#### Abstract

Macrosphelides E-I have been isolated, along with known macrosphelides A and C, from a strain of Periconia byssoides originally separated from the sea hare Aplysia kurodai, and the absolute stereostructures of macrosphelides E-G and I have been elucidated on the basis of spectroscopic analyses using 1D and 2D NMR techniques and some chemical transformations. In addition, the absolute configuration of macrosphelide C, previously undetermined, has been established by X-ray analysis and application of the modified Mosher method. Macrosphelides E-H inhibited the adhesion of human-leukaemia HL-60 cells to HUVEC.

## Introduction

Based on the fact that some of the bioactive materials isolated from marine animals have been produced by bacteria, we have chosen to seek new antitumour metabolites from microorganisms inhabiting the marine environment. ${ }^{1-3}$ As part of this program, we have made a search for antitumour compounds from a strain of Periconia byssoides OUPS-N133 which was separated from the sea hare Aplysia kurodai, and isolated pericosine A as an antitumour compound by bioassay-directed fractionation (cytotoxicity against P388 lymphocytic leukaemia cells) from a culture broth of this fungal strain. ${ }^{4}$ In the course of this experiment, we have found five new 16-membered macrolides, macrosphelides E-I 1-5, along with known macrosphelides A $\mathbf{6}$ and C 7, from non-cytotoxic fractions from column chromatography. Omura and co-workers have found that macrosphelides A 6-D, produced by Microsphaeropsis sp., potently inhibit cell-cell adhesion, ${ }^{5}$ and reported the absolute stereostructures and total synthesis of macrosphelides A 6 and B, ${ }^{6,7}$ and the planar structures of macrosphelides C, D, J and K. ${ }^{8,9}$ Arthritis and metastasis have been found to be associated with celladhesion molecules. ${ }^{10,11}$ This has evoked wide interest in inhibitors of cell adhesion because of the potential for the treatment of inflammation and tumour metastasis. Macrosphelides E 1-H 4 isolated in this experiment also inhibited the adhesion of human-leukaemia HL-60 cells to human-umbilical-vein endothelial cells (HUVEC). We describe herein the absolute stereostructures ${ }^{12}$ of macrosphelides E 1-G 3, I 5 and C 7, and the planar structure of macrosphelide H 4 in addition to their inhibition of cell adhesion. The absolute stereostructure of $\mathbf{1}$ and the planar structures of 2-4 have been briefly reported in a preliminary form. ${ }^{4}$

## Results and discussion

The fungal strain was cultured at $27^{\circ} \mathrm{C}$ for 4 weeks in a medium containing $1 \%$ malt extract, $1 \%$ glucose and $0.05 \%$ peptone in artificial seawater adjusted to pH 7.5 . The AcOEt extract of the culture filtrate was purified by fractionation employing a combination of Sephadex LH-20 and silica gel column chrom-

5
atography and high-performance liquid chromatography (HPLC) to afford macrosphelides A 6, C 7, and E 1-I 5. The known macrosphelides A 6 and C 7 were identified by comparison of spectral data with published values. ${ }^{6,8}$

Macrosphelide E 1 had the molecular formula $\mathrm{C}_{16} \mathrm{H}_{22} \mathrm{O}_{8}$ established by the $[\mathrm{M}+\mathrm{H}]^{+}$peak of $\mathbf{1}$ in high-resolution electron-impact mass spectrometry (HREIMS). Its IR spectrum exhibited bands at 3438, 1732, 1720, 1692, 1665 and 1648 $\mathrm{cm}^{-1}$, characteristic of hydroxy and carbonyl groups, and a double bond. A close inspection of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of 1 (Table 1) by DEPT and ${ }^{1} \mathrm{H}^{-13} \mathrm{C}$ correlation spectroscopy (COSY) experiments revealed the presence of three secondary methyl (C-17, C-18 and C-19), one $\mathrm{sp}^{3}$ hybridized methylene ( $\mathrm{C}-2$ ), five oxygen-bearing $\mathrm{sp}^{3}$-methines (C-3, C-8, C-9, C-14 and C-15), two 1,2-disubstituted double bonds (C-6, C-7, C-12 and C-13) and three ester/lactone carbonyl groups ( $\mathrm{C}-1, \mathrm{C}-5$ and $\mathrm{C}-11$ ). The ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY analysis of 1 led to three partial structural units as shown by bold-faced lines in Fig. 1, which were supported by HMBC correlations (Table 1). The $E$-geometry of both the $\Delta^{6}$ - and $\Delta^{12}$-double

${ }^{a}{ }^{1} \mathrm{H}$ Chemical-shift values ( $\delta / \mathrm{ppm}$ from $\mathrm{SiMe}_{4}$ ) followed by multiplicity and then the coupling constant. Figures in parentheses indicate the proton coupling with that position. ${ }^{b}$ Letters $\mathrm{p}, \mathrm{s}, \mathrm{t}$ and q , in parentheses, indicate, respectively, primary, secondary, tertiary and quaternary carbons, assigned by DEPT.

Scheme 1 Reaction conditions: (a) i. $\mathrm{K}_{2} \mathrm{CO}_{3}$, ii. HCl , iii. $\mathrm{CH}_{2} \mathrm{~N}_{2}$; (b) $\mathrm{MeOH}, \mathrm{H}_{2} \mathrm{SO}_{4}$; (c) $p$ - $\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{COCl}$, pyridine; $(\mathrm{d})\left(\mathrm{CH}_{3}\right)_{2} \mathrm{C}\left(\mathrm{OCH}_{3}\right)_{2}, \mathrm{PPTS}$.

Fig. 1 Selected ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY and HMBC correlations in macrosphelide E 1.
bonds was deduced from the coupling constants $\left(J_{6,7} 15.7 \mathrm{~Hz}\right.$ and $J_{12,13} 15.6 \mathrm{~Hz}$ ) of the olefinic protons. The connection of these three units and the remaining ester moiety was determined on the basis of the key HMBC correlations summarized in Fig. 1, and the planar structure of $\mathbf{1}$ was elucidated.

Since the stereochemistry of $\mathbf{1}$ could not be deduced from NOESY experiments, compound 1 was degraded to the methyl esters of the constituent carboxylic acids. Alkaline hydrolysis of 1 followed by treatment with diazomethane or acid-catalyzed methanolysis of $\mathbf{1}$ in MeOH gave only two products, methyl esters (respectively $\mathbf{8}$ and 9 ) of 3-hydroxybutyric acid and 4,5-dihydroxyhex-2E-enoic acid, which were isolated as $p$ bromobenzoates (respectively 10 and 11) because of the volatility of $\mathbf{8}$ (Scheme 1). This fact implied that the two dihydroxycarboxylic acid moieties of $\mathbf{1}$ have the same stereochemistry. In the acetonide $\mathbf{1 2}$ derived from the resulting ester $\mathbf{9}$,
the proton signals of the two isopropylidene methyl groups appeared with markedly different shifts ( $\delta_{\mathrm{H}} 1.38$ and 1.52 ), ${ }^{13}$ and NOEs were observed from one of the isopropylidene methyl groups ( $\delta_{\mathrm{H}} 1.38$ ) to both $\mathrm{H}-4$ and $\mathrm{H}-5$ and from the other methyl group to $\mathrm{H}-3$. From this evidence compound 12 was deduced to be the anti-acetonide and identified by comparison with published data. ${ }^{14}$ The absolute configuration could not been determined because of a vanishingly small value of the published specific optical rotation $\left([a]_{\mathrm{D}}-0.55 \times 10^{-1} \mathrm{dm}^{3}\right.$ $\left.\mathrm{mol}^{-1} \mathrm{~cm}^{-1}\right)^{14}$ and the small amount of the acetonide. On the other hand, bis- $p$-bromobenzoate derivative 11 from the methyl ester 9 exhibited a weak single curve at $240 \mathrm{~nm}(\Delta+1.26)$ in the CD spectrum. As reported by Harada, syn-1,2-acyclic diol dibenzoates exhibit typical exciton split Cotton effects in the CD spectra, from which their absolute configuration can be determined, ${ }^{15}$ whereas the absolute configuration of antidibenzoates is difficult to deduce from the CD spectra because of a weak single Cotton effect. ${ }^{16}$ Therefore, the CD data of $\mathbf{1 1}$ did not define its absolute configuration, though it was assumed to be $4 R, 5 S$ on the basis of the single Cotton effect. The other $p$-bromobenzoate 10, derived from $\mathbf{8}$, was identified as methyl (3R)-3-( $p$-bromobenzoyloxy)butyrate by comparison of spectral data including CD spectra with the synthetic compound prepared from commercial methyl (3R)-3-hydroxybutyrate, implying that the chirality of the 3-hydroxybutyric acid moiety in 1 is $R$.

