Total syntheses of $\alpha$-bisabol-1-one, curcumene, curcuphenol and elvirol have been accomplished via 1,4-conjugate addition of intact aldehydes to vinyl ketones followed by an intramolecular aldol condensation.

## Introduction

A variety of bisabolane type natural products are widely distributed both in terrestrial as well as in marine organisms. In spite of their rather simple structures, some of them have characteristic biological activities (vide infra). These compounds are attractive synthetic targets especially to verify the usefulness of newly developed synthetic methodologies.

We previously reported the highly expedient nucleophilic reaction of intact aldehydes $\mathbf{1}$ mediated by diethylamino(trimethyl)silane (DEATMS) or diethylamine (DEA). The reaction enabled 1,4-conjugate addition to vinyl ketone 2 leading to 5-keto-aldehydes $4,{ }^{1,2}$ domino 1,4 -conjugate addition-intramolecular substitution leading to formylcyclopropanecarboxylates $\mathbf{5}^{3}$ and self aldol condensation leading to $\alpha, \beta$-unsaturated aldehydes $\mathbf{6}^{4}$ (Scheme 1). The reaction was proved to follow a

catalytic enamine pathway as a catalytic amount of the diethylaminoenamine of aldehyde 1 promoted the reaction. ${ }^{1}$ The reaction conditions were so mild that acid or base sensitive protecting groups such as tetrahydropyranyl ether, acetate or tert-butyldimethylsilyl ether survived. Moreover, it is very simple to isolate the products by distillation or column chrom-

[^0]atography without aqueous work-up. In the case of $1,4-$ conjugate addition of intact aldehydes $\mathbf{1}$ to buten-3-one (MVK) 2, the reaction is completed with a catalytic amount of DEATMS or DEA in acetonitrile, which is another advantage. The product, 5 -keto-aldehyde $\mathbf{4}$, is a versatile precursor of substituted cyclohexenone 7 via an intramolecular aldol cyclisation. In order to exemplify further utility of the reaction, we wish to report herein the total synthesis of several bisabolane sesquiterpenoids 8-12 (Fig. 1) starting from citronellal 13 as a chiral source.

## Results and discussion

Cyclohexenone $\mathbf{8}$ was first isolated from Stevia puypurea Pers ${ }^{\text {5a }}$ and has been synthsised by Jefferies et al. ${ }^{6}$ Recently, both diastereomers $\mathbf{8}$ and 9 were found along with several other bisabolane type compounds from commercial Brazilian lantana oil obtained from Lantana camara L. (Verbenaceae). ${ }^{5 b}$
Synthesis started from keto-aldehyde 14, obtained by DEATMS or DEA mediated conjugate addition of citronellal 13 to buten-3-one 2 (Scheme 2). Results of the conjugate addition are compiled in Table 1. As shown in entry 7, the keto-aldehyde 14 was prepared in $96 \%$ yield on a 0.1 M scale by simply refluxing a solution of citronellal 13 and buten-3-one 2 in the presence of 0.1 equiv. of DEATMS in

${ }^{a}$ Reaction was carried out with DEATMS in acetonitrile and worked up by Kugelrohr distillation unless otherwise indicated. ${ }^{b}$ Reaction was carried out without solvent and worked up by MPLC (experimental procedure: see ref 1 ). ${ }^{c}$ Reaction was worked up by MPLC (experimental procedure: see ref 1). ${ }^{d}$ Reaction was carried out with DEA in toluene in a sealed tube and worked up by MPLC (experimental procedure: see ref 2). ${ }^{e}$ Reaction was carried out with DEA in ionic liquid, $[\mathrm{bmim}] \mathrm{PF}_{6}$ and worked up by MPLC. The ionic liquid was recycled (detailed experimental procedure will be reported in due course).

acetonitrile followed by evaporation of the solvent and subsequent Kugelrohr distillation. The reaction also proceeded with DEA (entries 3 and 4). The reaction in ionic liquid 1-butyl-3-methylimidazolium hexafluorophosphate [bmim] $\mathrm{PF}_{6}$ (entry 4), did not require a sealed tube in spite of the highly volatile nature of DEA. The ionic liquid was recycled several times without the yields changing.

