#### Abstract

A binuclear copper(II) complex $[\mathrm{Cu}(\mathrm{PDC})(\text { phen })]_{2} \cdot 2 \mathrm{CH}_{3} \mathrm{OH} \cdot 1.5 \mathrm{H}_{2} \mathrm{O}$ (1) and a sevencoordinate manganese(II) complex $\left[\mathrm{Mn}(\mathrm{PDC})(\mathrm{phen})_{2}\right] \cdot \mathrm{CH}_{3} \mathrm{OH} \quad$ (2) ( $\mathrm{PDC}=$ pyridine-2,6dicarboxylate, phen $=1,10$-phenanthroline) have been synthesized hydrothermally and characterized by elemental analyses, spectroscopic studies (IR and UV), and single-crystal Xray diffraction. In $\mathbf{1}$, the binuclear copper(II) compound consists of two kinds of $\mathrm{Cu}(\mathrm{II})$ centers with five- and six-coordination environments by PDC and phen. The two $\mathrm{Cu}(\mathrm{II})$ ions are bridged by one PDC. In 2, Mn(II) is seven-coordinate by two phen and one PDC.

Keywords: Binuclear copper(II) complex; UV spectra; Pyridine-2,6-dicarboxylate; Sevencoordinate manganese(II) complex

## 1. Introduction

Formation of metal/bi- or polycarboxylate assemblies are of interest [1-11]. A frequently used family of organic linkers consist of 1,4-benzenedicarboxylic acid, 1,3,5-benzenetricarboxylic, 1,2,4,5-benzenetetracarboxylic acid, pyridine-3,5-dicarboxylic acid, and pyridine-2,6-dicarboxylic acid. The versatile coordination modes of the carboxylates, as well as the chemical robustness, lead to the assembled frameworks exhibiting structural diversity and thermal stability [12]. Selection of appropriate multidentate ligands to link metal-organic frameworks is important for building lowdimensional coordination polymers and potential supramolecular complexes [13-17]. As a multidentate ligand, pyridine-2,6-dicarboxylic acid $\left(\mathrm{H}_{2} \mathrm{PDC}\right)$ is usually tridentate as a bridging linker in design of metal-organic molecular assemblies [18, 19].

Hydro(solvo)thermal method is good for synthesis of extended coordination networks and new materials [20-23], generating species that are difficult to obtain by routine synthetic methods. It is very difficult to assess the role of each reagent used [20], as some reagents control formation of product in ways that are difficult to predict.

[^0]Herein, we describe a binuclear copper complex $[\mathrm{Cu}(\mathrm{PDC})(\mathrm{phen})]_{2} \cdot 2 \mathrm{CH}_{3} \mathrm{OH} \cdot 1.5 \mathrm{H}_{2} \mathrm{O}$ (1) and a mononuclear manganese complex $\left[\mathrm{Mn}(\mathrm{PDC})(\text { phen })_{2}\right] \cdot \mathrm{CH}_{3} \mathrm{OH}(\mathbf{2})$, synthesized by hydrothermal methods and characterized by elemental analyses, spectroscopic studies (IR and UV), and single-crystal X-ray diffraction. The copper compound is asymmetric with each Cu center in a unique coordination environment. The manganese compound is seven-coordinate.

## 2. Experimental

### 2.1. Materials and physical measurements

All chemicals used in these syntheses were of reagent grade and used as purchased. Infrared (IR) spectra were recorded on a BRUKER EQUINOX-55 spectrophotometer from 400 to $4000 \mathrm{~cm}^{-1}$ using KBr pellets. Elemental analyses were performed on a Perkin-Elmer 2400 elemental analyzer. UV spectra were determined in methanol with concentration $\left(1.0 \times 10^{-4} \mathrm{M}\right)$ using a HITACHI UV-3310 spectrometer with 1 cm quartz cell in the range $200-800 \mathrm{~nm}$ at room temperature.

