(Received 5 November 2008; final version received 9 December 2008)

By introducing octyloxy to C-3 and alkyl groups to C-8 of jatrorrhizine, a series of 3-octyloxy-8-alkyljatrorrhizine derivatives were synthesized and their antimicrobial activities were evaluated *in vitro*. The results indicated that the derivatives exhibited high antimicrobial activities, especially against Gram-positive bacteria. The 3-octyloxy-8-butyljatrorrhizine displayed the highest antimicrobial activity in all compounds. Their structure–activity relationships were discussed.

Keywords: jatrorrhizine; 3-octyloxy-8-alkyljatrorrhizine derivatives; antimicrobial activity

1. Introduction

Jatrorrhizine (**1**) is a kind of quaternary protoberberine alkaloid (QPA) and is one of the active constituents of *Coptis chinensis* Franch. (*Ranunculaceae*), a traditional Chinese herbal medicine [1]. It has antimicrobial [2], hypoglycemic [3], antiarrhythmic [4], and antioxidant [5] activities and low host toxicity [6]. Substituted derivatives of QPA in the A, C, or D ring exhibit changes in their pharmacological effects. Iwasa *et al.* [7] reported that dioxymethylene replacement at the C-2 and C-3 positions in the A ring, as well as 8-alkyl- or 13-alkyl-substitution [8,9] increased, but 13-hydroxy-substituted derivatives decreased their antibacterial activity [10]. Duk *et al.* [11] reported that benzyl introduced to 13-C of berberine and berberubine increased the antifungal activities. The antimicrobial activities of 8-alkylberberine derivatives increased with the aliphatic chain

elongation and then decreased gradually when the alkyl chain exceeds eight carbon atoms [12]. In our previous study, 3-alkoxyjatrorrhizine derivatives were synthesized and their antimicrobial activities and toxicity were tested *in vitro*. The antimicrobial activities of the substituted derivatives were 32–1000 times higher than that of jatrorrhizine (**1**), which increased as the aliphatic chain was elongated and then decreased slightly when the alkyl chain exceeded eight carbon atoms. 3-Octyloxyjatrorrhizine (**2**) displayed the highest antimicrobial activity of all 3-alkoxyjatrorrhizine derivatives [13]. In this study, we synthesized a series of 3-octyloxy-8-alkyljatrorrhizine derivatives by introducing alkyl groups in C-8 and octyloxy to C-3 of jatrorrhizine and their antimicrobial activities were evaluated *in vitro* to study their structure–activity relationships.

Scheme 1. Synthetic route for compounds **5a–d**.

2. Results and discussion

The 3-octyloxy-8-alkyljatrorrhizine derivatives were synthesized successfully (Scheme 1). The yield of the derivatives was decreased from 77.9 to 47.4% as the aliphatic chain length increased. The ¹H NMR spectrum showed that the proton signals at δ 9.89 were disappeared and some new proton signals of CH₂/CH₃ appeared. The compounds were deeply analyzed by the ¹³C NMR, gCOSY, DEPT, and HMQC spectra. The results showed that the alkyl group was attached in position C-8.

The antimicrobial activities of the compounds **5a–c** were higher than that of 3-octyloxyjatrorrhizine (**2**) and displayed more potency against bacteria than fungus (Table 1). The antimicrobial activities of compounds **5a–d** did not increase as the aliphatic chain length increased. The compound 3-octyloxy-8-butyljatrorrhizine (**5b**) showed the strongest activity against the microbes tested. The antimicrobial activities of compound 3-octyloxy-8-octyljatrorrhizine were even lower than compound 3-octyloxyjatrorrhizine (**2**), which was not similar to the

Table 1. The minimum inhibitory concentration of compounds **2**, **5a–d** ($\mu\text{g/ml}$).

Compound	No.	Gram-positive bacteria				Gram-negative bacteria			Fungi <i>C. tropicalis</i>

3-Octyloxy-8-octyljatrorrhizine	5d	0.625	1.25	20	20	2.5	5	160	

The given values are means of three experiments. “–” showed no values given. Tween-80 was used as a blank and berberine as positive control.