Intramolecular aldol condensation of the keto-aldehyde 14 was successful with TBAF in acetonitrile at room temperature to give hydroxy ketone 15 in $69 \%$ yield. Subsequent dehydration with a catalytic amount of PTSA gave a mixture of enone $\mathbf{1 6}$ in $91 \%$ yield along with a small amount of deconjugated enone. Alternatively, cyclisation of the keto-aldehyde $\mathbf{1 4}$ under phase transfer reaction conditions employing potassium hydroxide, tetrabutylammonium hydroxide in ether and THF, provided the enone $\mathbf{1 6}^{6}$ directly in $89 \%$ yield as a mixture of diastereomers. Addition of methyllithium (MeLi) gave alcohol 17 in $96 \%$ yield. Oxidation of the alcohol 17 by PCC enabled oxidative rearrangement to provide enone in $89 \%$ yield as a mixture of diastereomers which were separated by MPLC to furnish natural enones $\mathbf{8}$ and 9.

Enantiomeric enones, ent-8 and ent-9, were also synthesized in the same way starting from $(R)$-citronellal ent-13.

Curcumene $\mathbf{1 0}$ is a constituent of Curcuma aromatica ${ }^{7}$ and its total synthesis has been reported so far by several groups. ${ }^{8}$ An attempt at aromatisation by dehydration of the alcohol 17 with PTSA in benzene followed by DDQ or chemical manganese dioxide (CMD) ${ }^{9}$ oxidations resulted in the formation of complex mixtures. Then a phenylselanyl group was introduced to give selenide 18 in $84 \%$ yield by the reaction of the kinetic enolate of the enone ent- $\mathbf{1 6}$ generated by LDA with phenylselanyl chloride in the presence of HMPA (Scheme 3). Addition of

Scheme 3 Reagents and conditions: LDA, THF then $\mathrm{PhSeCl}, 84 \%$; ii, $\mathrm{MeLi}, \mathrm{Et}_{2} \mathrm{O}, 77 \%$; iii, $\mathrm{PCC}, \mathrm{CH}_{2} \mathrm{Cl}_{2}, 51 \%$.

MeLi to the selenide $\mathbf{1 8}$ proceeded in $77 \%$ yield to give alcohol 19. Though hydrogen peroxide oxidation of the alcohol 19 to $\mathbf{1 0}$ resulted in a low yield due to the very sensitive nature of the trisubstituted double bond, PCC oxidation furnished curcumene $\mathbf{1 0}$ in $51 \%$ yield by spontaneous elimination of benzeneselenenic acid and subsequent dehydration. Oxidative 1,3-migration of the hydroxy group of $\mathbf{1 9}$ was suppressed owing to facile elimination of benzeneselenenic acid. The overall yield from citronellal 13 was $28 \%$ in 6 steps, the shortest total synthesis in the highest yield of reported syntheses.

Curcuphenol 11 was isolated from the marine sponge Didiscus flavus and gorgonian Pseudopterogorgia rigida ${ }^{10 b}$ as well as from the terrestrial plant Lasianthaea podocephala. ${ }^{10 a}$ While the $(R)-(-)$-enantiomer $\mathbf{1 1}$ has antibacterial properties, ${ }^{11 b}$ the $(S)-(+)$-enantiomer 11 shows antitumor activity and has inhibitory activity against K-ATPase which transfers potassium ions into cells and sodium ions from cells. ${ }^{8 b}$ Several total syntheses of $\mathbf{1 1}$ have already appeared in the literature. ${ }^{6,11}$ Though Jefferies et al. ${ }^{6}$ illustrated aromatisation of the enones $\mathbf{8}$ and 9 by pyridinium perbromide leading to curcuphenol 11, it was found that reproduction of the reported procedure was difficult. Dehydrogenation using sulfur gave curcuphenol 11 in only $8 \%$ yield with a large amount of enones 8 and 9 being recovered (Scheme 4). DDQ or CMD oxidation recovered the