Table $2{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data of macrosphelide F 2 in $\mathrm{CDCl}_{3}$

13a $R=(R)$ MTPA
13b $\mathrm{R}=(\mathrm{S})-\mathrm{MTPA}$
Fig. $2{ }^{1} \mathrm{H}$ Chemical-shift differences $\left(\Delta \delta=\delta_{S}-\delta_{R}\right)$ between the $(R)$ and ( $S$ )-MTPA esters 13a and 13b of macrosphelide E 1.

Since the chirality of the 4,5 -dihydroxyhex- $2 E$-enoic acid moiety in $\mathbf{1}$ could not be determined by CD, the modified Mosher method ${ }^{17}$ was applied for determination of the absolute configuration of macrosphelide E 1. The ${ }^{1} \mathrm{H}$ chemical-shift differences between the ' $(R)$ - and ( $S$ )-2-methoxy-2-phenyl-2(trifluoromethyl)acetic acid' (MTPA) esters 13a and 13b of compound $\mathbf{1}$ are shown in Fig. 2. The result suggested $8 R$ and $14 R$ configurations, and hence allowed assignment of absolute stereostructure $\mathbf{1}$ with the $3 R, 8 R, 9 S, 14 R, 15 S$ configuration to macrosphelide E . From this result, the absolute configuration of the bis- $p$-bromobenzoate derivative $\mathbf{1 1}$ was confirmed to be $4 R, 5 S$. Based on the above evidence, macrosphelide E 1 was found to be the C-3 stereoisomer of macrosphelide A $\mathbf{6}$. ${ }^{6,7}$

Macrosphelide F 2 was assigned a molecular formula which contained one oxygen atom less than that of $\mathbf{1}$. The general features of its UV, IR and NMR spectra closely resembled those of 1 except that the proton and carbon signals of one (C-8) of the hydroxymethines in $\mathbf{1}$ were replaced by those of a methylene in 2 (Tables 1 and 2). Analysis of ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H} \operatorname{COSY}(7-\mathrm{H} /$ $8 \mathrm{~A}-\mathrm{H}$ and $8 \mathrm{~B}-\mathrm{H}, 9-\mathrm{H} / 8 \mathrm{~A}-\mathrm{H}$ and $8 \mathrm{~B}-\mathrm{H}$, and $7-\mathrm{H} / 6-\mathrm{H}$ ) and HMBC ( $7-\mathrm{H} / \mathrm{C}-5,3-\mathrm{H} / \mathrm{C}-5$ and $9-\mathrm{H} / \mathrm{C}-11$ ) correlations showed that the methylene is present at the 8-position and thus led to the planar structure of $\mathbf{2}$. Methanolysis of $\mathbf{2}$ followed by treatment with $p$-bromobenzoyl chloride gave three $p$-bromobenzoates (Scheme 2). Two of them were identical with $p$ bromobenzoates 10 and $\mathbf{1 1}$ obtained from macrosphelide E 1.

Scheme 2 Reaction conditions: (a) $\mathrm{MeOH}, \mathrm{H}_{2} \mathrm{SO}_{4}$; (b) $p-\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{COCl}$, pyridine.

The third benzoate, 14, was identified as methyl (5S)-5-( $p$ -bromobenzoyloxy)hex- $2 E$-enoate by comparison of spectral data including CD, with the enantiomer 15 , which was derived from methyl ( $5 R$ )-5-hydroxyhex- $2 E$-enoate ${ }^{18,19}$ prepared from methyl (3R)-3-hydroxybutyrate by a modification of the procedure reported previously. ${ }^{19,20}$ This evidence allowed assignment of absolute stereostructure $\mathbf{2}$ to macrosphelide F .

Macrosphelide G 3 had the same molecular formula as $\mathbf{2}$ as deduced from HREIMS. Its ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR signals (Table 3) showed close correspondence with those of 2 (Table 2). ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY $(8-\mathrm{H} / 7-\mathrm{H}$ and $9-\mathrm{H}, 7-\mathrm{H} / 6-\mathrm{H}, 13-\mathrm{H} / 12-\mathrm{H}, 14 \mathrm{~A}-\mathrm{H}$ and $14 \mathrm{~B}-\mathrm{H}$, and $15-\mathrm{H} / 14 \mathrm{~A}-\mathrm{H}$ and $14 \mathrm{~B}-\mathrm{H}$ ) and HMBC ( $7-\mathrm{H} / \mathrm{C}-5$, 3-H/C-5, 9-H/C-11, 13-H/C-11 and 15-H/C-1) correlations in 3 implied that the C-8 methylene and C-14 methine in $\mathbf{2}$ change places with respect to each other in $\mathbf{3}$. Thus, compound $\mathbf{3}$ is a positional isomer of $\mathbf{2}$. In order to determine the absolute configuration for $\mathbf{3}$, methanolysis of $\mathbf{3}$ followed by treatment of $p$-bromobenzoyl chloride was carried out using the same procedure as above with macrosphelide F 2, to give the same three p-bromobenzoates as those obtained from 2 (Scheme 2). This evidence allowed assignment of absolute stereostructure 3 to macrosphelide G.
Macrosphelide H 4 had the molecular formula $\mathrm{C}_{18} \mathrm{H}_{24} \mathrm{O}_{8}$ established by the $[\mathrm{M}+\mathrm{H}]^{+}$peak in HREIMS. The general features of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (Table 4) of 4 closely resembled those of $\mathbf{3}$ except that the signal for one of the methyl groups in $\mathbf{3}$ was replaced by that of an acetonyl group [ $\delta_{\mathrm{H}} 3.16$, $3.19\left(19-\mathrm{H}_{2}\right) ; \delta_{\mathrm{C}} 45.24(\mathrm{C}-19) ; \delta_{\mathrm{C}} 205.78(\mathrm{C}-20) ; \delta_{\mathrm{H}} 2.22\left(21-\mathrm{H}_{3}\right)$, $\left.\delta_{\mathrm{C}} 30.57(\mathrm{C}-21)\right]$ in $4 .{ }^{1} \mathrm{H}-{ }^{1} \mathrm{H} \operatorname{COSY}(3-\mathrm{H} / 19-\mathrm{H}, 2 \mathrm{~A}-\mathrm{H}$ and $2 \mathrm{~B}-$ H) and HMBC (19-H/C-20 and 21-H/C-20) correlations (Table 4) revealed that the acetonyl group connects to the oxymethine at C-3, and hence the 3-hydroxybutyric acid moiety in $\mathbf{3}$ is replaced by a 3 -hydroxy- 5 -oxohexanoic acid moiety in 4 . The position of the methylene groups in 4 was confirmed by ${ }^{1} \mathrm{H}-{ }^{1} \mathrm{H}$ COSY $(13-\mathrm{H} / 12-\mathrm{H}, 14 \mathrm{~A}-\mathrm{H}$ and $14 \mathrm{~B}-\mathrm{H}$, and $15-\mathrm{H} / 14 \mathrm{~A}-\mathrm{H}$ and 14B-H) and HMBC (9-H/C-11, 13-H/C-11 and $15-\mathrm{H} / \mathrm{C}-1$ ) correlations. Thus, the planar structure of $\mathbf{4}$ was elucidated.
Macrosphelide I 5 was assigned a molecular formula which contained two hydrogen atoms more than that of $\mathbf{1}$ as deduced from a molecular-ion peak in HREIMS. The general features of the ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra (Table 5) of 5 closely resembled those of $\mathbf{1}$ except that the signals for one of the disubstituted double bonds in $\mathbf{1}$ were replaced by those of an ethylene group $\left[\delta_{\mathrm{H}} 2.36,2.63(\mathrm{H}-12), \delta_{\mathrm{C}} 30.41(\mathrm{C}-12) ; \delta_{\mathrm{H}} 1.46,1.71(\mathrm{H}-13)\right.$, $\left.\delta_{\mathrm{C}} 27.45(\mathrm{C}-13)\right]$ in 5 . The analysis of ${ }^{1} \mathrm{H}^{1} \mathrm{H}$ COSY ( $13 \mathrm{~A}-\mathrm{H} / 12-$ $\mathrm{H}, 13 \mathrm{~B}-\mathrm{H}$ and $14-\mathrm{H}$, and $14-\mathrm{H} / 15-\mathrm{H}$ ) and HMBC $(9-\mathrm{H} / \mathrm{C}-11$,