8-alkylberberine derivatives and 3-alkoxyjatrorrhizine derivatives [12,13]. We may conclude that by introducing the suitable alkyl groups to jatrorrhizine can increase the antibacterial activity.

3. Experimental

3.1 General experimental procedures

Melting points were determined on an RD-2C electrothermal melting point apparatus and are uncorrected. The UV spectra were recorded on a Hitachi U-1800 spectrophotometer. The IR spectra were carried out on a Perkin-Elmer one IR spectrophotometer. The ^1H and ^{13}C NMR spectra were recorded on a Varian INOVA 600 (600 MHz) using TMS as the internal standard and DMSO- d_6 as solvent. TLC analysis was used to confirm the purity of the compounds, which was performed on silica gel-GF254 thin layers and developed with a moving phase of $\text{CHCl}_3/\text{MeOH}$ (3:1) and $\text{C}_6\text{H}_6/\text{EtOAc}/\text{MeOH}/\text{C}_3\text{H}_7\text{OH}/\text{NH}_3$ (6:3:1.5:1.5:0.5).

3.2 Synthesis of 3-octyloxyjatrorrhizine

Jatrorrhizine was extracted and purified from *Rhizoma coptidis* according to Ref. [14]. The purity of jatrorrhizine used to synthesize its derivatives was up to 98%. The 3-octyloxyjatrorrhizine was synthesized according to our previous report [13]. The octyl bromate (18 mmol) in DMSO (20 ml) was slowly added to the suspension of jatrorrhizine (15 mmol) and KOH (16.5 mmol) in DMSO (20 ml). After 3 h of reflux at 75°C , the above reactants were poured into 100 ml of cool water and the 3-octyloxyjatrorrhizine bromates would be precipitated immediately. The crude 3-octyloxyjatrorrhizine was washed with distilled water and ethyl acetate thrice, respectively, and be recrystallized thrice from MeOH at -20°C gave 3-octyloxyjatrorrhizine **2** (5.35 g) in 73.4% yield.

3.3 Synthesis of 3-octyloxy-8-alkyljatrorrhizine derivatives

The 3-octyloxy-8-alkyljatrorrhizine derivatives were synthesized according to Ref. [15].

Grignard reagents prepared from Mg turnings (8.8 mmol) and the corresponding alkyl bromides (8 mmol) in absolute THF (10 ml) were slowly added to the suspension of dry 3-octyloxyjatrorrhizine chloride (2 mmol) in absolute THF (10 ml) under N₂ at 0°C. After 2 h of reflux, the 3-octyloxy-8-alkyl-dihydrojatrorrhizine bromides (**3**) were obtained. A mixture of hydrobromides, Br₂ (1.8 mmol) and THF (30 ml), was heated at 50°C; no further change in the composition of the reaction mixture was evident by TLC. After cooling, the precipitates were filtered and washed with 10% Na₂S₂O₅ solution and H₂O, respectively. The crude 3-octyloxy-8-alkyljatrorrhizine bromides were obtained, which were crystallized from MeOH. Thereafter, these bromides were added into hot MeOH containing AgCl (1.8 mmol) and converted into corresponding chlorides. Melting points, UV, IR, ¹H and ¹³C NMR, and TLC were used to identify the structures of **5a–d**.

3.3.1 3-Octyloxy-8-ethyljatrorrhizine (**5a**)

$R_f = 0.32$, yield: 77.9%; mp 146–150°C; UV (CH₃OH) λ_{\max} (nm): 435, 350, 243; IR (KBr) ν_{\max} (cm⁻¹): 3075 (CH_{Ar}), 2923 and 2854 (CH), 1604 (Ar), 1520 (C=N), 1469 and 1354 (C–H), 1243–1038 (C–O), 734 ((–CH₂–)_{*n*}, $n \geq 4$); ¹H and ¹³C NMR spectral data were shown in Table 2. Elemental analysis: Found: C, 70.10%; H, 7.78%; N, 2.72%; Cl, 6.91%; calcd for C₃₀H₄₀NCIO₄: C, 70.11%; H, 7.79%; N, 2.73%; Cl, 6.91%.