starting enones completely. Other attempts to prepare enolic derivatives such as enol acetate or trimethylsilylenol ether also resulted in recovery of enones $\mathbf{8}$ and 9 . To this end, aromatisation of the enones $\mathbf{8}$ and 9 by cupric bromide ${ }^{12}$ was investigated in order to furnish aromatic bromide 20.The trisubstituted double bond was dibrominated due to its highly nucleophilic character. Fortunately, the trisubstituted double bond was regenerated by treatment of the bromide 20 with zinc in acetic acid to give phenol 21. Finally, bromine atoms on the aromatic ring were removed by lithiation with $t$ - BuLi to complete the synthesis of curcuphenol 11 in $44 \%$ overall yield from the enones $\mathbf{8}$ and 9 .

Elvirol 12 was isolated from Elvira biflora $\mathrm{DC}^{13}$ and is known as a sesquiterpenoid which does not follow the isoprene rule. In addition to three syntheses of racemic 12, ${ }^{14 a-c}$ Akita et al. described the first total synthesis ${ }^{14 d}$ of both enantiomers of $\mathbf{1 2}$ via enzymatic kinetic resolution as a key chirality generating step during the course of their synthetic study. Our synthesis was started by preparation of vinyl ketone 23 as a Michael acceptor (Scheme 5). Addition of vinylmagnesium bromide to ( $R$ )-citronellal $\mathbf{1 3}$ gave allyl alcohol 22 quantitatively. Oxidation of the alcohol 22 was investigated using various reagents and it was found that tetrapropylammonium perruthenate (TPAP) could be successfully employed to give vinyl ketone 23 which was used for further reaction without purification because of the volatility of the vinyl ketone $\mathbf{2 3}$. Conjugate addition of propionaldehyde to the vinyl ketone $\mathbf{2 3}$ mediated by DEA afforded keto-aldehyde 24 in $48 \%$ overall yield in two steps. Reaction

with DEATMS provided intractable materials contrary to our anticipation. Intramolecular aldol condensation under phase transfer reaction conditions gave enone $\mathbf{2 5}$ in $95 \%$ yield as a mixture of two diastereomers. Final aromatisation of the enone $\mathbf{2 5}$ via selenylation in $93 \%$ yield followed by oxidative elimination furnished elvirol 12 in $58 \%$ yield. Enantiomeric elvirol ent-12 was also synthesized starting from ( $S$ )-citronellal 13.

Spectral data of synthetic compounds $\mathbf{8}-\mathbf{1 2}$ including values of optical rotations were completely identical with those of the natural products.

Thus, we have achieved total syntheses of both enantiomers of bisabolane sesquiterpenoids, $\alpha$-bisabol-1-one $\mathbf{8}$, its diastereomer 9, curcumene 10, curcuphenol 11 and elvirol $\mathbf{1 2}$ starting from citronellal as a chiral source. These syntheses demonstrate the utility of conjugate enamine addition of intact aldehydes to vinyl ketones catalysed by DEATMS or DEA. It is worthy of note that these syntheses have been accomplished in fewer steps with better overall yields without the use of any protecting groups.