${ }^{a, b}$ As in Table 1.
$13 \mathrm{~A}-\mathrm{H} / \mathrm{C}-11$ and $15-\mathrm{H} / \mathrm{C}-1$ ) correlations (Table 5) clarified the ethylene moiety in 5 to be present at $\mathrm{C}-12$ and $\mathrm{C}-13$, and hence led to the planar structure of $\mathbf{5}$. In order to determine the absolute configuration for $\mathbf{5}$, it was hydrogenated in the presence of $\mathrm{Pd}-\mathrm{C}$ to yield tetrahydro derivative 16, identical with that derived by hydrogenation from macrosphelide E 1 (Scheme 3). Based on this evidence, the absolute stereostructure for 5 was elucidated.

16
Scheme 3 Reaction condition: (a) $\mathrm{H}_{2}, \mathrm{Pd}-\mathrm{C}, \mathrm{MeOH}$, rt.
The planar structure of macrosphelide C 7 has already been reported by Omura and co-workers, ${ }^{8}$ but the stereochemistry has remained undecided. Since the planar structure of 7 is iden-
tical with that of $\mathbf{2 , 7}$ is considered to be a stereoisomer of $\mathbf{2}$. In order to determine the relative configuration of 7, an X-ray crystal-structure analysis was carried out for a single crystal of 7 (obtained by recrystallization from hexane- $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ). The result obtained (Fig. 3) allowed assignment of the relative configuration of all the asymmetric centers and the conformation for 7. The modified Mosher method was applied for determination of the absolute configuration of 7 . The ${ }^{1} \mathrm{H}$ chemical-shift differences between the $(R)$ - and ( $S$ )-MTPA esters 17a and 17b of 7 are shown in Fig. 4, and the result suggested the $R$ configuration for the asymmetric center at $\mathrm{C}-14$. The above summarized evidence led to absolute stereostructure 7 for macrosphelide C.

Compounds 1-5 and derivative 16 were examined together with 6, 7 and herbimycin A as standard samples in the adhesion-assay system using HL-60 cells and HUVEC, according to a modification of the method reported by Miki and co-workers. ${ }^{21}$ As shown in Table 6, compounds 1-4 inhibited the adhesion of HL-60 cell to HUVEC more potently than herbimycin A, and compound 4 exhibited the most potent inhibitory activity. The cytotoxic activities of compounds 1-5

spectrometer, operating at 500 and 125 MHz for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$, respectively, with TMS as internal reference. CD spectra were recorded on JASCO J-500A and J-820 polarimeters. The other procedures are the same as those reported previously. ${ }^{1}$

## Culturing and isolation of metabolites

A strain of Periconia byssoides OUPS-N133 was initially isolated from the sea hare Aplysia kurodai, collected in the Osaka Bay of Japan in April, 1994. The sea hare was wiped with EtOH and its gastrointestinal tract applied to the surface of nutrient agar layered in a Petri dish. Serial transfers of one of the resulting colonies provided a pure strain of $P$. byssoides. The fungal strain was grown in a liquid medium ( $90 \mathrm{dm}^{3}$ ) containing $1 \%$ malt extract, $1 \%$ glucose and $0.05 \%$ peptone in artificial seawater adjusted to pH 7.5 for four weeks at $27^{\circ} \mathrm{C}$. The culture was filtered under suction and the mycelia collected were extracted thrice with MeOH . The combined extracts were evaporated in vacuo to give a mixture of crude metabolites (21.5 g), the $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(1: 1)$-soluble fraction of which exhibited cytotoxicity $\left(\mathrm{ED}_{50}>100 \mu \mathrm{~g} \mathrm{~cm}^{-3}\right)$. The culture filtrate was extracted thrice with AcOEt. The combined extracts were evaporated in vacuo to afford a mixture of crude metabolites $(5.7 \mathrm{~g})$, which exhibited cytotoxicity ( $\mathrm{ED}_{50} 4.3 \mu \mathrm{~g} \mathrm{~cm}^{-3}$ ). The AcOEt extract was passed through Sephadex LH-20, using $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}(1: 1)$ as the eluent.

The second fraction ( 3.5 g ), in which the activity was concentrated, was chromatographed on a silica gel column with a $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$ gradient as the eluent. The $\mathrm{MeOH}-\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (2:98) and (5:95) eluates were collected as 2 fractions [Fr. 1 $(126.6 \mathrm{mg})$ and Fr. $2(54.1 \mathrm{mg})$ ] and 2 fractions [Fr. 3 ( 315.7
$\mathrm{mg})$ and Fr. $4(254.6 \mathrm{mg})$ ], respectively, all of which exhibited no cytotoxicity. Fr. 1 was purified by HPLC using MeOH-water ( $6: 4$ ) as the eluent to afford $2(3.2 \mathrm{mg}), \mathbf{3}(6.7 \mathrm{mg}), \mathbf{4}(5.6 \mathrm{mg})$, and $7(7.2 \mathrm{mg})$. Fr. 3 was purified by HPLC using $\mathrm{MeOH}-$ water $(5: 5)$ as the eluent to afford $\mathbf{1}(20.5 \mathrm{mg}), \mathbf{5}(11.1 \mathrm{mg})$ and $\mathbf{6}$ $(0.8 \mathrm{mg})$.

Macrosphelide E 1. Obtained as plates, $\mathrm{mp} 105-107^{\circ} \mathrm{C}$ (from hexane- $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ); $[a]_{\mathrm{D}}+56.8$ ( $c 0.46$ in EtOH$) ; \lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm}$ $213\left(\log \varepsilon / \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1} 4.18\right)$; $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 3438(\mathrm{OH})$, 1732, 1720, 1692 (ester), 1665 and 1648 (C=C); $m / z$ (EI) 343 ([M $\left.+\mathrm{H}]^{+}, 1.4 \%\right), 215\left(\left[\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{O}_{5}\right]^{+}, 17.7\right), 111\left(\left[\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{O}_{2}\right]^{+}, 100\right), 84$ $\left(\left[\mathrm{C}_{5} \mathrm{H}_{8} \mathrm{O}\right]^{+}, 97.3\right)$ and $69\left(\left[\mathrm{C}_{4} \mathrm{H}_{5} \mathrm{O}\right]^{+}, 47.5\right)\{\mathrm{m} / \mathrm{z}(\mathrm{HREI})$ Found: $[\mathrm{M}+\mathrm{H}]^{+}, 343.1390 . \mathrm{C}_{16} \mathrm{H}_{23} \mathrm{O}_{8}$ requires $\left.\mathrm{m} / \mathrm{z}, 343.1392\right\}$; $\mathrm{CD} \lambda(c$ $\left.6.75 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3} \mathrm{in} \mathrm{EtOH}\right) / \mathrm{nm} 289(\Delta \varepsilon 0), 248(-0.59), 238$ (0) and $227(+1.70) .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data are listed in Table 1.

