A linear bis-porphyrin bridged by a $5,5^{\prime}$-diphenyl-2,2'-bipyridine rod-like spacer complexing a $\left[\mathrm{Ru}(\mathrm{phen})_{2}\right]^{2+}$ fragment has been synthesized in $7.4 \%$ yield by one-pot condensation of 3,5 -di-tert-butylbenzaldehyde, $4,4^{\prime}$ -dimethyl-3, $3^{\prime}$-dihexyl-2,2'-methylenedipyrrole and the $\left[\mathrm{Ru}(\mathrm{phen})_{2}\right]^{2+}$ complex of $5,5^{\prime}$ - bis $\left(p\right.$-formylphenyl)-2, $2^{\prime}$ bipyridine, followed by chloranil oxidation. The protected dialdehyde (5,5'-bis[(5,5-dimethyl-1,3-dioxan-2-yl)phenyl]-$2,2^{\prime}$-bipyridine) was obtained in $80 \%$ yield by Suzuki coupling of 2-[4-(5,5-dimethyl-1,3-dioxan-2-yl)phenyl]-4,4,5,5-tetramethyl-1,3-dioxaborolane and $5,5^{\prime}$-dibromo-2,2'-bipyridine, using $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\right]$ as catalyst. A new procedure is reported for the preparation of $5,5^{\prime}$-dibromo- $2,2^{\prime}$-bipyridine, which is obtained in $80 \%$ yield by Stille homocoupling of 2,5 -dibromopyridine in the presence of hexamethylditin.

## Introduction

Bis-porphyrin conjugates are attracting considerable attention as many electron transfer proteins involve pairs of porphyrin analogues as redox partners. Among those, examples involving cytochromes as well as bacteriochlorophylls can be borrowed from the photosynthetic machinery of purple bacteria such as Rhodopseudomonas viridis. ${ }^{1}$ We have been interested for several years in mimicking the oblique arrangements in pairs of chromophores taken from the special pair/bacteriochlorophyll/ bacteriopheophytin triad of the bacterial Reaction Centers. For that purpose we designed and synthesized bis-porphyrins with covalent bridges such as the 2,9 -diphenyl-1,10-phenanthroline (dpp) ligand, which enforces a $60^{\circ}$ angle between the porphyrin planes. ${ }^{2}$ Precursors to phototriggered donor-acceptor conjugates were obtained by metallation with $\mathrm{Zn}(\mathrm{II})$ and $\mathrm{Au}(\mathrm{III}) .{ }^{3 a-c}$ We observed that the rate of electron transfer from the photoexcited Zn porphyrin donor to the Au porphyrin acceptor could be substantially increased by coordination of a transition metal to the bridging chelate by means of rotaxane formation (Fig. 1, structure (a)). ${ }^{3 d, e}$

Fig. 1 Schematic representation of selected mixed-metal bisporphyrin arrays containing a transition metal complex fragment as spacer. The thick lines represent bidentate (a and b) or terdentate (c) chelates. The black disk is a transition metal. Metalloporphyrins are represented by diamonds (empty $=\mathrm{Zn}(\mathrm{II})$; full $=\mathrm{Au}(\mathrm{III})$ ).

[^0]In this paper we describe our synthetic efforts to covalently and rigidly link two porphyrins in a strict linear arrangement using the $5,5^{\prime}$-diphenylene- $2,2^{\prime}$-bipyridine chelate as spacer (Fig. 1, structure (b)). A few examples of bis-porphyrins incorporating the $2,2^{\prime}$-bipyridine subunit are known, ${ }^{4}$ and several linear bis-porphyrins involving bridging metal complex fragments such as $\left[\mathrm{M}(\text { terpy })_{2}\right]^{n+}$ (where $\mathrm{M}=\mathrm{Ru}(\mathrm{II})^{5 a-c}$ or $\left.\operatorname{Ir}(\mathrm{III})^{5 d-f}\right)$ or $\left[\mathrm{M}(\text { phen })_{2}\right]^{n+}(\text { where } \mathrm{M}=\mathrm{Cu}(\mathrm{I}) \text { or } \mathrm{Zn}(\mathrm{II}))^{6}$ have been synthesized in our laboratory and elsewhere. However, the latter correspond to structure (c) of Fig. 1, in which the metal has been shown to play both the role of an assembling species, linking together the porphyrin modules, and a redox relay mediating photoinduced electron transfer between the Zn and the Au porphyrin termini in the case of $\mathrm{M}(\text { terpy })_{2}{ }^{n+}$-bridged systems. ${ }^{5}$ An exception is a multiporphyrin-containing [2]rotaxane, in which the bridging phenanthroline chelate is connected to the porphyrin stoppers by amide linkages. ${ }^{7}$ For practical reasons (see below), the $\left[\mathrm{Ru}(\mathrm{phen})_{2}\right]^{2+}$ moiety had to be attached to the bipyridine spacer prior to porphyrin construction, thus providing a new $\left[\mathrm{Ru}(\text { diimine })_{3}\right]^{2+}$-porphyrin conjugate. ${ }^{8}$

