Synthesis and characterization of end-functionalized oligo-(vinylthiophenes) with liquid crystal properties

Christophe Maertens, Jian-Xin Zhang, Philippe Dubois and Robert Jérôme

Centre for Education and Research on Macromolecules (C.E.R.M.), University of Liège, Sart Tilman B6, B-4000 Liège, Belgium

A general scheme for the synthesis of end-functionalized conjugated (E)-vinylthiophene oligomers with liquid crystal and potential second-order non-linear optical properties is described. These push-pull thiophene-containing aromatic molecules show mesogenic properties over different temperature ranges depending on the chain length and the functional end-groups.

Introduction

During the last decade, increasing attention has been paid to the design of new organic molecules with a high second order molecular non-linearity, for original applications in electrooptics. In this respect, π -conjugated chains capped at both ends with an electron-donor and an electron-acceptor, respectively, have been studied.¹ For instance, incorporation of a fivemembered heterocycle, such as thiophene, to a π -donoracceptor conjugated chain greatly enhances its non-linear optical (NLO) properties,² due mainly to a higher hyperpolarizability. However, production of useful NLO materials requires the supramolecular organization of the individual molecules,¹ which is currently carried out by electric poling techniques. Providing NLO materials with liquid crystal properties might also be a way of triggering well-defined supramolecular organization.³ Lehn and co-workers were the first to report mesophases formed by push-pull stilbene derivatives for NLO applications.⁴ Polymalonates containing liquid crystal pyridine heterocycle derivatives in the side-chains were described by Griffin et al. for the same applications.⁵ Until now, only Kossmehl and Hoppe referred to mesophases for thiophene containing molecules.6

Results and discussion

This paper describes the controlled synthesis and the characterization of end-functionalized oligo(vinylthiophenes) endowed with both potential NLO properties and liquid crystal behaviour. In agreement with the general structure reported for active NLO organic molecules,¹ compounds investigated in this study consist of an oligo[(E)-vinylthiophene] chain selectively capped with a nitro acceptor group at one end and an alkylamino or a butoxy donor group at the other. The choice of the donor substituents relies upon their well-known ability to promote, or at least to favour, formation of mesophases. The general formula of the synthesized conjugated chains is shown below.

where D is a dialkylamino or an alkoxy group

These NLO-mesogens have been synthesized by Wittig or Wittig-Horner reactions. Before discussing the synthesis of the short poly[(E)-vinylthiophene] chains, it is worthwhile reporting on the synthesis of the precursors of the functional end-groups, *i.e.* an aromatic aldehyde para-substituted by the nitro acceptor group and either an aromatic phosphonium salt or the phosphonate counterpart para-subsituted by the electron donor group.

N,N-Dialkylanilines 1 were prepared by alkylation of Nmethylaniline or aniline with a selected bromide or chloride 7 as described in Scheme 1. They were then formylated by a

Substituents and yields:

R	х	R ¹	R ²	Yield 1 (%)	Yield 2 (%)
CH ₃	Br	CH ₁	C ₈ H ₁₇	1a 64	2a 32
CH	Cl	CH,	HO(CH ₂) ₆	1b 72	2b 24
Н	Br	Bu	Bu	1c 88	2c 33

Scheme 1

Vilsmeier reaction. The resultant aldehydes were further reduced with sodium borohydride in ethanol and the corresponding benzyl alcohols were directly transformed into phosphonium salts 2 by means of triphenylphosphonium hydrobromide in refluxing chloroform.⁸

In the case of the butoxy electron donor, phosphonate 3 was selected as the reactive intermediate. Butoxybenzyl chloride was prepared easily by treatment of concentrated hydrochloric acid with the commercially available 4-butoxybenzyl alcohol and transformed into phosphonate 3 by an Arbusov reaction with a 90% overall yield (Scheme 2).

One or two (E)-vinylthiophene unit(s) (n = 1 or 2) were endcapped with an aldehyde and the nitro acceptor group, respectively, by the reaction pathway shown in Scheme 3.

