## X-Ray Crystal Structure of Hexahydro-1,4-dimethyl-s-tetrazine

By Gerald B. Ansell * and James L. Erickson, Chemistry Division, Code 605, Research Department Michelson Laboratory, Naval Weapons Center, China Lake, California 93555, U.S.A.
The structure of the title compound has been established by $X$-ray crystallography. Crystals are monoclinic, space group $P 2_{1} / n, Z=2$ and cell dimensions $a=8.996 \pm 0.005, b=8.905 \pm 0.005, c=4.086 \pm 0.002 \AA$, $\beta=95.9( \pm 0.1)^{\circ}$. The structure was solved by Patterson and Fourier methods and refined by full-matrix leastsquares techniques to $R 0.044$ for 315 observed reflections. The molecule is centrosymmetric and chair-shaped. $N$-Methyl groups are equatorial and $N$-hydrogen atoms axial. All bond lengths agree with previously found values. Each molecule is $\mathrm{NH} \cdots \mathrm{N}$ bonded to two others forming strings running parallel to the $c$ axis.

The title compound was studied because of its similarity to hexahydro-1,2,4,5-tetramethyl-s-tetrazine for which two conformers (I) ${ }^{\mathbf{1}}$ and (II) ${ }^{\mathbf{2}}$ have been suggested. The preparation, ${ }^{1} \mathrm{H}$ n.m.r. spectra, dipole moment, and preliminary $X$-ray structure have been discussed previously. ${ }^{3,4}$

## EXPERIMENTAL

All dimensions and intensity data were measured on a General Electric single-crystal orienter by use of $\mathrm{Cu}-K_{\alpha_{1}}$, and $-K_{\alpha_{2}}$ radiation $[\lambda=1.54050$ and $1.54434 \AA]$. The errors were estimated from the observed deviations of individual values from their mean.

Crystal Data.- $\mathrm{C}_{4} \mathrm{~N}_{4} \mathrm{H}_{12}, \quad M=116$. Monoclinic, $a=$ $8.996 \pm 0.005, b=8.905 \pm 0.005, c=4.086 \pm 0.002, \beta=$ $95 \cdot 9( \pm 0 \cdot 1)^{\circ}, D_{\mathrm{m}}=1 \cdot 18, Z=2, D_{\mathrm{c}}=1 \cdot 18$. Space group $P 2_{1} / n$ from systematic absences: $h 0 l$ when $h+l=2 n+1$, $0 k 0$ when $k=2 n+1 . \mu\left(\mathrm{Cu}-K_{\alpha}\right)=7.5 \mathrm{~cm}^{-1}$.

All intensity data below $2 \theta 120^{\circ}$ were measured by use of a block-shaped crystal, of dimensions $0.01 \times 0.01 \times$ 0.01 cm , mounted along the $c$ axis. To prevent sublimation the crystal was enclosed in a capillary. Total intensities ( $T_{\mathrm{c}}$ ) were measured by use of an automated General Electric diffractometer, equipped with a scintillation counter and pulse-height selector, by the moving-crystal moving-counter technique ( $3 \cdot 66^{\circ}$ at $2^{\circ} \mathrm{min}^{-1}$ ). Background counts ( $B_{1}$ and $B_{2}$ ) of 40 s were measured at the beginning and end of each scan. The integrated intensity $I$ was calculated as $I=T_{\mathrm{c}}-1 \cdot 376\left(B_{1}+B_{2}\right)$. Structure factors were obtained by application of the usual Lorentz and polarization corrections. Equivalent $h k l$ and $h \bar{k} l$ reflections were averaged. Of the 477 reflections measured, 315 , having $I>1 \cdot 5 \sigma$ [where $\left.\sigma^{2}=T_{\mathrm{c}}+1 \cdot 376\left(B_{1}+B_{2}\right)\right]$, were considered statistically significant, and were used in the subsequent structure determination. No absorption correction was made.

Solution and Refinement.-Nitrogen and carbon atoms were located from a three-dimensional Patterson synthesis and from packing considerations. Full-matrix isotropic refinement ${ }^{5}$ yielded $R \quad 0 \cdot 18$. A difference-Fourier syn-

thesis then enabled location of all hydrogen atoms. For the remaining cycles of least-squares, carbon and nitrogen were refined anisotropically and the hydrogen isotropically ( $B$ fixed at $5.0 \mathrm{~A}^{-2}$ ). At $R 0.004$ and $R^{\prime} 0.046$ the shifts were $\leqslant \frac{1}{3} \sigma$ and refinement was considered complete. ${ }^{5}$ A weighting scheme giving reasonably similar mean values of $w \Delta^{2}$ for ranges of $F$ was chosen such that for reflections with $F_{0}>15, \sqrt{ } w=15 / F_{0} ; \quad F_{0}<1 \cdot 5, \quad \sqrt{ } w=F_{0} / 1 \cdot 5$; and $1.5<F_{0}<15, \sqrt{ } w=1$. A difference-Fourier computed with this data was entirely featureless. All 159

## DISCUSSION

The molecule is centrosymmetric and chair-shaped with the two $N$-methyl groups equatorial and the two $N$-hydrogen atoms axial. The $\mathrm{N}-\mathrm{N}$ value ( $1.447 \AA$ ) is in close agreement with the accepted single-bond value $1 \cdot 44(4) \AA$. The $\mathrm{C}-\mathrm{N}$ values ( $1 \cdot 460$ and $1.467 \AA$ ) are similar and again are in close agreement with accepted values for carbon bonded to three-covalent nitrogen $[1.472(5)] . \quad \mathrm{C}-\mathrm{H}$ and $\mathrm{N}-\mathrm{H}$ values $(0.99-1.08 \AA)$ are as expected. Bond angles at $\mathrm{C}(1), \mathrm{C}(2), \mathrm{N}(1)$, and $\mathrm{N}(2)$ show they all have tetrahedral configuration with lone pairs on $N(1)$ and $N(2)$ and occupy the axial and equatorial positions respectively. The bond distance between $\mathrm{N}(2)$ and $\mathrm{N}\left(\mathrm{I}^{\text {II }}\right)$ in the adjacent molecule, one unit cell along $c$, is short ( $3 \cdot 337 \AA$ ). Bond angles $\left[\mathrm{N}(1)-\mathrm{N}(2) \cdots \mathrm{N}\left(1^{\mathrm{II}}\right) 110 \cdot 7^{\circ}, \mathrm{C}(2)-\mathrm{N}(2) \cdots \mathrm{N}\left(\mathrm{I}^{\text {II }}\right) 107 \cdot 2^{\circ}\right.$, $\mathrm{N}\left(2^{\mathrm{I}}\right)-\mathrm{H}(4) \cdots \mathrm{N}\left(\mathbf{1}^{\mathrm{II}}\right) 174 \cdot 2^{\circ}$ ] indicate quite clearly that there are strong hydrogen bonds between the axial hydrogens on $\mathrm{N}(2)$ and $\mathrm{N}\left(2^{\mathrm{I}}\right)$ and the methyl group carrying nitrogens $\mathrm{N}(1), \mathrm{N}\left(\mathbf{1}^{\mathrm{I}}\right)$ (via the axial lone-pair) in the molecules above and below, when viewed down the $c$ axis. Undoubtedly this rigid hydrogen bonding and the absence of axial interaction between the lone pairs and methyl groups accounts for the symmetrical chair configuration of this molecule in the solid state. As previously reported ${ }^{3,4}$ however, there is evidence for unsymmetrical conformers in solution.
We thank Dr. W. Tolles of the Naval Postgraduate School
Monterey for the sample.