## Results and discussion

5,5'-Diphenyl-2, $2^{\prime}$-bipyridine itself is not a very common ligand, compared to the $4,4^{\prime}$-diphenyl analogue, and only a few of its complexes with $\operatorname{Ru}(\mathrm{II})$ have been described. ${ }^{9 a}$ The free ligand has been prepared by Raney nickel coupling of 3phenylpyridine, ${ }^{9 b}$ a method that does not tolerate heat sensitive functional groups and that suffers from very moderate yields. In recent preparations of materials incorporating the $5,5^{\prime}-$ diaryl- $2,2^{\prime}$-bipyridine motif, aromatic cross-coupling reactions involving $5,5^{\prime}$-dibromo-2,2'-bipyridine as electrophile have been used with much success. Tilley and coworkers have prepared $5,5^{\prime}$-bis(4-trimethylsilylphenyl)-2, $2^{\prime}$-bipyridine in $90 \%$ yield by Stille coupling with $\mathrm{Me}_{3} \mathrm{SiC}_{6} \mathrm{H}_{4} \mathrm{SnMe}_{3}{ }^{10}$ Suzuki coupling was used by Klemm and coworkers to prepare polymers incorporating the $5,5^{\prime}$-bis( 2,5 -dihexylphenyl)-2, $2^{\prime}$ bipyridine motif, using 2,5-dihexylbenzene-1,4-diboronic acid as nucleophile. ${ }^{11 a}$ The same reaction has been applied to (5,5'-dibromo-2,2'-bipyridine)-bis(2,2'-bipyridine)ruthenium(II) bis(hexafluorophosphate), affording a conjugated polymer
containing an appended ruthenium(II) bipyridine complex. ${ }^{11 b}$ In the present case, we also found it very convenient to use a Suzuki coupling ${ }^{12}$ between $5,5^{\prime}$-dibromo-2, $2^{\prime}$-bipyridine and the appropriate aromatic boronic ester to prepare the functionalized precursor of the 5,5'-diphenylene-2,2'-bipyridine bridge.
Accordingly, the linear bis-porphyrins $\mathbf{8}^{2+}$ (free-base) and $\mathbf{1 1 2}^{2+}$ (Zn complex) were synthesized in several steps from the key compounds 5,5'-dibromo-2, $2^{\prime}$-bipyridine 2 and 2-[4-(5,5-dimethyl-1,3-dioxan-2-yl)phenyl]-4,4,5,5-tetramethyl-1,3-dioxaborolane 5, as shown in Schemes 1-4. Earlier reports describing the preparation of $5,5^{\prime}$-dibromo-2, $2^{\prime}$-bipyridine (2) involve Ullman-type coupling of 2 -chloro-5-bromopyridine, ${ }^{13}$ multistep transformations from 5,5'-disubstituted-2, $2^{\prime}$-bipyridines, ${ }^{14}$ or direct bromination of the $2,2^{\prime}$-bipyridine hydrobromide salt. ${ }^{15}$ The latter method also produces 5-bromo-2,2'bipyridine, which has to be separated from its disubstituted homologue. The yield of isolated 5,5'-dibromo-2,2'-bipyridine

Scheme 3
[(trifluoromethyl)sulfonyl]pyridine-5-carboxylate and 2-(tri-methylstannyl)-5-nitropyridine, we found that simple heating of commercially available 2,5 -dibromopyridine (1) and hexamethylditin in the presence of $\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\right]$ afforded, after 3 days reaction in refluxing benzene, the desired $5,5^{\prime}$-dibromo- $2,2^{\prime}$ bipyridine (2) in $80 \%$ yield after chromatography. This one-pot reaction allowed the preparation of $\mathbf{2}$ in $4-5 \mathrm{~g}$ scale amounts.
Separately, as shown in Scheme 2, boronic ester 5 was obtained in $80 \%$ yield by treating $p$-(5,5-dimethyl-1,3-dioxan-2yl)bromobenzene 4 with $t$-BuLi ( 2 equiv.) followed by sequential addition of trimethyl borate and pinacol. ${ }^{17}$ Subsequent coupling with $5,5^{\prime}$-dibromo-2, $2^{\prime}$-bipyridine 2 ( 0.5 equiv.) using Suzuki conditions $\left(\left[\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}\right], 1 \mathrm{~mol} \mathrm{dm}{ }^{-3}\right.$ aqueous $\mathrm{Na}_{2} \mathrm{CO}_{3}$, toluene, reflux) afforded the protected dialdehyde 6 in $80 \%$ yield after flash chromatography. The corresponding dialdehyde 7, which was obtained in $90 \%$ yield by hydrolysis with $5 \%$ aqueous HCl in THF at $50^{\circ} \mathrm{C}$, turned out to be poorly soluble in common organic solvents, and in our hands, did not react with the appropriate reagents (see below) to form the bis-porphyrin. Therefore, in the next step, the functionalized 5,5'-diphenyl-$2,2^{\prime}$-bipyridine derivative $\mathbf{6}$ was directly complexed to $\mathrm{Ru}(\mathrm{II})$, by reaction with Ru (phen) $)_{2} \mathrm{Cl}_{2}$ in refluxing $n$-butanol (Scheme 3). The deep-orange complex $\left[\mathrm{Ru}(\text { phen })_{2} 6\right]^{2+}$ was precipitated in $71 \%$ yield as its $\mathrm{PF}_{6}{ }^{-}$salt. Deprotection was done as above and afforded the dialdehyde $\left[\mathrm{Ru}(\mathrm{phen})_{2} 7\right]\left(\mathrm{PF}_{6}\right)_{2}$ in $89 \%$ yield.

