# Preparation and Crystal Structures of two Phosphorus-Sulphur Rings : $(R P S)_{4}$ and $\left(R_{P S}^{2}\right)_{2}\left(R=C_{6} \mathbf{H}_{2} \mathrm{Me}_{3}-2,4,6\right) \dagger$ 

Cornelia Lensch and George M. Sheldrick ${ }^{*}$<br>Institut für Anorganische Chemie der Universität Tammannstrasse 4, D-3400 Göttingen, Federal Republic of Germany

The 1:1 reaction between $\mathrm{PRCl}_{2}\left(\mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{2} \mathrm{Me}_{3}-2,4,6\right)$ and $\left(\mathrm{Me}_{3} \mathrm{Si}\right)_{2} \mathrm{~S}$ in toluene yields (RPS) ${ }_{4}$ (1) which slowly disproportionates under mild conditions (35-40 ${ }^{\circ} \mathrm{C}, 3 \mathrm{~d}$ ) to ( $\left.\mathrm{RPS}_{2}\right)_{2}(2)$. Both structures have been determined by $X$-ray diffraction. Compound (1) is monoclinic, space group Cc, with $a=2$ 299.3(7), $b=1167.9(3), c=1937.8(6) \mathrm{pm}, \beta=130.65(2)^{\circ}$, and $Z=4 ; R=0.050$ for 3209 unique observed reflections. The eight-membered (PS) 4 ring adopts the crown conformation but is disordered. Compound (2) is monoclinic, space group $P 2_{1} / c$, with $a=890.1$ (2), $b=1845.2(12)$, $c=641.3(1) \mathrm{pm}, \beta=98.74(1)^{\circ}$, and $Z=2 ; R=0.062$ for 904 unique observed reflections. The four-membered ring with two trans exocyclic sulphurs possesses a crystallographic centre of symmetry.

Very few phosphorus-sulphur ring compounds of the type (RPS) ${ }_{n}$ are described in the literature: (PhPS) ${ }_{3}$ has been shown ${ }^{1,2}$ to contain a five-membered ring, with one exocyclic $\mathbf{P}=\mathrm{S}$, and Lappert and co-workers ${ }^{3}$ reported a six-membered (RPS) $)_{3}$ ring with $R=\mathrm{C}_{6} \mathrm{H}_{2} \mathrm{Bu}_{3}-2,4,6$. In the course of our study ${ }^{2}$ of the reactions of organosilicon and organotin sulphides with phosphorus-halogen bonds, which enable phosphorus sulphides to be prepared under very mild conditions, we have synthesised a compound with the composition (RPS) $x_{x}\left(1 ; \mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{2} \mathrm{Me}_{3}-2,4,6=\right.$ mesityl). The molecular ion peak could not be observed in the mass spectrum and the proton-decoupled ${ }^{31} \mathrm{P}$ n.m.r. spectrum showed only a single line, so a crystal structure determination was required to establish the size of the PS ring. On warming a solution of compound (1), white crystals of $\left(\mathrm{RPS}_{2}\right)_{2}(2 ; R=$ $\mathrm{C}_{6} \mathrm{H}_{2} \mathrm{Me}_{3}-2,4,6$ ) separated, which were also employed for $X$ ray structure elucidation.

## Experimental

Phosphorus-31 n.m.r. spectra were recorded on a Bruker WP 80 SY Fourier-transform spectrometer with $85 \% \mathrm{H}_{3} \mathrm{PO}_{4}$ as external standard, mass spectra by electronic ionisation (e.i.) and field desorption (f.d.) at $70 \mathrm{eV}\left(1.12 \times 10^{-17} \mathrm{~J}\right)$ on a Varian CH5 spectrometer. Solvents were dried and distilled before use. Elemental analyses were performed by Beller in Göttingen.

Preparation of $\left(2,4,6-\mathrm{Me}_{3} \mathrm{C}_{6} \mathrm{H}_{2} \mathrm{PS}\right)_{4}$ (1).-Bis(trimethylsilyl) sulphide ( $5.5 \mathrm{~g}, 31 \mathrm{mmol}$ ) in toluene ( $50 \mathrm{~cm}^{3}$ ) was added dropwise to a stirred solution of mesitylphosphorus dichloride $(6.8 \mathrm{~g}, 31.0 \mathrm{mmol})$ in toluene ( $100 \mathrm{~cm}^{3}$ ). The solvent and trimethylsilyl chloride were removed under reduced pressure. Compound (1) remained as a white powder ( $5.2 \mathrm{~g}, 92 \%$ yield) (Found: C, 59.25; H, 6.05; P, 16.85; S, 17.45. $\mathrm{C}_{36} \mathrm{H}_{44} \mathrm{P}_{4} \mathrm{~S}_{4}$ requires C, $59.30 ; \mathrm{H}, 6.10 ; \mathrm{P}, 17.00 ; \mathrm{S}, 17.60 \%$ ). Crystals for $X$-ray examination were grown from a solution in toluene by slowly condensing in pentane at $-30{ }^{\circ} \mathrm{C}$. The proton-