### 2.2. Synthesis of $[\mathrm{Cu}(\mathrm{PDC})(\text { phen })]_{2} \cdot 2 \mathrm{CH}_{3} \mathrm{OH} \cdot 1.5 \mathrm{H}_{2} \mathrm{O}$ (1)

A mixture of pyridine-2,6-dicarboxylic acid ( 1 mmol ), 1,10-phenanthroline ( 1 mmol ), $\mathrm{Cu}(\mathrm{OAc})_{2} \cdot \mathrm{H}_{2} \mathrm{O}(1 \mathrm{mmol}), \mathrm{NaOH}(2 \mathrm{mmol})$, and 8 mL methanol were placed in a 23 mL Teflon lined stainless steel reactor. The vessel was heated to $120^{\circ} \mathrm{C}$ for 3 days and then cooled at $5^{\circ} \mathrm{C} \mathrm{h}^{-1}$ to room temperature; blue crystals were obtained by filtration. Anal. Calcd for $\mathrm{C}_{40} \mathrm{H}_{33} \mathrm{Cu}_{2} \mathrm{~N}_{6} \mathrm{O}_{11.5}$ : C, 52.86; H, 3.67; N, 9.25. Found: C, 53.47; H, 3.32; N, 9.36.

### 2.3. Synthesis of $\left[\mathrm{Mn}(\mathrm{PDC})(\text { phen })_{2}\right] \cdot \mathrm{CH}_{3} \mathrm{OH}$ (2)

Compound 2 was prepared similarly to $\mathbf{1}$ by using $\mathrm{Mn}(\mathrm{OAc})_{2} \cdot 4 \mathrm{H}_{2} \mathrm{O}(1 \mathrm{mmol}), \mathrm{NaOH}$ ( 2 mmol ), pyridine-2,6-dicarboxylic acid ( 1 mmol ), 1,10-phenanthroline ( 1 mmol ), and 8 mL methanol. Colorless crystals were obtained by filtration. Anal. Calcd for $\mathrm{C}_{33} \mathrm{H}_{27} \mathrm{MnN}_{5} \mathrm{O}_{6}$ : C, $61.49 ; \mathrm{H}, 4.22$; N, 10.87. Found: C, $60.84 ; \mathrm{H}, 4.18 ; \mathrm{N}, 10.70$.

### 2.4. X-ray crystallography

Suitable single crystals of $\mathbf{1}$ and 2 were mounted on a Rigaku R-axis Spider II diffractometer equipped with graphite-monochromated $\operatorname{Mo}-\mathrm{K} \alpha(\lambda=0.71073 \AA)$ radiation. The unit cell parameters were determined by least squares refinements of all reflections in both cases. The structures were solved by direct methods and refined by full-matrix least-squares on $F^{2}$. All non-hydrogen atoms were refined anisotropically. The hydrogens were located from the difference map and then added geometrically. All calculations were performed using the SHELXTL-97 program package [24-26]. Crystal data and experimental details for $\mathbf{1}$ and $\mathbf{2}$ are provided in table 1 . Selected bond distances and angles are listed in table 2.

## 3. Results and discussion

## 3.1. $X$-ray structure of 1

The molecular view of $[\mathrm{Cu}(\mathrm{PDC})(\text { phen })]_{2} \cdot 2 \mathrm{CH}_{3} \mathrm{OH} \cdot 1.5 \mathrm{H}_{2} \mathrm{O}$ (1) with atomicnumbering scheme is shown in figure 1. Selected bond distances and angles are listed in table 2. The asymmetric unit of $\mathbf{1}$ contains two copper(II) ions, two PDC, two phen, two methanol, and 1.5 waters (figure 1). One methanol and one water are disordered over two sites.

Single-crystal structure analysis reveals that there are two distinguishable copper ions in 1. In this binuclear molecule, the two PDC ligands differ considerably in their interaction with copper(II). One PDC is tetradentate linking two $\mathrm{Cu}(\mathrm{II})$ ions (scheme 1a). The other is tridentate to another $\mathrm{Cu}(\mathrm{II})$ (scheme 1b). The two copper(II) atoms are bridged by O7 from tetradentate PDC. Cu1 is five-coordinate by two phen molecules and one PDC in distorted square-pyramidal geometry and Cu 2 is in a distorted octahedral geometry with two PDC units (figure 1).

