The first versatile organometallic reagents derived from azulenes, i.e., 6-(tri-n-butylstannyl)azulene (1a) and its 1,3-diethoxycarbonyl derivative (1b), have been prepared by $\operatorname{Pd}(0)$-catalyzed direct stannylation of 6-bromoazulenes with bis(tri-n-butyltin). We demonstrate the utility of the reagents in the Stille cross-coupling reaction with aryl, acyl and azulenyl halides to afford 6-aryl-, 6-acyl- and bi-azulenes in good yield. Furthermore, the methodology was applied to the synthesis of poly(azulen-6-yl)benzene derivatives. The reaction of $\mathbf{1 b}$ with $1,4-\mathrm{di}-, 1,3,5-$ tri-, 1,2,4,5-tetra- and hexabromobenzenes afforded 1,4-di-, 1,3,5-tri-, 1,2,4,5-tetra-, 1,2,4-tri- and 1,2,3,5-tetra(azulen6 -yl)benzene derivatives $(\mathbf{1 8}, \mathbf{2 0}, \mathbf{2 2}, 24$ and $\mathbf{2 5}$ ). The redox behavior of $\mathbf{1 8}$ and $\mathbf{2 2}$ was examined by cyclic voltammetry $(\mathrm{CV})$ and compared with those of 20 and 24 reported previously. In contrast to the three-step reduction of $\mathbf{2 0}$, the compound 18 exhibited a reversible one-step two-electron reduction wave at -1.30 V upon CV , which revealed the formation of a closed-shell dianion. The four azulen-6-yl substituents on benzene in a 1,2,4,5 relationship increased electron-accepting properties because of the formation of a closed-shell dianion stabilized by four azulen-6-yl groups. As expected, the compound $\mathbf{2 2}$ exhibited a color change during the electrochemical reduction. However, the reverse oxidation did not regenerate the spectrum of $\mathbf{2 2}$ due to the low stability of the presumed dianionic species under the conditions of the UV-vis measurement.

## Introduction

Palladium-catalyzed cross-coupling reaction has become a widely used method for carbon-carbon bond formation in modern organic synthesis. ${ }^{1}$ Several applications of this transition-metal catalyzed reaction in the chemistry of azulenes have also appeared in the literature, e.g., palladium-catalyzed vinylation, ${ }^{2}$ arylation, ${ }^{3}$ ethynylation ${ }^{4}$ and alkylation ${ }^{5}$ of azulenyl halides or triflate. However, the lack of a versatile organometallic reagent for the transition-metal catalyzed reaction of azulene itself imposes restrictions ${ }^{6}$ because of the synthetic inaccessibility of such a reagent due to the high reactivity of azulenes with organolithium and magnesium reagents to produce dihydroazulene derivatives. ${ }^{7}$ From the viewpoint of the general usage of transition-metal catalyzed reactions in the chemistry of azulenes, we focused on the development of an organometallic reagent for the transition-metal catalyzed reaction of azulenes. Especially, application of the reagent would be a great advantage in multiple functionalization with azulenyl groups because the method does not require the preparation of troublesome polymetallic species. ${ }^{8}$

The Stille cross-coupling of organotin compounds with a variety of organic electrophiles, catalyzed by palladium, provides an efficient method for carbon-carbon bond formation. ${ }^{1,9}$ Functionalization of azulene in the seven membered-ring is rather difficult so far, although that of the 1,3-positions of the system can be easily achieved by electrophilic substitution. Therefore, we examined the stannylation of azulenes in the seven-membered ring and the potential of the reagents for the Stille cross-coupling reaction. Herein we report in detail the preparation of the first versatile organometallic reagents of azulenes, 6-(tri-n-butylstannyl)azulene (1a) and its 1,3-diethoxycarbonyl derivative (1b) and the successful application to the $\mathrm{Pd}(0)$-catalyzed Stille cross-coupling reaction of $\mathbf{1 a}$ and $\mathbf{1 b}$ with
aryl, acyl and/or azulenyl halides to demonstrate the utility of the reagents for carbon-carbon bond formation. ${ }^{10}$

We also demonstrate easy access to poly(azulen-6-yl)benzene derivatives via the cross-coupling reaction of $\mathbf{1 b}$ with aromatic polybromides promoted by the $\mathrm{Pd}(0)$-catalyzed reaction. Recently, Hünig et al. have proposed the concept of violenecyanine hybrids as stabilized organic electrochromics. ${ }^{11}$ The hybrids contain the moiety $X=C-Y$, which represents $a$ "cyanine"-type structure in fully reduced or oxidized form, as the end groups of violene. The system provides highly colored closed-shell systems such as cyanine dyes by an overall twoelectron transfer (Scheme 1). We have recently proposed that the

poly(azulen-6-yl)benzene derivatives could be considered as candidates for such a system. ${ }^{12}$ Depending on the number and position of the azulen-6-yl substituents, the system could

${ }^{a}$ Reactions of $\mathbf{1 b}(0.2 \mathrm{mmol})$ with $\mathbf{4 a}$ or $\mathbf{4 b}(0.6 \mathrm{mmol})$ were carried out at reflux temperature for 24 h by using $10 \mathrm{~mol} \% \mathrm{Pd}(0)$-catalyst, ligand ( $\mathrm{Pd}: \mathrm{P}=1: 2$ ), and 2.2 equiv of CsF in 20 ml of the solvent. ${ }^{b}$ All yields are isolated yields. ${ }^{c}$ BINAP: 2, $2^{\prime}$-bis(diphenylphosphino)-1, $1^{\prime}$-binaphthyl.
provide a closed-shell cyanine-type structure by the twoelectron reduction. Herein, we also report the redox behavior of several poly(azulen-6-yl)benzene derivatives prepared by the cross-coupling reaction of $\mathbf{1 b}$ with aromatic polybromides.