Scheme 3

Reaction conditions and yields:

Phosphonium	Aldehyde	Solvent	Base	Yield 8 (%)	n
2a	6	THF	BuLi	8a 70	1
2b	6	THF	LDA	8b 25	1
2b	7	EtOH-THF	EtOLi	8c 44	2
2c	7	THF	BuLi	8d 70	1

Scheme 4	

4-Nitrobenzylphosphonate 4^{\dagger} was treated with 5^{\ddagger} with formation of aldehyde 6 in a 75% yield.⁸ Further extension of 6 by one vinylthiophene unit into 7 was achieved by a Wittig reaction of 5 with the phosphonium salt of 6, that was previously prepared by the selective reduction of the aldehyde and reaction of the obtained alcohol with triphenylphosphonium hydrobromide.⁸

The NLO-mesogens bearing a dialkylamino substituent were finally synthesized in a one-step condensation between

† 4-Nitrobenzylphosphonate was prepared by the Arbusov reaction with 4-nitrobenzyl bromide and triethyl phosphite (82% yield).
‡ Compound 5 was prepared by protection of thiophene-2-carbaldehyde with trimethyl orthoformate, followed with the lithiation by BuLi-DMF in dry THF (overall yield: 77%).

phosphonium salts 2 and aldehyde 6 or 7 under the conditions reported in Scheme 4. Pure all-*trans* isomers of 8a-d were isolated by recrystallization from EtOH-H₂O, as attested by ¹H NMR analysis. Yields are shown in the caption to Scheme 4.

This reaction path was also used to prepare the counterpart of 8 in which the alkylamino group is substituted by a butoxy group. In contrast to the conjugated molecule with one (E)vinylthiophene unit 12a (n = 1) that was prepared in a good yield (72%, Scheme 5), this Wittig-Horner reaction did not yield the expected dimer 12b (n = 2). In order to overcome this drawback, the reaction path has been reversed as shown in Scheme 5.

Thus, thiophene-2-carbaldehyde was treated with phosphonate 3, followed by lithiation and DMF quenching, leading to the aldehyde 10. Compound 6 was transformed into the phosphonate 11 by a three-step synthesis (Scheme 5). The Wittig-Horner reaction between phosphonate 11 and aldehyde 10 gave 12b (n = 2) in 56% yield.⁸

Compounds **8a–d** and **12a,b** have been characterized by polarization optical microscopy and differential scanning calorimetry (DSC). Table 1 lists the liquid crystal behaviour and the transition temperatures observed by these two techniques, together with the UV–VIS maximum absorption frequency (for a 10^{-5} mol dm⁻³ solution in CHCl₃). It is worthwhile pointing out that all transitions observed by DSC are first order and do not permit us to distinguish the nature of the mesophase.

All synthesized compounds, except for 8d (D = Bu₂N), are thermotropic mesogens. Nematic phases were easily identified by the Schlieren textures observed under cross-polarizers. Increasing length of the conjugated chain sharply increases the mesophase transition temperature to the point where decomposition occurs, before an isotropic liquid is formed (comparison of 8b/8c and 12a/12b, Table 1). The nematic phase of 12a can be observed upon cooling down to 60 °C, although

				Transition temperatures/°C

^a C = Crystalline or glassy; N = nematic; S = smectic; I = isotropic liquid; dec = decomposition. ^b Heating rate = 10 K min^{-1} , cooling rate = 5 K min^{-1} ; br = broad.

Fig. 1 DSC thermogram of 12a (heating rate = 10 K min⁻¹, cooling rate = 5 K min⁻¹)

this phase only appears at $130 \,^{\circ}$ C when heating (Fig. 1). It is worth noting that **8a** is monotropic, the smectic phase can only be observed upon cooling.

Absorption of the NLO-phores (Table 1) is also indicative of an electronic delocalization between the donor and the acceptor groups. As expected, the nature of donor groups, *i.e.* butoxy and N,N-dialkylamino, strongly affects the relative chargetransfer absorption of the conjugated chain (Fig. 2). At the same chain length, the N-alkyl donor substituent on the N,Nalkylamino electron donor has also some slight effect on the absorption maximum. This charge-transfer band is red shifted upon increasing the chain length by one *trans*-vinylthiophene unit (Fig. 3).

Conclusions

An original and general scheme has been developed for the synthesis of end-functionalized conjugated (E)-vinylthiophene oligomers. These push-pull thiophene-containing aromatic molecules are clearly mesogenic over different temperature ranges, depending on the chain length and the functional end-groups. A more detailed analysis of the liquid crystal behaviour is under way. It must be mentioned that oligomers of poly[(E)-vinylthiophene] have shown an interesting second-order molecular non-linearity.⁸ These NLO properties will be confirmed and quantified. The next step of this study is the incorporation of these NLO-mesogens in macromolecules, either as side-chains or parts of the main-chain.

