First published as an Advance Article on the web 10th January 2002

A series of porphyrins 5-9 has been prepared, in which an aryl substituent is linked to the porphyrin via azo, imine, alkene and alkyne bridges. The strength of aryl-porphyrin electronic coupling in these systems was evaluated from the red shift and intensification of the $Q$ band absorption and emission spectra, and from the incremental red shift on changing from the phenyl to a 4-nitrophenyl substituent. The azo link provides the strongest electronic communication between the porphyrin and the benzene ring. The crystal structures of azo compounds 5a and 5c show that the porphyrin and benzene rings are almost coplanar, whereas imine $\mathbf{7 a}$ and alkene $\mathbf{8 a}$ are significantly twisted in the solid state. Imine and alkyne linked porphyrin dimers $\mathbf{1 8}$ and $\mathbf{2 3}$ were also synthesized; the alkynelinked dimer is much more conjugated than its imine-linked analogue.

## Introduction

Porphyrin-based electronic materials continue to attract attention because of their unusual electro-optical and nonlinear optical (NLO) behaviour. ${ }^{1}$ Work by several research teams has led to the conclusion that acetylenic meso-substituents provide the most efficient way of making conjugated connections to porphyrin $\pi$-systems. For example, Therien and coworkers have shown that donor-acceptor aryl-ethynyl porphyrins such as $\mathbf{1}$ have much higher second order NLO coefficients than analogous meso-aryl porphyrins, ${ }^{2,3}$ while we have shown that the strong inter-porphyrin conjugation in butadiyne-linked porphyrin oligomers results in exceptional third order NLO behaviour. ${ }^{4,5}$ meso-Tetraalkynylporphyrins are also remarkable for their sharp red-shifted absorption spectra ${ }^{6-9}$ and strong optical limiting in the visible region. ${ }^{10}$

The pre-eminence of alkyne links in this area contrasts with the emerging design principles in the wider field of conjugated organic materials, where alkene links generally provide stronger electronic communication than alkynes. ${ }^{11-13}$ For
example stilbene $\mathbf{2}$ exhibits more red-shifted absorption maxima and larger $2^{\text {nd }}$ and $3^{\text {rd }}$ order NLO coefficients than its tolan (diphenylacetylene) analogue $3 .{ }^{14}$ This is attributed to poor $\mathrm{sp}^{1}-\mathrm{sp}^{2} \pi$-overlap, due to the energy mismatch between the $p$-orbitals on $\mathrm{sp}^{1}$ and $\mathrm{sp}^{2}$ carbon atoms. ${ }^{15}$ Alkyne-links achieve higher conjugation in porphyrin-based materials because they allow planar $\pi$-overlap whereas aryl or alkene-links twist out of conjugation, due to steric interactions with the $\beta$-pyrrole substituents. Changing the atom attached at the porphyrin meso position to nitrogen should also remove this steric clash. An azo substituent is iso-electronic with an alkene, and almost as slim as an alkyne, which suggests that it may be interesting to explore the chemistry of meso azo-linked porphyrins. Azolinked porphyrins such as $\mathbf{4}$ have also been predicted to have strong NLO behaviour, ${ }^{16}$ but the synthesis of compounds of this type has not been reported.

Imines are generally easier to prepare than azo compounds, and an imine link might be expected to have properties intermediate between an azo and an alkene. However it has long been known that whereas $E$-stilbenes and $E$-azobenzenes are roughly planar, $E$-benzalanilines ( $\mathrm{Ar}-\mathrm{N}=\mathrm{CH}-\mathrm{Ph}$ ) are twisted. The $N$-aryl ring is at an angle of about $50^{\circ}$ to the plane of the $\mathrm{N}=\mathrm{CH}-\mathrm{Ph}$ group, as revealed in the solid state by X-ray crystallography, ${ }^{17}$ in the gas phase by electron diffraction ${ }^{18}$ and in

solution by CNDO/S CI (complete neglect of differential overlap configuration interaction) simulation of UV spectra. ${ }^{19}$ This nonplanarity results in weaker conjugation in imine-linked systems. ${ }^{20}$ We set out to explore this effect in meso imine-linked porphyrins.

Here we present a survey of meso-substituted porphyrins with alkyne, alkene, imine and azo links. To the best of our knowledge, this is the first synthesis of meso-azo-arylporphyrins such as 5a-c. There is only one previous report ${ }^{21}$ of meso-imine-arylporphyrins such as $\mathbf{6 a , b}$ and $7 \mathbf{7 a}, \mathbf{b}$, and these previous imines had $\beta$-pyrrolic alkyl substituents, making them much less conjugated. We have also prepared meso-ethene-arylporphyrins 8a,b and meso-ethynyl-arylporphyrins $\mathbf{9 a}, \mathbf{b}$ for comparison. Here we also compare the properties of imine-linked and acetylene-linked porphyrin dimers.

$$

The strength of porphyrin-aryl conjugation was assessed by comparing the absorption and emission spectra of these compounds, and by crystallographic and computational analysis of their geometries.

## Results and discussion

## Synthesis

Porphyrin azo dyes $\mathbf{5 a - c}$ were prepared by treating zinc porphyrin 10 with aryldiazonium tetrafluoroborates $11 \mathbf{a}-\mathbf{c}^{22}$ in THF at room temperature (Scheme 1). The reaction is fastest with the most electrophilic 4 -nitrophenyl diazonium salt 11b. The dioxo-porphyrin $\mathbf{1 2}$ was also isolated as a by-product from all three reactions, while the desired product was isolated in $23-27 \%$ yield. No disubstituted products were formed, even when using a large excess of the diazonium salt, due to the strongly electron-withdrawing effect of the azo substituent
Many types of aromatic electrophilic substitution have been reported with porphyrins, ${ }^{23}$ but as far as we are aware there have been no previous reports of azo coupling. An alternative route to porphyrin azo dyes would be to react a porphyrin diazonium salt with an electron-rich aromatic unit. There is only one previous report of the synthesis of a porphyrin meso-diazonium salt, and this was used for Sandmeyer halogenation rather than azo-coupling. ${ }^{24}$ We prepared a meso-aminoporphyrin 13 via nitration of $\mathbf{1 0}$ (Scheme 1) but all attempts at making the diazonium salt from this, and its subsequent reaction with porphyrin 10 to give dimer 14 , were unsuccessful.
Imine linked porphyrin-aryl compounds $\mathbf{6 a}$ and $\mathbf{6 b}$ were prepared in $68 \%$ and $49 \%$ yields by condensing aminoporphyrin 13 with benzaldehydes $\mathbf{1 5 a}$ and $\mathbf{1 5 b}$ (Scheme 1). Compound $\mathbf{1 3}$ was refluxed over 4 A molecular sieves in the presence of an excess of benzaldehyde and Amberlyst 15 macroreticular ion-exchange resin as catalyst. With 6b, difficult removal of excess unreacted 4-nitrobenzaldehyde reduced the yield. For the isomeric imines 7a and 7b, formylporphyrin 16 was prepared via Vilsmeier formylation of $\mathbf{1 0}$, then reaction with anilines $\mathbf{1 7 a}$ and $\mathbf{1 7 b}$ to give $\mathbf{7 a}$ and $\mathbf{7 b}$ in $78 \%$ and $85 \%$ yields (Scheme 2). Imine linked porphyrin dimer $\mathbf{1 8}$ was prepared under analogous conditions from formylporphyrin 16 and aminoporphyrin 13.

This gave 18 in $32 \%$ yield. The disappointing yield of dimer may be due to degradation of the aminoporphyrin during the long reaction time.