## Results and discussion

Traditionally, aryltin compounds have been prepared by reacting an aryllithium intermediate, generated by deprotonation or halogen-metal exchange, with trialkyltin compounds that have good leaving groups. ${ }^{13}$ However, the azulen-6-yllithium intermediate was so far unknown and could not be easily generated by halogen-metal exchange. Therefore, the first 6 -stannylazulenes ( $\mathbf{1} \mathbf{a}$ and $\mathbf{1 b}$ ) were synthesized from 6-bromoazulenes (2a and 2b) ${ }^{14}$ via $\operatorname{Pd}(0)$-catalyzed direct stannylation with bis(tri- $n$-butyltin) (3). ${ }^{15}$ The coupling reaction of $\mathbf{2 a}$ with $\mathbf{3}$ in the presence of a catalytic amount of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ in refluxing toluene for 1 d provided the desired 6 -(tri- $n$-butylstannyl)azulene (1a) in 49\% yield. Likewise, diethyl 6-(tri- $n$-butyl-stannyl)azulene-1,3-dicarboxylate (1b) was prepared from 2b with $\mathbf{3}$ in $69 \%$ yield (Scheme 2). These organotin compounds

Scheme 2
are stable and are easily characterized by the usual spectroscopic analysis.

To demonstrate the transformations using $\mathbf{1 a}$ and $\mathbf{1 b}$, we conducted the Stille cross-coupling reaction with aryl, acyl and azulenyl halides to produce 6 -aryl-, 6 -acyl- and bi-azulenes. The results of the reaction of $\mathbf{1 b}$ with 4-bromo- and 4-iodotoluenes ( $\mathbf{4 a}$ and $\mathbf{4 b}$ ) are summarized in Table 1. In our initial experiments, $\mathbf{1 b}$ proved to be inefficient in the cross-coupling reaction under typical conditions for the reaction with aryl halides. ${ }^{16}$ The reaction of $\mathbf{1 b}$ with $\mathbf{4 a}$ in the presence of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ catalyst produced the desired diethyl 6-(4-tolyl)azulene-1,3-dicarboxylate (5) in $16 \%$ yield together with a significant amount of undesired diethyl 6 -phenylazulene-1,3-dicarboxylate (6), ${ }^{17}$ diethyl azulene-1,3-dicarboxylate (7b) ${ }^{18}$ and tetraethyl $6,6^{\prime}$ -biazulene-1, 1', 3, 3'-tetracarboxylate (8b) (entry 1) (Chart 1).

Using $\mathbf{4 b}$ instead of $\mathbf{4 a}$ increased the recovery of $\mathbf{1 b}$ (entry 2 ). Formation of $\mathbf{6}$ in considerable yield is attributable to arylphenyl exchange with the triphenylphosphine ligand in the initial intermediate formed by oxidative addition of $\operatorname{Pd}(0)$ into the aryl halide. ${ }^{19}$ Thus, the choice of the catalytic system was very important for the success of the reaction of $\mathbf{1 b}$. Substitution of the $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ catalyst with $\mathrm{Pd}_{2}(\mathrm{dba})_{3}-\mathrm{P}(t-\mathrm{Bu})_{3}$ in the catalytic protocol resulted in a significant increase of the desired cross-coupling product 5 (entry 3 ). A fluoride-activation strategy ${ }^{20}$ which was utilized for the activation of the organotin compound, was effective for this Stille cross-coupling reaction. The addition of CsF in the catalytic protocol increased the desired coupling product 5 up to $74 \%$ yield (entry 4). While good conversions were obtained by using $\mathbf{4 a}$, the use of $\mathbf{4 b}$ was unfavorable under the reaction conditions, which decreased the conversion ratio of the catalytic reaction significantly (entries 5 and 6). The use of BINAP as a ligand did not afford satisfactory results either in the presence or absence of CsF (entries 7 and 8).
To test the generality, the cross-coupling reaction with several aryl bromides was conducted under the reaction conditions. The results of the cross-coupling reaction of $\mathbf{1 a}$ and $\mathbf{1 b}$ with aryl bromides are summarized in Table 2. The electron-deficient aryl bromide, 4-bromonitrobenzene was efficiently reacted with $\mathbf{1 b}$ to afford the coupled product $9 \mathbf{a}$ in high yield (entry 1 ). Under similar conditions, the reaction of $\mathbf{1 b}$ with 4-bromoacetophenone also afforded the desired coupling product $\mathbf{9 b}$ in good yield (entry 2). In the case of the reaction of $\mathbf{1 b}$ with

${ }^{a}$ Reaction conditions: $\mathbf{1 a}(0.3 \mathrm{mmol})$ or $\mathbf{1 b}(0.2 \mathrm{mmol})$, aryl bromides ( 0.9 and 0.6 mmol , respectively), $\mathrm{Pd}_{2}(\mathrm{dba})_{3}(10 \mathrm{~mol} \%), \mathrm{P}(t-\mathrm{Bu})_{3}(40$ $\mathrm{mol} \%$ ), CsF ( 2.2 eq ), dioxane ( 30 and 20 ml , respectively), refluxed under an Ar atmosphere. ${ }^{b}$ All yields are isolated yields. ${ }^{c}$ The reaction was carried out without an addition of CsF.
electron-rich bromide, 4-bromoanisole, the reaction also proceeded smoothly under our reaction conditions to give the cross-coupling product 9 c (entry 3 ).

The fluoride-activation strategy was also effective for the catalytic protocol of $\mathbf{1 a}$ with $\mathbf{4 a}$. In the presence of CsF the reaction afforded the desired cross-coupling product $9 d^{3 b, 21}$ in $60 \%$ yield, although the reaction without CsF did not afford satisfactory results (entries 4 and 5). On the whole, 1a also reacted rapidly with a variety of aryl bromides including an electron-rich one under the $\operatorname{Pd}(0)$-catalyzed conditions and generally the isolated yields of the cross-coupling product were above 60\% (entries 6-8).