Fig. 3 Effect of chain length on relative absorption of NLO-phores 12a and 12b

Experimental

General

The ¹H NMR spectra were measured at 400 MHz using a Bruker AM 400 spectrometer, the chemical shifts are given relative to tetramethylsilane (TMS) and J values are given in Hz. The IR spectra were recorded using a Perkin-Elmer 1600 FT spectrometer. The phase transitions were determined calorimetrically using a Dupont 9000 instrument, under a nitrogen atmosphere. Optical investigations were carried out with a Leitz Wetzlar polarizing microscope coupled with a Mettler heating regulation system.

Synthetic procedures

Synthesis of N-methyl-N-octylaniline 1a

Freshly distilled N-methylaniline (5.35 g, 0.05 mol), octyl bromide (9.65 g, 0.05 mol), potassium carbonate (6.9 g) and potassium iodide (0.041 g) in 100 cm³ of dry BuOH were stirred under nitrogen at 110 °C for 24 h. The solution was then allowed to cool to room temperature, filtered and the BuOH was distilled under vacuum. The residue was dissolved in 100 cm³ of diethyl ether and washed three times with 30 cm³ of water. The organic layer was dried over MgSO4 and the solvent removed under reduced pressure. Fractional distillation in vacuo gave 7.08 g (64%) of N-methyl-N-octylaniline 1a as a colourless oil, bp 105 °C, 10 mmHg; $\delta_{\rm H}(\rm CDCl_3)$ 7.25 (3 H, t, J 7.2, 3-, 4-, 5-H), 6.72 (2 H, t, J 7.2, 2-, 6-H), 3.32 [2 H, t, J 7.3, CH₂CH₂N(CH₃)], 2.95 [3 H, s, N(CH₃)], 1.60 [2 H, m, CH₂CH₂CH₂N(CH₃)], 1.33 [10 H, m, CH₃(CH₂)₅CH₂] and 0.92 [3 H, t, J 6.8, $CH_3(CH_2)_5$]; v_{max}/cm^{-1} 3048, 2919, 2855, 1600, 1504, 1461, 1370, 747 and 688.

Synthesis of N-(6-hydroxyhexyl)-N-methylaniline 1b

Freshly distilled N-methylaniline (5.35 g, 0.05 mol), 6chlorohexan-l-ol, (6.8 g, 0.05 mol), potassium carbonate (6.9 g) and potassium iodide (0.041 g) in 100 cm³ of dry BuOH were stirred under nitrogen at 110 °C for 72 h. After the treatment described for **1a** fractional distillation *in vacuo* gave 7.45 g (72%) of N-(6-hydroxyhexyl)-N-methylaniline **1b** as a colourless oil, bp 145 °C, 0.1 mmHg. Spectral data correspond to the reported values.⁷

Synthesis of N,N-dibutylaniline 1c

Freshly distilled aniline (4.65 g, 0.05 mol), butyl bromide (13.7 g, 0.10 mol), potassium carbonate (13.8 g) and potassium iodide (0.082 g) in 100 cm³ of dry BuOH were stirred under nitrogen at 110 °C for 24 h. After the treatment described for **1a**, fractional distillation *in vacuo* gave 6.95 g (88%) of *N*,*N*-dibutylaniline **1c** as a colourless oil, bp 120 °C, 10 mmHg; $\delta_{\rm H}(\rm CDCl_3)$ 7.17 (3 H, t, *J* 7.4, 3-, 4-, 5-H), 6.62 (2 H, m, 2-, 6-H), 3.24 [4 H, m, (CH₂CH₂)₂N], 1.31 {8 H, m, [CH₃-(CH₂)₂CH₂]₂N} and 0.95 [6 H, t, *J* 2.6, CH₃(CH₂)₂]; $v_{\rm max}/\rm cm^{-1}$ 3091, 2956, 2871, 1601, 1505, 1465, 1368, 744 and 691.