The ethene linked meso-arylporphyrins $\mathbf{8 a}$ and $\mathbf{8 b}$ were formed by Wittig reaction between 16 and phosphonium salts 19a and 19b (Scheme 2). meso $\mathrm{CH}=\mathrm{CH}-\mathrm{Ar}$ porphyrins have previously been prepared as intermediates to ethane linked photosynthetic models by Nishitani et al., ${ }^{25}$ and in low yield from pyrrole and cinnamaldehyde by Czuchajowski et al., ${ }^{26}$ but neither investigation addressed the extent of conjugation across the ethene link. meso-Ethynylporphyrins 9a and 9b were prepared using Heck-Sonogashira coupling between meso-bromoporphyrin 20 and the arylacetylenes 21a and 21b (Scheme 3). ${ }^{27}$ Acetylene linked porphyrin dimer 23 was synthesised via coupling of trimethylsilylacetylene to $\mathbf{2 0}$, deprotection and a second Pd-catalysed reaction of this with another equivalent of $\mathbf{2 0}$ (Scheme 3). Dimer $\mathbf{2 3}$ was isolated in $70 \%$ yield. Therien and coworkers have previously reported the synthesis of the phenyl (rather than the 3,5-di-tert-butylphenyl) analogue of this dimer. ${ }^{28}$

## Electronic absorption and emission spectra

The electronic spectra of compounds 5-10 are summarised in Table 1. Data for porphyrin dimers $\mathbf{1 8}$ and $\mathbf{2 3}$ are also included.

A porphyrin-aryl connection which provides efficient electronic communication will lead to a large change of the porphyrin electronic spectra due to conjugation into the benzene ring. Selected absorption spectra are shown in Fig. 1. Conjugation between the porphyrin and the aryl substituent is manifested in three ways: (i) change in positions of absorption and emission maxima relative to unsubstituted porphyrin 10; (ii) change in positions of absorption maxima on incorporation of the nitro group; (iii) change in the oscillator strength of absorptions, since the addition of conjugated connections to the meso positions of porphyrins generally intensifies the Q band by increasing the $\mathrm{a}_{1 \mathrm{u}} / \mathrm{a}_{2 \mathrm{u}}$ orbital separation. ${ }^{1 c}$
(i) Both the Q and B bands of all the porphyrin derivatives show a large red shift relative to the core porphyrin 10. Azo compounds $\mathbf{5 a - c}$ display by far the largest shifts, and in $\mathbf{5 b}$ the Soret band is widely split (Fig. 1a), indicating strong conjugation with the aryl substituent and suggesting this link provides the best electronic overlap. There is little difference between the absorption spectra of compounds $6-9$. In general, the red shift increases in the order: alkene $\mathbf{8}<$ imine $\mathbf{6} \approx$ imine $7<$ acetylene $9<$ azo 5, a trend which may be explained by decreasing steric bulk of the porphyrin-to-benzene bridge.
(ii) The para-nitro group gives an additional red shift in all cases. The magnitude of this change should give an indication of the extent of communication between the porphyrin and the

${ }^{a} \lambda_{\text {maxB }}, \lambda_{\text {maxQ }}, f_{\mathrm{B}}, f_{\mathrm{Q}}, \lambda_{\mathrm{em}}$ and $\Phi_{\mathrm{f}}$ are the absorption maxima, oscillator strengths, emission maxima and fluorescence quantum yield in $\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%$ pyridine. $\lambda_{\operatorname{maxB}}, \lambda_{\operatorname{maxQ}}, f_{\mathrm{B}}$ and $f_{\mathrm{Q}}$ refer to the porphyrin B and Q bands; in cases with several Q band maxima, the longest wavelength peak is listed here. Oscillator strengths in dimers $\mathbf{1 8}$ and $\mathbf{2 3}$ are per porphyrin macrocycle. $\theta_{\mathrm{AB}}, \theta_{\mathrm{BC}}$ and $\theta_{\mathrm{AC}}$ are the interplane angles as defined in Fig. 2 from X-ray crystallographic analysis (and from MM2 molecular mechanics calculations).
aryl substituent. Replacement of a hydrogen by a nitro group in the azo-linked system gives the largest Q band shift of 37 nm , comparing $\mathbf{5 a}$ and $\mathbf{5 b}$ (Fig. 1a and Table 1), which is about twice that for compounds 6-9, reinforcing our conclusion that the azo link provides exceptionally efficient conjugation. The presence of a nitro group, or a nitrogen in the link, leads to a large reduction in fluorescence quantum yield $\Phi_{\mathrm{F}}$, the only exceptions being imines $7 \mathbf{a}$ and $\mathbf{7 b}$, where the nitro compound is more fluorescent. Perhaps here the addition of the nitro group favours interaction of the imine nitrogen with the benzene ring, reducing electronic communication with, and quenching of, the porphyrin.
(iii) The increase in the Q band oscillator strength $f_{\mathrm{Q}}$ relative to that of $\mathbf{1 0}$ indicates the effectiveness of conjugation between the porphyrin and benzene. $\dagger$ Again, an increase in oscillator strength on addition of the para-nitro group would also testify to good electronic communication across the conjugated system. There is a general increase in Soret and Q-band oscillator strengths relative to unsubstituted porphyrin $\mathbf{1 0}$ (Table 1). The effect is largest in para-nitro phenylacetylene 9b and azo compounds $\mathbf{5 a - c}$. The intensification of the Q-band in the azo compounds again reveals the strong conjugation between porphyrin and benzene ring.

The absorption spectra of porphyrin dimers $\mathbf{1 8}$ and $\mathbf{2 3}$ are compared with those of their monomer analogues in Fig. 1b and 1c respectively. The acetylene linked dimer 23 shows a large red-shift, intensification of the Q band oscillator strength and a splitting of the Soret compared to meso-phenylethynyl porphyrin 9a (Fig. 1c), which indicates that there is strong conjugation between the porphyrin rings. Imine dimer 18 has an absorption spectrum which is similar to the meso-aryl imine porphyrins $6 \mathbf{a}$ and $7 \mathbf{7 a}$ (Fig. 1b). This can be explained by the twisting of the $N$-porphyrin ring in a similar manner to that seen in $N$-benzalanilines, limiting the conjugation between the porphyrins. However, as for $\mathbf{6 b}$, the long tail to the absorption to longer wavelengths, and the increase in Q band oscillator strength, suggest that some of the dimer exists in a planar more conjugated conformation.

## Crystal structures and molecular mechanics calculations

Electronic conjugation requires efficient orbital overlap, and is maximised if the $\pi$-system is planar. The planarity of the meso-arylporphyrins 5-9 and porphyrin dimers $\mathbf{1 8}$ and $\mathbf{2 3}$ was

$$
\begin{aligned}
& \dagger \text { Oscillator strength, } f \text {, was calculated using the equation: } \\
& \qquad f=4.319 \times 10^{-9} \mathrm{~A} / n
\end{aligned}
$$

where $A$ is the integrated absorption band (plotted as $\varepsilon / \mathrm{cm}^{-1}$ ), and $n$ is the solvent refractive index ( 1.42 for $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ).
assessed by X-ray crystallography and by molecular mechanics modelling using the MM2 force field. Crystallographic data for $\mathbf{5 a}, \mathbf{5 c}, 7 \mathrm{a}$ and $\mathbf{8 a}$ are summarised in Table 2. We were unable to grow satisfactory crystals of the remaining compounds.

The planarity was evaluated by measuring angles between the mean planes of the porphyrin core and $\mathrm{C}-\mathrm{X}-\mathrm{X}-\mathrm{C}$ bridge, $\theta_{\mathrm{AB}}$ and between the planes of the $\mathrm{C}-\mathrm{X}-\mathrm{X}-\mathrm{C}$ link and the benzene ring, $\theta_{\mathrm{BC}}$, as illustrated in Fig. 2. In addition, the angle between the porphyrin ring and benzene ring, $\theta_{\mathrm{AC}}$, was also measured. Note that $\theta_{\mathrm{AC}}$ is not always the sum or difference of $\theta_{\mathrm{AB}} \pm \theta_{\mathrm{BC}}$, because these are dihedral angles between leastsquares planes; although the major contribution to $\theta_{\mathrm{AB}}$ and $\theta_{\mathrm{BC}}$ is torsion about the bond between pairs of rings, other minor tilting factors are also included. These torsional parameters are listed in Table 1, from X-ray crystallography, where available, and from molecular mechanics.