To demonstrate the scope of this procedure, attempts were made for the preparation of 6 -acylazulenes, $6,6^{\prime}$ - and $2,6^{\prime}$ biazulenes utilizing the cross-coupling reaction of $\mathbf{1 b}$ with acyl chlorides, azulen-6-yl and azulen-2-yl bromides, respectively. Preparation of 6-actetylazulene 10 c has been achieved by multistep reaction from a tropolone derivative having an acetyl substituent. ${ }^{22}$ However, several 6-acylazulene derivatives 10a-c could be easily prepared by the cross-coupling reaction of $\mathbf{1 b}$ with acyl chlorides under the $\operatorname{Pd}(0)$-catalyzed reaction conditions. The results of the cross-coupling reaction of $\mathbf{1 b}$ with acyl chlorides are summarized in Table 3. Benzoyl chloride was efficiently reacted with $\mathbf{1 b}$ to afford the coupled product 10 a in high yield (entry 1). Under similar reaction conditions, the reaction of $\mathbf{1 b}$ with $n$-heptanoyl chloride also afforded the desired coupling product $\mathbf{1 0 b}$ in good yield together with a small amount of $\mathbf{7 b}$ (entry 2 ). In the case of the reaction of $\mathbf{1 b}$ with acetyl chloride, the reaction also proceeded smoothly under the reaction conditions, but the reaction did not give the coupled product 10c in satisfactory yield due to the formation of a significant amount of $\mathbf{7 b}$ (entry 3 ).

Preparation of biazulenes has been achieved by homocoupling reaction of azulenyl halides ${ }^{23}$ or stepwise reaction to prepare the two azulene rings. ${ }^{24}$ However, selective synthesis of unsymmetrical biazulenes has been significantly difficult so far because of the restriction of the synthetic methods. The

${ }^{a}$ Reaction conditions: 1b ( 0.2 mmol ), acyl chlorides ( 0.6 mmol ), $\mathrm{Pd}_{2}(\mathrm{dba})_{3}(10 \mathrm{~mol} \%), \mathrm{P}(t-\mathrm{Bu})_{3}(40 \mathrm{~mol} \%), \mathrm{CsF}(2.2 \mathrm{eq})$, dioxane ( 20 ml ), refluxed under an Ar atmosphere. ${ }^{b}$ All yields are isolated yields.
coupling reaction of a mixture of azulenyl halides affords homo-coupling products in addition to the desired crosscoupled one. We then applied our new 6-stannylazulene 1b to the selective synthesis of biazulenes including unsymmetrical ones. Under conditions analogous to those for the reaction with aryl bromides, $\mathbf{1 b}$ reacted smoothly with $\mathbf{2 a}$ and $\mathbf{2 b}$ to afford 6,6'-biazulenes ( $\mathbf{1 1}$ and $\mathbf{8 b}$ ) in $46 \%$ and $68 \%$ yields, respectively. Similarly, the present method could be applied to the selective synthesis of 2,6'-biazulene. The reaction of $\mathbf{1 b}$ with 2 -bromoazulene (13) under the $\operatorname{Pd}(0)$-catalyzed conditions afforded 2,6'-biazulene 12 in $51 \%$ yield (Chart 2 ).

Finally, we demonstrated the use of the new 6-stannylazulene 1b in the synthesis of poly(azulen-6-yl)benzene derivatives. We have recently reported the preparation of some azulen-6ylbenzene derivatives utilizing Diels-Alder reaction of azulen-6-ylacetylenes with cyclopentadienone ${ }^{4 a}$ and Co-catalyzed cyclotrimerization of the azulen-6-ylacetylenes. ${ }^{12}$ The reaction can introduce the azulen-6-yl groups to the aromatic core, but into limited positions. The scope of this methodology for multiple substitution was demonstrated utilizing the reaction of $\mathbf{1 b}$ with di-, tri-, tetra- and hexabromobenzenes (14-17).

The reaction of $\mathbf{1 b}$ with $\mathbf{1 4}$ afforded the desired coupled product, 1,4-bis[1,3-bis(ethoxycarbonyl)azulen-6-yl]benzene (18) in $32 \%$ yield along with 1-[1,3-bis(ethoxycarbonyl)azulen6 -yl]-4-butylbenzene (19) in $11 \%$ yield (Scheme 3 ). The reaction of $\mathbf{1 b}$ with $\mathbf{1 5}$ also gave the desired tris-adduct $\mathbf{2 0}^{12}$ in $28 \%$ yield together with 1,3-bis[1,3-bis(ethoxycarbonyl)azulen-6-yl]-5-butylbenzene (21) in 13\% yield (Scheme 4). Therefore, transfer of an $n$-butyl group from the organotin reagent $\mathbf{1 b}$ was the side reaction for the multi-functionalization of benzene with azulen-6-yl substituents. Likewise, the reaction of $\mathbf{1 b}$ with $\mathbf{1 6}$ afforded the expected tetrakis-adduct $\mathbf{2 2}$ in $\mathbf{1 3} \%$ yield together with 5-butyl-1,2,4-tris[1,3-bis(ethoxycarbonyl)azulen-6-yl]benzene (23) and 1,2,4-tris[1,3-bis(ethoxycarbonyl)azulen-6-yl]benz-

Scheme 3

15

$+$

Scheme 4
ene (24) ${ }^{12}$ in $5 \%$ and $6 \%$ yields, respectively (Scheme 5). On increasing the steric hindrance, the reduction of bromide also took place in addition to the transfer of an $n$-butyl group. In the case of the reaction of $\mathbf{1 b}$ with $\mathbf{1 7}$, the reaction afforded $\mathbf{2 0}$ and a mixture ( $1.6: 1$ ) of 22 and 1,2,3,5-tetrakis[1,3-bis(ethoxy-carbonyl)azulen-6-yl]benzene (25) in $16 \%$ and $8 \%$ yields, respectively, instead of the desired hexa(azulen-6-yl)benzene derivative 26 (Scheme 6). Separation of the products 22 and 25

