

Density and Viscosity Correlation for Several Common Fragrance and Flavor Esters

Hiannie Djojoputro and Suryadi Ismadji*

Department of Chemical Engineering, Widya Mandala Surabaya Catholic University, Kalijudan 37, Surabaya 60114, Indonesia

The density and viscosity of several fragrance and flavor esters were measured over a temperature range of (293.15 to 343.15) K. The esters studied were ethyl formate, *cis*-3-hexenyl formate, ethyl acetate, butyl acetate, isoamyl acetate, hexyl acetate, *trans*-2-hexenyl acetate, *cis*-3-hexenyl acetate, ethyl propionate, ethyl butyrate, butyl butyrate, isoamyl butyrate, hexyl butyrate, *cis*-3-hexenyl isobutyrate, ethyl isovalerate, ethyl 2-methylbutyrate, and ethyl hexanoate. The experimental data were correlated by temperature-dependence equations.

Introduction

In the flavor and fragrance industries, aliphatic and acrylic esters are important materials in manufacturing processes.¹ Most of the esters used in the flavor and fragrance industries are acetates, and ethanol is the most common alcohol component. In addition to straight-chain saturated compounds, branched-chain compounds and unsaturated compound esters are also important.

Several studies of the thermodynamic behavior and physical properties of several ester compounds in binary mixtures have been performed.^{1–4} However, detailed investigations of the physical properties of pure esters, especially their densities and viscosities over a wide range of temperature, are scarce in the literature. Therefore, this study was undertaken to obtain reliable density and viscosity data for a number of important flavor esters over a wide temperature range. The fragrance and flavor ester compounds chosen in this study with their physical characteristics are given in Table 1.

Experimental Section

Materials. High-purity and AR-grade samples of fragrance and flavor esters were purchased from Sigma-Aldrich Singapore. The purity of these chemicals was analyzed by gas chromatography (Shimadzu GC-17A) using a flame ionization detector with a DB-5 column. Helium (high purity) was used as the carrier gas. The purities of these esters are given in Table 1.

Density Measurements. Measurements of the densities of the pure components were carried out using a Mettler Toledo density meter type DE50 with an uncertainty of about 10^{-5} g·cm⁻³. Prior to measurement, the instrument was calibrated with double-distilled water. The temperature of the measuring cell was maintained at various temperatures using a Julabo Thermostat model F12-MD with an uncertainty of 0.1 K.

Viscosity Measurements. For viscosity measurements, an automatic microviscosimeter (Anton Paar type AMV_n) equipped with an automatic timer (± 0.01 s) was used. This instrument uses the rolling-ball principle according to DIN

53015 and ISO/DIS 12058, where a gold-covered steel ball rolls down inside an inclined, sample-filled glass capillary (diameter 0.16 cm). The uncertainty in time in the range of (0 to 250) s is less than 0.02 s with a resolution of ± 0.01 s. The temperature range of this viscosimeter is (283.15 to 343.15) K with an uncertainty of less than 0.05 K. The instrument was periodically calibrated with double-distilled water. The uncertainty in the viscosity measurement was estimated to be better than 0.004 mPa·s. The measuring temperature was kept at the desired temperature by placing the sample-filled glass capillary in a block controlled with a Julabo refrigerating and heating circulator.

All measurements described above were performed at least three times, and the results were averaged to give the final values.

Experimental Results

The experimental results of the density and viscosity measurements of several fragrance and flavor ester compounds are given in Table 2. The density and viscosity of ethyl formate were measured only at 323.15 K, whereas for *trans*-2-hexenyl acetate and *cis*-3-hexenyl acetate the density and viscosity were measured only at 333.15 K because of the low boiling points of these esters. From this Table, it can be seen that the experimental values of the density and viscosity are generally in agreement with those from the literature.^{1,4–10} However, for several viscosity data points, the deviation between experimental and literature data is as high as 0.04 mPa·s. This deviation is likely due to impurities in the flavor esters that we used.

The densities of pure esters were correlated using a temperature-dependence equation that has the following form:

$$\rho(T)/\text{g}\cdot\text{cm}^{-3} = a + b(T/\text{K}) + c(T/\text{K})^2 \quad (1)$$

Here, $\rho(T)$ is the density of the ester at absolute temperature and a , b , and c are fitted parameters. The fitted density parameters of each ester and standard deviation (σ) between experimental and calculated data are summarized in Table 3. Figure 1 depicts the experimental density data and predicted value versus temperature for several flavor esters. From Table 3 and Figure 1, it can be seen that eq 1 can predict the experimental data very well.