The acetylene linked systems are calculated to be essentially planar $\left(\theta_{\mathrm{AC}}=0\right)$, but the barrier to rotation is probably small. The crystal structures of several meso-arylethynylporphyrins have been reported. ${ }^{7,29-31}$ These structures have $\theta_{\mathrm{AC}}$ values in the range $3.5-60^{\circ}$ (mean $30.4^{\circ}$ for all 9 observations), showing that the electronic preference for planarity is easily compromised by crystal packing interactions.
The calculated structures of all three azo compounds also show very small deviations from planarity of less than $0.5^{\circ}$. The X-ray structure of azo compound 5a (Fig. 3) shows an almost planar geometry across the azo bond ( $\theta_{\mathrm{AB}}=9.7^{\circ} ; \theta_{\mathrm{BC}}=5.9^{\circ}$ ), whereas that of $\mathbf{5 c}$ is more twisted ( $\theta_{\mathrm{AB}}=26.1^{\circ} ; \theta_{\mathrm{BC}}=5.0^{\circ}$ ). These values are significantly larger than those predicted by our modelling, but agree well with values of $5-15^{\circ}$ found for $E$-azobenzene. ${ }^{32}$ The planarity of these azoporphyrins is consistent with a high degree of conjugation.

For alkene linked porphyrin $8 \mathbf{a}$, modelling predicts $\theta_{\mathrm{AB}}=$ $57.8^{\circ}$ and $\theta_{\mathrm{BC}}=20.2^{\circ}$. The X-ray structure of 8a (Fig. 3) indicates that molecular mechanics exaggerates the distortion, as in the crystal $\theta_{\mathrm{AB}}=41.6^{\circ}$ and $\theta_{\mathrm{BC}}=14.7^{\circ}$. The shortest $\mathrm{H}-\mathrm{H}$ contacts (Fig. 4) are $\mathrm{H}_{\mathrm{A}}-\mathrm{H}_{\mathrm{B}}(2.32 \AA)$ and $\mathrm{H}_{\mathrm{B}}-\mathrm{C}(2.15 \AA)$; both these contacts are close to the sum of the van der Waals radii $\ddagger$ so are likely to contribute towards the nonplanarity. The other $\mathrm{H}-\mathrm{H}$ distances $\mathrm{H}_{\mathrm{D}}-\mathrm{H}_{\mathrm{E}}(2.73 \AA)$ and $\mathrm{H}_{\mathrm{E}}-\mathrm{H}_{\mathrm{F}}(2.44 \AA)$ are significantly longer.

Our molecular mechanics calculations gave least realistic geometries for the imines, where electronic effects due to the interaction of the imine nitrogen with the aromatic system are important, as well as steric effects. MM2 calculations predict imines $7 \mathbf{a}, \mathbf{b}$ to have $\theta_{\mathrm{AB}}=40.1^{\circ}$ and $\theta_{\mathrm{BC}} \approx 0$, which seems

[^0]

Fig. 4 Short intramolecular H-H contacts in porphyrins 6-9.
$\mathrm{H}_{\mathrm{B}}(2.23 \AA)$ and $\mathrm{H}_{\mathrm{B}}-\mathrm{H}_{\mathrm{C}}(2.07 \AA)$, which are again within van der Waals contact. The $\mathrm{H}_{\mathrm{B}}-\mathrm{H}_{\mathrm{C}}$ distance in imine 7 a is shorter than that in alkene $\mathbf{8 a}$, despite the greater $\theta_{\mathrm{BC}}$ in the imine, due to the shorter length of the $\mathrm{C}=\mathrm{N}$ bond ( $1.25 \AA$ ) in 7 a compared with the $\mathrm{C}=\mathrm{C}$ bond $(1.34 \AA$ ) in $\mathbf{8 a}$. This short $\mathrm{C}=\mathrm{N}$ bond increases the steric congestion and nonplanarity. The discrepancy between predicted and observed structures casts doubt on the calculated geometry of imines $\mathbf{6 a}, \mathbf{6 b}$ and $\mathbf{1 8}$, although the nonplanarity of these systems is not necessarily the same in the solid state (as determined experimentally by crystallography) as in isolated molecules (as deduced from molecular mechanics calculations), because intermolecular interactions are ignored in the calculations and may have a significant effect in the solid state.

The calculated structure for imine dimer $\mathbf{1 8}$ has twists between the imine bond atoms and the $N$-porphyrin ring, $\theta_{\mathrm{AB}}$, and the $C$-porphyrin ring, $\theta_{\mathrm{BC}}$, of $16.8^{\circ}$ and $52.9^{\circ}$ respectively. With an even greater value of $\theta_{\mathrm{AB}}$ expected in the actual structure, it is not surprising that the absorption spectrum of $\mathbf{1 8}$ shows only weak conjugation.

## Conclusions

Analysis of the electronic spectra of porphyrin-aryl compounds 5-9 shows that the azo-link allows most efficient $\pi$-overlap between the porphyrin and the aryl moiety. This is manifested by strong red shifts in the absorption bands relative to the other porphyrins, a large increase in oscillator strength of the Q band and a further red shift and intensification of the Q band on addition of a nitro group comparing compounds $\mathbf{5 a}$ and $\mathbf{5 b}$. The X-ray crystal structure of azo compounds $\mathbf{5 a}$ and 5 c show that the azo link is almost coplanar with the porphyrin macrocycle, supporting the spectral evidence for strong electronic communication.
Alkene and imine links do not provide as good conjugation as the azo bridge. The crystal structures of imine linked porphyrin 7a and alkene linked 8a both show a large twist across the bridging unit, explaining the reduced conjugation observed for these compounds. For $8 \mathbf{a}$ this can be explained on steric grounds and the structure is predicted with reasonable accuracy by a simple molecular mechanics model. However, additional distortions are found in imine 7a, perhaps due to interactions between the nitrogen lone pair and the adjacent benzene ring which are not adequately reproduced by the MM2 force field.

Acetylene linked porphyrin dimer 23 shows strong communication between the porphyrin rings. The nonplanarity expected in imine linked porphyrin dimer 18, due to steric and electronic factors, is evident in its absorption spectrum, which shows very limited conjugation. The results reported here indicate that azo-linked porphyrin oligomers such as 14 should be even more conjugated than their alkyne-linked analogues, but viable routes to these azo-linked systems have yet to be discovered.

## Experimental

UV measurements were carried out using a Perkin Elmer Lambda 14P spectrophotometer. Fluorescence measurements were carried out on a Fluoro-Max 2 spectrofluorimeter, and fluorescence quantum yields were measured relative to tetraphenylporphyrin in benzene $\left(\Phi_{\mathrm{F}}=0.11\right) .{ }^{33}{ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were obtained using Bruker AM-200, 400 or 500 MHz instruments using deacidified deuterochloroform; coupling constants $J$ are quoted in Hertz. FAB mass spectra were
obtained on a VG Autospec from a 3-nitrobenzyl alcohol matrix in Oxford or by the EPSRC service at Swansea. MALDI-TOF mass spectra were recorded on a Micromass Tof Spec 2E mass spectrometer from anthracene-1,8,9-triol matrix. Only molecular ions and major peaks are reported. IR spectra were recorded in KBr discs using a Perkin Elmer Paragon 1000 spectrophotometer. None of the solids reported here melt below $350^{\circ} \mathrm{C}$. Molecular modelling calculations were run on Oxford Molecular Cache software version 4.1, and minimised using molecular mechanics employing a conjugate gradient optimisation method with the augmented MM2 force field to a convergence of $1 \times 10^{-5} \mathrm{kcal} \mathrm{mol}^{-1}$.

