# Synthetic and tautomeric studies of 5-amino-2,3-dihydro-1,2,4-oxadiazol-3-one 

Do Young Ra, ${ }^{a}$ Nam Sook Cho, *a Sung Kwon Kang, ${ }^{a}$ Eun Suk Choi ${ }^{a}$ and II Hwan Suh ${ }^{b}$<br>${ }^{a}$ Department of Chemistry and ${ }^{b}$ Department of Physics, Chungnam National University, Taejon, 305-764 Korea

Received (in Cambridge) 17th August 1998, Accepted 5th November 1998

5-Amino-2,3-dihydro-1,2,4-oxadiazol-3-one $\mathbf{2}$ was synthesized as an analogue of cytosine. Among the possible four tautomers it was established by spectroscopic methods and ab initio calculations that it exists as a lactam form $\mathbf{2 b}$ like cytosine. The NH is more acidic than $\mathrm{NH}_{2}$, thus it could be regioselectively mesylated and acetylated under basic conditions.

## Introduction

Comparison between $-\mathrm{CH}=\mathrm{CH}-$ of benzenoid hydrocarbons and either the divalent $-\mathrm{S}-$ or -O - in their sulfur and oxygen containing counterparts is a well-known subject within benzenoid hydrocarbon and heterocyclic chemistry. New analogues of pyrimidine bases are of interest as potential biologically active agents. On this basis, we have previously studied 5-amino-2,3-dihydro-1,2,4-thiadiazol-3-one $\mathbf{1}^{1-5}$ as an analogue of cytosine. As an extension of our work, we report our synthetic and tautomeric results on 5-amino-2,3-dihydro-1,2,4-oxadiazol-3one 2 , which is the oxygen counterpart of $\mathbf{1}$. Tautomeric structures of pyrimidine bases are of great importance and significance in view of the relationship between structure and reactivity. ${ }^{6}$

## Results and discussion

Target compound $\mathbf{2}$ was synthesized via cleavage of the ethyl group in 5 -amino-3-ethoxy-1,2,4-oxadiazole 3 by boron tribromide ${ }^{7}$ in $70 \%$ yield (Scheme 1). The preparation of

Scheme 1 Reagents and conditions: i, $\mathrm{BBr}_{3}, \mathrm{CH}_{2} \mathrm{Cl}_{2},-15^{\circ} \mathrm{C}, 6 \mathrm{~h}$; ii, RCOCl, base.

5-amino-3-ethoxy-1,2,4-oxadiazole 3 was accomplished following a literature procedure, ${ }^{8}$ the melting point of $\mathbf{3}$ being identical with that reported. However, the same dealkylation method ( HCl -dioxane), ${ }^{9-11}$ which was applied to the formation of 2,3-dihydro-1,3,4-thiadiazol-2-ones from alkoxy-1,3,4-thiadiazoles failed for 3 . The heteronuclear multiple bond correlation (HMBC) experiment ${ }^{12}$ was performed for 3 to determine the chemical shifts of the two ring carbons. The experiment was
optimized for a long-range ${ }^{1} \mathrm{H}-{ }^{13} \mathrm{C}$ coupling of 7 Hz . These traces show that the $\mathrm{CH}_{2}$ interacts with the carbon absorbing at $173.1 \mathrm{ppm}(\mathrm{C}(3))$. Thus, the ${ }^{13} \mathrm{C}$ chemical shifts of $\mathrm{C}(3)$ and $\mathrm{C}(5)$ could be assigned as 173.1 and 171.2 ppm , respectively (Scheme 2).

Scheme $2 \delta_{\mathrm{H}}\left(400 \mathrm{MHz} ;\right.$ DMSO $^{-} \mathrm{d}_{6} ; \mathrm{Me}_{4}$ Si $), \delta_{\mathrm{C}}\left(100 \mathrm{MHz} ;\right.$ DMSO- $\mathrm{d}_{6}$; $\mathrm{Me}_{4} \mathrm{Si}$ ).