Synthesis of 4-(N-methyl-N-octylamino)benzaldehyde

N-Methyl-*N*-octylaniline **1a** (5.47 g, 0.025 mol) was formylated with POCl₃ (2.6 cm³, 0.028 mol) and DMF (10 cm³, 0.1 mol). After the treatment described above the brown residue was distilled *in vacuo* to provide 2.8 g (45%) of 4-(*N*-methyl-*N*-octylamino)benzaldehyde, bp 152 °C, 0.1 mmHg; $\delta_{\rm H}$ (CDCl₃) 9.71 (1 H, s, CHO), 7.70 (2 H, d, *J* 7.0, 2-, 6-H), 6.66 (2 H, d, *J* 7.2, 3-, 5-H), 3.38 [2 H, t, *J* 7.3, CH₂CH₂N(CH₃)], 2.95 [3 H, s, N(CH₃)], 1.60 [2 H, m, CH₂CH₂CH₂N(CH₃)], 1.33 [10 H, m, CH₃(CH₂)₅CH₂] and 0.92 [3 H, t, *J* 6.8, CH₃(CH₂)₅]; $\nu_{\rm max}/{\rm cm}^{-1}$ 2923, 2853, 2723, 1681, 1596, 1555, 1528, 1386, 1313, 1240, 1166 and 814.

Synthesis of 4-[N-(6-acetoxyhexyl)-N-methylamino]benzaldehyde

After protection of the 6-hydroxyhexyl group in the acetate form as described,⁷ 4-[N-(6-acetoxyhexyl)-N-methylaniline (4.98 g, 0.020 mol) was formylated with POCl₃ (2.08 cm³, 0.022 mol) and MFA (9.56 cm³, 0.076 mol). After the treatment described above, the brown residue was purified by chromatography on a silica gel column (ethyl acetate-hexane 7:3, v:v) to provide 4.66 g (84%) of 4-[N-(6-acetoxyhexyl)-Nmethylamino]benzaldehyde; R_f 0.41 (ethyl acetate-hexane 7:3, v:v). Spectral data correspond to the reported values.⁷

Synthesis of 4-(N,N-dibutylamino)benzaldehyde

Following the described procedure, ⁷ N,N-dibutylaniline 1c (5.00 g, 0.032 mol) was formylated with POCl₃ (3.32 cm³, 0.035

mol) and DMF (12 cm³, 0.15 mol). After the treatment described above and two filtrations on silica gel, the brown residue was distilled *in vacuo* to provide 2.6 g (44%) of 4-(*N*,*N*-dibutylamino)benzaldehyde, bp 135 °C, 0.1 mmHg; $\delta_{\rm H}$ (CDCl₃) 9.69 (1 H, s, CHO), 7.69 (2 H, d, J 8.8, 2-, 6-H) 6.64 (2 H, d, J 8.8, 3-, 5-H), 3.34 [4 H, t, J 7.7, (CH₂CH₂)₂N], 1.58 {8 H, m, [CH₃(CH₂)₂CH₂]₂N} and 0.95 [6 H, t, J 7.3, CH₃(CH₂)₂]; $v_{\rm max}$ /cm⁻¹ 3091, 2871, 2727, 1666, 1595, 1552, 1526, 1406, 1367, 1168 and 813.

Synthesis of 4-(N,N-dialkylamino)benzyl alcohols

4-(N,N-Dialkylamino)benzaldehydes were reduced to the corresponding benzyl alcohols with reaction of an excess of sodium borohydride in ethanol (room temp., 1 h). After acidic hydrolysis (HCl 1 mol dm⁻³), usual diethyl ether work-up, MgSO₄ drying and solvent evaporation, the purity of the alcohols was confirmed by the total disappearance of the C=O IR band and by ¹H NMR. 4-(N,N-Dialkylamino)benzyl alcohols were used without any further purification. Yields were quantitative. Spectroscopic data are given below.

4-(N-Methyl-N-octylamino)benzyl alcohol. $\delta_{\rm H}({\rm CDCl}_3)$ 7.25 (2 H, d, J 8.7, 2-, 6-H), 6.71 (2 H, d, J 8.7, 3-, 5-H), 4.57 (2 H, s, CH₂OH), 3.32 [2 H, t, J 7.4, CH₂CH₂N(CH₃)], 2.95 [3 H, s, N(CH₃)], 1.90 (1 H, s, CH₂OH), 1.60 [2 H, m, CH₂CH₂CH₂-N(CH₃)], 1.33 [10 H, m, CH₃(CH₂)₅CH₂] and 0.92 [3 H, t, J 6.7, CH₃(CH₂)₅]; $\nu_{\rm max}/{\rm cm^{-1}}$ 3344, 2919, 2855, 1612, 1520, 1465, 1365, 1180, 1024 and 799.