16

22

23: $\mathrm{R}=n-\mathrm{Bu}$

Scheme 5

1b

Scheme 6
was attempted by repeated silica gel preparative TLC, but we could not separate 22 and 25 , completely. The ratio of 22 and $\mathbf{2 5}$ could be increased up to $1: 12$ and the characterization of $\mathbf{2 5}$ was accomplished by both ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectroscopy. Formation of the products $\mathbf{2 0}, \mathbf{2 2}$ and $\mathbf{2 5}$ indicates that the transfer of azulen-6-yl groups does not occur at the positions

Scheme 7
pointed out by asterisks in Scheme 7, which are interposed by two azulen-6-yl groups. Since 1,2-disubstitution is unfavorable for steric reasons, therefore, a plausible pathway for the formation of these compounds could be depicted as in Scheme 7.

The methodology was then applied to functionaliaztion at the 2-position of azulenes. However, the reaction of 2-bromoazulene (13) with 3 under similar $\operatorname{Pd}(0)$-catalyzed conditions afforded the desired 2 -stannylazulene (27) in only $11 \%$ yield together with $2,2^{\prime}$-biazulene (28) in $48 \%$ yield (Scheme 8 ). ${ }^{25}$ The

Scheme 8
high reactivity of either the desired product 27 with $\mathbf{1 3}$ or homocoupling ${ }^{26}$ of 27 under the reaction conditions leads to the formation of 28 in significant amounts. For functionalization at the 2-position, use of azulen-2-yl borate, which could be prepared by the same strategy, ${ }^{27}$ was more effective for similar $\operatorname{Pd}(0)$-catalyzed reactions. ${ }^{28}$

The redox behavior of the benzene derivatives $\mathbf{1 8}$ and $\mathbf{2 2}$ represented the presumed multi-electron redox properties. The reduction potentials ( V vs. $\mathrm{Ag} / \mathrm{Ag}^{+}$) of $\mathbf{1 8}$ and 22, along with those of $\mathbf{2 0}$ and 24, measured by CV are summarized in Table 4 In contrast to the three-step reduction of the 1,3,5-tri(azulen-6yl)benzene $20,{ }^{12}$ compound $\mathbf{1 8}$ showed a reversible one-step two-electron reduction wave at -1.30 V upon CV (Fig. 1a). The relatively less negative reduction potential of $\mathbf{1 8}$ compared with that of $\mathbf{2 0}$ is attributable to the stabilization of the dianion by the formation of a closed-shell dianionic structure $\mathbf{1 8}_{\text {RED }}{ }^{-2}$. Therefore, the two azulen- 6 -yl substituents on the benzene ring in a 1,4 relationship increased the electron-accepting properties. Thus, the redox system of $\mathbf{1 8}$ can be depicted as illustrated in Scheme 9

The voltammogram of $\mathbf{2 2}$ was characterized by a reversible wave at -1.27 V and the next barely separated irreversible one centered at -1.61 V upon CV (Fig. 1b). The first reversible

Table 4 Reduction potentials ${ }^{a}$ of the poly(azulen-6-yl)benzene derivatives

| Sample | $E_{1}{ }^{\text {red }} / \mathrm{V}$ | $E_{2}{ }^{\text {red }} / \mathrm{V}$ | $E_{3}{ }^{\text {red }} / \mathrm{V}$ | Ref. |
| :--- | :---: | :---: | :---: | :---: |
| $\mathbf{1 8}$ | $-1.30(2 \mathrm{e})$ |  |  |  |
| $\mathbf{2 0}$ | $(-1.38)^{b}$ | $(-1.46)^{b}$ | $(-1.55)^{b}$ | 12 |
| $\mathbf{2 2}$ | $-1.27(2 \mathrm{e})$ | $(-1.57)^{b}$ | $(-1.62)^{b}$ | 12 |
| $\mathbf{2 4}$ | $-1.31(2 \mathrm{e})$ | $-1.63(1 \mathrm{e})$ |  | 1 |

${ }^{a}$ The reduction potentials were measured by CV $\left(0.1 \mathrm{M} n\right.$ - $\mathrm{Bu}_{4} \mathrm{NBF}_{4}$ in tetrahydrofuran, Pt electrode, scan rate $=100 \mathrm{mV} \mathrm{s}^{-1}$, and $\mathrm{Fc} / \mathrm{Fc}^{+}=0.19$ V ). In the case of irreversible waves, which, are shown in parentheses, $E_{\text {red }}$ were calculated as $E_{\mathrm{pc}}$ (cathodic peak potential) $+0.03 \mathrm{~V} .{ }^{b}$ The values are peak potentials measured by DPV.
wave for $\mathbf{2 2}$ should be due to the one-step two-electron reduction to form dianion $\mathbf{2 2}_{\text {RED }}{ }^{-2}$ and the second one could be attributed to the stepwise redox reaction of $\mathbf{2 2}_{\mathrm{RED}}{ }^{-2}$ to produce tetraanion diradical $22_{\text {RED }}{ }^{\cdot-4}$, by analogy with those of $1,2,4-$ tri(azulen-6-yl)benzene derivative 24. ${ }^{\mathbf{1 2}}$ Indeed, the second wave was identified as two waves that were barely separated, at -1.57 and -1.62 V , by differential pulse voltammetry (DPV). Thus, the four azulen-6-yl substituents on benzene in a 1,2,4,5 relationship increased the electron-accepting properties because of the formation of a closed-shell dianionic structure $\mathbf{2 2}_{\text {RED }}{ }^{-2}$. Consequently, the redox system of $\mathbf{2 2}$ could be illustrated as a violene-cyanine hybrid and could exhibit a significant color change with a change to a different oxidation state (Scheme 10).

