#### Abstract

The reaction of trans $-\mathrm{RuCl}_{2}(\mathrm{dppe})_{2}(\mathbf{1})$, with $\mathrm{AgBF}_{4}$ in tetrahydrofuran leads to abstraction of one of the halide ligands to produce the trigonal-bipyrimidal complex, $\left[\mathrm{RuCl}(\mathrm{dppe})_{2}\right] \mathrm{BF}_{4}$ (2). Both products are characterized by ${ }^{31}$ P NMR spectroscopy and their crystal structures determined. For the coordinatively unsaturated trigonal-bipyramidal complex (2), we found no evidence for the presence of more than one species or fluxional behaviour at room temperature in the ${ }^{31} \mathrm{P}$ NMR spectrum. This complex was found to possess a trigonal-bipyramidal geometry in the solid state. Crystals of 1 are monoclinic, space group $P 2_{1} / c$ with $a=23.713(4) \AA, b=11.156(1) \AA, c=17.595(2) \AA, \beta=103.23(1)^{\circ}$ and $V=4531(1) \AA^{3}$. Convergence to conventional $R$ values of $R=0.043$ and $R_{w}=0.042$ was obtained for 416 variable parameters and 2746 reflections with $I>3 \sigma(I)$. Compound 2 in triclinic, $P \mathrm{I}, a=12.482(3) \AA, b=12.543(3) \AA, c=17.582(3) \AA$, $\alpha=87.52(2)^{\circ}, \beta=72.70(2)^{\circ}, \gamma=74.35(2)^{\circ}$ and $V=2529(1) \AA^{3}$. Values of $R=0.072$ and $R_{w}=0.097$ were obtained for 487 variable parameters and 3242 reflections with $I>3 \sigma(I)$.

KEY WORDS: Ruthenium, phosphines, X-ray structure, NMR.

## INTRODUCTION

Ruthenium(II) complexes containing tertiary phosphines have been extensively studied, particularly in connection with their ability to function as homogeneous catalysts in a variety of reactions. ${ }^{1}$ A number of $\mathrm{Ru}(\mathrm{II})$ complexes containing chelating phosphines have also been prepared. However, considerably less is known concerning the chemistry of these systems. ${ }^{2}$ In these complexes, reaction rates and selectivity appear to be highly dependent on a number of factors; quite frequently steric considerations play a major role, although electronic effects, as well as factors such as chelate ring size, are also important. ${ }^{3-5}$

[^1]Ruthenium(II), with its $d^{6}$ electron configuration, tends to favour octahedral coordination geometries. As a result, relatively few examples of five-coordinate complexes of $\mathrm{Ru}(\mathrm{II})$ containing chelating phosphine ligands have been described. ${ }^{6-8}$ Specific examples include a series of cationic complexes having the formula $\left[\mathrm{RuX}(\text { dcpe })_{2}\right]^{+}\left(\mathrm{X}=\mathrm{Cl}^{-}, \mathrm{Br}^{-}, \mathrm{I}^{-}\right)$where dcpe is 1,2-bis(dicyclohexylphosphino)ethane, and the hydrido complex, $\left[\mathrm{RuH}(\mathrm{dcpe})_{2}\right]^{+} .{ }^{8}$ The crystal structure of one of these, $\left[\mathrm{RuCl}(\mathrm{dcpe})_{2}\right]^{+}$, has been determined and shown to possess a trigonal-bipyramidal geometry. ${ }^{8}$ The syntheses of a series of five-coordinate $\mathrm{Ru}(\mathrm{II})$-halide complexes containing bidentate phosphines of the type $\mathrm{R}_{2} \mathrm{P}\left(\mathrm{CH}_{2}\right)_{\mathrm{n}} \mathrm{PR}_{2} \mathrm{n}=1-4, \mathrm{R}=$ phenyl or methyl) has also been described, although, interestingly, it was reported that no product could be obtained with $\mathrm{n}=2$ and $\mathrm{R}=$ phenyl. ${ }^{6}$

Recently we succeeded in preparing the missing member of this series, $\left[\mathrm{RuCl}(\mathrm{dppe})_{2}\right]\left[\mathrm{BF}_{4}\right]$, where dppe is the chelating phosphine, 1,2-bis(diphenylphosphino)ethane. Although the ${ }^{31}$ P NMR data indicated the presence of only one species in solution, the stereochemistry of the complex could not be unambiguously determined. Owing to the paucity of structural data on five-coordinate $\mathrm{Ru}(\mathrm{II})$ complexes, we undertook an X-ray crytal structure determination of this cation in order to establish its configuration. In this paper we also report for the first time the crystal structure of the parent compound, trans $-\mathrm{RuCl}_{2}(\mathrm{dppe})_{2}$.