4-[*N*-(6-Acetoxyhexyl)-*N*-methylamino]benzyl alcohol. $\delta_{\rm H}$ (CDCl₃) 7.25 (2 H, d, *J* 8.0, 2-, 6-H), 6.66 (2 H, d, *J* 8.0, 3-, 5-H), 4.53 (2 H, s, PhCH₂OH), 3.60 (2 H, t, *J* 6.6, CH₂CH₂OH), 3.29 [2 H, t, *J* 7.3, CH₂CH₂N(CH₃)], 2.91 [3 H, s, N(CH₃)], 2.03 (1 H, s, CH₂OH) and 1.77–1.36 (br) and 1.21 [9 H, HOCH₂(CH₂)₄CH₂ and CH₂OH]; $\nu_{\rm max}$ /cm⁻¹ 3371, 2933, 2859, 1612, 1520, 1364, 1242, 1187 and 799.

4-(*N*,*N*-**Dibutylamino)benzyl alcohol.** δ_{H} (CDCl₃) 7.22 (2 H, d, J 8.6, 2-, 6-H), 6.64 (2 H, d, J 8.6, 3-, 5-H), 4.53 (2 H, s, PhCH₂OH), 3.27 [4 H, t, J 7.6, CH₂(CH₂)₂N], 1.8 (1 H, br, PhCH₂OH), 1.58 and 1.32 {8 H, m, [CH₃(CH₂)₂CH₂]₂N} and 0.97 [6 H, t, J 7.2, CH₃(CH₂)₂]; ν_{max} /cm⁻¹ 3349, 2956, 2871, 1614, 1595, 1521, 1455, 1366, 1183 and 794.

General procedure for the synthesis of 4-(N,N-dialkylamino)benzylphosphonium bromides 2

To a 0.2 mol dm³ solution of benzyl alcohol in CHCl₃ was added triphenylphosphonium hydrobromide (0.95 equiv.).⁹ The solution was then refluxed for 2 h before solvent distillation. Residual solid was then dissolved in CHCl₃, the organic phase was washed once with saturated aqueous NaHCO₃, twice with water, dried over MgSO₄ and concentrated *in vacuo* before precipitating the phosphonium bromide in dry diethyl ether. The white powder was filtered off and dried *in vacuo* overnight.

4-(N-Methyl-N-octylamino)benzyl(triphenyl)phosphonium

bromide 2a. Following the general procedure, crude 4-(*N*-methyl-*N*-octylamino)benzyl alcohol (1.1 g, 0.0044 mol) was treated with triphenylphosphonium hydrobromide (1.43 g, 0.0042 mol). After precipitation, filtration and drying, 2.12 g (82%) of 4-(*N*-methyl-*N*-octylamino)benzyl(triphenyl)phosphonium bromide **2a** was isolated as a white powder; $\delta_{\rm H}$ (CDCl₃) 7.80–7.30 [15 H, m, P(*Ph*)₃], 6.84 (2 H, d, J 8.5, 2-, 6-H), 6.41 (2 H, d, J 8.5, 3-, 5-H), 5.02 [2 H, d, J 13, CH₂P(Ph)₃], 3.22 [2 H, t, J 7.4, CH₂CH₂N(CH₃)], 2.85 [3 H, s, N(CH₃)], 1.50 and 1.28 [12 H, br, CH₃(CH₂)₆CH₂] and 0.88 [3 H, t, J 6.7, CH₃(CH₂)₅]; $\nu_{\rm max}/{\rm cm^{-1}}$ 3051, 2946, 2848, 2776, 1612, 1522, 1466, 1437, 1377, 1185, 1111, 995, 850, 826, 745, 716 and 689.

