# Crystal and Molecular Structure of 4-Aminotetrolic Acid (4-Amino-but-2-ynoic Acid) 

By Graham P. Jones * and Peter J. Pauling, William Ramsay, Ralph Forster, and Christopher Ingold Laboratories, University College London, Gower Street, London WC1E 6BT

#### Abstract

Crystals of the title compound (I) are monoclinic, space group $P 2_{1} / c$, with $a=7.881$ (3), $b=6.446(4), c=$ $11.039(5) \AA, \beta=129.05(3)^{\circ}, Z=4$. The structure was solved by direct methods and refined by least-squares procedure to $R 0.056$ for 769 observed diffraction maxima. The molecules are zwitterions linked by a threedimensional $\mathrm{N} \cdots \mathrm{H} \cdots \mathrm{O}$ hydrogen-bond network.

4-Aminotetrolic acid [(I), 4-aminbut-2-ynoic acid], a structural analogue of 4 -aminobutanoic acid [(II), GABA] has been shown to have GABA-like action in the feline spinal cord ${ }^{1}$ where there is evidence that (II) functions as an inhibitory transmitter. ${ }^{2}$ We report here the crystal structure determination of 4 -aminotetrolic acid as part of a study of structure and physiological activity relationships of (II) and its analogues.

## EXPERIMENTAL

The acid (I) was synthesized by amination of 4 -chlorotetrolic acid prepared from commercial butyne-1,4-diol according to the method of ref. 3. Brown, prismatic crystals were grown by diffusion of ethanol into an aqueous solution.

Crystal Data.- $\mathrm{C}_{4} \mathrm{H}_{5} \mathrm{NO}_{2} \quad$ Monoclinic. $\quad M=99.1$, $a=7.881(3), b=6.446(4), c=11.039(5) \AA, \beta=129.05(3)^{\circ}$, $D_{\mathrm{c}}=1.495 \mathrm{~g} \mathrm{~cm}^{-3}, Z=4, D_{\mathrm{m}}=1.50(1) \mathrm{g} \mathrm{cm}^{-3}, U=$ $435.5 \AA^{3}, \mathrm{Mo}-K_{\alpha}$ radiation, $\lambda=0.7107 \AA ; \mu\left(\mathrm{Mo}-K_{\alpha}\right)=$ $1.2 \mathrm{~cm}^{-1}$. Space group $P 2_{1} / c\left(C_{2 h}^{5}\right.$, No. 14).

Data were corrected for Lorentz and polarization effects but not for absorption or extinction.

Structure Solution and Refinement.-Normalised structure factors $|E|$ were calculated from the observed structure factors by use of the $K$-curve method, normalising all parity groups of $\pm h, k, l$ separately to obtain the condition $\left.\left.\langle | E\right|^{2}\right\rangle_{\text {av }}=1.0$.

An initial set of phases for 128 reflections with $|E| \geqslant 1.2$ was obtained by use of MULTAN. ${ }^{5}$ An $E$ map calculated with the phases derived from the most consistent solution revealed the positions of all non-hydrogen atoms in the unit cell.

Refinement of the scale factor and overall temperature factor on these atoms gave $R 0.245$. Three cycles of fullmatrix least-squares refinement of positional and isotropic thermal parameters and an overall scale factor for the nonhydrogen atoms gave $R 0.125$ for the 448 data in the range $205-45^{\circ}$. Changing to anisotropic thermal parameters and subsequent refinement for two cycles gave $R 0.080$. At this stage a difference electron-density synthesis clearly revealed all hydrogen atom positions. The final cycles of anisotropic refinement using the 769 observed data, including the hydrogen-atom positional parameters, by fullmatrix least-squares were continued until all parameter shifts were $\leqslant 0.1 \sigma$. The function minimised was $\Sigma$

Intensity Measurements.-Three-dimensional $X$-ray diffraction data from a small single crystal (ca. $0.14 \times 0.21 \times$ 0.42 mm ) were collected on a computer-controlled fourcircle diffractometer ${ }^{4}$ by use of graphite-monochromated Mo- $K_{\alpha}$ radiation. A coupled $\theta-2 \theta$ step scan with $\Delta 2 \theta 0.04^{\circ}$, a counting time of 10 s per step, and a peak width of $2.0^{\circ}$ were used. In the range $2 \theta 5-60^{\circ}, 769$ diffraction maxima out of a possible 1377 in a quadrant of reciprocal space ( $\pm h, k, l$ ) had $I \geqslant 3 \sigma(I)$ and were considered observed.

[^0]$w\left(\left|F_{\mathrm{o}}\right|-\left|F_{\mathrm{c}}\right|\right)^{2}$ with $w=4 I / \sigma 2$ where $\sigma=\sigma(I)+0.05 I$. The term $0.05 I$ was included in the estimate of $\sigma$ to allow for the random long-term fluctuation in intensity measurement of a standard reflection which was taken after every 25 observations. Atomic scattering factors for neutral carbon, nitrogen, and oxygen were taken from ref. 6 and for hydrogen from ref. 7. The final $R$ is 0.056 . Positional and

[^1]thermal parameters for non-hydrogen atoms are listed in Table 1 and hydrogen atom positions in Table 2. Bond distances and angles are given in Table 3. Observed and

calculated structure factors are listed in Supplementary Publication No. SUP 21550 (3 pp.).*

## discussion

Atomic numbering and perspective drawing of the molecule is shown in Figure 1, and molecular packing and hydrogen bonding in Figure 2 viewed in the direction of $b$.

The $C(2)-C(3)$ triple-bond distance ( $1.186 \AA$ ) is similar to that found in other acetylenic compounds ${ }^{8-10}$ although the short $C(3)-C(4)$ single-bond distance (1.463 $\AA$ ) indicates a partial multiple-bond.

The location of three hydrogen atoms tetrahedrally surrounding nitrogen confirms the zwitterionic nature of the molecule. These hydrogen atoms enter into hydrogen-bond formation via adjacent oxygen atoms, and the details of these interactions are given in Table 4.

[^2]Intramolecular N •• O distances (5.227 and $5.699 \AA$ ) are similar to those found for other $\gamma$-aminocarboxy-