Cu 1 is five-coordinate with two phen ligands ( $\mathrm{N} 1, \mathrm{~N} 2, \mathrm{~N} 3, \mathrm{~N} 4$ ) and one oxygen (O7) from PDC ligand. Since the angular structural index parameter, $\tau=(\beta-\alpha) / 60$, is evaluated by the two largest angles $(\alpha<\beta)$ in the five-coordinate geometry, where $\alpha$ and $\beta$ are the bond angles involving the trans donors in the basal plane, $\tau=0$ and 1 for ideal square pyramidal and trigonal bipyramidal geometries, respectively [27]. In $\mathbf{1}$, the largest angle around Cu 1 is $\mathrm{N}(4)-\mathrm{Cu}(1)-\mathrm{N}(1)\left(175.46(5)^{\circ}, \beta\right)$ and the second largest is $\mathrm{O}(7)-\mathrm{Cu}(1)-\mathrm{N}(2)\left(146.78(5)^{\circ}, \alpha\right)$. The value of $\tau(0.20)$ indicates square-pyramidal

geometry around Cu 1 . The basal plane is defined by $\mathrm{N} 1, \mathrm{~N} 2, \mathrm{~N} 4$, and O 7 (root mean square (rms) deviation $0.273 \AA$ ) and the apical position is occupied by N3. The coordination geometry around Cu 2 is a distorted octahedron with two tridentate PDC ligands. Each Cu 2 has distorted $\left[\mathrm{CuO}_{4} \mathrm{~N}_{2}\right]$ octahedral coordination geometry with the apical positions taken up by O 5 and O 7 . The apical $\mathrm{Cu}-\mathrm{O}$ distances $(2.240(12) \AA$ for $\mathrm{Cu}(2)-\mathrm{O}(5) ; 2.381(11) \AA$ for $\mathrm{Cu}(2)-\mathrm{O}(7))$ are considerably longer than the equatorial ones and the geometry quite distorted from ideal octahedron. The axial elongation could be attributed to the Jahn-Teller distortion of copper(II). The basal atoms (Cu2, N5, N6, O1, and O3) are non-planar with rms deviation of $0.296 \AA$. The maximum deviation of any equatorial atom from the mean plane around Cu 2 is $0.0937 \AA$. The bond angle of $\mathrm{O}(3)-\mathrm{Cu}(2)-\mathrm{O}(1)$ is $159.35^{\circ}$, deviating from ideal value of $180^{\circ}$. The $\mathrm{N}(5)-\mathrm{Cu}(2)-\mathrm{O}(3), \mathrm{N}(6)-\mathrm{Cu}(2)-\mathrm{O}(3), \mathrm{N}(6)-\mathrm{Cu}(2)-\mathrm{O}(1)$, and $\mathrm{O}(1)-\mathrm{Cu}(2)-\mathrm{O}(7)$ angles are $80.07(5)^{\circ}, 99.52(5)^{\circ}, 100.42(5)^{\circ}$, and $91.15(5)^{\circ}$, respectively, implying geometry around Cu 2 is distorted.

Figure 1. Molecular structure of $\mathbf{1}$ with atom numbering scheme ( $30 \%$ thermal ellipsoids).

(a)

(b)

Scheme 1. Coordination modes of PDC.