4-[N-(6-Hydroxyhexyl)-N-methylamino]benzyl(triphenyl)phosphonium bromide 2b. Following the general procedure, crude 4-[N-(6-acetoxyhexyl)-N-methylamino]benzyl alcohol (0.554 g, 0.002 mol) was treated with triphenylphosphonium

hydrobromide (0.617 g, 0.0018 mol). After precipitation, filtration and drying, 0.62 g (56%) of 4-[N-(6-hydroxyhexyl)-N-methylamino]benzyl(triphenyl)phosphonium bromide **2b** was isolated as a white powder (deprotection of acetoxy group was observed to be quantitative); $\delta_{\rm H}(\rm CDCl_3)$ 7.75–7.25 [15 H, m, P(Ph)₃], 6.84 (2 H, d, J 8.5, 2-, 6-H), 6.38 (2 H, d, J 8.5, 3-, 5-H), 5.02 [2 H, d, J 13, CH₂P(Ph)₃], 3.60 (2 H, t, J 6.6, CH₂CH₂OH), 3.20 [2 H, t, J 7.3, CH₂CH₂N(CH₃)], 2.81 [3 H, s, N(CH₃)], 1.86 (1 H, s, CH₂OH) and 1.52–1.25 [8 H, br, HOCH₂(CH₂)₄CH₂]; $\nu_{\rm max}/\rm{cm}^{-1}$ 3327, 2927, 2854, 1610, 1520, 1436, 1364, 1110, 816, 744, 717 and 688.

4-(N,N-Dibutylamino)benzyl(triphenyl)phosphonium bromide 2c. Following the general procedure, crude 4-(*N*,*N*-dibutylamino)benzyl alcohol (1.5 g, 0.008 mol) was treated with triphenylphosphonium hydrobromide (2.61 g, 0.0072 mol). After precipitation, filtration and drying, 3.22 g (76%) of 4-(*N*,*N*-dibutylamino)benzyl(triphenyl)phosphonium bromide **2c** was isolated as a white powder; $\delta_{\rm H}$ (CDCl₃) 7.70–7.25 [15 H, m, P(*Ph*)₃], 6.90 (2 H, d, *J* 8.6, 2-, 6-H), 6.30 (2 H, d, *J* 8.6, 3-, 5-H), 5.03 [2 H, d, *J* 13, PhCH₂P(Ph)₃], 3.27 [4 H, t, *J* 7.6, CH₂(CH₂)₂N] and 1.58 and 1.32 {8 H, m, [CH₃(CH₂)₂-CH₂]₂N}, 0.97 [6 H, t, *J* 7.2, CH₃(CH₂)₂]; $\nu_{\rm max}$ /cm⁻¹ 3051, 2956, 2871, 2776, 1614, 1521, 1455, 1437, 1366, 1185, 1111, 995, 850, 826, 745, 716 and 689.

General procedure for the synthesis of dialkylamino-containing NLO-compounds 6, 8 and 12

To a suspension of dialkylaminobenzyl(triphenyl)phosphonium bromide 2 in dry THF, cooled at -78 °C and under a nitrogen atmosphere, was added a selected base (1 equiv.). After immediate dissolution of the phosphonium 2, the dark red solution was allowed to warm to room temp. and stirred for 15 min. Aldehyde 6 (1 equiv.) in dry THF was slowly added to the ylide solution and further stirred for 2 h before quenching with water. The aqueous phase was then extracted three times with chloroform, the organic phases washed with saturated aqueous sodium hydrogen carbonate and water and then dried over MgSO₄. After solvent evaporation under reduced pressure, the crude product was further purified by recrystallization or chromatography on silica gel column.

2-[(E)-4-(N-Methyl-N-octylamino)styryl]-5-[(E)-4-nitro-

styryl]thiophene 8a. Following the described procedure, 4-(*N*-methyl-*N*-octylamino)benzyl(triphenyl)phosphonium bromide 2a (1.76 g, 0.003 mol) in 25 cm³ of dry THF was treated with 15 cm³ of a 0.2 mol dm⁻³ BuLi solution in hexane. After 15 min, aldehyde 6 (0.77 g, 0.003 mol in 25 cm³ THF) was slowly added. After the treatment described above and recrystallization from EtOH-H₂O (7:3, v:v), filtration and drying, 1.0 g (70%) of

8a was isolated as red crystals (Found: C, 73.4; H, 8.0; N, 6.05; S, 6.7. Calc. for $C_{29}H_{34}N_2O_2S$: C, 73.37; H, 7.22; N, 5.90; S, 6.76%); δ_{H} (CDCl₃) (for the conjugated chain, see Table 2) 3.22 [2 H, t, J 7.4, CH₂CH₂N(CH₃)], 2.85 [3 H, s, N(CH₃)], 1.50 and 1.28 [12 H, br, CH₃(CH₂)₆CH₂] and 0.88 [3 H, t, J 6.7, CH₃(CH₂)₅]; ν_{max} /cm⁻¹ 3066, 3017, 2918, 2850, 1597, 1511, 1466, 1430, 1383, 1334, 1299, 1183, 1107, 1035, 952, 867, 805, 746 and 689.