Electrochemical reduction of $\mathbf{2 2}$ was examined to clarify the formation of colored species arising from dianion $\mathbf{2 2}_{\text {RED }}{ }^{-2}$ by visible spectroscopy under the electrochemical reduction conditions. When the visible spectra of $\mathbf{2 2}$ were measured under the electrochemical reduction conditions in benzonitrile containing $\mathrm{Et}_{4} \mathrm{NClO}_{4}(0.1 \mathrm{M})$ at room temperature, a new absorption in the visible region was gradually developed as shown in Fig. 2. The color of the solution of $\mathbf{2 2}$ gradually changed from pink to brown during the electrochemical reduction. However, the reverse oxidation of the colored solution did not regenerate the spectrum of the neutral 22, although good reversibility was observed upon CV. The color of the solution changed to orange during the electrochemical oxidation. These results demonstrate the low stability of the dianionic species under the conditions of the measurement, although the dianions $\mathbf{2 2}_{\mathrm{RED}^{-2}}$ are stabilized by four azulen-6-yl substituents.

## Conclusion

As stated above, the first organotin reagents of azulenes, 6 -stannylazulenes ( $\mathbf{1 a}$ and $\mathbf{1 b}$ ), were prepared by $\mathrm{Pd}(0)$-catalyzed direct stannylation of 6-bromoazulenes ( $\mathbf{2 a}$ and $\mathbf{2 b}$ ) and their application in $\mathrm{Pd}(0)$-catalyzed Stille cross-coupling reaction with aryl, acyl and azulenyl halides was investigated. In fact, our new stannylazulenes were effective in the Stille cross-

Fig. 1 Cyclic voltammograms of (a) $\mathbf{1 8}$ and (b) $\mathbf{2 2}$ in THF containing $n-\mathrm{Bu}_{4} \mathrm{NBF}_{4}(0.1 \mathrm{M})$ as a supporting electrolyte.

Fig. 2 Continuous change in visible spectrum of $22\left(2 \mathrm{~cm}^{3} ; 2.0 \times\right.$ $10^{-4} \mathrm{M}$ ) in benzonitrile containing $\mathrm{Et}_{4} \mathrm{NClO}_{4}(0.1 \mathrm{M})$ upon constantcurrent electrochemical reduction $(100 \mathrm{uA})$ at 3 min interval.
coupling reaction to afford 6-aryl-, 6-acyl- and bi-azulenes. This study shows the potential utility of the new transition-metal catalyzed reaction for the difficult functionalization of azulenes in the seven-membered ring. Indeed, the methodology was applied to the synthesis of several poly(azulen-6-yl)benzene derivatives (18-25). The redox behavior of $\mathbf{1 8}$ and $\mathbf{2 2}$ was examined by cyclic voltammetry (CV) and compared with those of $\mathbf{2 0}$ and $\mathbf{2 4}$ reported previously. We could not detect the

Scheme 10
colored closed-shell dianion of azulene-substituted benzene derivatives by UV-vis spectroscopy due to the instability of the species. However, the redox behavior examined by CV represented the presumed multi-electron redox properties under the electrochemical conditions used.

## Experimental

## General

Mps were determined on a Yanagimoto micro melting point apparatus MP-S3 and are uncorrected. Mass spectra were obtained with a JEOL HX-110 or a Hitachi M-2500 instrument usually at 70 eV . IR and UV spectra were measured on a Shimadzu FTIR-8100M and a Hitachi U-3410 spectrophotometers, respectively. ${ }^{1} \mathrm{H}$ NMR spectra ( ${ }^{13} \mathrm{C}$ NMR spectra) were recorded on a JEOL GSX 400 at $400 \mathrm{MHz}(100 \mathrm{MHz})$ or a JEOL A500 at $500 \mathrm{MHz}(125 \mathrm{MHz})$. Gel permeation chromatography (GPC) was performed on a TSKgel $\mathrm{G} 2000 \mathrm{H}_{6}$. Elemental analyses were performed at the Instrumental Analysis Center of Chemistry, Faculty of Science, Tohoku University.

## 6-(Tri-n-butylstannyl)azulene 1a

To a degassed solution of $\mathbf{2 a}(829 \mathrm{mg}, 4.00 \mathrm{mmol})$ and $\mathbf{3}(4.65 \mathrm{~g}$, $8.02 \mathrm{mmol})$ in dry toluene $\left(50 \mathrm{~cm}^{3}\right)$ was added $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}$ $(239 \mathrm{mg}, 0.207 \mathrm{mmol}$ ). After the resulting mixture was refluxed for 24 h under an Ar atmosphere, the solvent was removed under reduced pressure. The residue was purified by column chromatography on silica gel and medium-pressure liquid column chromatography on silica gel with hexane to afford $\mathbf{1 a}$ ( $817 \mathrm{mg}, 49 \%$ ) as a blue oil (Found: C, 63.3; H, 8.1. Calc. for $\left.\mathrm{C}_{22} \mathrm{H}_{34} \mathrm{Sn}: \mathrm{C}, 63.3 ; \mathrm{H}, 8.2 \%\right)$ ); $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 238$ ( $\log \varepsilon 4.16$ ), 286 (4.74), 332 (3.70), 339 (3.67), 347 (3.83), 575 (2.51), 620 (2.44) and 682 (2.01); $v_{\text {max }}$ (neat) $/ \mathrm{cm}^{-1} 2960,2924,2868,2852$, $1578,1464,1446,1396,814$ and $746 ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.22$ (d, $J 9.3,2 \mathrm{H}, 4,8-\mathrm{H}$ ), 7.88 (t, $J 3.8,1 \mathrm{H}, 2-\mathrm{H}$ ), 7.36 (d, $J 3.8,2 \mathrm{H}$, $1,3-\mathrm{H}), 7.35(\mathrm{~d}, J 9.3,2 \mathrm{H}, 5,7-\mathrm{H}), 1.57\left(\mathrm{~m}, 6 \mathrm{H}, 2^{\prime}-\mathrm{H}\right), 1.35(\mathrm{tq}$, $J 7.3$ and $\left.7.3,6 \mathrm{H}, 3^{\prime}-\mathrm{H}\right), 1.14\left(\mathrm{~m}, 6 \mathrm{H}, 1^{\prime}-\mathrm{H}\right)$ and $0.89(\mathrm{t}, J 7.3$, $\left.9 \mathrm{H}, 4^{\prime}-\mathrm{H}\right) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 159.8(\mathrm{C}-6), 139.7(\mathrm{C}-3 \mathrm{a}, 8 \mathrm{a})$,
137.0 (C-2), 134.5 (C-4,8), 130.6 (C-5,7), 117.4 (C-1,3), 29.0 (C-2'), 27.4 (C-3'), 13.7 (C-4') and 10.4 (C-1'); $m / z$ (EI) 418 $\left(\mathrm{M}^{+}, 50 \%\right), 361\left(\mathrm{M}^{+}-\mathrm{Bu}, 86\right), 305\left(\mathrm{M}^{+}-2 \mathrm{Bu}+\mathrm{H}, 56\right)$ and 247 ( $\left.\mathrm{M}^{+}-3 \mathrm{Bu}, 100\right)$.