The structure of $\mathbf{2}$ was verified to be 5 -amino-2,3-dihydro-1,2,4-oxadiazol-3-one by ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR and IR spectroscopy. In the ${ }^{1} \mathrm{H}$ NMR, the disappearance of the ethyl group of $\mathbf{3}$ and appearance of the $\mathrm{NH}(7.93 \mathrm{ppm})$ signal of $\mathbf{2}$ served as supporting evidence for the deethylation of $\mathbf{3}$ to give $\mathbf{2}$. The ${ }^{13} \mathrm{C}$ NMR contains signals for the two ring carbons at 171.8 and 171.6 ppm respectively.

Compound $\mathbf{2}$ can theoretically exist in four tautomeric forms, 2a-d (Scheme 1). The ${ }^{1} \mathrm{H}$ NMR spectrum presents evidence that 2 exists as either a lactam or a lactim because only two peaks appear in the ratio $2: 1$. However, structure 2c containing three different hydrogens cannot be entirely excluded because the two amide NHs might have very similar chemical shifts and therefore appear as one signal. ${ }^{13} \mathrm{C}$ NMR spectroscopy is a sensitive technique for the investigation of tautomerism. It has been demonstrated in purine and pyrimidine that the ${ }^{13} \mathrm{C}$ chemical shift for a lactam carbonyl lies upfield from those of a lactim. ${ }^{13}$ In the same way, the ${ }^{13} \mathrm{C}$ chemical shift of $\mathrm{C}(3)$ in 2 shows a lower chemical shift than that of $\mathbf{3}$. It indicates that 2 exists as a stable lactam form, either $\mathbf{2 b}$ or $\mathbf{2 c}$. A conjugated enamine with a carbonyl group is a more stable lactam structure than an unconjugated imine. Consequently, $\mathbf{2}$ exists as a stable lactam form $\mathbf{2 b}$ like cytosine and $\mathbf{1}$.

We conducted $a b$ initio calculations on the tautomers of 5 -amino-2,3-dihydro-1,2,4-oxadiazol-3-one 2a-d with the GAUSSIAN94 package ${ }^{14}$ on a Cray Y-MP C916 supercomputer. Standard $3-21 G^{*}$ and $6-31 G^{*}$ basis sets ${ }^{15}$ were used to optimize geometries at the Hartree-Fock (HF) level.

Table 1 Relative energies (in $\mathrm{Kcal} \mathrm{mol}^{-\mathbf{1}}$ ) and total energies (in arbitrary units) for 2a-d tautomers

|  | 2a | 2b | 2c | 2d |  |
| :--- | :--- | :--- | :--- | :--- | :--- |
|  | MP4//HF/6-31G* | 1.00 | 0.00 | 7.13 | 24.68 |
|  | $(-391.652904)^{b}$ | $(-391.654505)^{b}$ | $(-391.643146)^{b}$ | $(-391.615169)^{b}$ |  |
| MP2//HF/6-31G ${ }^{* a}$ | 0.55 | 0.00 | 7.45 | 25.08 |  |
| MP2//HF/3-31G | $(-391.586657)^{b}$ | $(-391.587527)^{b}$ | $(-391.575650)^{b}$ | $(-391.547565)^{b}$ |  |
|  | $(-389.035249)^{b}$ | 0.00 | 5.10 | 19.63 |  |
|  | $(-389.044507)^{b}$ | $(-389.036382)^{b}$ | $(-389.013218)^{b}$ |  |  |

${ }^{a}$ MP4//HF/6-31G* and MP2//HF/6-31G* (3-21G*) represent an MP4 and an MP2 single point calculation at the HF optimized geometry with 6$31 \mathrm{G}^{*}\left(3-21 \mathrm{G}^{*}\right)$ basis set respectively. ${ }^{b}$ The values in parentheses are total energies.

