# Crystal Structure and Absolute Configuration of Dihydro-O-methylcancentrinemethine Hydrobromide, a Derivative of the Alkaloid Cancentrine 

By G. R. Clark, Department of Chemistry, University of Auckland, Auckland, New Zealand
G. J. Palenik," Department of Chemistry, University of Florida, Gainesville, Florida 32601 , U.S.A.

The crystal and molecular structure and the absolute configuration of the title compound has been determined by $X$-ray diffraction methods. The crystals are orthorhombic with cell dimensions: $a=10.639 \pm 0.002, b=12.036 \pm$ 0.004 , and $c=26.979 \pm 0.007 \AA$, space group $P 2_{1} 2_{1} 2_{1} . Z=4$. The structure was solved by the heavy-atom method. After refinement by least-squares methods using anisotropic thermal parameters. $R$ was 0.072 for 2475 observed reflections. The molecule consists of two units derived from morphine and cularine. linked by a spiro-ring junction. The absolute configuration was determined and shows that the morphine-related fragment has the opposite configuration to that found in morphine.

Cancentrine (F-22), the yellow alkaloid of Dicentra canadensis, was first isolated forty years ago. ${ }^{1}$ After all subsequent investigations failed to elucidate the structure, an $X$-ray crystallographic study was undertaken.

Unit-cell dimensions and space groups of several derivatives were determined before crystals of the dihydro- $O$ methyl methine hydrobromide (I) salt appeared to be suitable. The subsequent deduction of the structure
of the parent alkaloid cancentrine (II) has been outlined in our preliminary report. ${ }^{2}$

## EXPERIMENTAL

The compound crystallizes from methanol as pale yellow needles. Preliminary Weissenberg photographs showed the crystals to be orthorhombic.

Crystal Data. $-\mathrm{C}_{38} \mathrm{H}_{42} \mathrm{~N}_{2} \mathrm{O}_{7}, \mathrm{HBr}, \quad M=719 \cdot 69$, Orthorhombic, $a=10.639 \pm 0.002, \quad b=12.036 \pm 0.004, \quad c=$ $26.979 \pm 0.007 \AA, U=3454.6 \AA^{3}, \quad D_{\mathrm{m}}$ (by flotation) $=$ $1.37 \pm 0.01, Z=4, D_{\text {c }}=1.379 \pm 0.001, F(000)=1504$. $\mathrm{Cu}-K_{\alpha} \quad$ radiation, $\quad \lambda\left(\alpha_{1}\right)=1.54051, \quad \lambda(\beta)=1.39217 \AA$, $\mu\left(\mathrm{Cu}-K_{\alpha}\right)=22.0 \mathrm{~cm}^{-1}$. Systematic absences: $h 00$ for $h=2 n+1,0 k 0$ for $k=2 n+1$ and $00 l$ for $l=2 n+1$, indicate space group $P 2_{1} 2_{1} 2_{1}\left(D_{2}^{4}\right)$.

The crystal used for the intensity measurements had dimensions $0.115 \times 0.095 \times 0.075 \mathrm{~mm}$. The intensity data were measured by use of the stationary-crystal-stationary-counter technique, with nickel-filtered $\mathrm{Cu}-K_{\alpha}$ radiation. All the unique reflections with $2 \theta \leq 135^{\circ}$ were measured first and then an additional 6100 of the 6955 reflections in the hemisphere, giving three measurements for most reflections. A correction (maximum $7 \%$ ) was applied for the decrease in the intensities of the four standard reflections which were measured after every 100 reflections. A total of 3509 independent reflections was obtained after averaging equivalent reflections, of which 2475 having $I \geqslant$ 1.2 times the respective background counts were considered observed. The remaining 1034 unobserved reflections were entered as $0 \cdot 1$ times the appropriate background count and were flagged with a minus sign. These

values were then corrected for the $\alpha_{1}-\alpha_{2}$ splitting at 20 values greater than $80^{\circ}$ and then converted to a set of structure amplitudes by standard means.