## EXPERIMENTAL

## Materials and Methods

All manipulations were carried out using standard Schlenk techniques under oxygen-free nitrogen or argon. Triphenylphosphine, 1,2-bis(dicyclohexylphosphino)ethane, and $\mathrm{AgBF}_{4}$ were purchased from the Aldrich Chemical Company, Inc., and used as received. Ruthenium trichloride was provided by the Engelhard Corporation. All solvents were freshly distilled prior to use using appropriate drying agents. ${ }^{31} \mathrm{P}$ NMR spectra were recorded in $\mathrm{CDCl}_{3}$ using a Bruker AC 200 spectrometer and referenced to an $85 \%$ solution of $\mathrm{H}_{3} \mathrm{PO}_{4}$ in $\mathrm{D}_{2} \mathrm{O}$.

## Preparation of dichlorobis(1,2-bis(diphenylphosphino) ethane) $R u(I I)$, ( $\mathbf{1}$ )

$\mathrm{RuCl}(\text { dppe })_{2}$ was prepared either from $\mathrm{RuCl}_{2}\left(\mathrm{PPH}_{3}\right)_{3}$ according to the literature ${ }^{9}$ procedure, or from the anionic $\mathrm{Ru}(\mathrm{III})$ complex, $\left[\mathrm{RuCl}_{4}\left(\mathrm{PPh}_{3}\right)_{2}\right]^{-}$, by procedures that have also been described. ${ }^{10}$ Recrystallization from a dichloromethane-diethyl ether solution led to the formation of numerous well-formed yellow crystals. ${ }^{31} \mathrm{P}$ : $39.85 \mathrm{ppm}(\mathrm{s})$.

Preparation of [chlorobis( 1,2-bis(diphenylphosphino)ethane) $R u(I I)]\left[B F_{4}\right]$, (2)
Preparation of the cationic $\mathrm{Ru}(\mathrm{II})$ complex was carried out by halide abstraction using $\mathrm{AgBF}_{4}$. To 100 mg of $\mathrm{RuCl}_{2}$ (dppe) $)_{2}$ in THF was added a two-fold excess ( 40 mg ) of $\mathrm{AgBF}_{4}$. The reaction was stirred for one hour whereupon it developed a purple colour. The solution was filtered to remove AgCl and the solvent was removed under reduced pressure. Crystals suitable for X-ray analysis were obtained by slow evaporation from a $\mathrm{CHCl}_{3}$-diethyl ether solution. ${ }^{31} \mathrm{P}$ NMR: 79.02(s) ppm, 50.79(t) $\mathrm{ppm} ; \mathrm{J}_{\mathrm{P}-\mathrm{P}} 11.5 \mathrm{~Hz}$.

## X-ray Crystallography

X-ray data collection for both compounds carried out using a Siemens R3m/V diffractometer equipped with graphite-monochromated $\mathrm{MoK} \alpha \mathrm{p} 0.71073 \AA$ ) radiation. Refined cell parameters were obtained from the setting of 25 high angle reflections. Data collection was carried out at ambient temperature using the $\omega$-scanning technique in bisecting geometry. For both structures, three standards measured every 97 data showed no significant variation over the period of data collection. The data were corrected for Lorentz and polarization effects, as well as absorption. Absorption coorrections for both data sets were applied semi-empirically on the basis of azimuthal scans of several reflections spanning a range of $2 \Theta$ values. The structures of both were solved using standard Patterson and difference Fourier techniques and refined using scattering factors that included terms for anomalous dispersion. ${ }^{11,12}$ Crystal data and details of the crystallographic experimental procedure for both complexes are summarized in Table 1.

