Perkin 1 Abstracts: Biocatalysis in Organic Synthesis aims to cover recent literature concerning the applications of enzymes and micro-organisms as catalysts in organic synthesis. The abstracts will emphasise the key synthetic step(s) that are mediated by the biocatalyst. Emerging technologies for biocatalyst design and optimisation will also be included.

Synthesis of dimeric sialyl Lewis X structures

Galactosyl transferase/fucosyl transferase

A. Düffels, L. G. Green, R. Lenz, S. V. Ley, S. P. Vincent and C.-H. Wong, Bioorg. Med. Chem., 2000, 8, 2519.

iii) GDP-L-galactose, α-1.3-fucosyltransferase V. MnCl₂, alkaline phosphatase, BSA, MES pH 6.0.

> Undecasaccharide 2 was elaborated in three enzymatic steps from the pentasaccharide 1. The sialylation was achieved in a high yield of 99%. The undecasaccharide 2 is being tested for binding affinity toward E-selectin.

Rapid detection of antibody catalysis by luminescent bacteria

Aldolase antibody 38C2

OH O Antibody 38C2

$$0.05 \text{ M Na}_2\text{PO}_4, 0.1 \text{ M NaCI},$$
 $pH 7.4 + 5\% \text{ CH}_3\text{CN at } 25\text{ °C}$

(2)

 $k_{\text{cat}} = 0.001 \text{ min}^{-1} \text{ and } K_{\text{M}} = 190 \text{ mM}$

VhM42, an aldehyde negative mutant of Vibrio harveyi, was used to detect nonanal (2) produced in the retro aldol fragmentation of 4-hydroxydodecan-2-one (1). Vibrio harvevi produces light as a result of the luciferase-catalysed reaction of reduced flavin mononucleotide, with a long chain aldehyde and oxygen. VhM42 produces light in the presence of exogenous aldehyde. Detection of $3x10^{-8}$ M of antibody 38C2 is feasible. Detection of activity of 24H6 towards 1 was also reported.

H. Shulman, A. Eberhard, C. Eberhard, S. Ulitzur and E. Keinan, Bioorg. Med. Chem. Lett., 2000, 10, 2353

Sialidase-catalysed transsialylation using polymer-supported solution phase techniques

Sialidase

Where R = DOX- MPEG Yield = 24% after 2

ccharide acceptors and two disaccharide acceptors were transsialylated using sialidases from Vibrio chloerae and Salmonella typhimurium in yields ranging from 12 to 24%. The acceptors were linked via an α, α' dioxyxylyl linker(DOX) to polyethylene glycol ω-monomethyl ether (MPEG; mw 5000), a polymer which is soluble under reaction conditions but insoluble during work-up in tert-butyl methyl ether. Unreacted polymer bound acceptor molecules were removed using β-galactosidase from Bacillus circulans

transsialylation steps

D. Schmidt and J. Thiem, Chem. Commun., 2000, 1919.

and β-N-acetylhexosaminidase from Aspergillus niger.

Outstanding stability of immobilized recombinant $\alpha(1\rightarrow 3/4)$ -fucosyltransferases

Fucosyltransferase

C. Auge, A. Malleron, H. Tahrat, A. Marc, J.-L. Goergen, M. Cerutti, W. F. A. Steelant, P. Delannoy and A. Lubineau, *Chem. Commun.*, 2000, 2017.

Immobilisation of $\alpha(1\rightarrow 3/4)$ -fucosyltransferase (FucT-III) on Ni²⁺-agarose increased the enzyme activity by a factor of 15-20 and improved enzyme stability under incubation conditions ($t_{1/2}=3$ weeks at 37 °C).

Enzyme labile protecting groups in peptide synthesis

Lipase/glucosidase/galactosidase

A. G. Gum, T. Kappes-Roth and H. Waldmann, Chem. Eur. J., 2000, 6, 3714.

A one-pot, two step enzymatic method for the removal of protecting groups was reported. Peptide conjugate 1 was transformed to the peptide 2 in 64% yield. For larger peptides, a β -galactose-derived urethane was employed, and deprotection accomplished using galactosidases. Using this methodology, the tetrapeptide 3 was synthesised.

Resolution of γ -ionone derivatives

Lipase

C. Fuganti, S. Serra and A. Zenoni, Helv. Chim. Acta, 2000, 83, 2761.

A chemoenzymatic approach to (+)- and (-)- γ -ionone was reported. The racemic form of alcohol 1 gave a 1:1 mixture of enantiomerically pure diastereomeric acetates on treatment with $Pseudomonas\ cepacia\$ lipase enzyme. Hence, both diastereomers were resolved by crystallisation, then diastereomer 1 was resolved using the same enzyme.

Four-step enzymatic synthesis of carbohydrates

Phytase/GPO oxidase/aldolase

R. Schoevaart, F. van Rantwijk and R. A. Sheldon, J. Org. Chem., 2000, 65, 6940.

A four step enzymatic cascade was devised for the synthesis of 5-deoxy-5-ethyl-D-xylulose **5** from glycerol. 1) Phosphorylation of glycerol (pH 4) 2) aerobic oxidation (pH 7.5) 3) aldolase C–C bond formation (pH 7.5) 4) dephosphorylation (pH 4). The phytase on/off switch by pH was therefore used to control phosphorylation/dephosphorylation.

