Appropriate aryl-substituted unsymmetrical azodicarbonyl compounds, generated from bishydrazides by oxidation, undergo intramolecular cyclisations to furnish a variety of useful heterocycles such as $N$-substituted oxindoles, carbostyrils, benzazepinones, benzazocinones, benzimidazolones, benzoxazinones and pyrazolones in varying degrees of efficiency. Methods are described to remove the $N$-acyl groups from the heteroaromatic compounds. Under mildly acidic conditions where equal opportunities are available for an ipso or a normal cyclisation it is the former process that occurs preferentially. Evidence is presented in favour of a C-to-C migration in the ipso product for the formation of a methoxy-substituted carbostyril derivative. One of the spiro substances is shown to participate in dienone-phenol rearrangement to provide the corresponding quinolone-phenol in high yield.

## Introduction

Intermolecular electrophilic amination of activated aromatics and other electron-rich olefins with diethyl azodicarboxylate either acid-catalysed or otherwise has been known for well over fifty years. ${ }^{1}$ Recently variants of this basic reaction have been developed to achieve high yields of the aryl amino compounds with the use of more electrophilic azodicarboxylates in conjunction with $\mathrm{LiClO}_{4}{ }^{2}$ or $\mathrm{ZrCl}_{4}{ }^{3}$ as the Lewis acid catalyst. However, the intramolecular version of such a reaction was not reported until 1994, when it was shown that a variety of appropriately substituted 2-(3-arylpropanoyl)diazenecarboxylates [ $N^{1}-\beta$-arylpropionyl- $N^{2}$-(methoxycarbonyl)azines] $\mathbf{1}$ led to $N$-substituted amino dihydrocarbostyrils 2 and spiro- $\gamma$-lactams 3 in synthetically useful yields. ${ }^{4}$

We describe herein details pertaining to the above work and also report results of our study on structurally related substances that show that the reaction is of general applicability. Thus other important heterocyclic systems such as oxindoles, benzazepinones, benzazocinones, benzimidazolones, benzoxazinones and pyrazolones can all be successfully prepared by this method with varying degrees of efficiency. ${ }^{5}$

## Preparation of starting materials

The bishydrazides of general structure $\mathbf{4 A}-\mathbf{E}$, required as starting materials, are readily obtained in excellent yields by hydrazinolysis of methyl esters 5 a of arylalkanoic acids or those ( $\mathbf{5 b}$ ) of aryloxyalkanoic acids to the hydrazides $\mathbf{5 A}-\mathbf{C}$ and 5e followed by acylation of the latter with appropriate acid chlorides. The utilisation of readily available monohydrazides $\mathbf{6 a}$ and $\mathbf{6 b}$ in conjunction with acid chlorides $5 \mathbf{c}$ provided an alternative route to some of these substances 4.

## Cyclisations

Oxidation of diacylhydrazines 4 to the reactive azodicarbonyl compounds of type 1 was achieved with several reagents.

${ }^{a}$ All the compounds were obtained through method 3b (see text).

Depending on the electronic nature of the substituent(s) present on the aromatic ring, very little, partial or complete cyclisation to heterocycles was observed during oxidation; in the former two instances a protic or Lewis acid, in necessary quantities, was added to the mixture to bring the reactions to rapid conclusion. The following reagents/methods were used in the oxidative cyclisation step:

1) Method 1: NBS-pyridine ${ }^{6}$ followed by acid $\left(\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}\right)$
2) Method 2a: Iodobenzene diacetate $(\text { IBDA })^{7}$

Method 2 b : IBDA followed by acid $\left(\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}\right)$
3) Method 3a: Iodobenzene bistrifluoroacetate (IBBTA) ${ }^{7}$

Method 3b: IBBTA followed by acid $\left(\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}\right)$
4) Method 4: Silver oxide on Celite support ${ }^{8}$ followed by acid $\left(\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}\right.$ or TFA).

Oxindoles. The first member of the series to be examined, the unsubstituted methyl $N^{2}$-(phenylacetyl)carbazate 4Aa (Table 1) on oxidation (IBBTA) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ developed an orange colour presumably due to the formation of the corresponding azodicarbonyl compound, which on treatment with $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ resulted in evolution of gas. The ${ }^{1} \mathrm{H}$ NMR spectrum and GCMS of the crude product showed it to be a mixture of methyl phenylacetate and iodobenzene. On the other hand, compound 7, derived from triphenylacetic acid, underwent oxidative cyclisation in excellent yield to furnish the known oxindole derivative $8 .{ }^{9}$ Siting a methoxy group meta to the side chain as in $\mathbf{4 A b}$ also largely suppressed the fragmentation process and a $51 \%$ yield of the product $9 \mathbf{b}$ was obtained. Similarly the phenyl urethane $\mathbf{4 A c}$ furnished the corresponding oxindole 9 c in $60 \%$ yield. Whilst the dimethoxy compound 4Ae underwent ring closure to 9 e without incident, the regioisomeric carbamate 4Af containing $p$-methoxys groups behaved anomalously. The two minor products of the reaction, each isolated in $5 \%$ yield, were $\mathbf{9 e}$ and a phenol, presumably 9 . The spectral data of the former ( ${ }^{1} \mathrm{H}$ NMR, IR) as well as its mobility in the TLC plates were identical with those of the oxindole $9 \mathbf{e}$ obtained directly from the bishydrazide 4Ae (vide infra Discussion). Compound 9 f was characterised as the $O, N$-dimethyl derivative $\mathbf{1 0}$ by alkylation (MeI- $\mathrm{K}_{2} \mathrm{CO}_{3}-\mathrm{Me}_{2} \mathrm{CO}$ ). The activation provided by a methyl group ( $\mathbf{4} \mathbf{A g}$ ) was also found to be sufficient for cyclisation to occur (to afford 9 g ).