Bis-porphyrin $[8]\left(\mathrm{PF}_{6}\right)_{2}$ was formed in the one-pot reaction ${ }^{18}$ of dialdehyde $\left[\mathrm{Ru}(\mathrm{phen})_{2} 7\right]\left(\mathrm{PF}_{6}\right)_{2}$ (1 equiv.), 3,5-di-tert-butylbenzaldehyde (9) ${ }^{19}$ (8 equiv.) and 3,3'-dihexyl-4,4'-dimethyl-$2,2^{\prime}$-methylenedipyrrole ( $\left.\mathbf{1 0}\right)^{20}$ (10 equiv.) in dichloromethane containing a few drops of trifluoroacetic acid, first at room temperature, then at reflux after the addition of tetrachloro- $p$ quinone (chloranil) to achieve oxidation of the porphyrinogen intermediates (Scheme 4). The desired compound was purified

$\left[\operatorname{Ru}(\text { phen })_{2} 7\right]\left(\mathrm{PF}_{6}\right)_{2}$

Scheme 4
by repeated column chromatography on silica gel and alumina, and isolated in $7.4 \%$ yield. Subsequent reaction with two equivalents of $\mathrm{Zn}(\mathrm{OAc})_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ afforded bis-porphyrin $[11]\left(\mathrm{PF}_{6}\right)_{2}$. It can be noted that, in the course of the chromatographic purification of bis-porphyrin $[8]\left(\mathrm{PF}_{6}\right)_{2}$, the porphyrin-Ru conjugate $[\mathbf{1 2}]\left(\mathrm{PF}_{6}\right)_{2}$, which bears a free aldehyde function, could be isolated in $2 \%$ yield from the reaction mixture.

The bis-porphyrins were characterized by ${ }^{1} \mathrm{H}-\mathrm{NMR}$, FAB-MS and UV-Vis. The data compiled in the Experimental section are in agreement with the expected structures (Scheme 5), with signatures of the porphyrins and the Ru complex fragment. For example, the following correlations were found in the ROESY maps of bis-porphyrin [11] $\left(\mathrm{PF}_{6}\right)_{2}:$ op- $\mathrm{CH}_{3 \mathrm{~d}}, \mathrm{CH}_{3 \mathrm{~d}}-\alpha_{\mathrm{d}}$, $\alpha_{\mathrm{d}}$-meso, meso- $\alpha_{\mathrm{p}}, \alpha_{\mathrm{p}}-\mathrm{CH}_{3 \mathrm{p}}, \mathrm{CH}_{3 \mathrm{p}}-\mathrm{m}$, o- $\gamma$, o- $\alpha, 4-5$, and 6-7, which, taken together with the COSY correlations could allow full assignment of the spectrum.

## Conclusion

We have described the multistep synthesis of a linear bisporphyrin rigidly bridged by a $5,5^{\prime}$-diphenylene- $2,2^{\prime}$-bipyridine spacer complexing a $\left[\mathrm{Ru}(\text { phen })_{2}\right]^{2+}$ metal complex fragment. It is noteworthy that the key starting material, $5,5^{\prime}$-dibromo-2, $2^{\prime}$ bipyridine, was prepared in good yield using a new route, i.e. Stille homocoupling of 2,5-dibromopyridine. Formally, the two porphyrins rings are separated by four $p$-phenylene-like groups, which makes our system a higher homologue of the existing bis-porphyrin compounds connected by up to three p-phenylene linkers. ${ }^{21}$

## Experimental

## General methods

Oxygen or water-sensitive reactions were conducted under a positive pressure of argon in oven-dried glassware, using