Macrosphelide F 2. Obtained as an oil, $[a]_{\mathrm{D}}+23.3$ ( c 0.09 in $\mathrm{EtOH}) ; \lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} 216\left(\log \varepsilon / \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1} 4.15\right) ; v_{\text {max }}$ (liquid)/ $/ \mathrm{cm}^{-1} 3445(\mathrm{OH}), 1720$ (ester), 1658 and $1651(\mathrm{C}=\mathrm{C})$; $m / z$ (EI) $327\left([\mathrm{M}+\mathrm{H}]^{+}, 0.8 \%\right), 111\left(\left[\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{O}_{2}\right]^{+}, 100\right), 84$ $\left(\left[\mathrm{C}_{5} \mathrm{H}_{8} \mathrm{O}\right]^{+}\right.$, 68.5) and $69\left(\left[\mathrm{C}_{4} \mathrm{H}_{5} \mathrm{O}\right]^{+}\right.$, 50.2) [ $\mathrm{m} / \mathrm{z}(\mathrm{HREI})$ Found: $[\mathrm{M}+\mathrm{H}]^{+}$, 327.1461. $\mathrm{C}_{16} \mathrm{H}_{23} \mathrm{O}_{7}$ requires $\mathrm{m} / \mathrm{z}$, 327.1442]; CD $\lambda$ (c $1.66 \times 10^{-3} \mathrm{~mol} \mathrm{dm}^{-3}$ in EtOH$) / \mathrm{nm} 291(\Delta \varepsilon 0), 240(-3.18)$, 225 (0) and $213(+8.72) .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data are listed in Table 2.

Macrosphelide G 3. Obtained as an oil, $[a]_{\mathrm{D}}+66.7$ (c 0.48 in $\mathrm{EtOH}) ; \lambda_{\text {max }}(\mathrm{EtOH}) / \mathrm{nm} 217\left(\log \varepsilon / \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1} 4.17\right) ; v_{\text {max }}$ (liquid) $/ \mathrm{cm}^{-1} 3443(\mathrm{OH}), 1718$ (ester), 1658 and $1648(\mathrm{C}=\mathrm{C})$; $m / z(E I) 326\left(\mathrm{M}^{+}, 1.8 \%\right), 111\left(\left[\mathrm{C}_{6} \mathrm{H}_{7} \mathrm{O}_{2}\right]^{+}, 100\right), 84\left(\left[\mathrm{C}_{5} \mathrm{H}_{8} \mathrm{O}\right]^{+}\right.$, 87.3) and $69\left(\left[\mathrm{C}_{4} \mathrm{H}_{5} \mathrm{O}\right]^{+}\right.$, 50.5) $\left[\mathrm{m} / \mathrm{z}\right.$ (HREI) Found: $\mathrm{M}^{+}$, 326.1362. $\mathrm{C}_{16} \mathrm{H}_{23} \mathrm{O}_{8}$ requires $\left.M, 326.1364\right]$; CD $\lambda\left(c 4.65 \times 10^{-4}\right.$ $\mathrm{mol} \mathrm{dm}{ }^{-3}$ in EtOH)/nm $308(\Delta \varepsilon 0), 235(-2.37), 219(0)$ and 215 $(+0.92) .{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR data are listed in Table 3.

Macrosphelide H 4. ## Acetonide 12 of degradation product $\mathbf{9}$ from macrosphelide E 1

A solution ( $2 \mathrm{~cm}^{3}$ ) of $5 \% \mathrm{~K}_{2} \mathrm{CO}_{3}$ in water was added to a solution of macrosphelide E $1(3.7 \mathrm{mg})$ in $\mathrm{MeOH}\left(0.05 \mathrm{~cm}^{3}\right)$, and the reaction mixture was left at room temperature overnight. The mixture was neutralized with 1 M HCl and extracted with diethyl ether, and then a solution of $\mathrm{CH}_{2} \mathrm{~N}_{2}$ in diethyl ether was added to the ether layer. The mixture was left for 2 h at room temperature, and then the solvent was evaporated off under reduced pressure to afford a mixture of crude methyl esters (respectively $\mathbf{8}$ and $\mathbf{9}$ ) of 3-hydroxybutyric acid and 4,5-dihydroxyhex- $2 E$-enoic acid. To a solution of the mixture in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(0.2 \mathrm{~cm}^{3}\right)$ were added 2,2-dimethoxypropane ( $0.3 \mathrm{~cm}^{3}$ ) and pyridinum toluene-p-sulfonate ( 3.7 mg ). After stirring of the mixture at room temperature for 1 h , the solvent was evaporated off under reduced pressure. The residue was purified by HPLC using MeOH-water $(9: 1)$ as the eluent to afford acetonide $\mathbf{1 2}(0.9 \mathrm{mg})$ as an oil.

Acetonide 12 [methyl ( $4 R, 5 S$ )-4,5-isopropylidenedioxyhex-2E-enoate]. $m / z$ (EIMS) $200\left(\mathrm{M}^{+}, 8.5 \%\right), 158\left(\mathrm{C}_{7} \mathrm{H}_{10} \mathrm{O}_{4}, 100.0\right)$ [ $\mathrm{m} / \mathrm{z}$ (HREI) Found: $\mathrm{M}^{+}$, 200.1046. $\mathrm{C}_{10} \mathrm{H}_{16} \mathrm{O}_{4}$ requires $M$, 200.1044]; $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 1.18\left(3 \mathrm{H}, \mathrm{d}, J=6.4 \mathrm{~Hz}, 6-\mathrm{H}_{3}\right), 1.38(3 \mathrm{H}$, s , acetonide $\left.\mathrm{CH}_{3}\right), 1.52\left(3 \mathrm{H}, \mathrm{s}\right.$, acetonide $\left.\mathrm{CH}_{3}\right), 3.76(3 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{COOCH}_{3}\right), 4.43(1 \mathrm{H}$, quintet, $J=6.4 \mathrm{~Hz}, 5-\mathrm{H}), 4.66(1 \mathrm{H}, \mathrm{dd}$, $J=6.4,5.8 \mathrm{~Hz}, 4-\mathrm{H}), 6.13(1 \mathrm{H}, \mathrm{d}, J=15.7 \mathrm{~Hz}, 2-\mathrm{H})$ and 6.79 ( $1 \mathrm{H}, \mathrm{dd}, J=15.7,5.8 \mathrm{~Hz}, 3-\mathrm{H}$ ). ${ }^{1} \mathrm{H}$ NMR data were identical with published values. ${ }^{14}$