Second-order (MP2) and fourth-order Möller-Pleset perturbation (MP4) calculations were carried out at the HF optimized geometries to obtain improved energy comparisons. The calculated total energies and relative energies of the tautomers studied at the MP2 and the MP4 levels are given in Table 1. The changes in molecular geometry associated with lactam-lactim tautomerism are similar in both basis sets (Scheme 3). The ring

$2 \mathbf{2}$

2c

2d

Scheme 3 Optimized bond distances (in $\AA$ ) at the HF/6-31G* and HF/ 3-21G* (the values in parentheses) levels.
structure is almost planar. The significant changes are in the $\mathrm{C}-\mathrm{O}$ bond distance and $\mathrm{C}-\mathrm{N}$ bond distance. The optimized $\mathrm{C}(3)-\mathrm{O}(7)$ distance of $1.32 \AA$ at $6-31 \mathrm{G}^{*}$ in 2 a is shortened to $1.18 \AA$ in $\mathbf{2 b}$ on account of the double bond. The $\mathrm{N}(2)-\mathrm{C}(3)$ bond distance of $1.28 \AA$ in $2 \mathbf{a}$ increases by $0.15 \AA$ in the $\mathrm{C}-\mathrm{N}$ single bond distance of $1.43 \AA$ in the $\mathbf{2 b}$ tautomer. These results are in good agreement with other $a b$ initio studies on the tautomerism of the pyrimidine bases. ${ }^{2,10,11,16}$ The most stable tautomer is $\mathbf{2 b}$ at both the $3-21 \mathrm{G}^{*}$ and $6-31 \mathrm{G}^{*}$ levels, in good agreement with spectroscopic results.

Like $\mathbf{1}^{1,2}$ and 5-amino-2,3-dihydro-1,3,4-thiadiazol-2-one ${ }^{10,17}$ the hydrogen at the 2 -position in $\mathbf{2}$ is more acidic than the amino group. Compound $\mathbf{2}$ was mesylated and acetylated under basic conditions to form 5-amino-2-mesyl-2,3-dihydro-1,2,4-oxadiazol-3-one 4a and 2-acetyl-5-amino-2,3-dihydro-1,2,4-oxadiazol-3-one $\mathbf{4 b}$, respectively. The structure of $\mathbf{4 a}$ was determined by X-ray crystallography. A drawing of the structure $\mathbf{4 a}$, showing the atom numbering scheme, is given in Fig. 1.

The amide carbonyl group of $\mathbf{4 b}$ ( 162.4 ppm ) was identified with the HMBC experiment, through its interaction with the methyl group. Compound $\mathbf{4 b}$ was confirmed by comparison of the ${ }^{13} \mathrm{C}$ chemical shifts of 2-acetyl-5-amino-2,3-dihydro-1,2,4-thiadiazol-3-one $5^{1}$ (Scheme 2).

## Experimental

All melting points were obtained using an electrically heated Thomas-Hoover capillary melting point apparatus and were uncorrected. The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were obtained using a Bruker ARX-400 spectrometer at 400 MHz and 100 MHz

Fig. 1 ORTEP drawing of 5-amino-2-mesyl-2,3-dihydro-1,2,4-oxadiazol-3-one $\mathbf{4 a}$, showing the atomic numbering used for the crystallographic analysis.
respectively with tetramethylsilane as reference. IR spectra were recorded on a Jasco Report-100 infrared spectrophotometer. Elemental analyses were carried out on an Elementar Analysensysteme GmbH Vario EL at the Korea Basic Science Institute, Seoul, Korea. Most of the commercially available starting materials and solvents were purchased from Aldrich Chemical Company.