2-{(E)-4-[N-(6-Hydroxyhexyl)-N-methylamino]styryl}-5-

[(*E*)-4-nitrostyryl]thiophene **8b.** Following the described procedure, 4-[*N*-(6-hydroxyhexyl)-*N*-methylamino]benzyl(triphenyl)phosphonium bromide **2b** (4.55 g, 0.007 mol) in 50 cm³ of dry THF was treated with 0.014 mol of LDA in 10 cm³ THF. After 15 min, aldehyde **6** (1.813 g, 0.007 mol) in 25 cm³ THF was slowly added. After the treatment described above, crude **8b** was purified by chromatography on silica gel column (hexane-ethyl acetate, 1:1) to give 0.65 g (25%) of **8b** as red crystals (Found: C, 69.7; H, 7.0; N, 5.6; S, 6.5. Calc. for C₂₇H₃₀N₂O₃S: C, 70.06; H, 6.48; N, 6.05; S, 6.90%); $\delta_{\rm H}$ (CDCl₃) (for the conjugated chain, see Table 2) 3.60 (2 H, t, *J* 6.6, CH₂CH₂OH), 3.20 [2 H, t, *J* 7.3, CH₂CH₂N(CH₃)], 2.81 [3 H, s, N(CH₃)], 1.86 (1 H, s, CH₂OH), 1.52–1.25 [8 H, br, HOCH₂(CH₂)₄CH₂)]; $v_{\rm max}/{\rm cm^{-1}}$ 3351, 2925, 2854, 1597, 1510, 1336, 1183, 1108, 943, 806, 746 and 689.

2-[(E)-(5-Formyl)-2-thienylvinyl]-5-[(E)-4-nitrostyryl]thiophene 7. Following the described procedure, 5-(4-nitrostyryl)thienyl(triphenyl)phosphonium bromide (1.172 g, 0.002 mol) in 10 cm³ of dry THF was treated with 5.5 cm³ of a 0.4 mol dm⁻³ EtOLi solution in EtOH. After 1 h, aldehyde 5 (0.372g, 0.002 mol) in 10 cm³ THF was slowly added and the orange solution further stirred for 2 h before quenching with 5 cm³ of 2 mol dm⁻³ HCl. After the treatment described above, crude 7 was purified by recrystallization from EtOH-H₂O (7:3, v:v), filtrated and dried to give 0.19g (30%) of 7 as orange crystals. Owing to product insolubility and low recoveries, no NMR spectra could be recorded; v_{max}/cm^{-1} 1660, 1617, 1586, 1508, 1461, 1425, 1337, 1230, 1109, 1048, 938, 860, 827, 798 and 746.

1-(5-{(E)-4-[N-(6-Hydroxyhexyl)-N-methylamino]styryl}-2thienyl)-2-{5-[(E)-4-nitrostyryl]-2-thienyl}ethene 8c. Following the described procedure, 4-[N-(6-hydroxyhexyl)-N-methylamino]benzyl(triphenyl)phosphonium bromide 2b (0.325 g, 0.0005 mol) in 10 cm³ of dry THF was treated with 0.0011 mol of EtOLi in 10 cm³ EtOH. After 15 min, aldehyde 7 (0.183 g, 0.0005 mol) in 5 cm³ THF was slowly added. After the treatment described above, crude 8c was purified by recrystallization from EtOH-H₂O (7:3, v:v), filtrated and dried to give 0.12 g (44%) of 8c as red crystals (Found: C, 69.7; H, 5.9; N, 4.2; S, 10.4. Calc. for $C_{33}H_{34}N_2O_3S_2$: C, 69.44; H, 6.00; N, 4.90; S, 11.23%); owing to product insolubility and low recoveries, no NMR spectra could be recorded; v_{max}/cm^{-1} 3300, 3094, 3041, 2924, 2853, 1593, 1513, 1465, 1427, 1386, 1338, 1182, 1109, 1044, 948, 885, 811, 746 and 688.