Carbostyril derivatives. The reactivity and chemistry of azodicarbonyl compounds derived from $N^{2}$-(3-arylpropionyl)carbazates ( $\mathbf{4 B}$ series) were largely similar to those described above. However, a few important differences were noticed. Thus unlike 4Aa the first member of this series, 4Ba, underwent ring closure to the carbostyril 12a (Table 2) in modest yield (44\%). Another notable difference observed in this series was that, in appropriate cases, spiro- $\gamma$-lactams could be isolated and characterised.

Thus, whilst 4Bb, on oxidation with IBBTA furnished the quinolone 12b ( $71 \%$ ) its regioisomer 4Bc afforded with the same oxidant only the $\gamma$-lactam 11 c in modest yield $(25 \%)$. $\mathrm{Ag}_{2} \mathrm{CO}_{3}$,

however, gave a mixture of 11c ( $17 \%$ ) and, of mechanistic relevance, the quinolone 12b (50\%) (vide infra Discussion).

The trimethoxy 4Bf and bromotrimethoxy 4Bg compounds furnished principally the corresponding $\gamma$-lactams (11f and $\mathbf{1 1 g}$ ), the respective quinolones ( $\mathbf{1 2 f}, \mathbf{1 2 g}$ ) constituting the minor products of the reactions. On the other hand, the $m$-dimethoxy isomer 4Bh yielded solely the quinoline $\mathbf{1 2 h}(64 \%)$. The veratrole derivative 4Be provided an opportunity to test the existence, if any, of preference for 1,5 -addition ( $\gamma$-lactam) over the 1,6 process ( $\delta$-lactam). Accordingly, reaction of 4Be with IBDA (1 equiv.), which only liberates a weak acid, i.e., HOAc, during the oxidation, was carried out in the absence of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$. No trace of the quinolone 12e could be detected in the reaction mixture. Only 11e, presumably the kinetically controlled product, was isolated, albeit in poor yield ( $4 \%$ ). The same compound could, however, be obtained in $50 \%$ yield when IBBTA was employed. An acid-catalysed rearrangement $\left(\mathrm{H}_{2} \mathrm{SO}_{4}-\mathrm{HOAc}\right)$ of the latter provided a phenol, presumably 12k $(91 \%)$, that was methylated $\left(\mathrm{CH}_{2} \mathrm{~N}_{2}\right)$ to 12e ( $87 \%$ ). The phenyl carbamate 12h derived from 4Bh on mild alkaline hydrolysis liberated the synthetically useful amino compound 13b, which could be reacylated with PhOCOCl to the starting material, showing that no structural alteration of 12h had occurred during its hydrolysis. Deamination of 13b to the known 6,8-dimethoxy-3,4-dihydrocarbostyril ${ }^{10}$ 13c could be accomplished in good yield either with $\mathrm{NaNO}_{2}-\mathrm{HOAc}$ at room temperature or under neutral conditions with $N$-nitrosodiphenylamine in benzene under reflux. ${ }^{11}$ The known $N$-amino compound 13a ${ }^{12}$ could also be obtained from the methyl carbamate 12a by heating it with conc. HCl .

${ }^{a}$ All the compounds were obtained through method 3b; 14e was also obtained from method 3a in $45 \%$ (see text).

The p-dimethoxy compound $4 \mathbf{B i}$ on oxidation gave a complex mixture of products from which a phenol was isolated in $33 \%$ yield. The formation of a phenol is very reminiscent of the chemical behaviour of $\mathbf{4 A f}$, which also bears such para-substituents. On the basis of its spectral characteristics and elemental composition, $\mathrm{C}_{17} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{5}$, the structure $\mathbf{1 2 i}$ is proposed for the product. It was characterised as the $O, N$-dimethyl compound $\mathbf{1 3 d}$.

Benzazepinones. Methyl $N^{2}$-(4-phenylbutanoyl)carbazate 4Ca, on oxidation with IBBTA followed by treatment with $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$, furnished the first member of the benzazepinone series $\mathbf{1 5}$ a in poor $4 \%$ yield (Table 3 ). The major product was identified as 1-tetralone 16a by comparison with an authentic sample (IR and its 2,4-dinitrophenylhydrazone derivative). The presence of a MeO group meta to the alkyl side chain as in $\mathbf{4 C b}$ strongly favoured the formation of 7-membered lactam 15b ( $82 \%$ ). 6-Methoxytetralone $\mathbf{1 6} \mathbf{b}$ was isolated as a minor product
(6\%). Similarly the phenyl carbazate 4Cc furnished $\mathbf{1 5 c}$ from which the known $\varepsilon$-lactam $\mathbf{1 7 b}{ }^{13}$ could be derived by hydrolysis and subsequent deamination of $\mathbf{1 7 a}$.

Whilst the veratrole derivative 4Cd furnished $\mathbf{1 5 d}$ ( $60 \%$ ), the trimethoxy compound 4Ce afforded exclusively the spirolactam $\mathbf{1 4 e}(45 \%)$ with IBBTA. Even in the presence of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ the above reaction still afforded $\mathbf{1 4 e}$ as the predominant product ( $45 \%$ ) along with only a $5 \%$ yield of 15 e . This probably indicates that the cyclohexadienone structure $\mathbf{1 4 e}$ is preferred

when the carbonyl group is flanked on either side by substituents ( OMe ) compared with the corresponding sterically crowded trimethoxybenzazepinone $\mathbf{1 5}$.

Benzazocinones. The formation of an 8-membered ring also occurred with three (4Db, 4Dc and 4Dd) of the four substances examined, to give 18b, 18c and 18d in 24,44 and $61 \%$ yield, respectively (Table 4). The bishydrazide 4Da failed to cyclise to the corresponding heteroaromatic compound (18).

18

As with $\mathbf{1 5 c}$ c, the hydrolysis of $\mathbf{1 8 b}$ and deamination of the resulting product 19a provided the known 8 -methoxy-3,4,5,6tetrahydrobenzo $[b]$ azocin-2( $1 H$ )-one ${ }^{14} \mathbf{1 9 b}$.