3.3.2 3-Octyloxy-8-butyljatrorrhizine (**5b**)

$R_f = 0.34$, yield: 64.0%; mp 143–147°C; UV (CH₃OH) λ_{\max} (nm): 438, 350, 243; IR (KBr) ν_{\max} (cm⁻¹): 3071 (CH_{Ar}), 2929 and 2856 (CH), 1605 (Ar), 1520 (C=N), 1463 and 1352 (CH), 1283–1016 (C–O), 730 ((–CH₂–)_{*n*}, $n \geq 4$); ¹H and ¹³C NMR data were shown in Table 2. Elemental analysis: Found: C, 70.92%; H, 8.12%; N, 2.58%; Cl, 6.57%; calcd for C₃₂H₄₄NCIO₄: C, 70.91%; H, 8.13%; N, 2.59%; Cl, 6.56%.

3.3.3 3-Octyloxy-8-hexyljatrorrhizine (**5c**)

$R_f = 0.37$, yield: 63.0%; mp 137–141°C; UV (CH₃OH) λ_{\max} (nm): 439, 352, 243; IR (KBr) ν_{\max} (cm⁻¹): 3071 (CH_{Ar}), 2927 and 2855 (CH), 1605 (Ar), 1519 (C=N), 1466 and 1349 (CH), 1278–1018 (C–O), 724 ((–CH₂–)_{*n*}, $n \geq 4$); ¹H and ¹³C NMR spectral data were shown in Table 2. Elemental analysis: Found: C, 71.65%; H, 8.42%; N, 2.45%; Cl, 6.24%; calcd for C₃₄H₄₈NCIO₄: C, 71.64%; H, 8.43%; N, 2.46%; Cl, 6.23%.

3.3.4 3-Octyloxy-8-octyljatrorrhizine (**5d**)

$R_f = 0.39$, yield: 47.4%; mp 133–137°C; UV (CH₃OH) λ_{\max} (nm): 441, 353, 243; IR (KBr) ν_{\max} (cm⁻¹): 3072 (CH_{Ar}), 2926 and 2854 (CH), 1605 (Ar), 1520 (C=N), 1466 and 1349 (CH), 1282–1020 (C–O), 724 ((–CH₂–)_{*n*}, $n \geq 4$); ¹H and ¹³C NMR spectral data were shown in Table 2. Elemental analysis: Found: C, 72.31%; H, 8.68%; N, 2.33%; Cl, 5.95%; calcd for C₃₆H₅₂NCIO₄: C, 72.30%; H, 8.70%; N, 2.34%; Cl, 5.94%.

3.4 Antimicrobial activity

The compounds of **2**, **5a–d** were investigated *in vitro* for antimicrobial activity against Gram-positive (G+) bacteria, Gram-negative (G-) bacteria, and a fungus. The minimum inhibitory concentration was evaluated by using the two-fold serial dilution test [16]. Compounds **2**, **5a–d** were dissolved in H₂O containing 1% Tween-80 and diluted to different concentrations from 0.0012 to 160 µg/ml with liquid medium. The mixtures of serious dilutions of compounds and the microbes (2×10^8 cfu/ml) in broth medium were incubated at 37°C for 24 h for bacteria and at 25°C for 48 h for the fungus. Microbial growth was examined by measuring the absorbance at 655 nm with a spectrophotometer [17]. The H₂O/Tween-80 was used as a blank and berberine as positive control. All experiments were run in triplicate.

Table 2. ¹H and ¹³C NMR spectral data of compounds **5a–d** (DMSO-*d*₆; δ in ppm, 600 MHz).