Aryldiazonium tetrafluoroborates 11a-c were prepared according to the general procedure of Doyle and Bryker. ${ }^{22}$ 5,15$\operatorname{Bis}\left(3^{\prime}, 5^{\prime}\right.$-di-tert-butylphenyl)porphyrin $\left(\mathbf{H}_{\mathbf{2}} \mathbf{1 0}\right)$ was prepared using the method for synthesising the bis-phenyl analogue reported by Therien and co-workers. ${ }^{34}\left[5,15-\operatorname{Bis}\left(3^{\prime}, 5^{\prime}\right.\right.$-di-tertbutylphenyl)porphyrinato]copper(II) (Cu10), [5,15-bis( $3^{\prime}, 5^{\prime}$-di-tert-butylphenyl)-10-(formyl)porphyrinato]copper(iI) (Cu16), [5,15-bis( $3^{\prime}, 5^{\prime}$-di-tert-butylphenyl)-10-(formyl)porphyrin]
$\left(\mathbf{H}_{2} \mathbf{1 6}\right)$ and $\quad$ [5,15-bis( $3^{\prime}, 5^{\prime}$-di-tert-butylphenyl)-10-(formyl)porphyrinatolzinc(II) (16) were prepared according to the route reported by Susumu et al. ${ }^{35}$ 4-Trimethylsilylethynylphenyldiazonium tetrafluoroborate 11c was kindly provided by Dr Sally Anderson. ${ }^{36}$

## X-Ray crystallographic data collection and processing §

Crystals of $\mathbf{5 a}$ were grown by vapour diffusion of pentane into a solution of the porphyrin in $\mathrm{CHCl}_{3}$. Crystals of $\mathbf{5 c}$ were grown by vapour diffusion of pentanes into a solution of the porphyrin in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ containing pyridine. Crystals of $\mathbf{8 a}$ were grown by vapour diffusion of methanol into a solution of the porphyrin in $\mathrm{CHCl}_{3}$ containing pyridine. Data for $5 \mathrm{a}, 5 \mathrm{c}$ and 8a were collected using an Enraf-Nonius DIP2000 Image Plate Diffractometer with graphite monochromated $\mathrm{Mo}-\mathrm{K}_{a}$ radiation ( $\lambda=0.7107 \AA$ ). Structure 5a was solved using the program SIR-92 ${ }^{37}$ and refined using full-matrix least-squares on all $F_{0}{ }^{2}$ data [SHELXL-93]. ${ }^{38}$ Structure 5c was solved using SIR-92 on all 11907 reflections with $I>5 \sigma(I)$, but refined (by full matrix least squares against $F$ [CRYSTALS $]^{39}$ using only 6181 reflections with $I>7 \sigma(I)$. This gave more than 10 observations per variable and compensated for the unrealistically low estimate of $\sigma$ produced by the DIP2000 diffractometer. Structure 8a was solved using SIR-92 and refined using full-matrix least-squares on all $F$ data [CRYSTALS]. All non-hydrogen atoms were refined anisotropically and hydrogen
§ CCDC reference numbers 173279-173282 for 5a, 5c, 7a and 8a respectively. See http://www.rsc.org/suppdata/p1/b1/b109915a/ for crystallographic files in .cif or other electronic format.
atoms were included in calculated positions with isotropic displacement parameters. Crystals of 5 a were found to contain one pentane molecule per porphyrin, disordered over two positions, with a total occupancy of $75 \%$. 5c crystallised with one pyridine coordinated to the porphyrin and one disordered pentane molecule. 8a crystallised with one coordinated pyridine and one chloroform molecule in the asymmetric unit.

Crystals of 7a were grown by vapour diffusion of pentane into a solution of the porphyrin in $\mathrm{CHCl}_{3}$ containing pyridine. Data were collected using a Bruker SMART 1K CCD diffractometer using synchrotron X-rays $(\lambda=0.6883 \AA$ ) at Daresbury SRS Station 9.8, solved by direct methods and refined using full-matrix least-squares on all $F_{0}{ }^{2}$ data [SHELXTL]. ${ }^{40}$ The crystals contained one pyridine coordinated to the zinc and one disordered pyridine at $50 \%$ occupancy, as well as a disordered pentane at $50 \%$ occupancy. The coordinated pyridine and the imine bridge are both two-fold disordered, and were successfully resolved and modelled.

## [5,15-Bis( $\mathbf{3}^{\prime}, 5^{\prime}$-di-tert-butylphenyl)-10-phenylazoporphyrinato]zinc(II) 5a

Zinc porphyrin $10(75 \mathrm{mg}, 0.10 \mathrm{mmol})$ was dissolved in THF $\left(75 \mathrm{~cm}^{3}\right)$ and phenyldiazonium tetrafluoroborate $11 \mathrm{a}(192 \mathrm{mg}$, $1.0 \mathrm{mmol})$ was added as a solution in methanol $\left(50 \mathrm{~cm}^{3}\right)$. The reaction was stirred at room temperature for 15 h . The reaction mixture was then passed through a short silica plug and the solvents removed. The residue was chromatographed on silica eluting with $1: 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}-60-80$ petroleum ether and crystallised from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ by layered addition of $1 \% \mathrm{H}_{2} \mathrm{O}$-methanol to yield $5 \mathbf{a}$ as green crystals ( $20 \mathrm{mg}, 23 \%$ ): $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine)/nm 457 ( $\log \varepsilon 5.22$ ), 602 (4.07), 655 (4.57); $v_{\max }(\mathrm{KBr}) /$ $\mathrm{cm}^{-1} 1594(\mathrm{~N}=\mathrm{N}) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) 10.05 ( $1 \mathrm{H}, \mathrm{s}$, meso $H$ ), $9.84(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H), 9.21(2 \mathrm{H}, \mathrm{d}, J 4.4$, $\beta H), 9.01(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H), 8.93(2 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 8.48(2 \mathrm{H}$, d, $J 7.7$, phenyl $H$ ), $8.04\left(4 \mathrm{H}, \mathrm{d}, J 1.8, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 7.79(2 \mathrm{H}, \mathrm{t}$, $J 1.8, \mathrm{Bu}^{t}$ aryl $\left.H\right), 7.70(2 \mathrm{H}, \mathrm{t}, J 7.7$, phenyl $H), 7.56(1 \mathrm{H}, \mathrm{t}$, $J 7.7$, phenyl $H$ ), $1.53\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right.$, $\mathrm{d}_{5}$-pyridine) $154.8,151.3,150.2,149.2,148.6,147.4,142.1$, 133.7, 132.3, 131.8, 130.22, 130.20, 130.0, 129.4, 129.1, 124.2, $122.9,120.8,108.9,35.1,31.9 ; m / z(F A B) 854\left(\mathrm{M}^{+}, \mathrm{C}_{54} \mathrm{H}_{56} \mathrm{~N}_{6} \mathrm{Zn}\right.$ requires 854.46 ).

## [5,15-Bis( $3^{\prime}, 5^{\prime}$-di-tert-butylphenyl)-10-(4-nitrophenyl)azoporphyrinato]zinc(II) 5b

Porphyrin 10 ( $50 \mathrm{mg}, 0.067 \mathrm{mmol}$ ) was dissolved in THF ( 60 $\mathrm{cm}^{3}$ ) and the solution cooled to $0^{\circ} \mathrm{C} .4$-Nitrophenyldiazonium tetrafluoroborate $\mathbf{1 1 b}(80 \mathrm{mg}, 0.333 \mathrm{mmol})$ was then added as a solution in methanol $\left(40 \mathrm{~cm}^{3}\right)$ and the reaction stirred for 1 h . On completion, the solvents were removed and the residue chromatographed on silica eluting with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Crystallisation from $\mathrm{CHCl}_{3}$ by layered addition of $30-40$ petroleum ether yielded the pure product as green crystals ( $14 \mathrm{mg}, 23 \%$ ): $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine) $/ \mathrm{nm} 415$ (5.02), 485 (5.05), 692 (4.71); $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 1592(\mathrm{~N}=\mathrm{N}), 1520\left(\mathrm{NO}_{2}\right), 1334\left(\mathrm{NO}_{2}\right) ; \delta_{\mathrm{H}}(500$ $\mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}$-pyridine) $10.12(1 \mathrm{H}, \mathrm{s}$, meso $H), 9.92(2 \mathrm{H}, \mathrm{d}$, $J 4.7, \beta H), 9.26(2 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 9.06(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H), 8.95$ $(2 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 8.54(2 \mathrm{H}, \mathrm{d}, J 8.8$, phenyl $H), 8.47(2 \mathrm{H}, \mathrm{d}$, $J 8.8$, phenyl $H$ ), $8.09\left(4 \mathrm{H}, \mathrm{d}, J 1.8, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 7.85(2 \mathrm{H}, \mathrm{d}$, $J 1.8, \mathrm{Bu}^{t}$ aryl $\left.H\right), 1.57\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right.$, $\mathrm{d}_{5}$-pyridine) 157.6, 152.2, 150.2, 149.2, 148.9, 147.6, 141.7, $134.5,132.3,132.2,130.5,129.9,128.1,126.1,125.3,125.2$, $122.9,121.2,111.5,35.2,32.0 ; \mathrm{m} / \mathrm{z}(\mathrm{FAB}) 899\left(\mathrm{M}^{+}, \mathrm{C}_{54} \mathrm{H}_{55^{-}}\right.$ $\mathrm{N}_{7} \mathrm{O}_{2} \mathrm{Zn}$ requires 899.45).