Benzimidazolones and benzoxazinones. Having thus developed a new method for the synthesis of oxindoles and their homologues, it was considered worthwhile to examine the viability of the process to form systems incorporating two heteroatoms in a ring. With this end in view the semicarbazide 20 and the phenoxy compounds $\mathbf{4 E}$, prepared in the usual manner, were subjected to oxidation. Compound 20 afforded on reaction with NBS-pyridine the corresponding azodicarbonyl compound 21 as a red oil $(92 \%)$ possessing a strong infrared absorption, inter alia at $1780 \mathrm{~cm}^{-1}$ indicative of the presence of the azodicarbonyl system..$^{15}$ The latter compound in $\mathrm{CHCl}_{3}$ on exposure to $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ furnished the N -aminobenzimidazolone 22 in $57 \%$ yield. Although its role is not clearly understood the use of $\mathrm{KHF}_{2}$ in conjunction with $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ improved the yield to $76 \%$.

Whereas the phenoxyacetic acid derivative 4Ea on oxidation (IBBTA) followed by addition of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ led to a complex mixture from which no useful compound could be isolated, the ether 4Eb yielded the benzoxazine derivative 23b in $39 \%$ yield (Table 5). On the other hand 4Ec, wherein the aromatic ring is doubly activated by OMe groups, on exposure to IBBTA at $-15^{\circ} \mathrm{C}$ to rt directly furnished $\mathbf{2 3 c}$, without requiring $\mathrm{BF}_{3}$. $\mathrm{Et}_{2} \mathrm{O}$, in $40 \%$ yield. The veratrole derivative 4Ed, despite the presence of an activating methoxy group at an appropriate
position to favour cyclisation, underwent, on oxidation, a reaction which generated a wealth of products from which only the known $o$-methoxy- $p$-benzoquinone 24 could be isolated albeit in poor yield.

Pyrazolones. Finally it was thought worthwhile to examine the chemistry of azodicarbonyl compounds incorporating an $E$ double bond. With this end in view cinnamic acid was converted into the corresponding diacylhydrazine derivative $\mathbf{2 5 a}$. On oxidation followed by work up in the usual manner (method 3b) it yielded a mixture from which two isomeric compounds were obtained. The major product $(45 \%)$ analysed for $\mathrm{C}_{11} \mathrm{H}_{10} \mathrm{~N}_{2} \mathrm{O}_{3}$. It possessed IR absorptions at 3300-2200, 1748, 1616 and $1595 \mathrm{~cm}^{-1}$. This information coupled with its ${ }^{1} \mathrm{H}$ NMR signals: $\delta 3.75(3 \mathrm{H}, \mathrm{s}), 6.00(1 \mathrm{H}, \mathrm{s}), 7.40(5 \mathrm{H}, \mathrm{m}), 11.03$ ( 1 H s , exchangeable with $\mathrm{D}_{2} \mathrm{O}$ ) uniquely defined its structure to be 1-methoxycarbonyl-5-phenyl-1,2-dihydropyrazol-3-one 26a. The minor compound $(9 \%)$ exhibited very similar spectroscopic features except that the 1 H singlet now appeared at considerably lower field, $\delta 8.54$. Therefore this product is assigned the structure 1-methoxycarbonyl-4-phenyl-1,2-dihydropyrazol-3one 27. The $p$-fluoro compound $\mathbf{2 5 b}$ also underwent cyclisation to 26b in rather poor yield ( $23 \%$ ). Its 4 -aryl isomer was not formed in the reaction (vide infra Discussion).

## Discussion

The intramolecular electrophilic amination that leads to the heterocyclic compounds described above can, in principle, occur via two distinct mechanisms as shown for the 4B series (Scheme 1): a, which involves the direct formation of the heterocycle or $\mathbf{b}$, an ipso substitution and subsequent rearrangement of the cationic spirodienone formed as an intermediate.

a $R=H$

27

Scheme 1

Although it is reasonable to assume that process a is the one that is involved in the formation of 12d it becomes difficult to choose a priori between the two alternatives for the formation of 12e from the dimethoxy compound 4Be since both C-to-C and N -to-C migration would give one and the same compound (12e).

However, evidence in favour of a C-to-C migration in the cationic intermediate 28a was forthcoming from the results of the oxidation of 4 Bc . The carbostyril obtained (12b) was indistinguishable from that generated from its regioisomer $\mathbf{4 B b}$ (Scheme 2).

Worthy of mention is the intriguing fact that all cyclisations involving azadicarbonyl compounds take place in such a manner as to place one of the nitrogen atoms always exo to the newly formed ring even for cases where both processes i.e., exo and endo, are equally possible. The reaction of 4 Bc with IBDA at room temperature is illustrative. Spiro-lactam 11c was the only isolable compound obtained from the reaction mixture, in $4 \%$ yield. Its IR spectrum in $\mathrm{CHCl}_{3}$ contained absorptions at $1756\left(\mathrm{NCO}_{2} \mathrm{Me}\right), 1720$ ( $\gamma$-lactam) and 1668 (dienone) $\mathrm{cm}^{-1}$ and is consistent with the pyrrolidone structure. ${ }^{4 b} \mathrm{~A}$ probable reason would be that structures of the type 29 are intrinsically less stable than the corresponding exo products. This could be due to greater destabilisation engendered by nitrogen lone pair-lone pair interactions in the geometrically constrained 6 -memberedring system.

Of relevance in this context is the easy conversion of 1,4-dihydro-cinnolin-3(2H)-one to the isomeric $N$-aminooxindole under strongly acidic conditions. ${ }^{16}$

The formation of pyrazolones from the cinnamic acid derivatives probably involves a Nazarov reaction ${ }^{17}$ (a diaza analogue) leading to the cyclic cation 30 ( $\mathbf{a}$ and $\mathbf{b}$ ), generated via 31 (Scheme 3). Proton loss from the former accounts for 26a A similar $\mathrm{H}^{+}$loss subsequent to the phenyl migration in 30a

Scheme 3
produces 27 . This is consistent with the results obtained for the fluoro compound $\mathbf{2 5 b}$. Both the formation of $\mathbf{3 0 b}$ and an aryl migration therein would be expected to be disfavoured vis-à-vis $\mathbf{2 5 a}$ due to the electronegativity of the fluorine atom in the aromatic ring.