## Preparation of methyl ( $\mathbf{3 R}$ )-3-( $\boldsymbol{p}$-bromobenzoyloxy)butyrate $\mathbf{1 0}$

To a solution of methyl ( $3 R$ )-3-hydroxybutyrate $\delta(8.2 \mathrm{mg})$ in pyridine $\left(2 \mathrm{~cm}^{3}\right)$ was added $p$-bromobenzoyl chloride ( 6.5 mg ), and the reaction mixture was left at room temperature overnight. The mixture was concentrated to dryness under reduced pressure, and the residue was purified by HPLC using $\mathrm{MeOH}-$ water $(9: 1)$ as the eluent to afford ester $\mathbf{1 0}(7.7 \mathrm{mg})$ as a pale yellow oil, $[a]_{\mathrm{D}}-21.6$ ( $c 0.09$ in EtOH ); $v_{\text {max }}$ (liquid) $/ \mathrm{cm}^{-1} 1725$ (ester), 1611 and 1593 (C=C); $m / z$ (EIMS) $300\left(\mathrm{M}^{+}, 21.7 \%\right.$ ), 200 ( $p-\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{COOH}, 77.6 \%$ ), $183\left(p-\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{CO}, 100.0\right), 100\left(\mathrm{M}^{+}\right.$ $-p-\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{COOH}, 12.6$ ) $\left[\mathrm{m} / \mathrm{z}\right.$ (HREI) Found: $\mathrm{M}^{+}, 299.9995$. $\mathrm{C}_{12} \mathrm{H}_{13} \mathrm{BrO}_{4}$ requires $\left.M, 299.9993\right] ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 1.43(3 \mathrm{H}, \mathrm{d}$, $\left.J=6.8 \mathrm{~Hz}, 4-\mathrm{H}_{3}\right), 2.63\left(1 \mathrm{H}, \mathrm{dd}, J=13.3,3.5 \mathrm{~Hz}, 2-\mathrm{H}_{\mathrm{A}}\right), 2.78$ $\left(1 \mathrm{H}, \mathrm{dd}, J=13.3,4.5 \mathrm{~Hz}, 2-\mathrm{H}_{\mathrm{B}}\right), 3.65\left(3 \mathrm{H}, \mathrm{s}, \mathrm{COOCH}_{3}\right), 5.50$ ( 1 H , qdd, $J=6.8,4.5,3.5 \mathrm{~Hz}, 4-\mathrm{H}$ ), 7.58 ( $2 \mathrm{H}, \mathrm{ArH}$ ) and 7.88 ( $2 \mathrm{H}, \mathrm{ArH}$ ); CD $\lambda\left(c 3.77 \times 10^{-4} \mathrm{~mol} \mathrm{dm}{ }^{-3}\right.$ in EtOH) $/ \mathrm{nm} 270$ $(\Delta \varepsilon 0), 256(+0.15), 244(0), 230(-0.82)$ and $210(0)$.

## $p$-Bromobenzoates 10 and 11 of degradation products from macrosphelide E 1

To a solution of macrosphelide E $\mathbf{1}(7.6 \mathrm{mg})$ in $\mathrm{MeOH}\left(0.2 \mathrm{~cm}^{3}\right)$ was added conc. $\mathrm{H}_{2} \mathrm{SO}_{4}\left(0.01 \mathrm{~cm}^{3}\right)$, and the reaction mixture was left at room temperature overnight. The mixture was diluted with water and extracted with diethyl ether, and the extract was evaporated under reduced pressure to give a mixture of crude $\mathbf{8}$ and 9 . To a solution of the mixture in pyridine $\left(0.3 \mathrm{~cm}^{3}\right)$ was added $p$-bromobenzoyl chloride ( 5.3 mg ), and the reaction mixture was left at room temperature overnight. The mixture was concentrated to dryness under reduced pressure,
and the residue was purified by HPLC using MeOH -water ( $9: 1$ ) as the eluent to afford $p$-bromobenzoates $\mathbf{1 0}(1.0 \mathrm{mg})$ and $11(4.5 \mathrm{mg})$ as a pale yellow oil. The spectral data, including CD spectra, of $\mathbf{1 0}$ were identical with those of the synthetic compound methyl ( $3 R$ )-3-( $p$-bromobenzoyloxy)butyrate prepared above.
$p$-Bromobenzoate 11 [methyl ( $4 R, 5 S$ )-4,5-bis-( $p$-bromobenzo-yloxy)hex-2-enoate]. $m / z$ (EIMS) 524 ( $\mathrm{M}^{+}, 4.7 \%$ ), 324 ( $\mathrm{M}^{+}-p$ $\left.\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{COOH}, 5.3 \%\right), 183\left(p-\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{CO}, 100.0\right)[\mathrm{m} / \mathrm{z}(\mathrm{HREI})$ Found: $\mathrm{M}^{+}, 324.9462 . \mathrm{C}_{21} \mathrm{H}_{18} \mathrm{Br}_{2} \mathrm{O}_{6}$ requires $\left.M, 326.9464\right]$; $\delta_{\mathrm{H}}$ $\left(\mathrm{CDCl}_{3}\right) 1.50\left(3 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz}, 6-\mathrm{H}_{3}\right), 3.81\left(3 \mathrm{H}, \mathrm{s}, \mathrm{COOCH}_{3}\right)$, $5.54(1 \mathrm{H}, \mathrm{qd}, J=6.8,3.2 \mathrm{~Hz}, 5-\mathrm{H}), 5.96(1 \mathrm{H}$, ddd, $J=5.3,3.2$, $1.2 \mathrm{~Hz}, 4-\mathrm{H}), 6.20(1 \mathrm{H}, \mathrm{dd}, J=15.3,1.2 \mathrm{~Hz}, 2-\mathrm{H}), 7.09(1 \mathrm{H}, \mathrm{dd}$, $J=15.3,5.3 \mathrm{~Hz}, 3-\mathrm{H}), 7.60(4 \mathrm{H}, \mathrm{ArH})$ and $7.88(4 \mathrm{H}, \mathrm{ArH}) ; \mathrm{CD}$ $\lambda\left(c 4.08 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}\right.$ in EtOH$) / \mathrm{nm} 275(\Delta \varepsilon 0)$ and 240 (+1.26).

Formation of the ( $R$ )- and ( $S$ )-MTPA esters 13a and 13b from macrosphelide E 1
( $R$ )-MTPA ( 2.0 mg ), dicyclohexylcarbodiimide (DCC) ( 2.0 mg ) and 4-(dimethylamino)pyridine (DMAP) ( 1.0 mg ) were added to a $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution $\left(0.2 \mathrm{~cm}^{3}\right)$ of macrosphelide $\mathrm{E} 1(0.6 \mathrm{mg})$, and the reaction mixture was left at room temperature for 3 h . The solvent was evaporated off under reduced pressure, and the residue was purified by HPLC using MeOH -water ( $4: 1$ ) as the eluent to afford $(R)$-MTPA ester $\mathbf{1 3 a}(0.7 \mathrm{mg})$. The same reaction with $4(0.7 \mathrm{mg})$ using ( $S$ )-MTPA ( 2.2 mg ) gave ester 13b $(0.8 \mathrm{mg})$.