decoupled ${ }^{31} \mathrm{P}$ n.m.r. spectrum in toluene showed one single peak at $\delta=85.87$ p.p.m. Mass spectrum: f.d., m/e 332 ( $\mathrm{R}_{2} \mathrm{P}_{2} \mathrm{~S}$ ); e.i., m/e 332 (relative intensity $59.4 \%, \mathrm{R}_{2} \mathrm{P}_{2} \mathrm{~S}$ ), 299 (19.6, $\left.\mathrm{R}_{2} \mathrm{P}_{2}-\mathrm{H}\right), 214$ (34.8, $\mathrm{RPS}_{2}$ ), and 181 ( 100, RPS - H) ( $\mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{2} \mathrm{Me}_{3}-2,4,6$ ).

Preparation of $\left(2,4,6-\mathrm{Me}_{3} \mathrm{C}_{6} \mathrm{H}_{2} \mathrm{PS}_{2}\right)_{2}$ (2). White crystals of compound (2) formed slowly when a solution of (1) (1.5 g, 2.0 mmol ) in toluene was allowed to stand. After 3 d at $35^{\circ} \mathrm{C}$ the yield was $0.31 \mathrm{~g}(0.7 \mathrm{mmol}, 35 \%$ ) (Found: C, $51.30 ; \mathrm{H}$, 5.25; P, 14.10; S, 29.15. $\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{P}_{2} \mathrm{~S}_{4}$ requires $\mathrm{C}, 50.45 ; \mathrm{H}$, $5.15 ;$ P, 14.45; S, $29.90 \%$ ). The proton-decoupled ${ }^{31}$ P n.m.r. spectrum in toluene exhibited a single peak at $\delta=11.47$ p.p.m. Mass spectrum: f.d., $m / e 428$ (relative intensity $1.9 \%$, M), 396 ( $10.4, M-S), 364$ ( $4.5, M-2 S$ ), 332 ( $100, R_{2} P_{2} S$ ), 214 (66.9, $\mathrm{RPS}_{2}$ ), and 182 (18.2, RPS) ( $\mathrm{R}=\mathrm{C}_{6} \mathrm{H}_{2} \mathrm{Me}_{3}-2,4,6$ ).

Crystal Data for Compound (1). $-\mathrm{C}_{36} \mathrm{H}_{44} \mathrm{P}_{4} \mathrm{~S}_{4}, M=728.88$, monoclinic, space group $C c, a=2$ 299.3(7), $b=1$ 167.9(3), $c=1937.8(6) \mathrm{pm}, \beta=130.65(2)^{\circ}, U=3.948 \mathrm{~nm}^{3}, Z=4$, $D_{\mathrm{c}}=1.226 \mathrm{Mg} \mathrm{m}{ }^{-3}, \quad F(000)=1536, \lambda\left(\mathrm{Mo}-K_{\alpha}\right)=71.069$ $\mathrm{pm}, \mu\left(\mathrm{Mo}-\mathrm{K}_{\alpha}\right)=0.41 \mathrm{~mm}^{-1}$, crystal dimensions $0.5 \times 0.5 \times$ 0.4 mm .

Data were collected for $2 \theta<50^{\circ}$ on a Stoe-Siemens four-

circle diffractometer by a profile-fitting procedure, ${ }^{4}$ and Lorentz, polarisation but no absorption corrections applied. 4063 Unique data were measured of which 3209 with $F>$ $4 \sigma(F)$ were used for all calculations. The structure was solved by multisolution direct methods. After some cycles of refinement, difference electron-density syntheses indicated an alternative ring orientation and all further refinement was thus based on a disordered model (Figure 1). The minor component [21.3(2)\%] was refined with isotropic $P$ and $S$, but its C and H atoms could not be located separately (the mesityl groups of the two components overlap extensively). All P-S and all $\mathrm{P} \rightarrow \mathrm{C}$ bond lengths were restrained to be equal with a weight based on an estimated standard deviation (e.s.d.) of 1 pm ; they refined to $212.7\left(\mathrm{P}^{-S}\right)$ and $186.4 \mathrm{pm}\left(\mathrm{P}^{-} \mathrm{C}\right)$. The $\mathbf{P}, \mathbf{S}$, and $\mathbf{C}$ atoms of the major component were refined anisotropically, with a riding model for aromatic $\mathrm{H}\left[\mathrm{C}^{--} \mathrm{H} 96\right.$ pm on external $\mathrm{C}^{-} \mathrm{C}^{-} \mathrm{C}$ bisectors, $U(\mathrm{H})=1.2 U_{\mathrm{eq}}(\mathrm{C})$ ], rigid methyl groups $\left[\mathrm{C}-\mathrm{H} 96 \mathrm{pm}, \mathrm{H}^{-} \mathrm{C}-\mathrm{H} 109.5^{\circ}, U(\mathrm{H})=1.5\right.$ $U_{\text {eq }}(\mathrm{C})$ ], complex neutral-atom scattering factors, and weights $w^{-1}=\left[\sigma^{2}(F)+0.00025 F^{2}\right]$. Refinement converged to $R^{\prime}=$ $\Sigma \boldsymbol{w}^{\ddagger} \Delta / \Sigma \boldsymbol{w}^{\ddagger}\left|F_{0}\right|=0.047$ and $R=\Sigma \Delta / \Sigma\left|F_{0}\right|=0.050$.