## 5-Amino-3-ethoxy-2,3-dihydro-1,2,4-oxadiazol-3-one 3

Compound $\mathbf{3}$ was obtained by the procedure described in the literature ${ }^{8}$ as a white precipitate ( $61 \%$ from $\mathrm{H}_{2} \mathrm{O}$ ), mp: $115-$ $116^{\circ} \mathrm{C}$ (lit. ${ }^{8} 114-114.5^{\circ} \mathrm{C}$ ) (Found: C, 36.5; H, 5.6; N, 32.3. $\mathrm{C}_{4} \mathrm{H}_{7} \mathrm{~N}_{3} \mathrm{O}_{2}$ requires C, 37.2; H, $\left.5.5 ; \mathrm{N}, 32.5 \%\right) ; v_{\text {max }} \mathrm{KBr} / \mathrm{cm}^{-1}$ 3250, $3175(\mathrm{NH}), 3025,2975(\mathrm{CH}), 1710,1680(\mathrm{NH}), 1580$ $(\mathrm{C}=\mathrm{N}), 1040(\mathrm{C}-\mathrm{O}) ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz} ;\right.$ DMSO- $\left.\mathrm{d}_{6} ; \mathrm{Me}_{4} \mathrm{Si}\right) 7.77(\mathrm{br}$, $2 \mathrm{H}, \mathrm{NH}_{2}$ ), $4.13\left(\mathrm{q}, 2 \mathrm{H}, \mathrm{CH}_{2}, J=7.0\right), 1.29\left(\mathrm{t}, 3 \mathrm{H}, \mathrm{CH}_{3}, J=7.1\right)$; $\delta_{\mathrm{C}}\left(100 \mathrm{MHz} ; \mathrm{DMSO}-\mathrm{d}_{6} ; \mathrm{Me}_{4} \mathrm{Si}\right) 173.1(\mathrm{C}-\mathrm{OEt}), 171.2(\mathrm{C}=\mathrm{N})$, $65.1\left(\mathrm{CH}_{2}\right), 14.4(\mathrm{Me})$.

## 5-Amino-2,3-dihydro-1,2,4-oxadiazol-3-one 2

Under $\mathrm{N}_{2}$ atmosphere, compound $\mathbf{3}(1 \mathrm{~g}, 7.7 \mathrm{mmol})$ was suspended in $\mathrm{CH}_{2} \mathrm{Cl}_{2}\left(25 \mathrm{~cm}^{3}\right)$. A solution of $\mathrm{BBr}_{3}\left(8.4 \mathrm{~cm}^{3}, 8.4\right.$ $\mathrm{mmol}, 1 \mathrm{M}$ hexane solution) was added dropwise at $-15^{\circ} \mathrm{C}$. The resulting mixture was stirred for 2 h at the same temperature then for 6 h at room temperature. The mixture was poured into ice-water and the resulting solid filtered and dissolved in 2 M NaOH . The solution was acidified with dilute hydrochloric acid to precipitate $2(0.55 \mathrm{~g}, 70 \%)$; mp: 205-206 ${ }^{\circ} \mathrm{C}$ (Found: C, 23.3; $\mathrm{H}, 3.1 ; \mathrm{N}, 41.1 . \mathrm{C}_{2} \mathrm{H}_{3} \mathrm{~N}_{3} \mathrm{O}_{2}$ requires $\mathrm{C}, 23.8 ; \mathrm{H}, 3.0 ; \mathrm{N}$, $41.6 \%$ ); $v_{\text {max }} \mathrm{KBr} / \mathrm{cm}^{-1} 3250(\mathrm{NH})$, 2750, 1660 (C=O), 1590 $(\mathrm{C}=\mathrm{N}) ; \delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{DMSO}_{6} ; \mathrm{de}_{4} \mathrm{Si}\right) 7.93$ (br, $\left.1 \mathrm{H}, \mathrm{NH}\right)$, 6.29 (br, 2H, NH $)_{2}$ ); $\delta_{\mathrm{C}}\left(100 \mathrm{MHz} ;\right.$ DMSO-d $\left.{ }_{6} ; \mathrm{Me}_{4} \mathrm{Si}\right) 171.8$ ( $\mathrm{C}=\mathrm{O}$ ), $171.6(\mathrm{C}=\mathrm{N})$.