## [5,15-Bis(3,5-di-tert-butylphenyl)-10-(4-trimethylsilylethynylphenyl)azoporphyrinato]zinc(II) 5 c

Compound $\mathbf{1 0}$ ( $150 \mathrm{mg}, 0.20 \mathrm{mmol}$ ) was dissolved in THF (150 $\mathrm{cm}^{3}$ ) and 4-trimethylsilylethynylphenyldiazonium tetrafluoroborate 11c ( $288 \mathrm{mg}, 1.0 \mathrm{mmol}$ ) was then added as a solution
in methanol $\left(100 \mathrm{~cm}^{3}\right)$ and the reaction stirred at room temperature for 2 h . After this time, the mixture was passed through a short silica plug and the solvents removed. The residue was chromatographed on silica eluting with $\mathrm{CH}_{2} \mathrm{Cl}_{2}-60-80$ petroleum ether $(1: 1)$ and crystallised from chloroform by layered addition of $30-40$ petroleum ether to yield the pure product as green crystals ( $52 \mathrm{mg}, 27 \%$ ). $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 418$ ( $\log \varepsilon 4.98$ ), 463 (5.20), 646 (4.58); $\delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) 10.16 ( 1 H , s, meso $H$ ), $9.90(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H), 9.33(2 \mathrm{H}, \mathrm{d}, J 4.5$, $\beta H), 9.15(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H), 9.08(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 8.41(2 \mathrm{H}$, $\mathrm{d}, J 8.3, p-\mathrm{NO}_{2}$ phenyl $\left.H\right), 8.15\left(4 \mathrm{H}, \mathrm{d}, J 1.7\right.$, $\mathrm{Bu}^{t}$ aryl H$), 7.89$ $\left(2 \mathrm{H}, \mathrm{t}, J 1.7, \mathrm{Bu}^{t}\right.$ aryl H), $7.86\left(2 \mathrm{H}, \mathrm{d}, J 8.3, p-\mathrm{NO}_{2}\right.$ phenyl $H$ ), $1.62\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right), 0.39(9 \mathrm{H}, \mathrm{s}, \mathrm{TMS}) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right.$, $\mathrm{d}_{5}$-pyridine) $153.9,151.5,150.4,149.5,149.0,147.1,141.6$, $134.0,133.3,132.9,132.2,130.6,130.0,129.6,125.5,124.5$, $123.0,121.3,108.9,105.3,97.3,35.3,32.0,0.3 ; m / z(\mathrm{FAB}) 951$ $\left(\mathrm{M}^{+}, \mathrm{C}_{59} \mathrm{H}_{64} \mathrm{~N}_{6} \mathrm{SiZn}\right.$ requires 950.7$)$.

## [5,15-Bis( $\mathbf{3}^{\prime}, 5^{\prime}$-di-tert-butylphenyl)-10-(nitro)porphyrinato]zinc(II)

The most successful conditions for meso-mononitration were similar to those reported by Cowan and Sanders. ${ }^{41}$ Free base porphyrin $\mathbf{H}_{2} 10(0.607 \mathrm{~g}, 0.88 \mathrm{mmol})$ was added to a vigorously stirred mixture of conc. $\mathrm{HNO}_{3}\left(60 \mathrm{~cm}^{3}\right)$ and acetic acid ( $60 \mathrm{~cm}^{3}$ ) at $0^{\circ} \mathrm{C}$. The mixture was stirred for 7 h , maintaining the temperature at $0-4{ }^{\circ} \mathrm{C}$, after which time the reaction mixture was poured into iced water. The porphyrin product was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, washed with water, and the organic layer evaporated to dryness to give crude $5,15-\mathrm{bis}\left(3^{\prime}, 5^{\prime}\right.$-di-tert-butylphenyl)-10-(nitro)porphyrin. $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 416$ ( $\log \varepsilon 5.56$ ), 514 (4.36), 552 (3.91), 585 (3.96), 642 (3.62); $v_{\text {max }}(\mathrm{KBr}) / \mathrm{cm}^{-1} 1525$ $\left(\mathrm{NO}_{2}\right), 1363\left(\mathrm{NO}_{2}\right) ; \delta_{\mathrm{H}}\left(250 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right) 10.37(1 \mathrm{H}, \mathrm{s}$, meso $H), 9.40(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H), 9.37(2 \mathrm{H}, \mathrm{d}, J 5.0, \beta H), 9.13(2 \mathrm{H}$, d, $J 5.0, \beta H), 9.08(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H), 8.12(2 \mathrm{H}, \mathrm{d}, J 1.8$, aryl $H), 7.90(2 \mathrm{H}, \mathrm{t}, J 1.8$, aryl $H), 1.60\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right),-2.84$ ( $2 \mathrm{H}, \mathrm{s}, \mathrm{NH}$ ); m/z (MALDI-TOF) $732.1\left(\mathrm{M}^{+}, \mathrm{C}_{48} \mathrm{H}_{53} \mathrm{~N}_{5} \mathrm{O}_{2}\right.$ requires 731.97).

All the product from the nitration was dissolved in $\mathrm{CHCl}_{3}$ $\left(100 \mathrm{~cm}^{3}\right)$ and $\mathrm{Zn}(\mathrm{OAc})_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}(0.970 \mathrm{~g}, 4.42 \mathrm{mmol})$ in methanol $\left(10 \mathrm{~cm}^{3}\right)$ was added. The solution was stirred at room temperature for 30 min . The reaction mixture was passed through a silica plug to remove excess zinc residues, then purified by column chromatography (silica, $12: 1: 0.560-80$ petroleum ether-EtOAc-pyridine). The product was eluted as a dark purple solution and recrystallised from $\mathrm{CHCl}_{3}$-methanol to yield [5,15-bis(3',5'-di-tert-butylphenyl)-10-(nitro)porphyrinato]zinc(II) $\left(0.551 \mathrm{~g}, 78 \%\right.$ over two steps). $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine)/nm 318 ( $\log \varepsilon 4.25$ ), 427 (5.21), 561 (4.06), 611 (3.80); $v_{\text {max }}(\mathrm{KBr}) / \mathrm{cm}^{-1} 1513\left(\mathrm{NO}_{2}\right), 1328\left(\mathrm{NO}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right.$, $\mathrm{d}_{5}$-pyridine) $10.19(1 \mathrm{H}$, s, meso $H), 9.33(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H)$, $9.28(2 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 9.04(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H), 8.98(2 \mathrm{H}, \mathrm{d}$, $J 4.4, \beta H), 8.00(4 \mathrm{H}, \mathrm{d}, J 1.8$, aryl $H), 7.80(2 \mathrm{H}, \mathrm{t}, J 1.8$, aryl $H), 1.51\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) 151.8, 150.7, 149.4, 148.7, 144.7, 141.5, 134.5, 132.8, 132.5, $129.9,129.2,128.2,124.2,121.1,109.8,35.1,31.8 ; m / z$ (FAB) $795\left(\mathrm{M}^{+}, \mathrm{C}_{48} \mathrm{H}_{51} \mathrm{~N}_{5} \mathrm{O}_{2} \mathrm{Zn}\right.$ requires 795.34).