## Limitations and side reactions

Although, in general, aromatic rings substituted with activating electron-donating methoxy groups furnish useful products, i.e. heterocycles and/or enone-lactams in reasonable yields, there are, not surprisingly, instances where other competing processes occur either partially or exclusively from an intermediate containing a multiplicity of functional groups.

Thus the formation of methyl phenylacetate from 4Aa with the oxidant and $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ is an example (Scheme 4). It could be

Scheme 4
rationalised by postulating involvement of the enol 32, easily formed under the action of a Lewis acid, suffering a fragmentation to $\mathrm{N}_{2}, \mathrm{CO}$, phenylketene and $\mathrm{MeO}^{-}$. Recombination of the latter two species would give rise to the observed product. Consistent with the mechanism is that the triphenyl analogue 7, lacking the requisite acidic hydrogens, undergoes cyclisation to oxindole derivative $\mathbf{8}$ in high yield ( $85 \%$ ).

A similar mechanism may well operate in the formation of 24 from 4Ed, although the involvement of the spiro compound $\mathbf{3 3}$ in such a fragmentation could not be ruled out (Scheme 5).

Scheme 5
A different chemical behaviour is exhibited by the azodicarbonyl derived from 4 Ca . The expected product, the benzazepinone 15a, and 1 -tetralone 16a were obtained, albeit in low yields, indicating that in the absence of sufficient electronic activation in the aromatic ring a 1,6-exo cyclisation to the carbonyl group of the azodicarbonyl group also occurs with equal facility (Scheme 6). However, placement of a MeO group para to the site of cyclisation largely overcomes this problem and, as a consequence, a 1,7-exo-addition product, the benzazepinone $\mathbf{1 5 b}$, is isolated as the major product.

An aryl methoxy substituent occasionally interferes in an interesting manner with the normal course of the cyclisation reaction. For example, the substrate 4Af containing $p$-methoxy groups did not yield, as anticipated, the substance 9 h

(Scheme 7). Instead a product, isolated in low yield, possessed in its ${ }^{1} \mathrm{H}$ NMR spectrum, besides two MeO signals, two aromatic hydrogens appearing as 1 H singlets suggesting that the para positions in the aromatic ring are unsubstituted. In fact the spectrum was found to be identical with that of $9 \mathbf{e}$ obtained from 4Ae. The respective TLC mobilities and IR spectra of the samples were also practically identical. A possible mechanism for the transformation 4Af to 9 e would involve an ipso substitution at the ortho carbon bearing the methoxy group to give the cation 34. The latter undergoes successive migrations ( $\mathbf{3 5} \longrightarrow \mathbf{3 6}$ $\rightarrow 37$ ) to 37 , which loses a proton to generate $9 \mathbf{e}$. The structure $\mathbf{1 2 i}$ is assigned to the phenol similarly obtained from $\mathbf{4 B i}$ because it possessed in its ${ }^{1} \mathrm{H}$ NMR spectrum inter alia two aromatic protons well separated from those due to the phenyl group, at $\delta 6.73(1 \mathrm{H}, \mathrm{s})$ and $6.88(1 \mathrm{H}, \mathrm{s})$. These $\delta$-values are very similar to those observed for the phenol $\mathbf{1 2 k}(\delta 6.63,6.81)$ derived from the dienone 11e by acid catalysis.

## Experimental

Melting points were recorded on a Reichert-Thermovar hotstage apparatus and are reported uncorrected. Infrared spectra were measured on a Buck Scientific M500 spectrometer as KBr pellets, unless stated otherwise. Proton nuclear magnetic resonance spectra ( ${ }^{1} \mathrm{H}$ NMR) were recorded on Brüker CXP 300 (300 $\mathrm{MHz})$ and Brüker ARX 400 ( 400 MHz ) spectrometers using $\mathrm{CDCl}_{3}$ as solvent and tetramethylsilane as internal standard, unless stated otherwise; $J$-Values are given in Hz. Mass spectra were obtained on a Shimadzu QP1000 EX (electron impact; 70 eV ) spectrometer. High-resolution mass spectra (electron impact) were determined at the Mass Spectrometry Laboratory of Imperial College of Science, Technology and Medicine, University of London. Elemental analyses were performed at the Microanalyses Service of Imperial College of Science, Technology and Medicine, University of London.

All reagents and solvents were reagent grade and were purified and dried by standard methods. Those methyl or ethyl esters used as starting materials that were not commercially

available were prepared from the corresponding acids by standard procedures. Organic extracts were dried over anhydrous sodium sulfate or magnesium sulfate. Analytical thin-layer chromatography was performed on E. Merck Kieselgel 60, F254 silica gel 0.2 mm thick plates. Preparative TLC (PTLC) used E. Merck Kieselgel 60, F-254 silica gel 0.5, 1 and 2 mm thick plates $(20 \times 20 \mathrm{~cm})$. Column chromatography was done on E. Merck Kieselgel $60(240-400 \mu \mathrm{~m})$ silica gel.

## General procedure for the preparation of monohydrazides (5A, 5B, 5C and 5E) ${ }^{18}$

The methyl esters of 2-arylacetic, 3-arylpropionic, 4-arylbutanoic and 2-aryloxyacetic acids (1 equiv.) were heated with stirring at $110-120{ }^{\circ} \mathrm{C}$ with hydrazine hydrate ( $98 \%$ ) (1.1-4 equiv.). On completion of the reaction ( $0.5-3 \mathrm{~h}, \mathrm{TLC}$ control; $\left.\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH} ; 9: 1\right)$ the mixture was cooled, benzene was added, and the solid that separated was filtered off. The crystalline solids obtained were taken up in AcOEt , filtered, and dried or purified by recrystallisation.

General procedures for the preparation of bishydrazides 4.
(A) From the corresponding monohydrazides 5.