Dichlorobis( $1,2 b i s($ diphenylphosphino ) ethane) $R u(I I)$, (1)
A small, regularly shaped crystal displaying a prismatic habit was mounted on the end of a glass fibre in a random orientation. Monoclinic symmetry was suggested on the basis of the interaxial angles and confirmed by axial rotation photographs. Assignment to the $P 2_{1} / c$ space group was based on an inspection of the systematically absent reflections. Phenyl rings were refined as rigid idealized polygons ( $\mathrm{C}-\mathrm{C}=1.395 \AA$ )

centrosymmetric cell which was assigned to the $P \overline{1}$ space group. Phenyl rings were refined as rigid idealized polygons ( $\mathrm{C}-\mathrm{C}=1.395 \AA$ ) including hydrogen atoms placed in idealized positions with fixed isotropic $U=0.08 \AA^{2}$. Two reflections ( $1,0,0$ ) and $-1,0,1$ ) suffered from extinction, and were therefore omitted during the refinement process. For the final cycle, maximum shift $/ \sigma=0.002$ with minimum and maximum residual electron densities of $-0.68 \mathrm{e} \AA^{-3}$ and $0.95 \mathrm{e}^{-3}$. Atomic coordinates, bond lengths and angles are listed in Tables 4 and 5.

## RESULTS AND DISCUSSION

Dichlorobis( I,2-bis(diphenylphosphino) ethane) Ru(II), (1)
This complex (Figure 1) possesses a trans octahedral stereochemistry with two chloride ligands coordinating axially and the chelating dppe ligands occupying equatorial sites. Bonds to the $\mathrm{Cl}^{-}$ligands measure $2.445(3)$ and $2.417(3) \AA$ for $\mathrm{Ru}-\mathrm{Cl}(1)$ and $\mathrm{Ru}(1)-\mathrm{Cl}(2)$, respectively, and bonds to the P atoms range from a minimum of 2.349(3) to a maximum of $2.394(3) \AA$. ( $\mathrm{Ru}-\mathrm{P}$ average $2.374(3) \AA$ ). The Ru atom is displaced just slightly $(0.077 \AA)$ from the least-squares plane defined by the four P atoms to which it is attached. Small deviations from ideal octahedral geometry are most noticeably evident within the interaxial angles associated with the coordination sphere of the Ru atom. The $\mathrm{Cl}(1)-\mathrm{Ru}(1)-\mathrm{Cl}(2)$ atoms define an angle of $173.3(1)^{\circ}$, and within the five-membered rings formed by the chelating dppe ligands the interaxial angles are

Figure 1 A perspective view of 1 illustrating the atomic numbering scheme. Thermal ellipsoids have been drawn at the $50 \%$ probability level and phenyl rings have been omitted for clarity.

Figure 2 A perspective view of 2 illustrating the atomic numbering scheme. Thermal ellipsoids have been drawn at the $50 \%$ probability level. Phenyl rings are not shown in order to highlight the coordination geometry. Not shown also is the $\mathrm{BF}_{4}^{-}$counterion.
acute (81.8(1) and $81.9(1)^{\circ}$ for $\mathrm{P}(1)-\mathrm{Ru}(1)-\mathrm{P}(2)$ and $\mathrm{P}(3)-\mathrm{Ru}(1)-\mathrm{P}(4)$, respectively). Many of the structural features of this complex are similar to those observed in the structure of trans- $\mathrm{RuCl}_{2}\left(\mathrm{PPhMe}\left(\mathrm{CH}_{2}\right)_{2} \mathrm{PPhMe}\right)$, particularly the chelate bite angle which, in that complex, displayed a value of $82.7^{\circ} .{ }^{13}$

The ${ }^{31} \mathrm{P}$ NMR spectrum of this complex shows a sharp singlet at 39.85 ppm , consistent with the trans stereochemistry observed in the solid state. These values are shifted significantly downfield relative to free dppe, and while we found small peak at -10.39 ppm indicative of a small amount of free triphenylphosphine, we found no evidence for the presence of any of the cis isomer.
[Chlorobis(1,2-bis(diphenylphosphino)ethane) $R u(I I)]\left[B F_{4}\right]$, (2)
Square-pyramidal coordination geometry has been predicted to be favoured for low-spin $d^{6}$ transition metal complexes. ${ }^{14,15} \mathrm{We}$ find, however, that our complex possesses a trigonal-bipyramidal structure in the solid state with the $P$ atoms of the dppe ligands occupying both equatorial and axial sites. Bonds to the axial $\mathbf{P}$ atoms are longer, on the average, by $0.040 \AA$ compared with those occupying equatorial

