benzoic acid $\mathbf{6 0}$; $\delta_{\mathrm{H}}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right.$ ) 7.73 $(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 7.40(1 \mathrm{H}, \mathrm{d}, J 8, \mathrm{ArH}), 5.25(2 \mathrm{H}, \mathrm{m}$, $\left.\mathrm{ArCH}_{2} \mathrm{OH}\right), 4.73\left(1 \mathrm{H}, \mathrm{dd}, J 12.5\right.$ and $\left.1.5, \mathrm{ArCH}_{\mathrm{A}} \mathrm{H}_{\mathrm{B}} \mathrm{OH}\right)$, $4.46\left(1 \mathrm{H}\right.$, dd, $J 12.5$ and $\left.9, \mathrm{ArCH}_{\mathrm{A}} H_{\mathrm{B}} \mathrm{OH}\right), 3.6-3.4(2 \mathrm{H}, \mathrm{m}$, $\mathrm{NCH} \times 2), 1.61(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{Me}), 1.54(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{Me}), 1.12$ $(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{Me}), 1.00(3 \mathrm{H}, \mathrm{d}, J 7, \mathrm{Me}) ; m / z(\mathrm{CI}) 292(100 \%$, $\left.(\mathrm{M}-\mathrm{OH})^{+}\right)$.

Determination of enantiomeric excess of (-)-61. (+)-MTPACl ( $17 \mathrm{mg}, 0.069 \mathrm{mmol}$ ) was added to a solution of alcohol ( - )-61 $(10 \mathrm{mg}, 0.046 \mathrm{mmol}), \mathrm{Et}_{3} \mathrm{~N}(19 \mu \mathrm{l}, 0.138 \mathrm{mmol})$, and DMAP ( 3 mg ) in $\mathrm{CDCl}_{3}(100 \mu \mathrm{l})$. After $1 \mathrm{~h},{ }^{1} \mathrm{H}$ NMR of the mixture revealed complete consumption of $\mathbf{6 1}$ and conversion into a single diastereoisomer of $\mathbf{6 2}$. Comparison with the diastereoisomeric esters formed from $(+)$ - or $( \pm)$-MTPACl and $(+)-61^{15}$ showed that the ee of $(-)-61$ was $>90 \%$.

## X-Ray crystallography

Crystal data for syn-46b: $\mathrm{C}_{27} \mathrm{H}_{37} \mathrm{NO}_{3}, M_{\mathrm{r}}=423.58$. A colourless block (ca. $0.50 \times 0.37 \times 0.35 \mathrm{~mm}^{3}$ ) was mounted on a glass fibre and analysed with a Rigaku AFC-5R diffractometer $\mathrm{Cu}-\mathrm{K} \alpha$ radiation $(\lambda=1.5418 \AA$ ) , triclinic, space group $P \overline{1}$, $a=11.0048(15), \quad b=12.0970(18), \quad c=10.7206(16) \quad \AA, \quad a=$ 103.229(13), $\beta=94.072(14), \gamma=113.705(11)^{\circ}, V=1250.6(3) \AA^{3}$, $Z=2, \rho_{\text {calcd }}=1.125 \mathrm{Mg} \mathrm{m}^{-3}, \mu(\mathrm{Cu}-\mathrm{K} \alpha)=0.566 \mathrm{~mm}^{-1}$. Total number of reflections measured $=5244$ of which 4966 were independent; $R_{\text {int }}=0.0154,2850$ reflections were observed, ( $I>2.0 \sigma(I)$ ). Hydrogen atoms were included in constrained positions, except for H2, which was found by difference Fourier techniques and refined isotropically. Atoms of the $\mathrm{C}_{6} \mathrm{H}_{13}$ group showed high thermal motion, especially towards the end of the chain. Refinement on $F^{2}$ with 290 parameters gave $R_{1}=0.0728$, $w R^{2}=0.2382$ (all data), $S=1.048, \Delta / \sigma_{\max }=0.003$. Maximum and minimum residual electron density $=0.271$ and -0.217 e $\AA^{-3}$ respectively. Data collection: MSC/AFC Diffractometer Control. Cell refinement: MSC/AFC Diffractometer Control. Data reduction: teXsan. ${ }^{74}$ Program used to solve structure: SHELXS86. Program used to refine structure: SHELXL97. ${ }^{15}$