The appropriate hydrazide and sodium bicarbonate ( 2 equiv./ mmol hydrazide) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $10 \mathrm{~cm}^{3} / \mathrm{mmol}$ hydrazide) was treated dropwise, under inert atmosphere at rt and with stirring, with methyl or phenyl chloroformate ( 1.1 equiv. $/ \mathrm{mmol}$ hydrazide) dissolved in the same solvent ( $1 \mathrm{~cm}^{3} / \mathrm{mmol}$ chloroformate). On completion of the reaction ( $2-20 \mathrm{~h}$, TLC control; $\mathrm{CHCl}_{3}-\mathrm{EtOH} ; 9: 1$ or $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH} ; 9: 1 / 9.5: 0.5$ ) the mixture was poured into water and the products extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, and the organic phase was washed with water and dried. The residue obtained on evaporation of the solution was purified by crystallisation or by column chromatography.

Methyl 2-(2-phenylacetyl)hydrazinecarboxylate 4Aa. Obtained from $5 \mathbf{A a}(2.40 \mathrm{~g}, 15.98 \mathrm{mmol})$ as a colourless solid in $84 \%$ yield ( 2.80 g ) after crystallisation from $\mathrm{Et}_{2} \mathrm{O} ; \mathrm{mp} 91-93{ }^{\circ} \mathrm{C}$; $v_{\text {max }} / \mathrm{cm}^{-1} 3260,1758,1718,1668 \mathrm{sh}, 1652 ; \delta_{\mathrm{H}} 3.61(2 \mathrm{H}, \mathrm{s}), 3.73$ $(3 \mathrm{H}, \mathrm{s}), 6.87\left(1 \mathrm{H}, \mathrm{br} \mathrm{s}\right.$, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right), 7.37-7.29(5 \mathrm{H}$, $\mathrm{m}), 7.55\left(1 \mathrm{H}, \mathrm{br}\right.$ s, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right) ; m / z 208\left(\mathrm{M}^{+}, 3 \%\right)$, 176 (9), 118 (52), 91 (100) (Calc. for $\mathrm{C}_{10} \mathrm{H}_{12} \mathrm{~N}_{2} \mathrm{O}_{3}: \mathrm{C}, 57.68 ; \mathrm{H}$, $5.81 ; \mathrm{N}, 13.45$. ## (B) From the corresponding acids

Oxalyl dichloride ( 2.5 equiv. $/ \mathrm{mmol}$ acid) was slowly added, at rt and under nitrogen, to a solution of the appropriated arylalkanoic acid in benzene ( $3 \mathrm{~cm}^{3} / \mathrm{mmol}$ acid) containing DMF ( $0.04 \mathrm{~cm}^{3} / \mathrm{mmol}$ acid). After a 30 min stirring period, the solvent and the excess of the oxalyl dichloride were removed by evaporation. The crude acyl chloride thus obtained was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $2 \mathrm{~cm}^{3} / \mathrm{mmol}$ acid), $\mathrm{NaHCO}_{3}$ (2 equiv./ mmol acid) was added, and the resulting suspension was treated with methyl ${ }^{26 a}$ or phenyl carbazate ${ }^{26 b}$ ( 1.05 equiv. $/ \mathrm{mmol}$ acid) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(2 \mathrm{~cm}^{3} / \mathrm{mmol}\right.$ carbazate) during 15 min . On completion of the reaction (TLC control, ca. $2.5 \mathrm{~h} ; \mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$; $9.5: 0.5$ ), water and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were added to the mixture and the organic phase was washed with brine, dried, and evaporated. The resulting oils were purified by column chromatography.

## Method $3 a^{7}$ (IBBTA). General procedure

The appropriate bishydrazide in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(10 \mathrm{~cm}^{3} / \mathrm{mmol}\right.$ bishydrazide), protected from light and under inert atmosphere was treated at rt with freshly crystallised IBBTA (1.0 equiv./ mmol bishydrazide $\mathbf{4 A}, \mathbf{4 B}$ or $\mathbf{2 5}$ or 1.1 equiv. $/ \mathrm{mmol}$ bishydrazide $4 \mathrm{C}-\mathbf{E}$ ) in portions ( 1 h ) or dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ( $10 \mathrm{~cm}^{3} / \mathrm{mmol}$ oxidant) during $10-15 \mathrm{~min}$. The mixture was found to acquire a yellow or orange-yellow colour and the course of the reaction was monitored by TLC $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}\right.$; $90: 10$ or $95: 5$ ). For suitably activated aromatics, the consumption of the starting material resulting in the formation of the spiro compound and/or the quinolone occurred smoothly at room temperature (method 3a). In cases where the conversion was found to be slow, addition of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ was found to be
advantageous (method 3b). On completion of the reaction the products were isolated and purified as detailed above.

## Method 3b (IBBTA and $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ ). General procedure

The method 3a was followed up until the addition of the oxidant was complete and, after a stirring period of $0.5-1 \mathrm{~h}$, $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ (1.0-1.05 equiv./mmol bishydrazide) was added to the mixture. After an additional stirring period of $0.5-1.5 \mathrm{~h}$ aq. $\mathrm{NaHCO}_{3}(5-10 \%)$ was added, the mixture was extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, and the extract was washed with brine and dried. Evaporation of the solution furnished, in general, oils, which were purified by column chromatography and/or PTLC.

## Oxidation of methyl 2-(2-phenylacetyl)hydrazinecarboxylate 4Aa

Compound 4Aa (208 mg, 1.0 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(5 \mathrm{~cm}^{3}\right)$ was treated with IBBTA ( $430 \mathrm{mg}, 1.00 \mathrm{mmol}$ ) and $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}(123$ $\mathrm{mm}^{3}, 1.00 \mathrm{mmol}$ ). On addition of the $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ a vigorous evolution of gas occurred, accompanied by a change in the colour of the solution to light yellow. TLC control (hexaneAcOEt; $6: 4$ ) showed a complex mixture that was worked up, and then purified by column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ to yield an oil consisting in iodobenzene and methyl phenylacetate ( $19 \%$ ) ( $4: 1 ;{ }^{1} \mathrm{H}$ NMR); $m / z$ (PhI) 204 ( $90 \%$ ), 77 (100), $51(50)\left(m / z\right.$ identical to authentic sample); $m / z\left(\mathrm{PhCH}_{2} \mathrm{CO}_{2} \mathrm{Me}\right)$ $150(30 \%), 91(100), 65(20)(m / z$ identical to authentic sample).