Ester 13a. Obtained as an amorphous powder; $m / z$ (EI) 774 $\left(\mathrm{M}^{+}\right)\left[\mathrm{m} / \mathrm{z}\right.$ (HREI) Found: $\mathrm{M}^{+}$, 774.2114. $\mathrm{C}_{36} \mathrm{H}_{36} \mathrm{~F}_{6} \mathrm{O}_{12}$ requires $M, 774.2112] ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 1.20\left(3 \mathrm{H}, \mathrm{d}, J=6.6 \mathrm{~Hz}, 17-\mathrm{H}_{3}\right), 1.25$ $\left(3 \mathrm{H}, \mathrm{d}, J=6.6 \mathrm{~Hz}, 19-\mathrm{H}_{3}\right), 1.43\left(3 \mathrm{H}, \mathrm{d}, J=6.6 \mathrm{~Hz}, 18-\mathrm{H}_{3}\right), 2.46$ $\left(1 \mathrm{H}, \mathrm{dd}, J=14.9,6.1 \mathrm{~Hz}, 2-\mathrm{H}_{\mathrm{A}}\right), 2.76(1 \mathrm{H}, \mathrm{dd}, J=14.9,3.0 \mathrm{~Hz}$, $\left.2-\mathrm{H}_{\mathrm{B}}\right), 3.45(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 3.50(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 5.16(1 \mathrm{H}, \mathrm{qdd}, J=$ $6.6,6.1,3.0 \mathrm{~Hz}, 3-\mathrm{H}), 5.23(1 \mathrm{H}, \mathrm{qd}, J=6.6,3.2 \mathrm{~Hz}, 9-\mathrm{H}), 5.30$ $(1 \mathrm{H}, \mathrm{qd}, J=6.6,4.3 \mathrm{~Hz}, 15-\mathrm{H}), 5.45(1 \mathrm{H}, \mathrm{ddd}, J=7.8,4.3,1.2$ $\mathrm{Hz}, 14-\mathrm{H}), 5.62(1 \mathrm{H}, \mathrm{ddd}, J=4.8,3.2,1.8 \mathrm{~Hz}, 8-\mathrm{H}), 5.95(1 \mathrm{H}$, dd, $J=15.9,1.2 \mathrm{~Hz}, 12-\mathrm{H}), 5.97(1 \mathrm{H}, \mathrm{dd}, J=15.9,1.8 \mathrm{~Hz}, 6-\mathrm{H})$, $6.74(1 \mathrm{H}, \mathrm{dd}, J=15.9,7.8 \mathrm{~Hz}, 13-\mathrm{H}), 6.91(1 \mathrm{H}, \mathrm{dd}, J=15.9,4.8$ $\mathrm{Hz}, 7-\mathrm{H}), 7.37(6 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$ and $7.45(4 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$.

## Preparation of methyl (5R)-5-p-bromobenzoyloxy)hex-2Eenoate 15

Methyl (5R)-5-( $p$-bromobenzoyloxy)hex-2E-enoate, $[a]_{\mathrm{D}}-16$ (c 0.18 in EtOH ), ${ }^{18,19}$ was prepared from methyl ( $3 R$ )-3-hydroxyhex- $2 E$-enoate by a modification of the method reported previously. ${ }^{19,20}$ To a solution of the ester ( 7.1 mg ) in pyridine ( $2 \mathrm{~cm}^{3}$ ) was added $p$-bromobenzoyl chloride ( 6 mg ), and the reaction mixture was left at room temperature overnight. The mixture was concentrated to dryness under reduced pressure, and the residue was purified by HPLC using $\mathrm{MeOH}-$ water $(9: 1)$ as the eluent to afford methyl $(5 R)-5$-( $p$-bromo-benzoyloxyhex- $2 E$-enoate $15(5.7 \mathrm{mg})$ as a pale yellow oil, $[a]_{\mathrm{D}}$ -38.7 (c 0.15 in EtOH); $v_{\text {max }}$ (liquid)/ $/ \mathrm{cm}^{-1} 1715$ (ester), 1644
(C=C), 1610 and 1593 (ArC-C); $m / z$ (EIMS) 326 ( $\mathrm{M}^{+}, 15.2 \%$ ), $226\left(p-\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{COOH}, 66.8\right), 183\left(p-\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{CO}, 100.0\right), 126$ $\left(\mathrm{M}^{+}-p-\mathrm{BrC}_{6} \mathrm{H}_{4} \mathrm{COOH}\right.$, 15.3) [ $\mathrm{m} / \mathrm{z}$ (HREI) Found: $\mathrm{M}^{+}$, 299.9995. $\mathrm{C}_{14} \mathrm{H}_{15} \mathrm{BrO}_{4}$ requires $M$, 299.9993]; $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 1.39$ $\left(3 \mathrm{H}, \mathrm{d}, J=6.8 \mathrm{~Hz}, 6-\mathrm{H}_{3}\right), 2.60\left(2 \mathrm{H}, \mathrm{dd}, J=4.8,3.7 \mathrm{~Hz}, 4-\mathrm{H}_{2}\right)$, $3.73\left(3 \mathrm{H}, \mathrm{s}, \mathrm{COOCH}_{3}\right), 5.28(1 \mathrm{H}, \mathrm{qt}, J=6.8,3.7 \mathrm{~Hz}, 5-\mathrm{H}), 5.91$ $(1 \mathrm{H}, \mathrm{d}, J=15.2 \mathrm{~Hz}, 2-\mathrm{H}), 6.95(1 \mathrm{H}, \mathrm{dt}, J=15.2,4.8 \mathrm{~Hz}, 3-\mathrm{H})$, $7.59(2 \mathrm{H}, \mathrm{ArH})$ and $7.88(2 \mathrm{H}, \mathrm{ArH}) ; \mathrm{CD} \lambda\left(c 4.58 \times 10^{-4} \mathrm{~mol}\right.$ $\mathrm{dm}^{-3}$ in EtOH)/nm $275(\Delta \varepsilon 0)$ and $239(-1.79)$.

## $p$-Bromobenzoates 10, 11 and 14 of degradation products from macrosphelide F 2

Using the same procedure as above with compound 1, a solution of macrosphelide $\mathrm{F} 2(3.4 \mathrm{mg})$ in $\mathrm{MeOH}\left(0.1 \mathrm{~cm}^{3}\right)$ was treated with conc. $\mathrm{H}_{2} \mathrm{SO}_{4}\left(0.02 \mathrm{~cm}^{3}\right)$. A solution of the resulting mixture of three crude esters in pyridine $\left(0.2 \mathrm{~cm}^{3}\right)$ was treated with $p$-bromobenzoyl chloride ( 3.2 mg ) and purified by HPLC [ MeOH -water $(9: 1)$ ] to afford $p$-bromobenzoates $\mathbf{1 0}(0.4 \mathrm{mg})$, $11(2.1 \mathrm{mg})$ and $\mathbf{1 4}(1.8 \mathrm{mg})$ as a pale yellow oil.
p-Bromobenzoate 14 [methyl (5S)-5-( $p$-bromobenzoyloxy)-hex-2E-enoate]. CD $\lambda\left(c 4.36 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}\right.$ in EtOH) $/ \mathrm{nm}$ $275(\Delta \varepsilon 0)$ and $238(+1.80)$. Its spectral data were identical with those of the synthetic enantiomer 15 except that the curves of the CD spectrum were the mirror image of those of $\mathbf{1 5}$.

## $p$-Bromobenzoates 10, 11 and 14 of degradation products from macrosphelide G 3

Using the same procedure as above with compound 1, a solution of macrosphelide G $3(4.6 \mathrm{mg})$ in $\mathrm{MeOH}\left(0.1 \mathrm{~cm}^{3}\right)$ was treated with conc. $\mathrm{H}_{2} \mathrm{SO}_{4}\left(0.02 \mathrm{~cm}^{3}\right)$. A solution of the resulting mixture of three esters in pyridine $\left(0.2 \mathrm{~cm}^{3}\right)$ was treated with $p$-bromobenzoyl chloride ( 3.8 mg ) and purified by HPLC [MeOH-water ( $9: 1$ )] to afford $p$-bromobenzoates $\mathbf{1 0}(0.7 \mathrm{mg})$, $11(2.8 \mathrm{mg})$ and $14(2.2 \mathrm{mg})$.

