Editors' Foreword

The papers in this issue were presented in the form of working papers at a symposium held at NASA–Ames Research Center, Moffett Field, California on October 19–22, 1981 devoted to numerical boundary condition procedures and multigrid methods. The authors of a selection of the symposium papers were invited to submit complete versions for this Special Issue. As is customary, all the papers which appear have been refereed according to the usual standards of this Journal.

We thank the organizers of the conference, Dr. Paul Kutler and Mr. Harvard Lomax, for their help as well as Dr. Gerald Hedstrom for special assistance with this issue.