## Method $4^{8}\left(\mathrm{Ag}_{2} \mathrm{CO}_{3}\right.$ and $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$ or TFA). General procedure

A suspension of $\mathrm{Ag}_{2} \mathrm{CO}_{3}$ on Celite ( 5 equiv. $/ \mathrm{mmol}$ bishydrazide), previously azeotropically dried by distillation with benzene, and the substrate in dry benzene $\left(40 \mathrm{~cm}^{3} \mathrm{mmol}^{-1}\right)$ was heated under reflux (ca. 5-8 h) until all the starting material had been consumed (TLC control; $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-acetone; $85: 15$ ). The initial yellow colour was replaced by a black precipitate of silver as the reaction proceeded. The mixture was filtered hot over a pad of Celite and the filtrate was treated with either $\mathrm{BF}_{3}$. $\mathrm{Et}_{2} \mathrm{O}$ or TFA ( 1.0 equiv. $/ \mathrm{mmol}$ bishydrazide). The products were isolated by evaporation of the solution under reduced pressure and the residue thus obtained was purified either by PTLC $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$-acetone; $\left.85: 15\right)$ or column chromatography.

Compound 12a. A suspension of 4Ba ( $100 \mathrm{mg}, 0.45 \mathrm{mmol}$ ) and $\mathrm{Ag}_{2} \mathrm{CO}_{3}$ on Celite ( $1.35 \mathrm{~g}, 2.25 \mathrm{mmol}$ ) in benzene ( $4.5 \mathrm{~cm}^{3}$ ) was heated for 8 h . Work-up subsequent to the addition of $\mathrm{BF}_{3}$. $\mathrm{Et}_{2} \mathrm{O}\left(55 \mathrm{~mm}^{3}, 0.45 \mathrm{mmol}\right)$, as indicated above, gave a residue, which was purified by PTLC to give the title compound in $62 \%$ yield ( 62 mg ).

Compounds 11c, 12b. Similarly, compounds 11c $(19.7 \mathrm{mg}$, $17 \%$ ) and $\mathbf{1 2 b}$ ( $62 \mathrm{mg}, 50 \%$ ) were obtained from 4Bc ( 126 mg , $0.50 \mathrm{mmol})$.

Compound 12d. Obtained in $74 \%$ yield ( 104 mg ) from 4Bd $(141 \mathrm{mg}, 0.50 \mathrm{mmol})$.

Compounds 11e, 12e. From 4Be ( $142 \mathrm{mg}, 0.50 \mathrm{mmol}$ ) were obtained products 11e ( $17.0 \mathrm{mg}, 13 \%$ ) and $\mathbf{1 2 e}(75 \mathrm{mg}, 54 \%)$.

Methyl (7,9-dimethoxy-2,8-dioxo-1-azaspiro[4.5]deca-6,9-dien-1-yl)carbamate 11f and compound 12f. Compounds 11f and $\mathbf{1 2 f}$ were isolated from 4Bf ( $156 \mathrm{mg}, 0.50 \mathrm{mmol}$ ), in the presence of $\mathrm{BF}_{3} \cdot \mathrm{Et}_{2} \mathrm{O}$, in $47 \%(69 \mathrm{mg})$ and $29 \%$ yield ( 45 mg ), respectively. Compound $\mathbf{1 1 f}$ was obtained as a colourless solid; mp 226-228 ${ }^{\circ} \mathrm{C}$ (from AcOEt-hexane); $v_{\max } / \mathrm{cm}^{-1} 3280,1760$, 1720,$1668 ; \delta_{\mathrm{H}} 2.37(2 \mathrm{H}, \mathrm{t}, J 7.8), 2.68(2 \mathrm{H}, \mathrm{t}, J 7.8), 3.70(6 \mathrm{H}$, s), $3.71(3 \mathrm{H}, \mathrm{s}), 5.78(2 \mathrm{H}, \mathrm{s}), 6.61(1 \mathrm{H}, \mathrm{br}$ s) (Calc. for $\mathrm{C}_{13} \mathrm{H}_{16} \mathrm{~N}_{2} \mathrm{O}_{6}: ~ M, ~ 296.1008$. Dienone-phenol rearrangement of 11e to methyl (6-hydroxy-7-methoxy-2-oxo-1,2,3,4-tetrahydroquinolin-1-yl)carbamate 12k. A mixture of 11e ( $50 \mathrm{mg}, 0.19 \mathrm{mmol}), \mathrm{H}_{2} \mathrm{SO}_{4}-\mathrm{HOAc}\left(10 \mathrm{~cm}^{3}\right.$; $0.5 \mathrm{M})$ and $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(10 \mathrm{~cm}^{3}\right)$ was heated under reflux ( 16 h ). The organic phase was separated, washed successively with aq. $\mathrm{NaHCO}_{3}(5 \%)$ and water, and dried. Usual work-up gave a product which was purified by PTLC $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right.$-acetone; $\left.8: 2\right)$. The phenol 12k ( $46 \mathrm{mg}, 91 \%$ ) had $\mathrm{mp} 215-218{ }^{\circ} \mathrm{C}$ (from acetone); $v_{\text {max }} / \mathrm{cm}^{-1} 3470,3170,1736,1660 ; \delta_{\mathrm{H}}\left(\mathrm{CD}_{3} \mathrm{CN}\right) 2.63$ $(2 \mathrm{H}, \mathrm{t}, J 7.3), 2.85(2 \mathrm{H}, \mathrm{t}, J 7.3), 3.71(3 \mathrm{H}, \mathrm{s}), 3.81(3 \mathrm{H}, \mathrm{s}), 6.54$ $(1 \mathrm{H}, \mathrm{s}), 6.63(1 \mathrm{H}, \mathrm{s}), 6.81(1 \mathrm{H}, \mathrm{s}), 7.66(1 \mathrm{H}, \mathrm{br}$ s) (Calc. for $\mathrm{C}_{12} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{5}$ : C, $54.13 ; \mathrm{H}, 5.30 ; \mathrm{N}, 10.52$. Methylation of $\mathbf{1 2 k}$ to 12e. The phenol 12k ( $25 \mathrm{mg}, 0.094$ $\mathrm{mmol})$ in $\mathrm{MeOH}\left(1 \mathrm{~cm}^{3}\right)$ was treated with an excess of $\mathrm{CH}_{2} \mathrm{~N}_{2}$ at $0^{\circ} \mathrm{C}$ and the solution was kept at this temperature for an additional hour. Evaporation of the solution followed by crystallisation of the residue (from EtOAc-hexane) gave a sample ( $23 \mathrm{mg}, 87 \%$ ) identical with 12e in all aspects ( mp , TLC, IR).