## Hydrogenation of macrosphelide E 1

To a solution of macrosphelide E $\mathbf{1}(2.2 \mathrm{mg})$ in $\mathrm{MeOH}\left(0.5 \mathrm{~cm}^{3}\right)$ was added $10 \% \mathrm{Pd} / \mathrm{C}(5.7 \mathrm{mg})$, and the reaction mixture was stirred under hydrogen atmosphere ( 1 atm ) at room temperature for 2 h . The catalyst was filtered off and the solvent was evaporated off under reduced pressure. The residue was purified by HPLC using MeOH-water $(1: 1)$ as the eluent to afford compound $16(2.0 \mathrm{mg})$ as an oil, $[a]_{\mathrm{D}}+15.0(c 0.20, \mathrm{EtOH}) ; \lambda_{\text {max }}$ (EtoH)/nm $215\left(\log \varepsilon / \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1} 3.18\right) ; v_{\text {max }}$ (liquid) $/ \mathrm{cm}^{-1}$ $3448(\mathrm{OH})$ and 1721 (ester); $m / z$ (EI) $346\left(\mathrm{M}^{+}, 0.1 \%\right), 215$ $\left(\left[\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{O}_{5}\right]^{+}, 45.5\right), 199\left(\left[\mathrm{C}_{10} \mathrm{H}_{15} \mathrm{O}_{4}\right]^{+}, 58.4\right), 113\left(\left[\mathrm{C}_{6} \mathrm{H}_{9} \mathrm{O}_{2}\right]^{+}\right.$, 100) and $85\left(\left[\mathrm{C}_{5} \mathrm{H}_{9} \mathrm{O}\right]^{+}\right.$, 42.7) [ $\mathrm{m} / \mathrm{z}$ (HREI) Found: $\mathrm{M}^{+}$, 456.1616. $\mathrm{C}_{16} \mathrm{H}_{26} \mathrm{O}_{8}$ requires $M$, 456.1626]; $\delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 1.21$ $\left(3 \mathrm{H}, \mathrm{d}, J=6.6 \mathrm{~Hz}, 17-\mathrm{H}_{3}\right), 1.24\left(3 \mathrm{H}, \mathrm{d}, J=6.4 \mathrm{~Hz}, 18-\mathrm{H}_{3}\right), 1.30$ $\left(3 \mathrm{H}, \mathrm{d}, J=6.6 \mathrm{~Hz}, 19-\mathrm{H}_{3}\right), 1.60\left(1 \mathrm{H}, \mathrm{m}, 13-\mathrm{H}_{\mathrm{A}}\right), 1.75(1 \mathrm{H}, \mathrm{m}$, $\left.13-\mathrm{H}_{\mathrm{B}}\right), 1.77\left(1 \mathrm{H}, \mathrm{m}, 7-\mathrm{H}_{\mathrm{A}}\right), 2.12\left(1 \mathrm{H}, \mathrm{m}, 7-\mathrm{H}_{\mathrm{B}}\right), 2.34(1 \mathrm{H}, \mathrm{m}$, $\left.12-\mathrm{H}_{\mathrm{A}}\right), 2.36\left(2 \mathrm{H}, \mathrm{m}, 6-\mathrm{H}_{2}\right), 2.52(1 \mathrm{H}, \mathrm{dd}, J=14.9,10.1 \mathrm{~Hz}$, $\left.2-\mathrm{H}_{\mathrm{A}}\right), 2.59\left(1 \mathrm{H}, \mathrm{dd}, J=14.9,2.5 \mathrm{~Hz}, 2-\mathrm{H}_{\mathrm{B}}\right), 2.68(1 \mathrm{H}, \mathrm{m}$, $\left.12-\mathrm{H}_{\mathrm{B}}\right), 3.68(1 \mathrm{H}$, ddd, $J=12.9,10.6,4.1 \mathrm{~Hz}, 8-\mathrm{H}), 3.76(1 \mathrm{H}$, ddd, $J=10.9,4.1,1.9 \mathrm{~Hz}, 14-\mathrm{H}), 4.82(1 \mathrm{H}, \mathrm{qd}, J=6.63,1.9 \mathrm{~Hz}$, $15-\mathrm{H}), 5.10(1 \mathrm{H}, \mathrm{dq}, J=12.9,6.4 \mathrm{~Hz}, 9-\mathrm{H})$ and $5.64(1 \mathrm{H}, \mathrm{dqd}$, $10.1,6.6,2.5 \mathrm{~Hz}, 3-\mathrm{H}) ; \delta_{\mathrm{C}}\left(\mathrm{CDCl}_{3}\right) 12.31(\mathrm{C}-17), 16.33(\mathrm{C}-18)$, 20.48 (C-19), 25.29 (C-7), 28.47 (C-13), 30.11 (C-6), 31.44 (C-12), 42.43 (C-2), 67.09 (C-3), 69.91 (C-14), 71.87 (C-9), 73.05 (C-8), 74.59 (C-15), 169.09 (C-1), 174.34 (C-11) and 174.94 (C-5); CD $\lambda\left(c 7.23 \times 10^{-4} \mathrm{~mol} \mathrm{dm}^{-3}\right.$ in EtOH$) / \mathrm{nm} 238$ $(\Delta \varepsilon 0)$ and $223(+0.90)$.

## Hydrogenation of macrosphelide I 5

Using the same procedure as above with compound 1, a solution of macrosphelide I $5(1.7 \mathrm{mg})$ in $\mathrm{MeOH}\left(0.5 \mathrm{~cm}^{3}\right)$ was hydrogenated in the presence of $10 \% \mathrm{Pd} / \mathrm{C}(4.7 \mathrm{mg})$, and the
resulting product was purified by HPLC $[\mathrm{MeOH}$-water $(1: 1)]$ to afford $\mathbf{1 6}(1.5 \mathrm{mg})$, identical with the compound derived from 1.

## Formation of the $(R)$ - and ( $S$ )-MTPA esters 17a and 17b from macrosphelide C 7

Using the same procedure as above with macrosphelide E 1, macrosphelide C $7(0.7$ and 0.8 mg$)$ was treated with $(R)$-MTPA $(2.0 \mathrm{mg})$ and $(S)$-MTPA ( 2.0 mg ) to afford esters $17 \mathrm{a}(0.9 \mathrm{mg})$ and $\mathbf{1 7 b}(0.7 \mathrm{mg})$, respectively.

Ester 17a. Obtained as an amorphous powder; $m / z$ (EI) 542 $\left(\mathrm{M}^{+}\right)\left[\mathrm{m} / \mathrm{z}\right.$ (HREI) Found: $\mathrm{M}^{+}, 542.1761 . \mathrm{C}_{26} \mathrm{H}_{29} \mathrm{~F}_{3} \mathrm{O}_{9}$ requires $M, 542.1763] ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 1.30\left(3 \mathrm{H}, \mathrm{d}, J=6.4 \mathrm{~Hz}, 17-\mathrm{H}_{3}\right), 1.32$ $\left(3 \mathrm{H}, \mathrm{d}, J=6.6 \mathrm{~Hz}, 19-\mathrm{H}_{3}\right), 1.37\left(3 \mathrm{H}, \mathrm{d}, J=6.4 \mathrm{~Hz}, 18-\mathrm{H}_{3}\right), 2.35$ ( 1 H, dddd, $\left.J=13.3,4.7,3.4,1.1 \mathrm{~Hz}, 8-\mathrm{H}_{\mathrm{A}}\right), 2.49(1 \mathrm{H}, \mathrm{dd}, J=$ $\left.15.2,8.1 \mathrm{~Hz}, 2-\mathrm{H}_{\mathrm{A}}\right), 2.51\left(1 \mathrm{H}, \mathrm{dtd}, J=13.3,10.1,0.9 \mathrm{~Hz}, 8-\mathrm{H}_{\mathrm{B}}\right)$, $2.61\left(1 \mathrm{H}, \mathrm{dd}, J=15.2,3.0 \mathrm{~Hz}, 2-\mathrm{H}_{\mathrm{B}}\right), 3.50(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 5.11$ ( $1 \mathrm{H}, \mathrm{dqd}, J=10.1,6.4,4.7 \mathrm{~Hz}, 9-\mathrm{H}), 5.14(1 \mathrm{H}, \mathrm{dq}, J=7.6,6.4$ $\mathrm{Hz}, 15-\mathrm{H}), 5.27(1 \mathrm{H}, \mathrm{dqd}, J=8.1,6.4,3.0 \mathrm{~Hz}, 3-\mathrm{H}), 5.43(1 \mathrm{H}$, ddd, $J=7.6,6.3,1.1 \mathrm{~Hz}, 14-\mathrm{H}), 5.76$ ( 1 H , ddd, $J=15.9,1.1,0.9$ $\mathrm{Hz}, 6-\mathrm{H}), 5.86(1 \mathrm{H}, \mathrm{dd}, J=15.9,1.1 \mathrm{~Hz}, 12-\mathrm{H}), 6.70(1 \mathrm{H}, \mathrm{dd}$, $J=15.9,6.3 \mathrm{~Hz}, 13-\mathrm{H}), 6.82(1 \mathrm{H}, \mathrm{ddd}, J=15.9,10.1,3.4 \mathrm{~Hz}$, $7-\mathrm{H}), 7.42(3 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$ and $7.47(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$.