sites. The length of the bond to $\mathrm{Cl}(1)$ in this structure is shorter than either of the $\mathrm{Ru}-\mathrm{Cl}$ bonds observed in the structure of $\mathbf{1}(\mathrm{Ru}(1)-\mathrm{Cl}(1)=2.400(4) \AA$ ) but compares favourably with that observed in the X-ray crystal structure of the trigonalbipyramidal $\left[\mathrm{RuCl}(\text { dcpe })_{2}\right]^{+}$cation ( $\mathrm{Ru}-\mathrm{Cl}=2.386(3) \AA$ ), as well as two squarepyramidal $\mathrm{Ru}(\mathrm{II})$ complexes where an average $\mathrm{Ru}-\mathrm{Cl}$ bond length of $2.390(4) \AA$ was found. ${ }^{16,17}$

The $\mathrm{P}(2)-\mathrm{Ru}(1)-\mathrm{P}(4)$ atoms in this structure are essentially collinear (176.5(1) ${ }^{\circ}$ ). However, substantial deviations from ideal trigonal bipyramidal geometry are evident in the interaxial angles associated with atoms located at equatorial sites. Thus we find in this complex that the $\mathrm{Cl}-\mathrm{Ru}-\mathrm{P}$ angles are obtuse $\left(\mathrm{Cl}(1)-\mathrm{Ru}(1)-\mathrm{P}(1)=131.6(1)^{\circ}\right.$; $\left.\mathrm{Cl}(1)-\mathrm{Ru}(1)-\mathrm{P}(3)=133.7(1)^{\circ}\right)$, whereas the angle defined by the $\mathrm{P}(1)-\mathrm{Ru}(1)-\mathrm{P}(3)$ atoms is nearly orthogonal $\left(94.7(1)^{\circ}\right)$. Similar patterns of bond lengths and angles have been observed in the structure of $\operatorname{Ir}(\mathrm{dppe})_{2} \mathrm{CO}$ and have been attributed to steric interactions involving the ortho H atoms of the phenyl rings. ${ }^{18}$

Although fluxional behaviour is frequently the norm for five coordinate complexes, the presence of chelating ligands might be expected to increase the stereochemical rigidity of the complex. ${ }^{31} \mathrm{P}$ NMR data for the complex described here shows a pair resonance with quite different chemical shifts centred at 79.02 ppm and 50.79 ppm . The peak at 79.02 ppm was present as a sharp singlet, whereas that at 50.79 ppm was observed as a triplet ( $\mathrm{J}-\mathrm{J}_{\mathrm{P}-\mathrm{P}}=11.5 \mathrm{~Hz}$ ). Fluxional behaviour has been documented in other five-coordinate complexes of $\mathrm{Ru}(\mathrm{II})$ containing bidentate phosphines, however, the sharp resonances observed in this complex suggest we are observing only one species in solution. ${ }^{8}$

Although these data are consistent with the trigonal-bipyramidal geometry observed in the solid state, it could be argued that a similar spectrum would be obtained for a complex possessing a square-pyramidal structure with some degree of distortion in the basal plane as, for example, in the structure of $\mathrm{RuCl}_{2}\left(\mathrm{PPh}_{3}\right)_{3}$. In the latter case, however, the differences in the ${ }^{31} \mathrm{P}$ NMR chemical shifts would not be expected to be very great. Since rather large chemical shifts are observed in the ${ }^{31} \mathrm{P}$ NMR spectrum of the complex described here, it suggests that the trigonal-bipyramidal geometry observed in the solid state also persists in solution, at least when non-coordinating solvents are involved.

## Acknowledgements

Acknowledgement is made to the Donors of the Petroleum Research Fund, administered by the American Chemical Society, and the Welch Foundation. Additional support was provided by grants from the Exxon Educational Foundation, the University Research Institute, the Chancellors Research Council, and IM ${ }^{3}$. We wish to especially thank the Engelhard Corporation for their gift of ruthenium trichloride and F. Cervantes-Lee for collecting the intensity data.

## Supplementary Data

Lists of structure factors, anisotropic thermal parameters, and hydrogen atoms coordinates are available from the authors upon request.