Preparation of $N$-amino derivatives of quinolones, benzazepinones and benzazocinones from the corresponding phenyl carbamates $\mathbf{1 2 h}, \mathbf{1 5 c}$ and $\mathbf{1 8 b}$. General procedure
A mixture of the appropriate phenyl carbamate and $10 \%$ aq. KOH ( 30 equiv. $/ \mathrm{mmol}$ carbamate) in 1,4-dioxane ( $15 \mathrm{~cm}^{3} / \mathrm{mmol}$ carbamate) was kept at $\mathrm{rt}(6-15 \mathrm{~h})$ with stirring under nitrogen. It was then neutralised with $5 \%$ aq. HCl , diluted with water, and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The extract was washed with brine and dried. Evaporation of the solution and purification of the resulting residue by PTLC gave the compounds described below.

1-Amino-6,8-dimethoxy-3,4-dihydroquinolin-2(1H)-one 13b. Obtained from phenyl carbamate $\mathbf{1 2 h}(100 \mathrm{mg}, 0.29 \mathrm{mmol})$ after 15 h ; purification by PTLC $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH} ; 95: 5\right)$ gave the title compound in $96 \%$ yield ( 62 mg ); mp 118-120 ${ }^{\circ} \mathrm{C}$ (from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane); $v_{\text {max }} / \mathrm{cm}^{-1} 3350,1656 ; \delta_{\mathrm{H}} 2.63(2 \mathrm{H}, \mathrm{t}, J 6.9)$, $2.84(2 \mathrm{H}, \mathrm{t}, J 6.9), 3.79(3 \mathrm{H}, \mathrm{s}), 3.88(3 \mathrm{H}, \mathrm{s}), 5.37(2 \mathrm{H}, \mathrm{br}$ s), 6.33 $(1 \mathrm{H}, \mathrm{d}, J 2.4), 6.43(1 \mathrm{H}, \mathrm{d}, J 2.4)\left(\right.$ Calc. for $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{3}: \mathrm{C}$, $59.45 ; \mathrm{H}, 6.35 ; \mathrm{N}, 12.61$. Found: C, $59.14 ; \mathrm{H}, 6.02 ; \mathrm{N}, 12.36 \%)$.

## 1-Amino-7-methoxy-1,3,4,5-tetrahydrobenzo[b]azepin-2-one

 17a. Obtained from $15 \mathrm{c}(130 \mathrm{mg}, 0.40 \mathrm{mmol})$ after 6 h (TLC control; AcOEt-hexane; $7: 3$ ). Work-up followed by PTLC (AcOEt-hexane; 7:3) yielded the title compound in $50 \%$ yield ( 41 mg ), as a pale pink solid; $\mathrm{mp} 117-117.5^{\circ} \mathrm{C}$ (from AcOEthexane); $v_{\text {max }} / \mathrm{cm}^{-1} 3330,3210,1644 ; \delta_{\mathrm{H}} 2.20(2 \mathrm{H}$, quintet, $J 7.1), 2.34(2 \mathrm{H}, \mathrm{t}, J 7.1), 2.68(2 \mathrm{H}, \mathrm{t}, J 7.1), 3.82(3 \mathrm{H}, \mathrm{s}), 4.73$ $\left(2 \mathrm{H}, \mathrm{s}\right.$, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right), 6.71(1 \mathrm{H}, \mathrm{d}, J 2.8), 6.85(1 \mathrm{H}$, dd, $J 8.8, J 2.8), 7.40(1 \mathrm{H}, \mathrm{d}, J 8.8) ; m / z 206\left(\mathrm{M}^{+}, 100 \%\right), 191$ (3), 178 (22), 163 (63), 162 (66), 135 (38), 91 (28) (Calc. for $\mathrm{C}_{11} \mathrm{H}_{14} \mathrm{~N}_{2} \mathrm{O}_{2}: M, 206.1055$. 1-Amino-3,4-dihydroquinolin-2(1H)-one 13a. A mixture of 12a $(60 \mathrm{mg}, 0.27 \mathrm{mmol})$ and conc. hydrochloric acid was heated under reflux ( 24 h ). Excess of acid was removed under reduced pressure and the resulting residue on crystallisation (from water) gave the title compound $\mathbf{1 3 a}$ ( $42 \mathrm{mg}, 96 \%$ ), mp 139-141 ${ }^{\circ} \mathrm{C}$ (lit., ${ }^{12} 143.5-144{ }^{\circ} \mathrm{C}$ ).