## 5-Amino-2-mesyl-2,3-dihydro-1,2,4-oxadiazol-3-one 4a

Compound $2(0.5 \mathrm{~g}, 5 \mathrm{mmol})$ was dissolved in 2 M NaOH solution ( $10 \mathrm{~cm}^{3}$ ) and mesyl chloride ( $0.45 \mathrm{~cm}^{3}, 5.9 \mathrm{mmol}$ ) was
added. After stirring for 18 h , the precipitate was filtered and recrystallized from water to give $\mathbf{4 a}(0.22 \mathrm{~g}, 25 \%)$; $\mathrm{mp}: 182^{\circ} \mathrm{C}$ (Found: C, 19.8; H, 2.7; N, 23.1; S, 17.9. $\mathrm{C}_{3} \mathrm{H}_{5} \mathrm{~N}_{3} \mathrm{O}_{4} \mathrm{~S}$ requires C, 20.1; H, 2.8; N, 23.5; S, 17.9\%); $v_{\text {max }} \mathrm{KBr}^{\left(\mathrm{cm}^{-1} 3350,3180\right.}$ (NH), 3030, 2945 (CH), 1769 (NH), 1673 (C=O), 1576 (C=N); $\delta_{\mathrm{H}}\left(400 \mathrm{MHz} ; \mathrm{DMSO}_{6} \mathrm{~d}_{6} ; \mathrm{Me}_{4} \mathrm{Si}\right) 9.29$ (br, 2H, $\mathrm{NH}_{2}$ ), 3.38 (s, $3 \mathrm{H}, \mathrm{Me}) ; \delta_{\mathrm{C}}\left(100 \mathrm{MHz} ;\right.$ DMSO- $\left.\mathrm{d}_{6} ; \mathrm{Me}_{4} \mathrm{Si}\right) 170.7$ (C=N), 162.2 (C=O), 36.9 (Me).

## 2-Acetyl-5-amino-2,3-dihydro-1,2,4-oxadiazol-3-one 4b

Compound $2(0.3 \mathrm{~g}, 3 \mathrm{mmol})$ was suspended in anhydrous pyridine $\left(10 \mathrm{~cm}^{3}\right)$ at $-5-0{ }^{\circ} \mathrm{C}$. Acetyl chloride ( $0.21 \mathrm{~cm}^{3}, 3 \mathrm{mmol}$ ) was added dropwise to the stirred mixture over 6 h . The mixture was then poured into ice-water. The resulting solid was filtered and recrystallized from pyridine to give $\mathbf{4 b}(0.27 \mathrm{~g}, 65 \%)$; mp: $198{ }^{\circ} \mathrm{C}$ (Found: C, 33.4; H, 3.55; N, 29.3. $\mathrm{C}_{2} \mathrm{H}_{3} \mathrm{~N}_{3} \mathrm{O}_{2}$ requires C, $33.6 ; \mathrm{H}, 3.5 ; \mathrm{N}, 29.4 \%)$; $v_{\text {max }} \mathrm{KBr} / \mathrm{cm}^{-1} 3265(\mathrm{NH}), 3101(\mathrm{CH})$, 1735 (NH), 1664 (C=O), 1589 (C=N); $\delta_{\mathrm{H}}\left(400 \mathrm{MHz}\right.$; DMSO-d ${ }_{6}$; $\left.\mathrm{Me}_{4} \mathrm{Si}\right) 8.92$ (br, 2H, NH 2 ), 2.38 (s, $3 \mathrm{H}, \mathrm{CH}_{3}$ ); $\delta_{\mathrm{C}}(100 \mathrm{MHz}$; DMSO- $\mathrm{d}_{6} ; \mathrm{Me}_{4} \mathrm{Si}$ ) $167.3(\mathrm{C}=\mathrm{N}), 162.4$ (amide $\mathrm{C}=\mathrm{O}$ ), 157.6 $(\mathrm{C}=\mathrm{O}), 21.9\left(\mathrm{CH}_{3}\right)$.

## X-Ray crystal structure of $\mathbf{4 a} \dagger$

The structure was determined by the application of the direct method SHELXS $86^{18}$ (all non-H atoms) and refined by full matrix least-squares (SHELXL $97{ }^{19}$ ). Hydrogen atoms were located from $\Delta F$ synthesis and positionally refined. Final $R_{1}$ [ $F \geq 4 \sigma(F)$ ] and $w R_{2}$ [all data] were 0.0354 and 0.0848 for 120 refined parameters, $S\left[F^{2}\right] 0.986$. And $(\Delta / \sigma)_{\text {max }}$ was 0.000 . Maximum and minimum features in $\Delta F$ synthesis are 0.250 and $-0.409 \mathrm{e}^{-3}$, respectively.