Table 1. Physical Characteristics of the Esters Used in This Study⁵

name of ester	molecular formula	molecular weight/g·mol ⁻¹	characteristic	purity/%	used
ethyl formate	C ₃ H ₆ O ₂	74.08	clear liquid with a slightly pungent, fruity, ethereal odor	98.2	fruit flavors
<i>cis</i> -3-hexenyl formate	C ₇ H ₁₂ O ₂	128.17	green-fruity odor, sweet	97.4	perfume and flavor to impart fruity-green notes
ethyl acetate	C ₄ H ₈ O ₂	88.11	fruity-smelling liquid with a brandy note	99.6	fruit and brandy flavors
butyl acetate	C ₆ H ₁₂ O ₂	116.16	liquid with a strong fruity odor	99.7	constituent of apple aroma
isoamyl acetate	C ₇ H ₁₄ O ₂	130.19	strongly fruity-smelling liquid	98.9	banana flavors
hexyl acetate	C ₈ H ₁₆ O ₂	144.21	liquid with a sweet-fruity, pearlike odor	99.0	fruit aroma composition
<i>trans</i> -2-hexenyl acetate	C ₈ H ₁₄ O ₂	142.20	fresh-fruity, slightly green-smelling liquid	98.9	fruit flavors
<i>cis</i> -3-hexenyl acetate	C ₈ H ₁₄ O ₂	142.20	fruit aromas and green tea	99.5	fruit flavors
ethyl propionate	C ₅ H ₁₀ O ₂	102.13	liquid with fruity odor reminiscent of rum	99.4	creating both fruity and rum notes
ethyl butyrate	C ₆ H ₁₂ O ₂	116.16	clear liquid with a fruity odor reminiscent of pineapples	99.6	perfume and flavor compositions
butyl butyrate	C ₈ H ₁₆ O ₂	144.21	clear liquid with a sweet-fruity odor	99.3	fruit flavor composition
isoamyl butyrate	C ₉ H ₁₈ O ₂	158.23	clear liquid with a very strong fruity odor	98.5	fruit flavors
hexyl butyrate	C ₁₀ H ₂₀ O ₂	172.27	liquid with a very strong fruity odor	98.4	fruit flavor composition
<i>cis</i> -3-hexenyl isobutyrate	C ₁₀ H ₁₈ O ₂	170.25	fruity-green odor	96.2	in perfume to create freshness in blossom compositions
ethyl isovalerate	C ₇ H ₁₄ O ₂	130.19	colorless liquid with a fruity odor reminiscent of blueberries	98.8	fruity aroma composition
ethyl 2-methylbutyrate	C ₇ H ₁₄ O ₂	130.19	liquid with a green-fruity odor reminiscent of apples	99.2	fruit flavor compositions
ethyl hexanoate	C ₈ H ₁₆ O ₂	144.21	colorless liquid with a strong fruity odor reminiscent of pineapples	98.7	flowery-fruity notes in perfume compositions and fruit flavors

**Figure 1.** Experimental density data and correlated values for several flavor esters: ●, ethyl formate; ■, *cis*-3-hexenyl formate; ▲, *trans*-2-hexenyl acetate; ◆, *cis*-3-hexenyl isobutyrate.

The viscosity of fragrance and flavor esters is a function of temperature and can be represented by the following equation

$$\log(\eta/\text{mPa}\cdot\text{s}) = A + \frac{B}{T/\text{K}} + C(T/\text{K}) + D(T/\text{K})^2 \quad (2)$$

where A , B , C , and D are fitted parameters and η is the viscosity of pure esters in $\text{mPa}\cdot\text{s}$. The fitted viscosity parameters of each ester and standard deviation (σ) between experimental and calculated data are summarized in Table 4. Figure 2 shows the experimental viscosity data

**Figure 2.** Experimental viscosity data and predicted values for several flavor esters: ●, ethyl acetate; ■, hexyl butyrate; ▲, ethyl 2-methylbutyrate; ◆, isoamyl acetate.

and predicted value versus temperature for several flavor esters. Table 4 and Figure 2 reveal that eq 2 can also represent the experimental viscosity data very well.

Conclusions

New experimental density and viscosity data for several important flavor ester compounds over a wide range of temperature were obtained. The results were then correlated using temperature-dependence equations. It was found that the models used in this study represent the experimental data very well.