Structure Analysis.-The position of the bromine atom was determined from a sharpened Patterson function. The bromine atom was close to $z=\frac{4}{4}$ so that the Fourier synthesis phased on only the bromine atom contribution contained many false maxima. Consequently, four Fourier
cycles were computed after all the atoms had been correctly identified and $R$ was reduced to $0 \cdot 12$. All atoms were then assigned anisotropic thermal parameters and subsequent refinements were carried out using a block-diagonal approximation to the matrix. One-half the calculated shift was applied during each cycle. After 10 cycles, the shifts were $<0.7 \sigma$ and the refinement was terminated; $R$ was 0.072 . No attempt was made to locate the 43 hydrogen atoms.

Table 1
Final positional and thermal parameters $\left(\times 10^{-4}\right)^{*}$ with their estimated standard deviations in parentheses

* The temperature factor for an atom is of the form $\exp \left(-\beta_{11} h^{2}-\beta_{22} h^{2}-\beta_{33} l^{2}-\beta_{12} h k-\beta_{13} h l-\beta_{23} k l\right)$.
syntheses and one difference Fourier synthesis were required before all the lighter atoms could be located. One full-matrix least-squares cycle was calculated in which all the atoms (except bromine) were treated as carbon atoms. The resulting lower isotropic thermal parameters for the nitrogen and oxygen atoms, in conjunction with chemical evidence, was used to distinguish these atoms from the remaining carbon atoms. Two additional least-squares
$\dagger$ For details of Supplementary Publications, see Notice to Authors No. 7 in J. Chem. Soc. (A), Issue No. 20 (items less than 10 pp . will be supplied as full size copies).

The final parameters are given in Table l. Observed and calculated structure factors are listed in Supplementary Publication No. SUP 20386 (4 pp., 1 microfiche). $\dagger$

The quantity $\Sigma w\left(F_{\mathrm{o}}-F_{\mathrm{c}}\right)^{2}$ was minimized in the leastsquares calculations. The weighting scheme used was $\sqrt{ } w=F_{\mathrm{o}} / 20$ if $F_{0}<20, \sqrt{ } w=1$ if $20<F_{0}<40$ and $\sqrt{ } w=40_{0} / F$ if $F_{0}>40$. The scattering factors for bromine ${ }^{3}$ were corrected for real dispersion effects. The
${ }^{3}$ H. P. Hanson, F. Herman, J. D. Lea, and S. Skillman, Acta Cryst., 1964, 17, 1040.
scattering factors for carbon, nitrogen, and oxygen were taken from ref. 4.

Absolute Configuration.-The chirality of the molecule was determined by use of the anomalous dispersion factor of the bromine atom. ${ }^{5}$ Eighteen reflections were selected on the basis of their relatively large calculated differences between $I_{\bar{h} \bar{k} \bar{l}}$ and $I_{h k l}$. Each reflection $h k l$ and its corresponding Friedel partner $h k l$ were measured and the intensities compared with those previously calculated assuming the listed atomic co-ordinates relative to a right-handed axial system (Table 1). The results are outlined in Table 2.

| 5 | 1 | 5 | 448 | 360 | $>$ |
| 7 | 3 | 2 | 156 | 113 | $>$ |

The comparison establishes the absolute configuration of the molecule as being the same as the listed co-ordinates and as illustrated in the diagram. The chirality of the morphinerelated segment of the molecule is seen to be the opposite of that of morphine itself, ${ }^{6}$ but the same as some other morphine-related alkaloids e.g., ( + )-kreysiginine. ${ }^{7}$

## DISCUSSION

The overall molecular geometry is illustrated in the Figure. The basic skeleton is composed of two major fragments, modified cularine ${ }^{8}$ and morphine, joined by a spiro-ring junction at $C(12)$. The structure of the parent alkaloid cancentrine was deduced from the present derivative and differs mainly in that $\mathrm{N}(2)$ is bonded to $C(6)$, forming another heterocyclic ring.