## Diethyl 6-(tri-n-butylstannyl)azulene-1,3-dicarboxylate 1b

The same procedure as was used for the preparation of $\mathbf{1 a}$ was adopted. The reaction of $\mathbf{2 b}(3.49 \mathrm{~g}, 9.94 \mathrm{mmol})$ with $\mathbf{3}(11.52 \mathrm{~g}$, 19.86 mmol ) in dry toluene ( $200 \mathrm{~cm}^{3}$ ) in the presence of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(569 \mathrm{mg}, 0.492 \mathrm{mmol})$ followed by chromatographic purification on silica gel with hexane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and mediumpressure column chromatography on silica gel with $30 \%$ ethyl acetate-hexane afforded $\mathbf{1 b}(3.86 \mathrm{~g}, 69 \%)$ as a red oil (Found: C, 59.7; H, 7.45. Calc. for $\mathrm{C}_{28} \mathrm{H}_{42} \mathrm{O}_{4} \mathrm{Sn}: \mathrm{C}, 59.9 ; \mathrm{H}, 7.5 \%$ ); $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 235(\log \varepsilon 4.52), 275$ (4.44), 311 (4.65), 377 (4.06) and 502 (2.88); $v_{\text {max }}($ neat $) / \mathrm{cm}^{-1} 2957,2928,1694(\mathrm{C}=\mathrm{O})$, 1431, 1202 and 1048; $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.63(\mathrm{~d}, J 10.0,2 \mathrm{H}$, $4,8-\mathrm{H}), 8.83$ (s, 1H, 2-H), 7.96 (d, J 10.0, 2H, $5,7-\mathrm{H}$ ), 4.44 (q, $J 7.1,4 \mathrm{H}, 1,3-\mathrm{COOEt}), 1.58\left(\mathrm{~m}, 6 \mathrm{H}, 2^{\prime}-\mathrm{H}\right), 1.46(\mathrm{t}, J 7.1$, $6 \mathrm{H}, 1,3-\mathrm{COOEt}), 1.35\left(\mathrm{tq}, J 7.3\right.$ and $\left.7.3,6 \mathrm{H}, 3^{\prime}-\mathrm{H}\right), 1.21(\mathrm{~m}$, $\left.6 \mathrm{H}, 1^{\prime}-\mathrm{H}\right)$ and $0.90\left(\mathrm{t}, J 7.3,9 \mathrm{H}, 4^{\prime}-\mathrm{H}\right) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right)$ 166.6 (C-6), 165.1 (s, 1,3-COOEt), 143.6 (C-3a,8a), 143.5 (C-2), 138.6 (C-5,7), 136.6 (C-4,8), 115.7 (C-1,3), 59.9 (t, 1,3-COOEt), 28.9 (C-2'), 27.3 (C-3'), 14.6 (q, 1,3-COOEt), 13.6 (C-4') and 10.6 (C-1'); m/z (EI) 562 ( ${ }^{+}, 40 \%$ ) and 505 $\left(\mathrm{M}^{+}-\mathrm{Bu}, 100\right)$.

## General procedure for the Stille cross-coupling reaction of 1a and 1b

To a degassed solution of $\mathbf{1 a}$ or $\mathbf{1 b}$ and aryl, acyl or azulenyl halides in dry solvent was added $\mathrm{Pd}(0)$-catalyst, ligand and CsF. After the resulting mixture was refluxed under an Ar atmosphere, the solvent was removed under reduced pressure. The products were isolated by column chromatography on silica gel with $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and/or $5-10 \%$ ethyl acetate- $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, mediumpressure column chromatography on silica gel with $30 \%$ ethyl acetate-hexane and/or gel permeation chromatography (GPC) with $\mathrm{CHCl}_{3}$.

Diethyl 6-tolylazulene-1,3-dicarboxylate 5. The general procedure was followed by using $\mathbf{1 b}$ ( $116 \mathrm{mg}, 0.207 \mathrm{mmol}$ ), $\mathbf{4 a}$ $(104 \mathrm{mg}, 0.608 \mathrm{mmol}), \mathrm{Pd}_{2}(\mathrm{dba})_{3}(18.3 \mathrm{mg}, 0.0200 \mathrm{mmol})$, $\mathrm{P}(t-\mathrm{Bu})_{3}(20.1 \mathrm{mg}, 0.0993 \mathrm{mmol})$, CsF $(66.5 \mathrm{mg}, 0.438 \mathrm{mmol})$ and dioxane $\left(20 \mathrm{~cm}^{3}\right)$. Chromatographic purification afforded 5 $(55.4 \mathrm{mg}, 74 \%)$ as deep red needles, $7 \mathrm{~b}(4.4 \mathrm{mg}, 8 \%)$ as red crystals and $\mathbf{8 b}(2.7 \mathrm{mg}, 5 \%)$ as a purple powder.