Schlenk techniques. Benzene and toluene were distilled from Na , THF was distilled from Na -benzophenone, and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was distilled from $\mathrm{P}_{2} \mathrm{O}_{5}$ prior to use. Common reagents and materials were purchased from commercial sources. The following materials were prepared according to literature procedures: $p$-(5,5-dimethyl-1,3-dioxan-2-yl)bromobenzene (1), ${ }^{22}$ $\left[\mathrm{Ru}(\text { phen })_{2} \mathrm{Cl}_{2}\right],{ }^{23} \quad 3,3^{\prime}$-dihexyl-4,4'-dimethyl-2, $2^{\prime}$-methylenedipyrrole (10), ${ }^{20}$ and 3,5-di-tert-butylbenzaldehyde (9). ${ }^{19}$ Thinlayer chromatography (TLC) was performed on glass plates coated with silica gel $60 \mathrm{~F}_{254}$ ( E . Merck). Column chromatography was carried out on silica gel 60 (E. Merck, 70-230 mesh). ${ }^{1} \mathrm{H}$ NMR spectra were obtained on either Bruker WP $200 \mathrm{SY}(200 \mathrm{MHz})$ or AM $400(400 \mathrm{MHz})$ spectrometer. NMR chemical shifts $\delta$ are expressed in ppm relative to TMS. The coupling constants $J$ are measured in Hz. Labels of the protons of the bis-porphyrins are provided in Scheme 5. Fast atom bombardment mass spectrometry (FAB MS) data were recorded in the positive ion mode with a xenon primary atom beam in conjunction with a 3-nitrobenzyl alcohol matrix and a ZAB-HF mass spectrometer. Melting points were determined in open capillary tubes on a Büchi 530 apparatus, and are uncorrected. Elemental analyses were performed by the Service de Microanalyse de l'Institut de Chimie de Strasbourg.

To a cold solution of $p$-(5,5-dimethyl-1,3-dioxan-2-yl)bromobenzene $4(1.00 \mathrm{~g}, 3.68 \mathrm{mmol})$ in THF $\left(40 \mathrm{~cm}^{3}\right)$ at $-75^{\circ} \mathrm{C}$ under argon, a solution of $t-\mathrm{BuLi}\left(1.4 \mathrm{~mol} \mathrm{dm}{ }^{-3}\right.$ in pentane, $5.52 \mathrm{~cm}^{3}$, 7.74 mmol ) was slowly added, keeping the temperature below $-70{ }^{\circ} \mathrm{C}$. This was followed 20 min later by trimethyl borate ( $0.451 \mathrm{~cm}^{3}, 4.05 \mathrm{mmol}$ ). The temperature was allowed to rise slowly up to room temperature over 2.5 h . Pinacol ( 0.982 g , 8.31 mmol ) was added and 10 min later the reaction was quenched with acetic acid $\left(0.215 \mathrm{~cm}^{3}, 3.77 \mathrm{mmol}\right)$. The reaction mixture was filtered through Celite, the filter washed with diethyl ether and the solvents removed from the filtrate under reduced pressure. The yellow residue was dissolved in $\mathrm{CHCl}_{3}-$ $\mathrm{H}_{2} \mathrm{O}\left(50: 50,40 \mathrm{~cm}^{3}\right)$. The organic phase was separated and washed with water $\left(3 \times 10 \mathrm{~cm}^{3}\right)$. It was dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, filtered and the chloroform removed under reduced pressure to leave a residue which was recrystallized from cyclohexane. Compound 5 was obtained as a white crystalline solid $(0.98 \mathrm{~g}$, $80 \%$ ), mp 170.5-172 ${ }^{\circ} \mathrm{C}$ (Found: C, 67.75; H, 8.64. $\mathrm{C}_{18} \mathrm{H}_{27} \mathrm{BO}_{4}$ requires $\mathrm{C}, 67.94 ; \mathrm{H}, 8.55 \%) ; \delta_{\mathrm{H}}\left(200 \mathrm{MHz} ; \mathrm{CDCl}_{3} ; \mathrm{Me}_{4} \mathrm{Si}\right) 7.82$ $\left(2 \mathrm{H}, \mathrm{d}, J_{1,3} 8.2, \mathrm{Ar}-\mathrm{H}\right), 7.51\left(2 \mathrm{H}, \mathrm{d}, J_{1,3} 7.9, \mathrm{Ar}-\mathrm{H}\right), 5.41(1 \mathrm{H}, \mathrm{s}$, $\mathrm{CH}), 3.72\left(4 \mathrm{H}, \mathrm{q}, J_{\mathrm{AB}} 11.0, \mathrm{CH}_{2}\right), 1.35\left(12 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right), 1.30(3 \mathrm{H}$, $\left.\mathrm{s}, \mathrm{CH}_{3}\right), 0.81\left(3 \mathrm{H}, \mathrm{s}, \mathrm{CH}_{3}\right)$.