## Deamination of $N$-amino derivatives of quinolones, benzazepinones and benzazocinones. Method A. General procedure

To the appropriate $N$-amino derivative in acetic acid $\left(20 \mathrm{~cm}^{3} /\right.$ mmol $N$-amino compound) at rt was added, with stirring, sodium nitrite ( 1.5 equiv. $/ \mathrm{mmol} \mathrm{N}$-amino compound) in water ( $7.5 \mathrm{~cm}^{3} / \mathrm{mmol}^{\mathrm{NaNO}_{2}}$ ) and the mixture was stirred for an additional hour; TLC control (AcOEt-hexane; $7: 3$ ) showed the completion of the reaction. The mixture was then diluted with water, basified with $10 \%$ aq. NaOH , and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$; the extract was washed with water and dried. Evaporation of the solution furnished a solid, which was purified by PTLC to give the compounds described below.

6,8-Dimethoxy-3,4-dihydroquinolin-2( $\mathbf{1 H}$ )-one 13c. Obtained from the amine 13b ( $20 \mathrm{mg}, 0.09 \mathrm{mmol}$ ) in $75 \%$ yield ( 13.9 mg ) after PTLC ( $\mathrm{Et}_{2} \mathrm{O}$-hexane; $8: 2$ ); mp 104-105 ${ }^{\circ} \mathrm{C}$; no depression in the mp was observed on admixture with an authentic sample ( $\mathrm{mp} 103-105{ }^{\circ} \mathrm{C}$ ) prepared by the literature procedure. ${ }^{10}$ In addition the IR and ${ }^{1} \mathrm{H}$ NMR spectra of the two samples were identical.

## 7-Methoxy-1,3,4,5-tetrahydrobenzo[b]azepin-2-one 17b

 Obtained from 17 a ( $30 \mathrm{mg}, 0.145 \mathrm{mmol}$ ) as a colourless solid in $61 \%$ yield ( 16.8 mg ) after PTLC (AcOEt-hexane; $7: 3$ ); mp 143-144 ${ }^{\circ} \mathrm{C}$ (lit., ${ }^{13} 141-142{ }^{\circ} \mathrm{C}$ ); $v_{\text {max }} / \mathrm{cm}^{-1} 3175,1674 ; \delta_{\mathrm{H}} 2.21$ ( 2 H , quintet, $J 7.1$ ), 2.33 ( $2 \mathrm{H}, \mathrm{t}, J 7.1$ ), 2.77 ( $2 \mathrm{H}, \mathrm{t}, J 7.1$ ), 3.81 $(3 \mathrm{H}, \mathrm{s}), 6.79-6.73(2 \mathrm{H}, \mathrm{m}), 6.89(1 \mathrm{H}, \mathrm{d}, J 8.2), 7.06(1 \mathrm{H}, \mathrm{br}$ s, exchangeable with $\mathrm{D}_{2} \mathrm{O}$ ); $\mathrm{m} / \mathrm{z} 191\left(\mathrm{M}^{+}, 59 \%\right), 162$ (28), 148 (13), 136 (100).8-Methoxy-3,4,5,6-tetrahydrobenzo[b]azocin-2(1H)-one 19b. Obtained from 19a ( $19.8 \mathrm{mg}, 0.09 \mathrm{mmol}$ ) as a colourless solid in $80 \%$ yield ( 14.8 mg ) after PTLC (AcOEt-hexane; 7:3); mp $144-146{ }^{\circ} \mathrm{C}$ (lit., ${ }^{14} 145-146{ }^{\circ} \mathrm{C}$ ); $v_{\text {max }} / \mathrm{cm}^{-1} 3200,1666 ; \delta_{\mathrm{H}} 1.43$ $(1 \mathrm{H}, \mathrm{m}), 2.00-1.65(2 \mathrm{H}, \mathrm{m}), 2.42-2.00(3 \mathrm{H}, \mathrm{m}), 2.91-2.42(2 \mathrm{H}$, $\mathrm{m}), 3.82(3 \mathrm{H}, \mathrm{s}), 6.75(1 \mathrm{H}, \mathrm{dd}, J 8.6, J 2.8), 6.79(1 \mathrm{H}, \mathrm{d}, J 2.8)$, $7.00(1 \mathrm{H}, \mathrm{d}, J 8.6), 7.21\left(1 \mathrm{H}\right.$, br s, exchangeable with $\left.\mathrm{D}_{2} \mathrm{O}\right) ; m / z$ $205\left(\mathrm{M}^{+}, 100 \%\right), 162(28), 149(61), 136$ (58), 57 (37).

## Method B

The amine 13b ( $20 \mathrm{mg}, 0.09 \mathrm{mmol}$ ) and $N$-nitrosodiphenylamine ( $17.8 \mathrm{mg}, 0.09 \mathrm{mmol}$ ) were heated in benzene $\left(2 \mathrm{~cm}^{3}\right)$ under reflux for 3 h . The residue obtained on evaporation of the solution was purified by PTLC ( $\mathrm{Et}_{2} \mathrm{O}$-hexane; $8: 2$ ) to give the deaminated product $\mathbf{1 3 c}(13.9 \mathrm{mg}, 75 \%)$, identical with that obtained by method $A$.

## Supplementary reactions

Carbamate 12d from amine 13b. A suspension of the amine $\mathbf{1 3 b}(10 \mathrm{mg}, 0.045 \mathrm{mmol})$ and $\mathrm{NaHCO}_{3}(4.9 \mathrm{mg}, 0.058 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(2 \mathrm{~cm}^{3}\right)$ was treated with methyl chloroformate ( 5.1 $\mathrm{mm}^{3}, 0.066 \mathrm{mmol}$ ) and the mixture was stirred at rt for 14 h . Work-up in the usual manner led to a solid, which as purified by crystallisation from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane to furnish a product (10 $\mathrm{mg}, 79 \%$ ) identical in all respects (IR, ${ }^{1} \mathrm{H}$ NMR, TLC, mp and mixed mp ) with carbamate 12d.

Carbamate 12h from amine 13b. Similarly, the amine 13b (10 $\mathrm{mg}, 0.045 \mathrm{mmol}$ ) provided carbamate $\mathbf{1 2 h}$ on acylation with phenyl chloroformate in nearly quantitative yield.