## [5,15-Bis( $3^{\prime}, 5^{\prime}$-di-tert-butylphenyl)-10-(amino)porphyrinato]zinc(II) 13

Reduction of the nitro group to obtain the amine was performed using the successful procedure reported by both Baldwin and co-workers, ${ }^{42}$ and Arnold's group. ${ }^{43}$ [5,15$\operatorname{Bis}\left(3^{\prime}, 5^{\prime}\right.$-di-tert-butylphenyl)-10-(nitro)porphyrinato]zinc(II)
$(0.480 \mathrm{~g}, 0.604 \mathrm{mmol})$ was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(200 \mathrm{~cm}^{3}\right)$ and methanol ( $200 \mathrm{~cm}^{3}$ ) and $10 \% \mathrm{Pd}$ on carbon ( 320 mg ) was added. The mixture was degassed and $\mathrm{NaBH}_{4}(0.571 \mathrm{~g}, 15.5 \mathrm{mmol})$ added in portions over 20 min . Stirring was continued for 1.5 h at room temperature. The $\mathrm{Pd} /$ carbon was then filtered off, the filtrate washed with water and the organic phase evaporated to
dryness. Pure 13 was obtained by recrystallisation from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-methanol ( 0.385 g , $83 \%$ ). $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine)/ nm 306 ( $\log \varepsilon 4.17$ ), 353 (4.08), 432 (5.28), 542 (3.98), 646 (4.09); $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 3389\left(\mathrm{NH}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) $9.22(1 \mathrm{H}, \mathrm{s}$, meso $H), 9.05(2 \mathrm{H}, \mathrm{d}, J 4.2, \beta H), 8.81(2 \mathrm{H}, \mathrm{d}$, $J 4.2, \beta H), 8.68(2 \mathrm{H}, \mathrm{d}, J 4.2, \beta H), 8.55(2 \mathrm{H}, \mathrm{d}, J 4.2, \beta H), 7.91$ $(4 \mathrm{H}, \mathrm{d}, J 1.7$, aryl $H$ ), $7.71(2 \mathrm{H}, \mathrm{d}, J 1.7$, aryl $H), 3.91(2 \mathrm{H}, \mathrm{s}$, $\left.\mathrm{N}_{2}\right), 1.50\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) 153.0, 149.1, 148.5 (2C), 142.3, 139.6, 133.5, 133.4, 130.5, 129.6, 129.4, 122.6, 121.5, 120.5, 99.9, 35.1, 31.9; m/z (FAB) $765\left(\mathrm{M}^{+}\right.$, $\mathrm{C}_{48} \mathrm{H}_{53} \mathrm{~N}_{5} \mathrm{Zn}$ requires 765.36).

## [5,15-Bis( $3^{\prime}, 5^{\prime}$-di-tert-butylphenyl)-10-(phenylmethylidene amino)porphyrinatolzinc(II) 6a

Toluene ( $15 \mathrm{~cm}^{3}$ ) and benzaldehyde $\mathbf{1 5 a}\left(0.26 \mathrm{~cm}^{3}, 2.56 \mathrm{mmol}\right)$ were added to aminoporphyrin $13(0.073 \mathrm{~g}, 0.085 \mathrm{mmol})$ and Amberlyst $15(30 \mathrm{mg})$ under argon and the mixture heated to reflux for 3 h over a Soxhlet apparatus containing $4 \AA$ molecular sieves. The solids were filtered off and the product chromatographed in $10: 1: 0.160-80$ petroleum ether-EtOAcpyridine. ## Imine-linked porphyrin dimer 18

Aminoporphyrin 13 ( 18.1 mg , $23.6 \mu \mathrm{~mol}$ ), formylporphyrin 16 ( $20.2 \mathrm{mg}, 26.0 \mu \mathrm{~mol}$ ) and Amberlyst $15(20 \mathrm{mg}$ ) were mixed with toluene $\left(15 \mathrm{~cm}^{3}\right)$ and pyridine $\left(0.005 \mathrm{~cm}^{3}\right)$ then brought to reflux over a Soxhlet containing 3 A molecular sieves. TFA $\left(0.015 \mathrm{~cm}^{3}\right)$ was added and the mixture refluxed for $48 \mathrm{~h} . \mathrm{Et}_{3} \mathrm{~N}$ (approx. $1 \mathrm{~cm}^{3}$ ) was added, and the solids were filtered off and the filtrate evaporated to dryness. Column chromatography on silica in $10: 1: 0.160-80$ petroleum ether-EtOAc-pyridine separated unreacted 16, while changing to $1: 160-80$ petroleum ether- $\mathrm{CHCl}_{3}$ was required to elute the dimer. Pure $\mathbf{1 8}(11.4 \mathrm{mg}$, $32 \%$ ) was obtained by recrystallising from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ by the layered addition of methanol. $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine $) / \mathrm{nm}$ 427 ( $\log \varepsilon 5.32$ ), 443 (5.31), 565 (4.31), 622 (4.32), 663 (4.31); $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 1591(\mathrm{C}=\mathrm{N}) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) $11.68(1 \mathrm{H}, \mathrm{s}, \mathrm{N}=\mathrm{CH}), 10.55(2 \mathrm{H}, \mathrm{d}, J 4.7, \beta H), 10.21(1 \mathrm{H}, \mathrm{s}$, meso $H$ ), $9.96(1 \mathrm{H}$, s, meso $H), 9.89(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 9.35$ $(2 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 9.27(2 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 9.18$ ( $2 \mathrm{H}, \mathrm{d}, J 4.7$, $\beta H$ ), $9.06(2 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 9.05(2 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 9.04(2 \mathrm{H}$, d, $J 4.5, \beta H), 8.16\left(4 \mathrm{H}, \mathrm{d}, J 1.7, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 8.14(4 \mathrm{H}, \mathrm{d}, J 1.7$, $\mathrm{Bu}^{t}$ aryl $H$ ), $7.82\left(2 \mathrm{H}, \mathrm{t}, J 1.7, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 7.79(2 \mathrm{H}, \mathrm{t}, J 1.7$, $\left.\mathrm{Bu}^{t} \operatorname{aryl} H\right), 1.57\left(72 \mathrm{H}, \mathrm{m}, \mathrm{Bu}^{t} H\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{~d}_{5}-\right.$ pyridine) 151.6, 151.2, 150.5, 150.0, 149.8, 149.7, 149.0, 148.3, 148.2, 147.6, 144.0, 142.4, 142.0, 135.8, 134.0, 132.7, 132.2, 131.7, 131.4, 130.8, 129.9, 129.8, 128.7, 123.2, 123.1, 121.7, 120.6, 120.3, 110.8, 108.6, 103.4, 35.0, 34.9, 31.7 (2 C); m/z (MALDI-TOF) $1525.8\left(\mathrm{M}^{+}, \mathrm{C}_{97} \mathrm{H}_{103} \mathrm{~N}_{9} \mathrm{Zn}_{2}\right.$ requires 1525.7).

## [5,15-Bis( $3^{\prime}, 5^{\prime}$ 'di-tert-butylphenyl)-10-bromoporphyrinato]zinc(II) 20

Zinc porphyrin $10(400 \mathrm{mg}, 0.533 \mathrm{mmol})$ was dissolved in $\mathrm{CHCl}_{3}\left(120 \mathrm{~cm}^{3}\right)$ and pyridine $\left(0.5 \mathrm{~cm}^{3}\right)$. The solution was cooled to $0^{\circ} \mathrm{C}$ and $N$-bromosuccinimide ( $123 \mathrm{mg}, 0.693 \mathrm{mmol}$ ) added. The reaction was stirred for 15 min , quenched with acetone and then the solvents were removed under reduced pressure. The residue was washed with copious methanol to give a mixture of mono- and di-brominated products. This mixture was washed with $\mathrm{CHCl}_{3}$ and both the filtrate and the remaining residue were then separately chromatographed on silica eluting with $10: 1: 0.160-80$ petroleum ether-EtOAcpyridine. The fractions containing the mono-brominated product 20 were evaporated to dryness and crystallised from $\mathrm{CHCl}_{3}$ by layered addition of $30-40$ petroleum ether to yield the pure product as a pink solid ( $263 \mathrm{mg}, 59 \%$ ): : $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-\right.$ $1 \%$ pyridine)/nm 319 ( $\log \varepsilon 4.29$ ), 429 (5.68), 563 (4.24), 603 (3.87); $\delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) $10.05(1 \mathrm{H}$, s, meso $H$ ), $9.71(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 9.24(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 8.98(4 \mathrm{H}$, app. t, $J 5.5, \beta H), 8.01(4 \mathrm{H}, \mathrm{d}, J 1.8$, aryl $H), 7.77(2 \mathrm{H}, \mathrm{t}$, $J$ 1.8, aryl $H), 1.50\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right.$, $\mathrm{d}_{5}$-pyridine) 150.7, 150.6, 150.1, 149.1, 148.4, 142.0, 133.1, $132.9,132.3,131.7,130.1,123.7,120.7,106.0,104.1,35.0,31.8 ;$ $m / z(\mathrm{FAB}) 829\left(\mathrm{M}^{+}, \mathrm{C}_{48} \mathrm{H}_{51} \mathrm{~N}_{4} \mathrm{BrZn}\right.$ requires 829.23).