The intramolecular bond distances and angles are listed in Tables 3 and 4, together with their estimated standard deviations. The bond lengths of $\mathrm{O}(3)-\mathrm{C}(14)$, $\mathrm{C}(14)-\mathrm{C}(15), \mathrm{C}(15)-\mathrm{C}(16)$, and $\mathrm{C}(16)-\mathrm{N}(1)$ indicate an extensive delocalization characteristic of the vinylogous amide grouping. The remaining bond distances appear normal. The mean values for different bond types are: $\mathrm{C}(\mathrm{Ph})-\mathrm{O}$ (ether) $\quad 1 \cdot 369, \quad \mathrm{O}$ (ether) $-\mathrm{C}(\mathrm{Me}) \quad 1 \cdot 433, \quad \mathrm{C}=\mathrm{C}$ -

[^0](aromatic) $1 \cdot 387, \mathrm{~N}\left(s p^{3}\right)-\mathrm{C}\left(s p^{3}\right) 1 \cdot 502$, and $\mathrm{C}\left(s p^{3}\right)-\mathrm{C}\left(s p^{3}\right)$ $1.542 \AA$.

The cularine fragment contains three heterocyclic ring systems. The seven-membered ring defined by atoms

The molecular stereochemistry and atomic numbering. The absolute configuration is that shown in the diagram
$\mathrm{O}(2), \mathrm{C}(15), \mathrm{C}(16), \mathrm{C}(17), \mathrm{C}(24)$, and $\mathrm{C}(28)$ is boatlike, the ring defined by atoms $\mathrm{N}(1), \mathrm{C}(16), \mathrm{C}(17)$, $C(18), C(19)$, and $C(20)$ has a half-boat conformation

define rings which, though puckered, are almost planar. The six-membered ring formed by $\mathrm{C}(1), \mathrm{C}(2), \mathrm{C}(3)$, $\mathrm{C}(4), \mathrm{C}(5)$, and $\mathrm{C}(6)$, is seen to be a slightly flattened boat. In both morphine and the parent alkaloid, $\mathrm{N}(2)$ forms another heterocyclic ring system which is opened in forming the present derivative.

The distance from the bromide ion to $\mathrm{N}(2)$ is $3 \cdot 140 \pm$ $0.009 \AA$, shorter than the values ( $3 \cdot 17-3 \cdot 38 \AA$ ) found in

[^2]most other alkaloid hydrobromide derivatives. ${ }^{9}$ The possibility of an $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}^{-}$hydrogen bond has been discussed and presumably accounts for the observed $\mathrm{N} \cdots \mathrm{Br}$ distance. Although the hydrogen atom on $\mathrm{N}(2)$ was not located, the angles $\mathrm{C}(32)-\mathrm{N}(2) \cdots \mathrm{Br}$ (99.8 ${ }^{\circ}$, $\mathrm{C}(33)-\mathrm{N}(2) \cdots \mathrm{Br}\left(116 \cdot 9^{\circ}\right)$, and $\mathrm{C}(34)-\mathrm{N}(2) \cdots \mathrm{Br}$ ( $106 \cdot 4^{\circ}$ ), are sufficiently close to the ideal tetrahedral value to suggest that there is an $\mathrm{N}-\mathrm{H} \cdots \mathrm{Br}$ hydrogen bond. The range of angles about $\mathrm{N}(2)$ is smaller than

## Table 5

Equations of best least-squares planes in the form $A X+$ $B Y+C Z=D$ where $X, Y$, and $Z$ are orthogonal coordinates in $\AA$ relative to $\boldsymbol{a}, \boldsymbol{b}$, and $\boldsymbol{c}$. Deviations ( $\AA \times 10^{2}$ ) of atoms from the planes are given in square brackets
