

Decomposition occurred at 187° with evolution of dense white fumes, and droplets of a dark brown oil collected in the flask and condenser. The oil was extracted with acetone (three 100-ml portions) and steam distilled to give a yellow oil in 15% yield, bp 235–236°. *Anal.* (C₆H₃ClFNO₂) C, H, Cl, N; F: calcd, 10.8; found, 10.1.

2-Chloro-3-fluoroaniline.—2-Chloro-3-fluoronitrobenzene (19.6 g) was heated under reflux (15 min) with SnCl₂ (118 g) and HCl (11 N, 180 ml). The solution was then basified with NaOH (2 N) and extracted with CHCl₃ (four 100-ml portions) to yield 12.5 g (77%) of a clear colorless oil, bp 212–215°.

2-Chloro-3-fluoroacetanilide.—2-Chloro-3-fluoroaniline was acetylated with Ac₂O–NaOAc to give colorless needles, mp 131–132° (from EtOH). *Anal.* (C₈H₇ClFNO) C, H, F, N; COCH₃: calcd, 22.9; found, 22.4.

2,6-Dinitrofluorobenzene.—Another attempted method of preparation of 2,3-difluoroaniline involved the initial preparation of 2,6-dinitrofluorobenzene, which was accomplished by two routes different from those previously reported.^{5–7}

(a) Fluorobenzene (251 g) was heated (2 hr) on a water bath with constant stirring with a mixture of H₂SO₄ (36 N, 1.5 l.) and fuming H₂SO₄ (20% O₂, 300 ml). The reaction mixture was cooled to 0° and solid KNO₃ (750 g) was added slowly, the temperature being maintained between 40 and 60°. The solution was then heated at 110° (20 hr) and poured onto ice and the white precipitate was filtered off under vacuum; after being pressed dry, the precipitate was heated under reflux (7.5 hr) with H₂SO₄ (18 N, 1.9 l.) and the reaction mixture was poured onto ice and extracted (Et₂O, four 200-ml portions). Evaporation of the dried (Na₂SO₄) ether extract yielded 104 g (22%) of a yellow, steam-volatile oil, bp 288–290° dec. *Anal.* (C₆H₃FN₂O₄) C, H, F, N.

(b) 3,5-Dinitro-4-chlorobenzenesulfonic acid (60 g), prepared by the method of Schmitz,⁸ was heated with anhydrous KF (31 g), DMF (100 ml), and C₆H₆ (100 ml) until the temperature of the distillate was 120° in order to dehydrate the system. The mixture was then heated under reflux (10 hr), brown fumes being evolved throughout. The DMF was then removed under reduced pressure and the residue was heated under reflux (8 hr) with H₂SO₄ (7 N, 1.25 l.). Extraction with CHCl₃ (four 100-ml portions) gave a yellow, steam-volatile oil, bp 288–290° dec, in 22% yield.

2-Fluoro-3-nitroaniline.—2,6-Dinitrofluorobenzene (28.5 g) was heated under reflux (30 min) with SnCl₂ (90 g), HCl (3 N, 540 ml), and EtOH (130 ml).⁹ The reaction mixture was basified with 2 N NaOH and extracted (Et₂O, seven 200-ml portions) to give (11.2 g, 43%) yield when crystallized from petroleum ether (bp 40–60°) as orange needles, mp 99–100°. *Anal.* (C₆H₅FN₂O₂) C, H, N; F: calcd, 12.2; found 12.7.

Acknowledgments.—This work was mainly supported by grants from the Anti-Cancer Council of Victoria, of which P. E. Hughes was the W. J. Kilpatrick Fellow. Jill M. Blunck is in receipt of a Research Scholarship from the University of Melbourne.

Synthesis of Some Antithyroid Compounds. I

P. K. SRIVASTAVA AND M. SALEEM

Department of Chemistry, University of Roorkee, Roorkee, India

Received July 29, 1968

Various 1-arylformamidino-1-arylthiocarbamide hydrochlorides have been synthesized for biological testing since these compounds might prove to be antithyroid drugs due to their facile oxidation into the corresponding heterocyclic bases.

Experimental Section

Following the general technique for the reaction as worked out by earlier workers,^{1–4} it has been found possible to prepare many substituted 1-arylformamidino-1-arylthiocarbamide hydrochlorides (I) by the interaction of arylycyanamides with the appropriate thiocarbamides.

1-Phenylformamidino-1-phenylthiocarbamide Hydrochloride.¹—Equimolecular quantities of phenylcyanamide (6 g) in dry Et₂O and 1-phenylthiocarbamide (8 g) dissolved in acetone were mixed and dry HCl was passed through the mixture for a few minutes. A colorless crystalline product separated which was filtered and washed freely (warm Me₂CO, Et₂O) (mp 158°). It could not be crystallized as it decomposed on boiling with any common solvent.

Similarly other substituted formamidinothiocarbamide hydrochlorides have been prepared and the results are summarized in Table I.

TABLE I
1-ARYLFORMAMIDINO-1-ARYLTHIOCARBAMIDE HYDROCHLORIDE (I)

No.	Ar'	Ar	Formula ^a	Yield, %	Mp, °C
1	C ₆ H ₅	C ₆ H ₅	C ₁₄ H ₁₄ N ₄ S · HCl	92	157–158

N-(β-Guanidinoethyl)- and N-Guanylazetidines

EIVIO BELLASIO AND GIANFRANCO CRISTIANI

Research Laboratories of Lepetit S.p.A., Milan, Italy

Received August 30, 1968

This communication deals with the synthesis of a series of 3,3-disubstituted N-(β-guanidinoethyl)azetidines¹ and 3,3-disubstituted N-guanylazetidines (Table I).