### 3.2. X-ray structure of 2

The X-ray crystal structure of $\left[\mathrm{Mn}(\mathrm{PDC})(\mathrm{phen})_{2}\right] \cdot \mathrm{CH}_{3} \mathrm{OH}(\mathbf{2})$ is shown in figure 2 and selected bond lengths and angles are listed in table 2. The asymmetric unit consists of tridentate PDC, two bidentate phen's and one methanol. The Mn center resides on a two-fold axis, through $\mathrm{Mn}, \mathrm{N}(3)$, and $\mathrm{C}(16)$ so that the phen groups are cis to each other. The best equatorial pentagonal plane is defined by $\mathrm{O}(1), \mathrm{O}(1 \mathrm{~A}), \mathrm{N}(2), \mathrm{N}(2 \mathrm{~A})$, $\mathrm{N}(3)$, and Mn (rms deviation of the fitted atoms $0.296 \AA$ ). The five angles in this plane are approximately evenly distributed (70.62(3), 70.62(3), 77.05(5), 77.05(5), and 77.39(7) for $\mathrm{N}(3)-\mathrm{Mn}-\mathrm{O}(1 \mathrm{~A}), \mathrm{O}(1)-\mathrm{Mn}-\mathrm{N}(3), \mathrm{O}(1 \mathrm{~A})-\mathrm{Mn}-\mathrm{N}(2 \mathrm{~A}), \mathrm{O}(1)-\mathrm{Mn}-\mathrm{N}(2)$, and $\mathrm{N}(2 \mathrm{~A})-$ $\mathrm{Mn}-\mathrm{N}(2)$, respectively). $\mathrm{N}(1)$ and $\mathrm{N}(1 \mathrm{~A})$ are apical with equal bond lengths (table 2); the $\mathrm{N}(1)-\mathrm{Mn}-\mathrm{N}(1 \mathrm{~A})$ angle is $177.65(7)^{\circ}$. The axial $\mathrm{Mn}-\mathrm{N}$ bond length of 2.306 A is between the equatorial ones $(2.229 \AA, 2.350 \AA)$. There are several reports of seven-coordinate pentagonal bipyramidal manganese(II) [28, 29]. Macrocyclic ligands

Figure 2. Molecular structure of $\mathbf{2}$ with atom numbering scheme ( $30 \%$ thermal ellipsoids). The symmetry element names end in "A" $(-x, y, 0.5-z)$.
or rigid, resonance-stabilized planar ligands have been employed to enforce pentagonal planar coordination [30]. The PDC ligand uses three atoms to coordinate to the Mn (II) to form two, five-membered chelate rings, leaving space to accommodate four other donors. Steric crowding of the four, five-membered chelate rings may prevent dimerization of the monomeric units in solid state.

### 3.3. Spectroscopic properties

Infrared spectrum of $\mathbf{1}$ shows two strong carboxylate bands at $1633-1596 \mathrm{~cm}^{-1}$ for the symmetric vibration and $1428-1360 \mathrm{~cm}^{-1}$ for the asymmetric vibration [31]. For 2, typical asymmetric and symmetric stretching bands of carboxylates are at 1623$1589 \mathrm{~cm}^{-1}$ and $1422-1376 \mathrm{~cm}^{-1}$. The IR bands attributable to the presence of phen in 1 ( $3064 \mathrm{~m}, 3050 \mathrm{~m}, 1271 \mathrm{~m}, 856 \mathrm{~m}$, and 727 m ) and in $2(3058 \mathrm{~m}, 2925 \mathrm{~m}, 1276 \mathrm{~m}, 1044 \mathrm{~m}$, 863 s , and 730 m ) are also observed [32].

The UV absorption spectra of pyridine-2,6-dicarboxylic acid (L), $\mathbf{1}$ and $\mathbf{2}\left(10^{-4} \mathrm{M}\right)$ in MeOH are shown in figure 3. The free ligand L exhibits absorption bands at 227 and 268 nm (with molar absorption coefficients in $\mathrm{dm}^{3} \cdot \mathrm{~mol}^{-1} \cdot \mathrm{~cm}^{-1}$ ), indicating $\pi-\pi^{*}$ electronic transitions [33], originating from the pyridyl groups of pyridine-2,6dicarboxylic acid; these bands are red-shifted upon coordination in $\mathbf{1}$ and $\mathbf{2}$.

Figure 3. UV spectra of $\mathbf{1 , 2}$, and $\mathrm{H}_{2} \mathrm{PDC}(\mathrm{L})$ in methanol ( $c a .10^{-4} \mathrm{M}$ ).

## 4. Conclusion

In this article, a new binuclear copper(II) and a seven-coordinate manganese(II) compound have been synthesized and characterized. Although the two compounds were synthesized from a similar reaction system, the structures are very different because of the different metal centers and the steric demands of ligands.