Reaction of 1b with 17. Following the general procedure, the reaction of 1b ( $804 \mathrm{mg}, 1.43 \mathrm{mmol}$ ) with $17(104 \mathrm{mg}$, 0.189 mmol ) in refluxing dioxane ( $20 \mathrm{~cm}^{3}$ ) in the presence of $\mathrm{Pd}_{2}(\mathrm{dba})_{3}(105 \mathrm{mg}, 0.115 \mathrm{mmol}), \mathrm{P}(t-\mathrm{Bu})_{3}(121 \mathrm{mg}$, 0.598 mmol ) and CsF ( $497 \mathrm{mg}, 3.27 \mathrm{mmol}$ ) afforded 20 ( $27.5 \mathrm{mg}, 16 \%$ ), a mixture ( $1.6: 1$ ) of 22 and $25(16.8 \mathrm{mg}, 8 \%)$ and the recovered $\mathbf{1 b}(119.2 \mathrm{mg}, 15 \%)$.

For 25. $\delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 9.89\left(\mathrm{~d}, J 11.1,2 \mathrm{H}, 4^{\prime \prime \prime \prime}, 8^{\prime \prime \prime \prime}-\mathrm{H}\right)$, $9.55\left(\mathrm{~d}, J 11.1,4 \mathrm{H}, 4^{\prime}, 8^{\prime}-\mathrm{H}\right.$ and $\left.4^{\prime \prime \prime}, 8^{\prime \prime \prime}-\mathrm{H}\right), 9.31$ (d, $J 11.1,2 \mathrm{H}$, $\left.4^{\prime \prime}, 8^{\prime \prime}-\mathrm{H}\right), 8.88\left(\mathrm{~s}, 1 \mathrm{H}, 2^{\prime \prime \prime \prime}-\mathrm{H}\right), 8.78\left(\mathrm{~s}, 2 \mathrm{H}, 2^{\prime}-\mathrm{H}\right.$ and $\left.2^{\prime \prime \prime}-\mathrm{H}\right), 8.68$ (s, 1H, 2"-H), 8.08 (d, J 11.1, 2H, $\left.5^{\prime \prime \prime \prime}, 7^{\prime \prime \prime \prime}-\mathrm{H}\right), 7.96$ (s, 2H, 4,6-H), 7.68 (d, J 11.1, 4H, $5^{\prime}, 7^{\prime}-\mathrm{H}$ and $\left.5^{\prime \prime \prime}, 7^{\prime \prime \prime}-\mathrm{H}\right), 7.50$ (d, J 11.1, 2H, $\left.5^{\prime \prime}, 7^{\prime \prime}-\mathrm{H}\right), 4.45\left(\mathrm{q}, J 7.1,4 \mathrm{H}, 1^{\prime \prime}, 3^{\prime \prime}-\right.$ or $\left.1^{\prime \prime \prime}, 3^{\prime \prime \prime \prime}-\mathrm{COOEt}\right), 4.38$ (q, $J 7.1,8 \mathrm{H}, 1^{\prime}, 3^{\prime}-$ and $\left.1^{\prime \prime \prime}, 3^{\prime \prime \prime}-\mathrm{COOEt}\right), 4.32\left(\mathrm{q}, J 7.1,4 \mathrm{H}, 1^{\prime \prime}, 3^{\prime \prime}\right.$ - or $\left.1^{\prime \prime \prime \prime}, 3^{\prime \prime \prime \prime}-\mathrm{COOEt}\right), 1.47\left(\mathrm{t}, J 7.1,6 \mathrm{H}, 1^{\prime \prime}, 3^{\prime \prime}-\right.$ or $\left.1^{\prime \prime \prime \prime}, 3^{\prime \prime \prime \prime}-\mathrm{COOEt}\right)$, $1.41\left(\mathrm{t}, J 7.1,12 \mathrm{H}, 1^{\prime}, 3^{\prime}-\right.$ and $\left.1^{\prime \prime \prime}, 3^{\prime \prime \prime}-\mathrm{COOEt}\right)$ and $1.36(\mathrm{t}, J 7.1$, $6 \mathrm{H}, 1^{\prime \prime}, 3^{\prime \prime}-$ or $\left.1^{\prime \prime \prime}, 3^{\prime \prime \prime \prime}-\mathrm{COOEt}\right) ; \delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 164.9$ (s, $1^{\prime \prime \prime \prime}, 3^{\prime \prime \prime \prime}$-COOEt), 164.7 ( $\mathrm{s}, 1^{\prime}, 3^{\prime}-$ and $1^{\prime \prime \prime}, 3^{\prime \prime \prime}-\mathrm{COOEt}$ ), 164.6 ( s , $1^{\prime \prime}, 3^{\prime \prime}$-COOEt), 152.4 ( $\mathrm{C}-6^{\prime}$ and C- $6^{\prime \prime \prime}$ ), 151.8 (C-6"'"), 150.0 (C-6"), 144.9 (C-1,3), 144.4 (C-2"'"), 144.2 (C-5), 144.1 (C-2', $\mathrm{C}-2^{\prime \prime}$ and $\left.\mathrm{C}-2^{\prime \prime \prime}\right), 142.9$ ( $\mathrm{C}-3^{\prime \prime} \mathrm{a}, 8^{\prime \prime} \mathrm{a}$ ), 142.8 ( $\mathrm{C}-3^{\prime} \mathrm{a}, 8^{\prime} \mathrm{a}$ and C-3"'a, $8^{\prime \prime \prime}$ a), 142.6 (C-3""'a, $8^{\prime \prime \prime \prime}$ a), 140.8 (C-2), 138.6 (C-4"", $8^{\prime \prime \prime \prime}$ ), 137.8 (C-4', $8^{\prime}$ and $\left.\mathrm{C}-4^{\prime \prime \prime}, 8^{\prime \prime \prime}\right), 137.2$ (C-4", $8^{\prime \prime}$ ), 133.7 (C-5",7"), 132.2 (C-5', $7^{\prime}$ and $\left.\mathrm{C}-5^{\prime \prime \prime}, 7^{\prime \prime}\right)$, 131.0 (C-4,6), 130.4 (C-5"'1, $7^{\prime \prime \prime}$ ), 117.4 (C-1", $3^{\prime \prime}$ ), 117.2 ( $\mathrm{C}-1^{\prime}, 3^{\prime}, \mathrm{C}-1^{\prime \prime \prime}, 3^{\prime \prime \prime}$ and $\left.\mathrm{C}-1^{\prime \prime \prime}, 3^{\prime \prime \prime \prime}\right), 60.2$ (t, $1^{\prime \prime}, 3^{\prime \prime}-$ or $\left.1^{\prime \prime \prime \prime}, 3^{\prime \prime \prime \prime}-\mathrm{COOEt}\right)$, $60.1\left(\mathrm{t}, 1^{\prime}, 3^{\prime}-, 1^{\prime \prime \prime}, 3^{\prime \prime \prime}-\right.$ and $1^{\prime \prime}, 3^{\prime \prime}-$ or $\left.1^{\prime \prime \prime \prime}, 3^{\prime \prime \prime \prime}-\mathrm{COOEt}\right), 14.6\left(\mathrm{q}, 1^{\prime \prime}, 3^{\prime \prime}-\right.$ or $\left.1^{\prime \prime \prime \prime}, 3^{\prime \prime \prime \prime}-\mathrm{COOEt}\right), 14.5\left(\mathrm{q}, 1^{\prime}, 3^{\prime}-\right.$ and $1^{\prime \prime \prime}, 3^{\prime \prime \prime}-$ COOEt $)$ and 14.5 ( $\mathrm{q}, 1^{\prime \prime}, 3^{\prime \prime}$ - or $1^{\prime \prime \prime \prime}, 3^{\prime \prime \prime \prime}$-COOEt).