Asymmetric reduction of ketones by *Geotrichum candidum* in the presence of Amberlite™

Geotrichum candidum

$$\begin{array}{c} O \\ R^2 \end{array} \xrightarrow{ \begin{array}{c} Geotrichum\ candidum\ IFO\ 4597 \\ \hline XAD-7,\ H_2O \end{array} } \begin{array}{c} OH \\ R^1 \\ \hline \end{array} \\ \begin{array}{c} OH \\ R^2 \end{array} \\ \end{array} \\ \begin{array}{c} Where\ R^1 = Bu\ and\ R^2 = Me,\ yield = 89\%\ ee = 99\% \\ \end{array}$$

A range of aliphatic ketones were reduced with yields in the range 14-98% and ee in the range 18 to >99%. A range of acetophenone derivatives and aromatic ketones were reduced, under argon, with yields in the range 32 to 99% and ee in the range 84 to >99%. Reduction of a range of ketones on a 300 mg scale was reported.

K. Nakamura, M. Fujii and Y. Ida, J. Chem. Soc., Perkin Trans. 1, 2000, 3205.

G. Allan, A. J. Carnell, M. L. E. Hernandez and A. Pettman, *J. Chem. Soc.*, *Perkin Trans. 1*, 2000, 3382.

 $R^1 = Ph, R^2 = CN$

Substrates with varying R¹ and R² groups were screened. It was found that the highest selectivity was obtained for substrates containing a 4-cyano and 4-aryl or a 4-benzyloxy substituent.

Synthesis of isotopically labelled L-α-amino acids

Lipase

J. R. Harding, R. A. Hughes, N. M. Kelly, A. Sutherland and C. L. Willis, *J. Chem. Soc., Perkin Trans.* 1, 2000, 3406.

Similar enzymatic hydrolysis-reductive amination sequences were used to prepare other L- α -amino acids e.g. *allo*-isoleucine, threonine, *allo*-threonine and valine.

Enantioselective yeast reduction of diacetylferrocene

Reductase

L. Veum, H. Brouard, P. Meffre, M. Larchevêque, D. Buisson, E. Demousseau and R. Azerad, *Tetrahedron: Asymmetry*, 2000, **11**, 4055.

The enantioselective enzymatic reduction of diacetylferrocene was achieved using 4 yeast strains. Of these, *R. toruloides* MUCL 30010 gave enantiomerically pure (S)-ketoalcohol, and *Saccharomyces montanas* CBS 6772 gave the (*R*) enantiomer with lower ee. Other effective strains were *R. glutinis* NRRL Y1091 and *Pichia anomalis* NRRL Y40.

B. Wirz, H. Iding, and H. Hilpert. Tetrahedron: Asymmetry, 2000, 11, 4171.

84% yield

A number of lipases were screened for suitability for the selective hydrolysis of the triacetate (1). Of these, lipase MY was most effective. The resulting diacetoxy alcohol (2) was used in the synthesis of Retiferol. The other enantiomers were obtained *via* the enzymatic steps shown. In each case lipase QL was found to be most effective.

Lipase resolution of a β -amino acid

Lipase

F. Fülöp, M. Palkó, J. Kámán, L. Lázár and R. Sillanpää, *Tetrahedron: Asymmetry*, 2000, **11**, 4179.

Other solvents, lipase PS, and vinyl acetate were also tested, but found to be less effective. Subsequent steps in the synthesis gave all 4 enantiomers of 1-aminoindane-2-carboxylic acid hydrochloride separately.

Y. Zhao, Y. Wu, P. De Clercq, M. Vandewalle, P. Maillos and J.-C. Pascal, *Tetrahedron: Asymmetry*, 2000, **11**, 3887.

Hydrolysis of the chemically synthesised 4-alkyl-diesters led to the opposite enantiomeric series. Interestingly, hydrolysis of the 4-unsubstituted diester resulted in the same enantiomeric series as the transesterification reaction.

The lipase selectively removes the primary acetyl group at C-9, then the secondary acetyl groups at C-8 and C-7 migrate to the C-9 position where they are hydrolysed by the lipase.

T.-L. Shih, M.-C. Cheng and S.-H. Wu, Tetrahedron Lett., 2000, 41, 7921.

Resolution of cis-β-hydroxypipecolic acid

Lipase

J. D. Scott and R. M. Williams, Tetrahedron Lett., 2000, 41, 8413.

M.-X. Wang, C.-S. Liu, J.-S. Li and O. Meth-Cohn, *Tetrahedron Lett.*, 2000, **41**, 8549.

The chemical conversion and enantioselectivity is dependent on X and the reaction conditions. Using acetone as additive results in a greater enantioselectivity but a decrease in yield.

Aerogels as novel supports for enzyme adsorption

Amidase/Protease

A. Basso, L. De Martin, C. Ebert, L. Gardossi, A. Tomat, M. Casarci and O. Li Rosi, *Tetrahedron Lett.*, 2000, **41**, 8627.

An increase in the initial reaction rate was observed when compared to adsorption of PGA on Celite. Adsorption of the proteases thermolysin and α -chymotrypsin resulted in incomplete conversion after 144 hours. Entrapment of PGA during aerogel synthesis results in a complete loss of amidase activity.