## [5,15-Bis( $3^{\prime}, \mathbf{5}^{\prime}$ 'di-tert-butylphenyl)-10-phenylethynylporphyrinatolzinc(II) 9a

$\mathrm{Pd}_{2}(\mathrm{dba})_{3}(1.5 \mathrm{mg}, 0.0014 \mathrm{mmol}), \mathrm{PPh}_{3}(3.0 \mathrm{mg}, 0.0116 \mathrm{mmol})$ and CuI ( $1.0 \mathrm{mg}, 0.0058 \mathrm{mmol}$ ) were dried under vacuum and $\mathrm{Et}_{3} \mathrm{~N}\left(5 \mathrm{~cm}^{3}\right)$ added. The solution was degassed and then heated at $70{ }^{\circ} \mathrm{C}$ for 1.5 h . Simultaneously, bromoporphyrin $20(40 \mathrm{mg}$,
0.0482 mmol ) was dissolved in dry toluene ( $10 \mathrm{~cm}^{3}$ ) and pyridine ( $0.3 \mathrm{~cm}^{3}$ ) and the solution also degassed. Phenylacetylene $21 \mathbf{a}\left(0.011 \mathrm{~cm}^{3}, 0.0964 \mathrm{mmol}\right)$ was added to the porphyrin solution and the active catalyst solution transferred via cannula to this mixture. The reaction was heated to $80^{\circ} \mathrm{C}$ and stirred under inert atmosphere for 2 h . On completion, the mixture was washed with water $\left(2 \times 20 \mathrm{~cm}^{3}\right)$ and the organic phase evaporated to dryness. The residue was chromatographed on silica eluting with 2:160-80 petroleum ether- $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and 9 a was then obtained as a green solid by crystallisation from $\mathrm{CHCl}_{3}$ by layered addition of $30-40$ petroleum ether ( $29 \mathrm{mg}, 71 \%$ ). $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine)/nm 439 ( $\log \varepsilon 5.61$ ), 574 (4.20), 623 (4.43); $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 2194(\mathrm{C} \equiv \mathrm{C}) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5^{-}}\right.$ pyridine) $10.10(1 \mathrm{H}$, s, meso $H$ ), $9.85(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 9.28$ (2 H, d, $J 4.5, \beta H$ ), $9.05(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 9.02(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H)$, $8.09\left(4 \mathrm{H}, \mathrm{d}, J 1.6, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 8.05(2 \mathrm{H}, \mathrm{d}, J 7.4$, phenyl $H$ ), $7.83\left(2 \mathrm{H}, \mathrm{t}, J 1.6, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 7.56(2 \mathrm{H}, \mathrm{t}, J 7.4$, phenyl $H)$, $7.47\left(1 \mathrm{H}, \mathrm{t}, J 7.4\right.$, phenyl $H$ ), $1.58\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right)$ ); $\delta_{\mathrm{C}}(125$ $\mathrm{MHz}, \mathrm{CDCl}_{3}, \mathrm{~d}_{5}$-pyridine) 152.0, $150.9,150.1,149.6,148.6$, $142.2,133.0,132.6,131.7,131.6,130.5,130.3,128.8,128.2$, 124.9, 122.7, 120.8, 107.4, 99.1, 95.6, 94.1, 35.2, 32.0; m/z (FAB) $850\left(\mathrm{M}^{+}, \mathrm{C}_{56} \mathrm{H}_{56} \mathrm{~N}_{4} \mathrm{Zn}\right.$ requires 850.47).

## [5,15-Bis( $\mathbf{3}^{\prime}, \mathbf{5}^{\prime}$-di-tert-butylphenyl)-10-(4-nitrophenylethynyl)porphyrinatolzinc(II) 9b

$\mathrm{Pd}_{2}(\mathrm{dba})_{3}(4.0 \mathrm{mg}, 4.3 \mu \mathrm{~mol}), \mathrm{PPh}_{3}(9.5 \mathrm{mg}, 36 \mu \mathrm{~mol})$ and CuI $(3.4 \mathrm{mg}, 18 \mu \mathrm{~mol})$ were dissolved in $\mathrm{Et}_{3} \mathrm{~N}\left(11 \mathrm{~cm}^{3}\right)$ and the solution warmed at $70^{\circ} \mathrm{C}$ for $30 \mathrm{~min} .20(60.0 \mathrm{mg}, 72 \mu \mathrm{~mol})$ and 4-nitrophenylacetylene 21b ( $32.0 \mathrm{mg}, 217 \mu \mathrm{~mol}$ ) were dissolved in dry toluene $\left(11 \mathrm{~cm}^{3}\right)$ and pyridine $\left(0.25 \mathrm{~cm}^{3}\right)$ in a separate flask. The active catalyst solution was transferred to the reaction flask via cannula and the mixture heated at $80^{\circ} \mathrm{C}$. The solution was cooled after 1 h , filtered through a silica plug and then chromatographed in $10: 1: 0.160-80$ petroleum ether-EtOAc-pyridine. Recrystallisation from $\mathrm{CHCl}_{3}$ by layered addition of methanol yielded $9 b(59.7 \mathrm{mg}, 92 \%) . \lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-\right.$ $1 \%$ pyridine) $/ \mathrm{nm} 452(\log \varepsilon 5.48), 579$ (4.30), 637 (4.81); $\lambda_{\text {em }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine $) / \mathrm{nm} 649\left(\lambda_{\mathrm{ex}} 450 \mathrm{~nm}\right) ; v_{\text {max }}(\mathrm{KBr}) / \mathrm{cm}^{-1}$ $2185(\mathrm{C} \equiv \mathrm{C}), 1517\left(\mathrm{NO}_{2}\right), 1338\left(\mathrm{NO}_{2}\right) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}\right.$, $\mathrm{d}_{5}$-pyridine) $10.04(1 \mathrm{H}$, s, meso $H), 9.36(2 \mathrm{H}, \mathrm{d}, J 4.3, \beta H)$, $9.29(2 \mathrm{H}, \mathrm{d}, J 4.2, \beta H), 9.09(2 \mathrm{H}, \mathrm{d}, J 4.2, \beta H), 9.06(2 \mathrm{H}, \mathrm{d}$, $J 4.3, \beta H), 8.90(1 \mathrm{H}, \mathrm{s}, \mathrm{N}=\mathrm{C} H), 8.40(4 \mathrm{H}$, two s, phenyl $H$ ), $8.15\left(4 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 7.87\left(2 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 1.75-1.50$ $\left(36 \mathrm{H}, \mathrm{m}, \mathrm{Bu}^{t} H\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) 165.7 , $150.3,150.1,149.2,148.4,145.1,143.1,142.1,141.7,132.9$, $131.8,131.3,130.0,129.5,127.7,124.2,122.5,122.1,120.6$, 104.8, 35.0, 31.8; m/z (MALDI-TOF) $895.6\left(\mathrm{M}^{+}, \mathrm{C}_{56} \mathrm{H}_{55^{-}}\right.$ $\mathrm{N}_{5} \mathrm{O}_{2} \mathrm{Zn}$ requires 895.46).