## 2-(Tri-n-butylstannyl)azulene 27

The same procedure as was used for the preparation of $\mathbf{1 a}$ was adopted. The reaction of $\mathbf{1 3}(106 \mathrm{mg}, 0.512 \mathrm{mmol})$ with 3 ( $583 \mathrm{mg}, 1.01 \mathrm{mmol}$ ) in dry toluene ( $20 \mathrm{~cm}^{3}$ ) in the presence of $\mathrm{Pd}\left(\mathrm{PPh}_{3}\right)_{4}(28.7 \mathrm{mg}, 0.0248 \mathrm{mmol})$ followed by chromatographic purification on silica gel with hexane and $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ afforded 28 ( $31.1 \mathrm{mg}, 48 \%$ ) as a green powder. Further purification of the hexane eluate by medium-pressure column chromatography on silica gel with hexane afforded $27(23.1 \mathrm{mg}$, $11 \%$ ) as a blue oil.

For 27. (Found: C, 63.3; H, 8.2. Calc. for $\mathrm{C}_{22} \mathrm{H}_{34} \mathrm{Sn}$ : C, 63.3; $\mathrm{H}, 8.2 \%)$; $\lambda_{\text {max }}\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right) / \mathrm{nm} 242(\log \varepsilon 4.25), 288$ (4.74), 336 (3.78), 351 (3.82), 364 (3.48), 589 (2.52) and 632 (2.46); $v_{\text {max }}$ (neat) $/ \mathrm{cm}^{-1} 2957,2926,2870,2853,1458,1393,803,727$ and $573 ; \delta_{\mathrm{H}}\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 8.27$ (d, $\left.J 9.7,2 \mathrm{H}, 4,8-\mathrm{H}\right), 7.53$ (t, $J 9.9,1 \mathrm{H}, 6-\mathrm{H}$ ), 7.53 (s, 2H, 1,3-H), 7.13 (dd, $J 9.9$ and 9.7 , $2 \mathrm{H}, 5,7-\mathrm{H}), 1.60\left(\mathrm{~m}, 2 \mathrm{H}, 2^{\prime}-\mathrm{H}\right), 1.36$ (qt, $J .4$ and $7.3,2 \mathrm{H}$, $\left.3^{\prime}-\mathrm{H}\right), 1.14\left(\mathrm{~m}, 2 \mathrm{H}, 1^{\prime}-\mathrm{H}\right)$ and $0.90\left(\mathrm{t}, J 7.4,3 \mathrm{H}, 4^{\prime}-\mathrm{H}\right)$; $\delta_{\mathrm{C}}\left(125 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) 153.9(\mathrm{C}-2), 140.0(\mathrm{C}-3 \mathrm{a}, 8 \mathrm{a}), 136.9(\mathrm{C}-6)$, 134.9 (C-4,8), 126.5 (C-1,3), 122.5 (C-5,7), 29.3 (C-2'), 27.4 (C-3'), 13.7 (C-4') and 10.0 (C-1'); $m / z$ (EI) 418 ( $\mathrm{M}^{+}, 15 \%$ ), 361 (100), 360 (50), 359 (77), 357 (40), 305 (45), 249 (72), 247 (92), 245 (62) and 129 (43).

For 28. $\mathrm{Mp}>300^{\circ} \mathrm{C}\left(\right.$ lit. $\left..^{23 a} \mathrm{mp}>320^{\circ} \mathrm{C}\right)$.

## Acknowledgements

We are grateful to Professor Klaus Hafner of Techische Universität Darmstadt for helpful discussions.