## Experimental

IR spectra were recorded on a Shimadzu FT/IR-4200 spectrophotometer for solutions in carbon tetrachloride unless otherwise indicated. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ spectra were obtained for solutions in deuteriochloroform with a Varian Gemini 200 H ( 200 MHz ) instrument with tetramethylsilane as internal standard. ${ }^{13} \mathrm{C}$ NMR spectra were obtained for solutions in deuteriochloroform with a Varian Gemini $200 \mathrm{H}(50 \mathrm{MHz}$ ) instrument with tetramethylsilane as internal standard. Specific rotations were measured ( $10^{-1}$ deg $\mathrm{cm}^{2} \mathrm{~g}^{-1}$ ) with a Horiba SEPA-200 spectrophotometer for solutions in chloroform. Medium-pressure liquid chromatographies (MPLC) were carried out on a JASCO

PRC-50 instrument with a silica gel packed column. Microanalyses were carried out in the Instrumental Analysis Center for Chemistry, Tohoku University.

Evaporation of the solvent in vacuo followed by MPLC separation (eluent ethyl acetate $-n$-hexane $=1: 5$ ) gave more polar ( $69 \mathrm{mg}, 48 \%$ ) and less polar ( $64 \mathrm{mg}, 45 \%$ ) diastereomers 26.

To a solution of selenide $26(69 \mathrm{mg}, 0.18 \mathrm{mmol})$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ $\left(4 \mathrm{~cm}^{3}\right)$ was added pyridine ( $28 \mu \mathrm{l}, 0.36 \mathrm{mmol}$ ) and $30 \% \mathrm{aq}$. hydrogen peroxide ( $31 \mu \mathrm{l}, 0.27 \mathrm{mmol}$ ) at $0{ }^{\circ} \mathrm{C}$. After being stirred for 2.5 h , the reaction was quenched by addition of aq. ammonium chloride and aq. sodium thiosulfate. The organic layer was extracted with ethyl acetate four times and the combined organic layers were washed with water and brine, and dried over anhydrous sodium sulfate. Evaporation of the solvent in vacuo followed by MPLC separation (eluent ethyl acetate $-n$-hexane $=1: 5$ ) gave elvirol $12(23 \mathrm{mg}, 58 \%)$; $[\alpha]_{\mathrm{D}}^{30}$ -35.6 (c 0.18), lit. ${ }^{14 a}[\alpha]_{\mathrm{D}}^{30}-37.2(c 0.23) ; v_{\max } / \mathrm{cm}^{-1} 3615$, 2965 , 2924, 2859, 2361, 1501, 1452, 1377 and 1179; $\delta_{\mathrm{H}}(200 \mathrm{MHz})$ $1.23(\mathrm{~d}, 3 \mathrm{H}, J 7.0 \mathrm{~Hz}), 1.54(\mathrm{~s}, 3 \mathrm{H}), 1.69(\mathrm{~s}, 3 \mathrm{H}), 1.55-1.66$ (m, 2H), 1.91 (dddd, 1H, J 14.0, 7.0, 7.0, 7.0 Hz ), 1.96 (dddd, $1 \mathrm{H}, J 14.0,7.0,7.0,7.0 \mathrm{~Hz}$ ), 2.26 (s, 3H), 2.96 (sextet, 1H, J 7.0 $\mathrm{Hz}), 4.55(\mathrm{~s}, 1 \mathrm{H}), 5.13(\mathrm{t}, 1 \mathrm{H}, J 7.0 \mathrm{~Hz}), 6.65(\mathrm{~d}, 1 \mathrm{H}, J 7.9 \mathrm{~Hz})$, 6.85 (ddd, 1H, $J .9,2.0,1.1 \mathrm{~Hz}$ ) and $6.94(\mathrm{~d}, 1 \mathrm{H}, J 72.0 \mathrm{~Hz})$; $\delta_{\mathrm{C}}(50 \mathrm{MHz}) 17.6(\mathrm{q}), 20.7(\mathrm{q}), 20.9(\mathrm{q}), 25.7(\mathrm{q}), 26.0(\mathrm{t}), 31.6$ (d), 37.2 (t), 115.2 (d), 124.5 (d), 127.0 (d), 127.5 (d), 130.0 (s), 132.0 (s), 132.7 (d) and 150.7 (s).