2-[(E)-4-(N,N-Dibutylamino)styryl]-5-[(E)-4-nitrostyryl]-

thiophene 8d. Following the described procedure, 4-(*N*,*N*-dibutylamino)benzyl(triphenyl)phosphonium bromide **2c** (2.104 g, 0.004 mol) in 50 cm³ of dry THF was treated with 0.014 mol of LDA in 10 cm³ THF. After 15 min, aldehyde **6** (1.813 g, 0.007 mol) in 25 cm³ THF was slowly added. After the treatment described above, crude **8b** was purified by chromatography on silica gel column (hexane-ethyl acetate, 1:1) to give 0.65 g (25%) of **8b** as red crystals (Found: C, 73.5; H, 7.5; N, 6.3; S, 7.1. Calc. for C₂₈H₃₂N₂O₂S: C, 73.01; H, 7.00; N, 6.08; S, 6.96%); $\delta_{\rm H}$ (CDCl₃) (for the conjugated chain, see Table 2) 3.27 [4 H, t, *J* 7.6, CH₂(CH₂)₂N], 1.58 and 1.32 {8 H, m, [CH₃(CH₂)₂CH₂]₂N} and 0.97 [6 H, t, *J* 7.2, CH₃(CH₂)₂]; $\nu_{\rm max}/{\rm cm^{-1}}$ 3071, 3015, 2954, 2868, 1588, 1512, 1402, 1336, 1222, 1183, 1107, 1034, 947, 855, 807, 745 and 688.

1-{5-[(*E*)-4-Butoxystyryl]-2-thienyl}-2-{5-[(*E*)-4-nitrostyryl]-2-thienyl}ethene 12b. A solution of 5-[(*E*)-4-butoxystyryl] thiophene-2-carbaldehyde 10 (0.45 g, 0.0015 mol) and diethyl phosphonate 11 (0.60 g, 0.0015 mol) in 30 cm³ dry THF under nitrogen was slowly added to sodium hydride (0.08 g, 0.002 mol) under nitrogen. After immediate reaction followed by gas evolution, the reaction mixture was heated at 50 °C for 2 h, allowed to cool to room temp. and neutralized with water. Crude 12b was obtained by precipitation in a mixture EtOH– H₂O (7:3, v:v), filtered and recrystallized from Et₂O to afford 0.45 g (50%) of 12b as orange crystals (Found: C, 69.0; H, 4.95; N, 3.6; S, 11.9. Calc. for C₃₀H₂₇NO₃S₂: C, 70.0; H, 5.2; N, 2.73; S, 12.4%); owing to product insolubility and low recoveries, no NMR spectra could be recorded; v_{max} /cm⁻¹ 2955, 1588, 1511, 1336, 1248, 1172, 1108, 1022, 946 and 821.

2-[(E)-4-Butoxystyryl]-5-[(E)-4-nitrostyryl]thiophene 12a. Following the same procedure as for 12b diethyl 4-butoxybenzylphosphonate (0.6 g, 0.002 mol) 3 and aldehyde 6 (0.518 g, 0.002 mol) in 30 cm³ of dry THF were added to sodium hydride (0.09 g, 0.003 mol). The treatment described above gave 0.58 g (72%) of **12a** as orange crystals (Found: C, 72.1; H, 6.6; N, 3.5; S, 7.9. Calc. for $C_{24}H_{23}NO_3S$: C, 71.04; H, 5.67; N, 3.45; S, 7.89%); $\delta_{\rm H}({\rm CDCl}_3)$ (for the conjugated chain, see Table 2) 3.99 (2 H, t, J 6.4, CH₂CH₂O), 1.78 (2 H, m, CH₂CH₂CH₂O), 1.51 (2 H, m, CH₂CH₂CH₂O), 0.99 (3 H, t, J 7.5, CH₃CH₂); $\nu_{\rm max}/{\rm cm}^{-1}$ 2924, 2870, 1588, 1515, 1465, 1340, 1252, 1174, 1107, 1067, 1035, 953, 867, 825, 796, 745 and 689.