Ester 17b. Obtained as an amorphous powder; $m / z$ (EI) 542 $\left(\mathrm{M}^{+}\right)\left[\mathrm{m} / \mathrm{z}\right.$ (HREI) Found: $\mathrm{M}^{+}$, 542.1762. $\mathrm{C}_{26} \mathrm{H}_{29} \mathrm{~F}_{3} \mathrm{O}_{9}$ requires $M, 542.1763] ; \delta_{\mathrm{H}}\left(\mathrm{CDCl}_{3}\right) 1.16\left(3 \mathrm{H}, \mathrm{d}, J=6.2 \mathrm{~Hz}, 17-\mathrm{H}_{3}\right), 1.30$ $\left(3 \mathrm{H}, \mathrm{d}, J=6.6 \mathrm{~Hz}, 19-\mathrm{H}_{3}\right), 1.37\left(3 \mathrm{H}, \mathrm{d}, J=6.4 \mathrm{~Hz}, 18-\mathrm{H}_{3}\right), 2.33$ ( $\left.1 \mathrm{H}, \mathrm{dddd}, J=13.3,4.7,3.1,1.2 \mathrm{~Hz}, 8-\mathrm{H}_{\mathrm{A}}\right), 2.47(1 \mathrm{H}, \mathrm{dd}, J=$ $\left.15.0,8.2 \mathrm{~Hz}, 2-\mathrm{H}_{\mathrm{A}}\right), 2.51\left(1 \mathrm{H}, \mathrm{dtd}, J=13.3,10.0,1.0 \mathrm{~Hz}, 8-\mathrm{H}_{\mathrm{B}}\right)$, $2.52\left(1 \mathrm{H}, \mathrm{dd}, J=15.0,3.0 \mathrm{~Hz}, 2-\mathrm{H}_{\mathrm{B}}\right), 3.52(3 \mathrm{H}, \mathrm{s}, \mathrm{OMe}), 5.09$ $(1 \mathrm{H}, \mathrm{dq}, J=7.6,6.2 \mathrm{~Hz}, 15-\mathrm{H}), 5.14(1 \mathrm{H}, \mathrm{dqd}, J=10.0,6.4,4.7$ $\mathrm{Hz}, 9-\mathrm{H}), 5.26$ ( $1 \mathrm{H}, \mathrm{dqd}, J=8.2,6.4,3.0 \mathrm{~Hz}, 3-\mathrm{H}$ ), 5.41 ( 1 H , ddd, $J=7.6,6.3,1.0 \mathrm{~Hz}, 14-\mathrm{H}$ ), 5.76 ( 1 H , ddd, $J=15.9,1.2,1.0$ $\mathrm{Hz}, 6-\mathrm{H}), 6.0(1 \mathrm{H}, \mathrm{dd}, J=15.9,1.0 \mathrm{~Hz}, 12-\mathrm{H}), 6.75(1 \mathrm{H}, \mathrm{dd}, J=$ $15.9,6.3 \mathrm{~Hz}, 13-\mathrm{H}), 6.81(1 \mathrm{H}$, ddd, $J=15.9,10.0,3.1 \mathrm{~Hz}, 7-\mathrm{H})$, $7.42(3 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$ and $7.47(2 \mathrm{H}, \mathrm{m}, \mathrm{ArH})$.

## X-Ray crystallography of macrosphelide $\mathbf{C} 7 \dagger$

Macrosphelide C 7 was crystallized from hexane- $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution by the vapor diffusion method. Crystal data: $\mathrm{C}_{16} \mathrm{H}_{22} \mathrm{O}_{7}$, $M=326.34$, orthorhombic, $P 2_{1} 2_{1} 2_{1}, a=10.514(2), b=$ $28.460(2), c=5.860(2) \AA, V=1753.4(7) \AA^{3}, Z=4, D_{\mathrm{x}}=1.236$ $\mathrm{Mg} \mathrm{m}{ }^{-3}, F(000)=696, \mu(\mathrm{Cu}-\mathrm{K} \alpha)=0.817 \mathrm{~mm}^{-1}$. Data collection was performed by a Rigaku AFC5R using graphitemonochromated radiation ( $\lambda=1.5418 \AA$ ). A total of 2473 reflections were collected until $\theta=67.63 \AA$, in which 2185 reflections were observed $[I>2 \sigma(I)]$. The crystal structure was solved by the direct method using SHELXS-97. ${ }^{22}$ The structure was refined by the full matrix least-squares method on $F^{2}$ using SHELXL-97. ${ }^{23}$ In the structure refinements, non-hydrogen atoms were refined with anisotropic temperature factors. Hydrogen atoms were calculated on the geometrically ideal positions by the 'ride on' method, and were included in the calculation of structure factors with isotropic temperature factors. In the final stage, $R=0.0437, R_{\mathrm{w}}=0.1055$ and $S=1.060$ were obtained.

## Cell-adhesion assay

This assay was carried out according to a modification of Miki's method using 3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl2 H -tetrazolium bromide (MTT)-labeled cells. ${ }^{20}$ HUVEC (DIAIATRON Co., Ltd., Japan) were cultured until confluent in a
$\dagger$ CCDC reference number 169025. See http://www.rsc.org/suppdata/ $\mathrm{pl} / \mathrm{b} 1 / \mathrm{b} 104337 \mathrm{~b} /$ for crystallographic files in .cif or other electronic format.

96-well plate in medium 199 (Invitrogen Corp., USA) containing $10 \%$ fetal calf serum (FCS, Invitrogen Corp.) and washed with phosphate-buffered saline (PBS, DIA-IATRON Co., Ltd.) containing $20 \%$ FCS. The HUVEC were stimulated with a solution of lipopolysaccharides (LPS, Sigma) in RPMI 1640 medium (Invitrogen Corp.) containing $10 \%$ FCS for 4 h in the presence of various concentrations of macrosphelides, and then MTT-labelled HL-60 cells were added and incubated for 40 min at $37^{\circ} \mathrm{C}$ in $5 \% \mathrm{CO}_{2}$. Unbound cells were gently washed out with PBS containing $10 \%$ FCS, and DMSO was added to lyse the adherent HL-60 cells. Absorbance at 540 nm was measured using a microplate reader (Model 450, Bio-Rad).

## Acknowledgements

We thank Professor M. Kobayashi (Osaka University) and Dr K. Kawai (Fuso Pharmaceutical Industries, Ltd.) for their helpful advice on NMR spectral chemical shifts of acetonides and cell-adhesion assay, respectively. This work was supported in part by a Grant-in-Aid for Scientific Research from the Ministry of Education, Science, Sports and Culture, Japan.