## [5,15-Bis(3,5-di-tert-butylphenyl)-10-trimethylsilylethynylporphyrinatolzinc(II)

Bromoporphyrin 20 ( $300 \mathrm{mg}, 0.362 \mathrm{mmol}$ ), $\mathrm{Pd}_{2}(\mathrm{dba})_{3}(10 \mathrm{mg}$, $0.012 \mathrm{mmol}), \mathrm{PPh}_{3}(23 \mathrm{mg}, 0.087 \mathrm{mmol})$ and $\mathrm{CuI}(8 \mathrm{mg}, 0.044$ mmol ) were dried under vacuum and then dissolved in dry toluene ( $75 \mathrm{~cm}^{3}$ ), pyridine $\left(2.25 \mathrm{~cm}^{3}\right)$ and $\mathrm{Et}_{3} \mathrm{~N}\left(35 \mathrm{~cm}^{3}\right)$. The solution was degassed and trimethylsilylacetylene $\left(0.112 \mathrm{~cm}^{3}\right.$, 0.796 mmol ) added and the reaction stirred under inert atmosphere at $45^{\circ} \mathrm{C}$ for 15 h . On completion, the reaction mixture was washed with water $\left(2 \times 100 \mathrm{~cm}^{3}\right)$, the organic phase evaporated to dryness and the residue chromatographed on silica eluting with $60-80$ petroleum ether-EtOAc-pyridine ( $10: 1: 0.1$ ). Crystallisation from chloroform by layered addition of $1 \%$ water-methanol yielded pure $[5,15$-bis( 3,5 -di-tert-butylphenyl)-10-trimethylsilylethynylporphyrinato]zinc(II) as a green solid ( $254 \mathrm{mg}, 83 \%$ ). $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine) $/ \mathrm{nm} 319$ ( $\log \varepsilon 4.24), 434$ (5.50), 440 (5.47), 571 (4.13), 617 (4.12); $v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 2138(\mathrm{C} \equiv \mathrm{C}) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine $)$ 10.19 ( 1 H , s, meso $H$ ), 9.81 ( $2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H$ ), $9.34(2 \mathrm{H}$, d, $J 4.5, \beta H), 9.08(4 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 8.11\left(4 \mathrm{H}, \mathrm{d}, J 1.8, \mathrm{Bu}^{t}\right.$ aryl
H), $7.85\left(2 \mathrm{H}, \mathrm{t}, J 1.8, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 1.59\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right), 0.64$ ( $9 \mathrm{H}, \mathrm{TMS}$ ); $\delta_{\mathrm{c}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) $152.4,151.0$, $150.4,149.6,148.9,141.8,133.3,132.8,131.9,131.0,130.1$, $122.9,121.1,108.6,107.7,100.8,99.6,35.3,32.0,0.7 ; \mathrm{m} / \mathrm{z}$ (FAB) $847\left(\mathrm{M}^{+}, \mathrm{C}_{53} \mathrm{H}_{60} \mathrm{~N}_{4} \mathrm{SiZn}\right.$ requires 846.6).

## [5,15-Bis(3,5-di-tert-butylphenyl)-10-ethynylporphyrinato]zinc(II) 22

[5,15-Bis(3,5-di-tert-butylphenyl)-10-trimethylsilylethynylporphyrinato]zinc(II) ( $200 \mathrm{mg}, 0.236 \mathrm{mmol}$ ) was dissolved in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(80 \mathrm{~cm}^{3}\right)$ and TBAF $\left(0.354 \mathrm{~cm}^{3}\right.$ of a 1 M solution in THF, 0.354 mmol ) added. The reaction was stirred at room temperature for 15 min and then quenched by adding acetic acid $\left(0.020 \mathrm{~cm}^{3}, 0.354 \mathrm{mmol}\right)$. The pure product 22 was precipitated from the reaction mixture with $1 \%$ water in methanol as purple crystals ( $166 \mathrm{mg}, 91 \%$ ). $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine) $/ \mathrm{nm}$ $426(\log \varepsilon 5.60), 560(4.24) ; v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1} 2089(\mathrm{C} \equiv \mathrm{C}) ; \delta_{\mathrm{H}}(500$ $\mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}$-pyridine) $10.15(1 \mathrm{H}, \mathrm{s}$, meso $H), 9.78(2 \mathrm{H}, \mathrm{d}$, $J 4.5, \beta H), 9.31(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 9.06(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 9.03$ $(2 \mathrm{H}, \mathrm{d}, J 4.5, \beta H), 8.08\left(4 \mathrm{H}, \mathrm{d}, J 1.8, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 7.82(2 \mathrm{H}, \mathrm{t}$, $\left.J 1.8, \mathrm{Bu}^{t} \operatorname{aryl} H\right), 4.15(1 \mathrm{H}, \mathrm{s}, \mathrm{C} \equiv \mathrm{C}-H), 1.59\left(36 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t} H\right)$; $\delta_{\mathrm{C}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) $152.6,151.2,150.5,149.7$, $148.8,142.4,133.4,132.7,131.9,130.8,130.4,122.8,121.0$ 107.8, 97.5, 87.8, 82.8, 35.4, 32.2; $m / z$ (FAB) $774\left(\mathrm{M}^{+}\right.$, $\mathrm{C}_{50} \mathrm{H}_{52} \mathrm{~N}_{4} \mathrm{Zn}$ requires 774.4).

## Acetylene-linked porphyrin dimer 23

Ethynylporphyrin 22 ( $100 \mathrm{mg}, 0.129 \mathrm{mmol}$ ), bromoporphyrin $20(210 \mathrm{mg}, 0.258 \mathrm{mmol}), \mathrm{Pd}_{2}(\mathrm{dba})_{3}(3.4 \mathrm{mg}, 0.004 \mathrm{mmol}), \mathrm{PPh}_{3}$ $(7.9 \mathrm{mg}, 0.030 \mathrm{mmol})$ and $\mathrm{CuI}(2.9 \mathrm{mg}, 0.015 \mathrm{mmol})$ were dried under vacuum and dissolved in dry toluene ( $25 \mathrm{~cm}^{3}$ ), pyridine $\left(0.5 \mathrm{~cm}^{3}\right)$ and $\mathrm{Et}_{3} \mathrm{~N}\left(25 \mathrm{~cm}^{3}\right)$. The solution was degassed and the reaction stirred under inert atmosphere for 1.5 h at $80^{\circ} \mathrm{C}$. On completion, the mixture was passed through a short silica plug and the product then separated from excess bromoporphyrin 20 on a silica column eluting with $60-80$ petroleum ether$\mathrm{CH}_{2} \mathrm{Cl}_{2}$-pyridine ( $10: 1: 0.1$ and then increasing the polarity to $2: 1: 0.1) .1 \%$ Pyridine in chloroform was required to remove all the product from the column. Crystallisation from chloroform by layered addition of methanol yielded the pure dimer as a black solid ( $138 \mathrm{mg}, 70 \%$ ). $\lambda_{\max }\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-1 \%\right.$ pyridine) $/ \mathrm{nm} 415$ ( $\log \varepsilon 5.21$ ), 434 (5.17), 481 (5.59), $710(4.84) ; v_{\max }(\mathrm{KBr}) / \mathrm{cm}^{-1}$ $2155(\mathrm{C} \equiv \mathrm{C}) ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) $10.48(4 \mathrm{H}, \mathrm{d}$, $J 4.4, \beta H), 10.03(2 \mathrm{H}, \mathrm{s}$, meso $H$ ), $9.22(4 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 9.14$ $(4 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 8.97(4 \mathrm{H}, \mathrm{d}, J 4.4, \beta H), 8.09(8 \mathrm{H}, \mathrm{d}, J 1.5$, $\mathrm{Bu}^{t}$ aryl $\left.H\right), 7.79\left(4 \mathrm{H}, \mathrm{t}, J 1.5, \mathrm{Bu}^{t}\right.$ aryl $\left.H\right), 1.52\left(72 \mathrm{H}, \mathrm{s}, \mathrm{Bu}^{t}\right.$ $H) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz} ; \mathrm{CDCl}_{3}, \mathrm{~d}_{5}\right.$-pyridine) 152.6, 150.8, 150.1 , 149.7, 148.6, 142.2, 133.0, 132.5, 131.4, 130.5, 129.9, 122.8, 120.7, 107.0, 101.3, 100.9, 35.1, 31.8; m/z (FAB) $1523\left(\mathrm{M}^{+}\right.$, $\mathrm{C}_{98} \mathrm{H}_{102} \mathrm{~N}_{8} \mathrm{Zn}_{2}$ requires 1522.7).

## Acknowledgements

This work was supported by the Engineering and Physical Sciences Research Council (EPSRC) and the Defence Science and Technology Laboratory (DSTL, Malvern). Dr David J. Watkin provided valuable advice on crystallography. We are also grateful to the EPSRC Mass Spectrometry Service in Swansea for FAB mass spectra.