Figure 2. The molecule of $\left(2,4,6-\mathrm{Me}_{3} \mathrm{C}_{6} \mathrm{H}_{2} \mathrm{PS}\right)_{4}$ (1), with the $P$ and $S$ atoms labelled. Only the predominant component is shown

The final atomic co-ordinates are given in Table 1, bond lengths and angles in Table 2.

Crustal Data for Compound (2). $-\mathrm{C}_{18} \mathrm{H}_{22} \mathrm{P}_{2} \mathrm{~S}_{4}, M=428.56$, monoclinic, space group $P 2_{1} / c, a=890.1(2), b=1845.2(12)$, $c=641.3(1) \mathrm{pm}, \beta=98.74(1)^{\circ}, U=1.041 \mathrm{~nm}^{3}, Z=2, D_{\mathrm{c}}=$ $1.367 \mathrm{Mg} \mathrm{m}^{-3}, \quad F(000)=448, \quad \lambda\left(\mathrm{Mo}-K_{\alpha}\right)=71.069 \mathrm{pm}$, $\mu\left(\mathrm{Mo} \circ K_{\alpha}\right)=0.59 \mathrm{~mm}^{-1}$, crystal dimensions $0.3 \times 0.1 \times 0.2$ mm .
The data collection was performed as for compound (1). 1417 Data with $2 \theta<45^{\circ}$ were reduced to 1354 unique refleciions, of which 904 with $F>4 \sigma(F)$ were used for structure solution by direct methods. The structure was refined with riding aromatic H and rigid methyl groups as for (1), with the remaining atoms anisotropic and $w^{-1}=\left[\sigma^{2}(F)+\right.$ $0.0008 F^{2}$ ]. Refinement converted to $R^{\prime}=0.060$ and $R=$ 0.062 . Final atomic co-ordinates are given in Table 3, bond lengtts and angles in Table 4. All calculations were performed using programs written by G. M. S.

## Results and Discussion

The molecular structures of compounds (1) and (2) are displayed in Figures 2 and 3. Compound (1) appears to be the first structure containing an eight-membered (PS) $)_{4}$ ring with trivalent phosphorus, although bridged rings of this type are found in the cage molecules $\alpha-P_{4} S_{4}{ }^{5}$ and $\beta-P_{4} S_{5} .{ }^{6}$ The mean P-S bond length of 212.7 pm in (1) is only slightly greater than

Figure 3. The molecule of $\left(2,4,6-\mathrm{Me}_{3} \mathrm{C}_{6} \mathrm{H}_{2} \mathrm{PS}_{2}\right)_{2}(2)$, with the P and S atoms labelled
the mean values in $\alpha-P_{4} \mathbf{S}_{4}$ (210.9) and $\beta-P_{4} \mathbf{S}_{5}$ ( 212.1 pm ), and the librational correction is likely to be larger for the two cages. The mean $\mathrm{P}^{\mathrm{II}-\mathrm{S}}$ distance in $\left[(\mathrm{PhP})_{3} \mathrm{~S}_{3}\right]^{2}$ is 210.9 pm . Compound (1) adopts the crown conformation as in the molecule $\mathrm{S}_{8}$; the six-membered ring in $\left(2,4,6-\mathrm{Bu}^{1} \mathrm{C}_{6} \mathrm{H}_{2} \mathrm{PS}\right)_{3}$ has the chair form. ${ }^{3}$ The mesityl groups in (1) lie approximately perpendicular to the plane of the ring.
The four-membered (PS) $)_{2}$ ring in compound (2) lies on a crystallographic inversion centre, which obliges the exocyclic sulphur atoms to be trans. The endocyclic $\mathrm{P}-\mathrm{S}$ bonds are significantly different ( 209.3 and 212.5 pm ), as found also in $\left(\mathrm{PhPS}_{2}\right)_{2}{ }^{2}$ but not $\left(\mathrm{MePS}_{2}\right)_{2}{ }^{7}$ This might be considered as a small step along the reaction pathway for the dissociation into two monomer units; $2,4,6-\mathrm{Bu}^{{ }^{t}}{ }_{3} \mathrm{C}_{6} \mathrm{H}_{2} \mathrm{PS}_{2}$ is monomeric. ${ }^{8}$
